Var. β, latifòlia (Link, l. c.) leaves broad-lanceolate. ♃. H. V. longifòlia, Willd. enum. 1. p. 19. V. grόssa, Mart. hort. erl. p. 12. Leaves deeply serrated.

Var. γ, abbreviàta (Link, l. c.) lower leaves generally short-acuminated. ♃. H. V. acùta, Mart. hort. erl. p. 13. V. rígens, Mart. l. c. in which the leaves are hardly cordate. V. ambígua, Mart.

Var. δ, subincìsa (Link, l. c.) leaves deeply serrated, like those of *V. elàtior*, but smaller.

Var. ε, quadrifòlia (Schkuhr.) leaves 4 in a whorl. V. petiolàris, Lapeyr. and V. Schrebèri, Lapeyr.

Long-leaved Speedwell. Fl. July, Sept. Clt. 1731. Pl. 2 to 4 feet.

20 V. RAMO'SA (Pall. ex Link, jahrb. 1-3. p. 39.) stem downy; stem leaves 3 in a whorl, oblong-lanceolate, remotely serrulated: rameal ones opposite, crowded, linear: uppermost ones quite entire. ♃. H. Native of Siberia. This is a very showy species.

Branched Speedwell. Pl. 1 to 2 feet.

* * *Leaves always opposite, never verticillate, serrated and crenated. Racemes numerous or solitary. Plants usually furnished with sterile surculi, or branches.*

21 V. NEGLE'CTA (Vahl, enum. 1. p. 59.) white from hoary tomentum; leaves lanceolate, crenately serrated, acute, cuneated at the base, and quite entire. ♃. H. Native of Hungary and Siberia, on hills. Willd. enum. 1. p. 15. V. canéscens, Schrad. comm. ver. no. 3. Link, enum. 1. p. 21. V. incàna, Waldst. et Kit. 3. p. 271. t. 244. Besser. fl. gall. p. 28. Schultes, fl. austr. ed. 2d. 1. p. 18. Radical leaves oblong, obtuse. Cauline leaves opposite, or alternate, attenuated at both ends: uppermost ones quite entire. Bracteas usually longer than the flowers. Racemes spicate, usually numerous, seldom solitary. Flowers blue, or purple.

Neglected Speedwell. Fl. July, Aug. Clt. 1797. Pl. 1½ to 2 feet.

22 V. INCA'NA (Lin. spec. p. 14. Vahl. enum. 1. p. 59.) white from hoary tomentum; leaves lanceolate, oblong, crenated, and nearly entire, obtuse. ♃. H. Native of the Ukraine and Samara, and Altaia. Bieb. fl. cauc. 1. p. 7. suppl. p. 9. Hoffm. in comm. gott. 15. p. 123. t. 6. Steven, mem. mosc. 5. p. 339. V. canéscens, Pall. itin. 2. p. 522.—Amm. ruth. no. 30. Stem simple. Radical leaves a foot long, ovate-oblong, very blunt. Raceme spicate, terminal, solitary. Flowers blue, or purple. There is a variety of this having all the cauline leaves, or only the upper ones, quite entire.

Hoary Speedwell. Fl. July, Sept. Clt. 1759. Pl. ½ to 1 foot.

23 V. CARTILAGI'NEA (Ledeb. fl. ross. alt. ill. t. 210. fl. alt. 1. p. 28.) stem downy: leaves glabrous: lower ones opposite, spatulate, serrated towards the apex: superior ones alternate, linear, serrulated; lower bracteas exceeding the calyxes; calyx 4-parted, with ovate, 3-nerved, glabrous, ciliated segments. ♃. H. Native of Dauria, near Nertschinsk. Surculose at the base. Raceme usually solitary. Corolla blue.

Cartilaginous Speedwell. Pl. 1 to 2 feet.

24 V. RUBICU'NDA (Ledeb fl. ross. alt. ill. t. 208. fl. alt. 1. p. 28.) villously downy; leaves tapering into the petioles, oblong, or lanceolate, serrated; bracteas all longer than the pedicels, and are, as well as the calyxes, clothed with glandular hairs. ♃. H. Native of Dauria. Superior leaves sub-alternate, coarsely serrated. Racemes several. Calyx 4-parted, unequal, obtuse. Corollas showy, rose-coloured. Perhaps the same as *V. rubélla*, Pall. Said to be nearly allied to *V. serrulàta*, Pall. and *V. élegans*, D. C., but differs from the first in the leaves being opposite, and from both in the leaves not being petiolate, but tapering to their insertion.

Reddish-flowered Speedwell. Pl. 1 to 2 feet.

25 V. E'LEGANS (D. C. cat. hort. monsp. 1813. p. 154. Link, enum. 1. p. 21.) leaves serrated, quite entire at top, petiolate, ovate-oblong, or oblong, attenuated, acute, and are, as well as the stems downy; racemes numerous; lower bracteas longer than the pedicels: upper ones shorter. ♃. H. Native about Verviers, in humid meadows. Flowers rose-coloured. V. incarnàta, G. Don, in Loud. hort. brit. p. 6. ?

Elegant Speedwell. Fl. May, June. Clt. 1822. Pl. 1 to 2 feet.

26 V. SPICA'TA (Lin. spec. p. 14.) downy, canescent, rather clammy; leaves crenated: radical ones oblong, or obovate, running into the petioles: cauline leaves lanceolate, or oblong-lanceolate, or linear-lanceolate, sessile, toothed, entire at top; bracteas and calyxes pilose. ♃. H. Native of Switzerland, Germany, France, Siberia; in England in high dry chalky pastures, especially on Newmarket Heath, and about Bury St. Edmund's. Smith, fl. brit. 1. p. 15. engl. bot. t. 2. Schmidt, fl. boh. no. 7. Oed. fl. dan. 52. Poit. et Turp. fl. par. 1. p. 19. t. 19. Schrad. fl. germ. exclusive of the synonymes of Poll. Crantz, Vaillant and Fl. dan. Wahl. fl. ups. p. 3. Svensk, fl. suec. t. 2. Bieb. fl. cauc. 1. p. 8. V. hýbrida, Bieb. 1. p. 8, and 3. p. 9. V. spicàta, and V. orchídea, Besser, enum. pl. volh. p. 2. no. 8 and 9.—Clus. hist. p. 347.—Hall. helv. no. 452.—Mor. hist. 2. p. 318. sect. 3. t. 22. f. 4. Root hard, creeping. Stems usually simple. Leaves sessile, firm, entire at top. Racemes spicate, dense, usually solitary. Flowers blue, or purple, or white; tube of corolla thicker than in its congeners, longer and white, and the segments of the limb narrower. Capsules downy.

Var. β, spicàta alpìna (Rœm. et Schultes, syst. 1. p. 93.) ♃. H. Native of the Pyrenees. V. Sterbergiàna, Bernh. Lapeyr, pl. des. pyr. p. 5. Leaves glabrous.

Spicate-flowered Speedwell. Fl. July, Sept. England. Pl. ½ to 1 foot.

27 V. CLU'SII (Schott. ex Rœm. et Schultes, syst. 1. p. 94.) tomentose from pedicellate glands; leaves toothed; radical ones

ovate, running into the petioles: cauline ones lanceolate, petiolate; bracteas and calyxes ciliated. ♃. H. Native of Hungary, Bohemia, Austria, and Denmark. V. spicàta, var. *α*, 2. Scop. carn. ed. 2d. p. 17. Poll. pal. no. 7. Schultes, fl. austr. ed. 2d. p. 7. V. hybrida, Schmidt, fl. boh. no. 8. V. spicàta, Vahl, fl. dan. t. 52.? Raceme usually solitary, spicate, dense. Flowers blue, or purple. This is probably only a variety of *V. spicàta*, clothed with viscid glandular pubescence.

Clusius's Speedwell. Fl. July, Sept. Clt. 1822. Pl. ½ to 1 foot.

28 V. HY'BRIDA (Lin. spec. p. 14.) leaves unequally and bluntly crenated, and are, as well as the stem, villous and canescent; radical ones petiolate, ovate: cauline ones nearly sessile, elliptic-oblong; bracteas linear, longer than the calyxes. ♃. H. Native of Europe, on the mountains; in England, at the sides of mountains, rare; on Craig Wreidhin, Montgomeryshire; on Humphrey Head, a steep rock near Cartmell Wells, Lancashire. Vahl, enum. 1. p. 60. Willd. spec. 1. p. 50. enum. 1. p. 16, and in Schrad. diar. bot. 1799. t. 3. Baumg. fl. trans. 1. p. 19. Ray. syn. p. 278. t. 11. f. 1. Smith, engl. bot. t. 673. good. Schrad. ver. p. 22. fl. germ. 1. p. 17. V. Barrelièri, Schott, ex Rœm. et Schultes, syst. 1. p. 94. V. spicàta mìnor, Vaill. par. t. 33. f. 7. V. spicàta, D. C. fl. fr. no. 2408.—Barrel. icon. t. 682. Leaves all obtuse. Raceme spicate, solitary, or few together. Bracteas and calyxes ciliated. Flowers blue, or purple. There is a variety of this with numerous spicate racemes.

Hybrid Speedwell. Fl. July, Sept. England. Pl. ½ to 1 foot.

29 V. CONFU'SA (Rœm. et Schultes, syst. 1. p. 95.) leaves opposite: lower ones cordate: superior ones ovate-lanceolate, acuminated, doubly and unequally serrated, and are, as well as the stem, clothed with soft canescent pubescence; segments of corolla divaricate, acuminated; capsules pilose. ♃. H. Native country unknown. Said to be nearly allied to *V. complicàta*. Young leaves soft: adult ones more rough: lower ones petiolate: superior ones almost sessile. Calycine segments pilose, ciliated. Racemes spicate, usually solitary.

Confused Speedwell. Fl. June, July. Clt. 1819. Pl. 1 foot.

30 V. LONGIFLO'RA (Rœm. et Schultes, syst. 1. p. 95.) leaves cordate-lanceolate, sharply and unequally serrated, almost glabrous; tube of corolla twice as long as the calyx, which is small and unequal. ♃. H. Native country unknown. Plant downy at top; petioles ciliated. Leaves cuneiform: superior ones having the teeth tipped with red. Pedicels and calyxes downy. Corolla lilac; tube 1½ line long. Capsule obcordate, pilose.

Long-flowered Speedwell. Fl. July, Aug. Clt. 1824. Pl. 1½ foot.

31 V. POLYSTA'CHYA (Link, enum. 1. p. 23.) leaves nearly sessile, ovate, acute, serrated, downy; spiciferous branches crowded; flowers nearly sessile. ♃. H. Native country unknown. V. corymbòsa, Hort. Plant downy. Leaves serrated even to the top, with a reflexed acumen. Lower bracteas longer than the flowers. Flowers small, pale blue. Racemes crowded in a corymbose manner at the tops of the branches. comose.

Many-spiked Speedwell. Fl. June, July. Clt. 1817. Pl. 1½ to 2 feet.

32 V. RUTHE'NICA (Hort. vind. ex Rœm. et Schultes, syst. 1. p. 96.) leaves ovate-lanceolate, unequally serrated; bracteas length of calyxes; calyx unequal; capsule a little longer than the calyx. ♃. H. Native country unknown, being gathered in the botanic garden of Vienna. Very like *V. argùta*, but the leaves are serrated to the apex. Flowers blue, or purple.

Russian Speedwell. Fl. July, Aug. Clt. 1821. Pl. 1 foot.

33 V. VILLO'SA (Schrad. ver. p. 13. t. 1. f. 3.) leaves oblong-ovate, serrated, and are, as well as the stems, villous and canescent. ♃. H. Native country unknown. Willd. enum. 1. p. 361. Poir. encycl. 8. p. 513. Stems ascending. Leaves reflexed at top, thickish, wrinkled, and shining above: lower ones ovate, obtuse: the rest ovate-oblong, acutish, tapering into the petioles. Racemes spicate, long for the size of the plant, erectish, often flexuous. Flowers blue, or purple, also white. Capsule a little higher than the calyx. This species has been joined by Willd. and Mart. with *V. crenulàta*.

Villous Speedwell. Fl. July, Aug. Clt. 1804. Pl. 1 to 1½ foot.

34 V. LUXU'RIANS (Ledeb. fl. ross. alt. ill. t. 211. fl. alt. p. 27.) stem pilose; leaves smoothish, petiolate, oblong, acuminated, rounded at the base, acutely and simply serrated: serratures nearly equal; bracteas about equal in length to the pedicels; calyx 4-cleft, spreadingly reflexed, unequal. ♃. H. Native of Siberia, near Irkutch. Leaves 4 inches long, or longer. Racemes 3 or more. Corolla blue.

Luxuriant Speedwell. Pl. 2 to 3 feet.

35 V. LINARIÆFÒLIA (Pall. in herb. Willd. Link, jahrb. 1-3. p. 35.) leaves opposite, linear, gradually attenuated, long-acuminated, remotely serrated; bracteas longer than the pedicels. ♃. H. Native of Siberia. V. angustifòlia, Fisch. hort. gorenk. Link, enum. 1. p. 19. Stem angular, with a few scattered hairs. Leaves entire at base and apex, serrated only in the middle. Raceme elongated; rachis downy. Calyx glabrous, with ciliated segments. Corollas large blue.

Toadflax-leaved Speedwell. Fl. July, Sept. Clt. 1822. Pl. 1 to 2 feet.

36 V. BRACHYPHY'LLA (Rœm. et Schultes, syst. 1. p. 96.) stem downy, simple; leaves opposite, lanceolate to oblong, gradually attenuated at the base, acuminated, serrated, quite entire at the apex: upper ones sub-serrated; lower bracteas foliaceous, longer than the pedicels. ♃. H. Native country unknown. V. brevifòlia, Link, enum. 1. p. 21. Leaves 2 inches long, and 4-5 lines broad. Calyx downy. Corolla blue.

Short-leaved Speedwell. Fl. June, July. Clt. 1822. Pl. 1 foot.

37 V. MENTHÆFÒLIA (Schott. l. c.) villous; leaves unequally crenated: radical ones ovate: cauline ones oblong, acute, petiolate, quite entire at base and apex; bracteas linear. ♃. H. Native of Austria, and on the shores of the Volga.—J. Bauh. hist. 3. p. 282.—Clus. hist. 347. Flowers racemose, blue, or purple. Schultes had specimens of this plant from the garden at Gorenki, under the name of *V. spicàta affìnis*. Raceme usually solitary. The segments of the corolla are twisted, as in *V. orchídea*, but shorter.

Mint-leaved Speedwell. Fl. July, Sept. Clt. 1823. Pl. ½ to 1 foot.

38 V. CRASSIFO'LIA (Kit. ex Rœm. et Schultes, syst. 1. p. 96.) leaves ovate-lanceolate, running into the petioles, remote: lower ones crenated: superior ones quite entire; corolla orchideous. ♃. H. Native country unknown. Stem red. Leaves rather downy beneath, fleshy. Racemes spicate, solitary, or tern, a foot and more long. Calyx downy, unequal. Bracteas all longer than the calyxes. Corolla violaceous, with twisted segments. Capsule downy. Allied to *V. orchídea*.

Thick-leaved Speedwell. Fl. July, Aug. Clt. 1822. Pl. 2 to 3 feet.

39 V. ORCHI'DEA (Crantz, austr. fasc. 4. p. 333, exclusive of the synonymes of Vaill. and Fl. dan.) downy; leaves deeply serrated: radical ones oblong-ovate, running into the petioles: cauline ones lanceolate, acutish, almost sessile; segments of corolla lanceolate, twisted a little, exceeding the anthers. ♃. H. Native of Austria, Pannonia, and Cape Caucasus, on arid

hills. Bess. fl. gal. 1. p. 27. Baumg. fl. trans. 1. p. 18. Wahl. fl. carp. p. 4. Sims, bot. mag. 2210. V. cristàta, Bernh. siber, einig. ehrenpreis, p. 14-21. V. Crántzii, Schultes, obs. bot. no. 16. V. hýbrida, Bieb. cauc. p. 8, exclusive of most of the synonymes.—Bauh. hist. 3. p. 283. icone.—Mor. hist. 2. sect. 3. t. 22. f. 2. bad. V. spicàta latifòlia, Bauh. pin. p. 246. Habit of *V. spicàta* and *V. hýbrida*. Racemes spicate, dense, usually solitary. Corollas purple or blue. This is a very singular species, from the long twisted segments of the corolla.

Orchideous-flowered Speedwell. Fl. July, Sept. Clt. 1819. Pl. 1 foot.

40 V. Pònæ (Gouan. ill. t. 1. f. 1.) leaves cordate-ovate, sessile, acuminated, and are, as well as the stems, which are quite simple, pilose; racemes few-flowered; calyxes downy. 4. H. Native of Mount Baldo, and the Pyrenees. Link, enum. 1. p. 23. Schrad. ver. p. 34, exclusive of *β*. V. sempervìrens, Lam. fl. fr. ed. 2d. p. 436. V. Gouànii, Moretti, giorn. de fis. 5. p. 41. Lower leaves small, roundish, crenated: the rest an inch long, acuminated and coarsely serrated, pale beneath. Bracteas length of pedicels. Flowers distant, size of those of *V. chamæ`drys*, blue. Calyx 5-parted. Capsule swollen a little. Seeds small, very flat.

Var. β, acutifòlia; leaves acute. 4. H. Lapeyr. pl. pyr. p. 5.

Var. γ, trîloba; leaves 3-lobed. 4. H. Lapeyr. l. c.

Var. δ, ramosíssima; branches numerous, axillary. 4. H. Lapeyr. l. c.

Var. ε, procèrior; taller, with broader leaves, and a long spicate raceme of flowers. 4. H. Lapeyr. l. c.

Var. ξ, nàna; dwarf, with large flowers. 4. H. Lapeyr. l. c. V. pùmila, All. pedem. no. 270. t. 22. f. 5.

Pona's Speedwell. Fl. May, July. Clt. 1822. Pl. ½ to 1 foot.

41 V. Stelle`ri (Pall. ex Link, jahrb. 1-3. p. 50.) stems simple, hairy; leaves sessile, cordate, serrately crenated, obtuse; raceme short, corymbose; bracteas crenated, shorter than the pedicels; calyx hairy. 4. H. Native of Kamtschatka. Nearly allied to *V. Pònæ*, but the stems and racemes are shorter, &c.

Steller's Speedwell. Pl. ¼ to ½ foot.

42 V. gra´ndis (Fisch. ex Spreng. neu. entd. 2. p. 122.) leaves cordate-oblong, obtuse, deeply toothed, somewhat pinnatifid at the base, naked; raceme elongated; capsules nearly globose, glabrous. 4. H. Native of Siberia. Stem usually simple, downy. Calyx nearly equal, 4-cleft. Corollas white; anthers and pistil flesh-coloured. This species has a habit of those species with lateral racemes, but with the characters of those of the present section.

Great Speedwell. Fl. July, Sept. Clt. 1826. Pl. 1 to 2 feet.

* * * *Leaves always opposite, never verticillate, pinnate, and pinnatifid. Racemes solitary or numerous.*

43 V. pinna`ta (Ait. hort. kew. ed. 1st. vol. 1. p. 19.) leaves somewhat fascicled: lower ones pinnate: superior ones pinnatifid and simple: leaflets and segments filiform, divaricate; calyx 5-parted. 4. H. Native of Siberia. Ait. hort. kew. ed. 1st. vol. 1. p. 19. ed. 2d. vol. 1. p. 28. Vahl, enum. 1. p. 61. Schrad. comm. ver. p. 32. Hoffm. in comm. gott. 15. p. 130. t. 10. Laxm. act. petrop. 1770. t. 29. f. 1. V. Hispánica, Meerb. t. 11. ex Poir. encycl. 8. p. 513.—Amm. ruth. no. 33. Stem ascending, downy, but usually glabrous in the cultivated state. Leaves approximate, very narrow, with unequal segments. Racemes solitary in the spontaneous plant, but many in the cultivated plant. Corollas blue or white. Capsule oval.

Var. β; leaves simple, filiform. Link, jahrb. 1. 3. p. 39.

Pinnate-leaved Speedwell. Fl. June, Aug. Clt. 1776. Pl. 1 foot.

44 V. sessiliflòra (Bunge, in Ledeb. fl. ross. alt. ill. t. 126. fl. alt. 1. p. 32.) leaves oblong, cuneated at the base, tapering into the petioles, pectinately pinnatifid, with entire bluntish segments; superior leaves linear, quite entire, and are, as well as the stem, downy; spike usually solitary, dense; flowers exactly sessile. 4. H. Native of Altaia, in sterile places at the rivers Kurai and Tschuja. The whole plant villously pubescent. Bracteas exceeding the calyxes. Calyx 4-parted, rather unequal. Corollas blue.

Sessile-flowered Speedwell. Pl. ½ foot.

45 V. incìsa (Ait. l. c.) leaves somewhat fascicled, petiolate, lanceolate, pinnatifid: segments almost entire; calycine segments lanceolate. 4. H. Native of Siberia. Vahl, enum. 1. p. 61. Schrad. comm. ver. p. 33. Lodd. bot. cab. 1397. Stem downy. Racemes numerous, never solitary. Leaves cuneated at the base. Calyx 5-cleft, unequal. Corollas blue or white.

Cut-leaved Speedwell. Fl. July, Aug. Clt. 1397. Pl. 1 to 2 feet.

46 V. lacinia`ta (Ait. l. c.) leaves somewhat fascicled, on short petioles, lanceolate, pinnatifid: segments quite entire, unequal, linear, or lanceolate; calycine segments oblong-ovate. 4. H. Native of Siberia. Vahl, enum. 1. p. 60. Willd. enum. 1. p. 19. V. spùria, Junghans, icon. rar. C. L. f. 2. Veronicástrum laciniàtum, Mœnch. Stem downy. Leaves spreadingly deflexed. Racemes usually solitary, about a foot long, loose. Bracteas equal in length, or exceeding the calyxes. Calyx 5-cleft, unequal. Flowers blue, or purple. Capsule equalling the calyx in length.

Jagged-leaved Speedwell. Fl. June, Aug. Clt. 1780. Pl. 2 feet.

47 V. sublacinia`ta; rather downy; leaves opposite or 3-4 in a whorl, subfascicled, ovate-lanceolate, shining above, so deeply and doubly toothed as to be almost pinnatifid; calyx 4-cleft, unequal. 4. H. Native country unknown. Corolla purplish-blue. V. marítima, Lin. herb.

Somewhat-jagged-leaved Speedwell. Fl. Aug. Sept. Clt. ? Pl. 1 to 1½ foot.

Sect. II. Gentianòides (from *gentiana*, gentian; and *idea*, form; in reference to the appearance of the plants.) Capsule swollen, emarginate. Seeds large, flat, oblique, somewhat saucer-shaped. Leaves opposite, connate, or sheathing at the base, smooth and glossy. Racemes usually solitary, terminal, elongated, loose.

48 V. gentianoìdes (Vahl, symb. 1. p. 1. enum. 1. p. 62.) radical leaves oblong, crenated: cauline leaves ovate-lanceolate, with cartilaginous edges, crenated at top, and narrowed at the base: uppermost leaves acute, quite entire; stems simple, ascending; upper segment of corolla smaller than the lateral ones. 4. H. Native of Tauria, Cappadocia, and Armenia. Vent. malm. t. 86. Sims, bot. mag. t. 1002. Sibth. et Smith, fl. græc. 1. p. 5. t. 5. V. Buxbaumiàna, Pall. ind. taur. ex Bieb. fl. cauc. 1. p. 9.—Buxb. cent. 1. t. 35. Stem glabrous at bottom. Leaves rather downy, obscurely 3-nerved. Bracteas villous. Calycine segments unequal. Flowers pale blue.

Gentian-like Speedwell. Fl. May, June. Clt. 1748. Pl. 1 to 3 feet.

49 V. pa´llida (Horn. hort. hafn. 1. p. 17.) leaves lanceolate, obtuse, subserrated; superior segment of corolla larger than the lateral ones; stem ascending. 4. H. Native country unknown. V. olýmpicum, Pall.? Very like the preceding; but the leaves are much thinner and narrower, length of internodes, not twice their length, as in that species. Flowers distant, pale blue.

Pale Speedwell. Fl. May, June. Clt. 1821. Pl. 1 to 1½ foot.

SECT. III. SERPYLLIFÒLIA (from *Serpýllium*, Wild Thyme; and *folium*, a leaf; in reference to the small leaves of the species.) Capsules ovate or obovate, usually emarginate, compressed. Seeds compressed. Leaves small, opposite. Racemes terminal, elongated, or corymbose, few-flowered. Small, alpine, erect, creeping, or trailing plants.

50 V. BELLIDIOI'DES (Lin. spec. p. 15.) leaves obovate, crenated, and are, as well as the stems, which are simple and ascending, hairy; cauline leaves remote, few; racemes corymbose, hairy, few-flowered; capsules obovate, hairy. 4. H. Native of Switzerland and the Pyrenees, on the alps. Vahl, enum. 1. p. 61. Lapeyr. pl. pyr. p. 6. D. C. fl. fr. 3. p. 2414. —Hall. helv. no. 543. t. 15. f. 1. The whole plant is clothed with articulated hairs. Leaves crenated from the middle to the apex, half stem-clasping at the base. Calyxes nearly equal. Corollas blue, with a white throat. Radical leaves rosulate.

Daisy-leaved Speedwell. Fl. June, July. Clt. 1775. Pl. ¼ to ½ foot.

51 V. BAUMGARTE'NII (Rœm. et Schultes, syst. 1. p. 100.) erect, glabrous; lower leaves opposite, sessile, oval, or ovate-lanceolate, serrated: upper ones alternate, half stem-clasping, linear-lanceolate; corymbs dichotomous; pedicels filiform, erectly spreading, 1-flowered; segments of the calyx equal; corolla twice as long as the calyx, pale blue. 4. H. Native of Transylvania, in the fissures of rocks on the alps. V. petræ'a, Baumg. trans. 1. p. 21. no. 27.

Baumgarten's Speedwell. Pl. ¼ foot.

52 V. NUMMULA'RIA (Gouan, ill. 1. t. 1. f. 2. exclusive of the synonymes) stem downy or smoothish; leaves obovate-orbicular, tapering into the petioles, crowded, entire, or obsoletely crenated; racemes short, few-flowered, crowded; calycine segments obtuse, ciliated; stem prostrate, fruticulose. ♄. H. Native of the Pyrenees. D. C. fl. fr. no. 2413. V. saxátilis, β, Vahl, enum. 1. p. 63. Willd. spec. 1. p. 62. V. strictiflòra, Lapeyr. abr. p. 6. no. 8. fl. pyr. t. 51. exclusive of the synonymes and figure, but not the diagnosis. Flowers nearly sessile, pale blue. Lower segments of corolla cuneiform, obtuse, the other 3 linear. Leaves decussate, imbricated.

Money-wort-leaved Speedwell. Fl. June, Aug. Clt. 1820. Pl. prostrate.

53 V. JAVA'NICA (Blum. bijdr. p. 742.) procumbent; leaves almost sessile, opposite, ovate, bluntly serrated, downy; spikes axillary and terminal; calycine segments obtuse.—Native of Java, on Mount Gede, and elsewhere.

Java Speedwell. Pl. procumbent.

54 V. NU'TANS (Bongard. mem. acad. imp. st. petersb. 2. p. 157.) stems simple, nutant at apex; leaves sessile, ovate, serrated, acutish; capsule nearly glabrous, about equal in length to the calyx; corymbs terminal. 4. H. Native of the Island of Sitcha. Stem downy. Leaves opposite, half stem-clasping, downy, about 4 on a stem. Bracteas and calyxes pilose; segments of calyx nearly equal. Corolla small, blue, unequal. Capsule ovate, emarginate. Nearly allied to *V. Stellèri;* but differs in the flowers being smaller; in the stems being nutant; and in the capsule being nearly glabrous, not pilose; and in the corolla being glabrous inside.

Nodding-stemmed Speedwell. Pl. ¼ to ½ foot.

55 V. DENSIFLÒRA (Ledeb. fl. ross. alt. ill. t. 125. fl. alt. 1. p. 34.) stem fruticulose, bifariously pilose; leaves sessile, elliptic, densely serrated, obtuse, smoothish, ciliated at the base; racemes terminal, crowded, subcapitate; bracteas and calyxes articulately pilose; calyx 5-parted: the fifth segment very short. 4. H. Native of Altaia, on the tops of the alps, at the river Koksun (Ledeb.); and at the rivers Aigulac, Kurai, and Tschuja (Bunge); and on the mountains of Farbagatai (Sievers). V. alpìna, Siev. in Pall. fl. nord. beytr. 7. Bracteas twice as long as the pedicels. Corolla large for the size of the plant, pale blue. Nearly allied to *V. nummulària* and *V. capitàta.*

Dense-flowered Speedwell. Pl. ¼ to ½ foot.

56 V. CAPITA'TA (Royle, mss. ex Benth. scroph. ind. p. 45.) pilose; stem simple; leaves sessile, ovate-roundish, a little toothed; raceme terminal, crowded, capitate, articulately pilose; stamens a little exserted. 4. H. Native of Kanaour, Royle. Flowers double the size of those of *V. alpìna.* Capsules not seen.

Capitate-flowered Speedwell. Pl. small.

57 V. ALPI'NA (Lin. spec. p. 15.) glabrous; leaves sessile, elliptic-ovate, obtuse, quite entire or subserrated; corymbs terminal, subspicate, articulately pilose; calyxes hairy; stamens shorter than the corolla; capsules oval, emarginate; stems tufted, simple. 4. H. Native of the alps of Europe; in Scotland, on the margins of rivulets on the highest mountains; in the Himalaya, at Peer Pungal, Royle. Smith, fl. brit. 1. p. 18. engl. bot. 484. Vahl, enum. 1. p. 64. Lapeyr, abr. p. 7. —Oed. fl. dan. 16.—Hall. helv. no. 544. t. 15. f. 2. Stem sometimes furnished with articulated hairs. Corollas blue. Capsule ovate, emarginate, downy. The Asiatic plant is rather more villous than the European, but otherwise similar.

Var. α, *alpìna;* leaves elliptic, ovate, obtuse, quite entire. 4. H. Native of the North of Europe, on the alps; as of Lapland, Denmark, Britain, and Switzerland. V. alpìna, Smith, engl. bot. t. 484. fl. dan. t. 16. Lin. fl. suec. no. 13. fl. lapp. p. 7. t. 9. f. 4.—Hall. helv. t. 15. f. 2.

Var. β, *pùmila;* leaves elliptic-ovate, acutish, serrated. 4. H. Native of Piedmont. V. pùmila, All. pedem. 1. p. 75. t. 22. f. 5. spec. 1. p. 19. t. 13. f. 3. V. Pònæ, var. ξ, Lapeyr.? —Hall. helv. 1. p. 235. t. 15. f. 2. V. Teùcrium Etscheriànum, Crantz, p. 337.

Var. γ, *integrifòlia;* leaves elliptic-ovate, obtuse, quite entire. 4. H. Native of Transylvania, Silesia, and Salisburgh, on the alps. V. integrifòlia, Willd. spec. 1. p. 63. Pers. ench. 1. p. 12. Braune, salisb. no. 12. Baumg. fl. trans. 1. p. 21. V. alpìna, Krock. fl. siles. t. 3.

Var. δ, *Schultèsii;* leaves almost quite entire: lower ones roundish: superior ones ovate. 4. H. V. alpìna, var. ε, Rœm. et Schultes, syst. 1. p. 101.

Var. ε, *rotundifòlia;* leaves serrated: lower ones ovate-roundish: superior ones ovate. 4. H. Native of Salisburgh. V. rotundifòlia, Braune, salisb. no. 15. t. 2. V. pygmæ'a, Braune, l. c. no. 11. f. 1. V. saxátilis, β, nummulària, Poir. dict.

Var. ξ; smaller, very hairy; leaves alternate, acute, nearly linear. 4. H. Native of the Pyrenees. Lapeyr. abr. p. 4.

Alpine Speedwell. Fl. May, June. Scotland. Pl. ½ to ¼ foot.

58 V. GRANDIFÒLIA (Vest. in litt. ex Rœm. et Schultes, l. mant. 1. p. 103.) stems firm, villous, prostrate; leaves sessile, ovate-oblong, smoothish: superior ones toothed: middle ones nearly one half the length of the stem; spike oblong-cylindrical; corolla exceeding the calyx a little; bracteas about equal in length to the calyx. 4. H. Native of the Tyrol, on the alps of Zillerthal. Leaves 1½ inch long, and more. From the axils of the upper leaves rise short few-flowered racemes.

Great-leaved Speedwell. Pl. ¼ to ½ foot.

59 V. EUPHRASIÆFÒLIA (Link, jahrb. 3. p. 41.) stems creeping, downy at top; leaves nearly sessile, oblong, serrately crenated, glabrous; racemes few-flowered: pedicels elongated; calycine segments ovate, glabrous. 4. H. Native of Persia, on Mount Ghilan. V. thymifòlia, Willd. herb. Plant slender.

Euphrasia-leaved Speedwell. Pl. creeping.

60 V. THYMIFÒLIA (Sibth. et Smith, fl. græc. 1. t. 6. prod. 1.

p. 6.) stems shrubby, diffuse; leaves elliptic, revolute, hoary, entire; racemes terminal, capitate or corymbose, solitary; calyx regular; lobes of capsule divaricate. 4. H. Native of Candia, on the tops of the Spaciotic mountains. Habit of *V. fruticulòsa*. Bracteas obovate. Corolla blue, with a white tube.

Thyme-leaved Speedwell. Pl. suffruticose.

61 V. pauciflòra (Kit. ex Link. l. c.) stems procumbent, downy at top; leaves nearly sessile, oblong, serrately crenated, acute, glabrous; racemes few-flowered; pedicels elongated; calycine segments ovate, glabrous. 4. H. Native of the Carpathian mountains. Plant slender.

Few-flowered Speedwell. Pl. procumbent.

62 V. Wormskiòldi (Rœm. et Schultes, syst. 1. p. 101.) villous; leaves ovate, quite entire, obtuse, villous, ciliated; racemes terminal, short, crowded; stems simple, ascending. 4. H. Native of Greenland. V. villòsa, Wormsk. V. alpìna, *β*, Wormskiòldi, Hook. bot. mag. t. 2975. V. alpìna, var. Unalaschénsis, Cham. et Schlecht, in Linnæa, 2. p. 556. V. alpìna, var. Fl. dan. 1961.? Stems creeping at bottom, dark purple, beset with long glandular hairs, as well as the calyxes and leaves. Radical leaves crowded: cauline ones sessile. Flowers blue.

Wormskiold's Speedwell. Fl. June, July. Clt. 1819. Pl. ½ foot.

63 V. saxa'tilis (Lin. suppl. 83.) glabrous; superior leaves oblong-obovate or elliptic, crenulated; racemes corymbose, few-flowered; capsules ovate, exceeding the calyx; stems fruticulose, diffuse. ♄. H. Native throughout Europe, on the alps; in Scotland, on rocks and stony ground, among the mountains. Ben Lawers, Dickson. Wulf. in Jacq. coll. 3. p. 25. Wahl. fl. lapp. p. 6. Vahl, enum. 1. p. 63. ex Willd. spec. 1. p. 63. exclusive of var. *β* and *γ*. Lapeyr. abr. p. 6. Baumg. trans. 1. p. 20. V. fruticulòsa, fl. dan. t. 342. Smith, in Lin. trans. 1. p. 190. engl. bot. t. 1027.—Pona, bald. 181. f.—Mor. hist. 2. p. 318. sect. 3. t. 22. f. 5.—Hall. helv. no. 545. *β*.—This is very like *V. fruticulòsa;* but the stems are procumbent; the leaves smaller, and deeper green; the pedicels longer than the bracteas; the flowers disposed in corymbose racemes; the segments of the calyx obtuse; and the corollas azure blue. The capsule is ovate, compressed, nearly entire, hairy or downy.

Rock Speedwell. Fl. July. Scotland. Pl. prostrate.

64 V. Cre'tica (Pall. ex Link, jahrb. 1-3. p. 41.) procumbent; leaves linear-spatulate, very scabrous; racemes short, dense. 4. H. Native of Candia. Allied to *V. saxátilis*, but smaller.

Cretan Speedwell. Fl. May, June. Clt. 1819. Pl. procumbent.

65 V. fruticulòsa (Lin. spec. p. 15.) nearly glabrous; superior leaves oblong, obtuse, entire, or nearly so: stems erect, fruticulose, rather downy; racemes loose, many-flowered, downy; capsule roundish-ovate, equal in length or shorter than the calyx; stems erectish. ♄. H. Native of Switzerland, Savoy, and the Pyrenees, on the alps; in Scotland, on Ben Cruachan, Argyleshire, Rev. Dr. Walker; Ben Lawers, R. Brown. —Vahl, enum. 1. p. 62.—Wulf, in Jacq. coll. 4. p. 229. t. 5. exclusive of Clus. syn. Smith, engl. bot. 1028. Lapeyr. abr. p. 6. D. C. fl. fr. no. 2411. V. frutéscens, Scop. carn. no. 20. exclusive of the syn. of Mor.—Hall. hist. 1. p. 235. t. 10. f. 1. Lower leaves obovate, tapering into the petioles. Corolla pale red, with deeper veins. Capsule hairy. Bracteas at first longer than the pedicels. Segments of calyx obtuse. Seeds compressed.

Fruticulose Speedwell. Fl. June, Aug. Scotland. Pl. ¼ to ½ foot.

66 V. lanòsa (Royle, mss. ex Benth. scroph. ind. p. 45.) stem woody at the base; branches tufted, erectish, woolly; leaves sessile, ovate-lanceolate, deeply serrated, glabrous above and hairy beneath; racemes rather loose; calyx unequally 4-5-parted; capsule ovate, acute in the immature state. ♄. H. Native of Kanaour, Royle.

Woolly-branched Speedwell. Pl. shrubby.

67 V. macroste'mon (Bunge, in Ledeb. fl. ross. alt. ill. t. 127. fl. alt. 1. p. 35.) stems fruticulose, branched; lower leaves roundish-ovate, quite entire: superior ones oblong, serrulated, villously pubescent; racemes villous, many-flowered, at length elongated; capsule downy, twice as long as the calyx, which is 5-parted and unequal. ♄. H. Native of Altaia, on alps at the river Tschuja, among stones. Corollas large, violaceous. Capsule obovate, emarginate. Stamens much exserted.

Long-stamened Speedwell. Pl. ¼ to ½ foot.

68 V. serpyllifòlia (Lin. spec. 15.) glabrous; leaves nearly sessile, oblong or ovate, 3-nerved, entire and crenated; racemes elongated; flowers distant; stems creeping. 4. H. Native of Europe, Siberia, and North America, in pastures and meadows; plentiful in all parts of Britain; in the Himalaya, Royle. Vahl, enum. 1. p. 21. Smith, engl. bot. t. 1075. Fl. dan. t. 492. Bieb. fl. cauc. 1. p. 9. Curt. fl. lond. fasc. 15. t. 3. Bertol. pl. rar. ital. dec. 3. p. 5. Lapeyr. abr. p. 7.—Lob. icon. 1. t. 472. f.—Riv. mon. t. 99. f. 1. Stem creeping at base, ascending at top, downy. Leaves fleshy, shining, glabrous. Bracteas shorter than the pedicels. Corolla blue, pale red and white. Capsule obcordate, didymous, compressed.

Var. β, tenélla; leaves ovate-roundish. 4. H. V. tenélla, Flor. wett. and Schmidt, fl. bohem.

Var. γ, neglécta; leaves 4 in a whorl. 4. H. V. neglécta, Schmidt.

Var. δ, nummulariæfòlia (Thuil.) 4. H. Native of France.

Var. ε, humifùsa; prostrate; leaves cordate-roundish; stems creeping. 4. H. Native of the Highlands of Scotland, on wet shady rocks; and on the Cheviot Hills, Northumberland. V. humifùsa, Dicks. in Lin. trans. 2. p. 288. Plant downy.

Var. ζ, hirsùta; hairy; hairs short, crowded. 4. H. Native of the Pyrenees.

Wild-Thyme-leaved Speedwell. Fl. April, July. Britain. Pl. creeping.

69 V. herniarioi'des (Pourr. chl. hisp. no. 60. Lapeyr. suppl. abr. p. 4.) leaves obovate, glabrous, quite entire, small: lower ones reflexed; stems prostrate, scattered, rooting; raceme terminal, dense, ovate. 4. H. Native of the Pyrenees, at Port de Jacca. Flowers blue, with pale claws.

Herniaria-like Speedwell. Pl. creeping.

70 V. fonta'na (Pall. ex Link, enum. 1. p. 102.) stem creeping, downy; leaves sessile, ovate, obtuse, crenated, glabrous; bracteas foliaceous; pedicels much shorter than the bracteas. 4. H. Native of the Island of Unalaschka and Kamtschatka, Pall.

Fountain Speedwell. Pl. creeping.

71 V. Gebhardia'na (Vest. ex Rœm. et Schultes, syst. 1. mant. 1. p. 104.) branches prostrate, rooting; leaves elliptic, roundish, quite entire, glabrous: lower ones petiolate; raceme terminal; flowers and capsules erect. 4. H. Native on alp Schwarzenstein, in Zillerthal, beside rivulets formed by the melting of ice. Pedicels length of bracteas. Capsule broadly obcordate.

Gebhard's Speedwell. Pl. creeping.

72 V. tene'lla (All. pedem. no. 272. t. 22. f. 1.) leaves roundish, a little wrinkled, subcrenated, all petiolate: stems creeping, and are, as well as the calyxes, villous. 4. H. Native of Piedmont, Pyrenees, &c. Vahl, enum. 1. p. 65. Lapeyr. abr. p. 8. Willd. spec. 1. p. 64. exclusive of the syn. of Dill.—Pluck. t. 233. f. 4. This is very like *V. serpyllifòlia*, and probably only a variety of it. Leaves on longer petioles. Flowers blue or purple, on long pedicels.

Var. β; stems erectish; leaves distant; flowers rose-

coloured. ♃. H. Native of the Pyrenees. Lapeyr. abr. suppl. p. 4.

Slender Speedwell. Fl. May, Aug. Clt. 1820. Pl. creeping.

73 V. MICROPHY'LLA (Kit. in Schultes, fl. austr. ed. 2d. vol. 1. p. 20.) leaves ovate, inordinately crenated; bracteas hardly the length of the pedicels; stems ascending. ♃. H. Native of Hungary, in sandy places. Stems creeping at the base. Perhaps only a variety of *V. serpyllifòlia*, occasioned by the dry sandy soil in which it grows.

Small-leaved Speedwell. Fl. April, July. Clt. 1822. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

74 V. TELEPHIIFÒLIA (Tourn. cor. p. 7.) glabrous; leaves obovate, almost quite entire; stems creeping. ♃. H. Native of Armenia. Vahl, enum. 1. p. 64. Stems filiform. Leaves petiolate, hardly half a nail in length, obsoletely crenulated outside. Perhaps a variety of *V. serpyllifòlia*.

Telephium-leaved Speedwell. Pl. creeping.

75 V. RUDERA'LIS (Vahl, enum. 1. p. 66. H. B. et Kunth, nov. gen. amer. 2. p. 312.) leaves ovate-oblong, obtuse, crenated, somewhat 5-nerved: superior ones subciliated, quite entire; stems creeping. ♃. H. Native of Peru, in waste humid places; and near Santa Fe de Bogota, and on Mount Quindiu. Vahl, enum. 1. p. 66. V. serpyllifòlia, Ruiz. et Pav. fl. per. 1. p. 6. Stems filiform, diffuse, red. Bracteas longer than pedicels. Corolla violaceous; the smaller segment white. Probably a mere var. of *V. serpyllifòlia*.

Rubbish Speedwell. Pl. creeping.

SECT. IV. PIRI'TIA (the vernacular name of one of the species.) Capsule elliptic or roundish, acuminated. Leaves opposite, quite entire. Racemes terminal. Shrubs natives of New Zealand.

76 V. SPECIÒSA (R. Cunningh. ex bot. mag. no. 3461.) quite glabrous; stem shrubby, erectish or diffuse; leaves opposite, flat, obovate, coriaceous, decurrent, with a callous obtuse point, and quite entire, thickened, coloured margins; racemes terminal, short, erect, crowded with flowers; bracteas ovate-lanceolate, one half shorter than the pedicels; calycine segments ovate, acutish, finely ciliated, about equal in length to the middle of the tube of the corolla. ♄. F. Native of New Zealand, on the north side of the island; and on sandy hills near the estuary of the Hokianga, on the west coast. Leaves 3-4 inches long. Flowers showy, bluish-violet, almost like those of *Lysimàchia atropurpùrea*. Stamens exserted. Capsule elliptic, acuminated, glabrous, twice as long as the calyx.

Showy Speedwell. Shrub 3 to 6 feet.

77 V. LIGUSTRIFÒLIA (Cunningh. l. c.) quite glabrous; stem shrubby; leaves opposite, ovate-oblong or narrow-lanceolate, bluntish, quite entire; racemes peduncled, terminal, pubigerous, about equal in length to the leaves; bracteas oblong-lanceolate, about half the length of the pedicels; calycine segments ovate-lanceolate, acutish, length of the tube of the corolla. ♄. F. Native of New Zealand, on the north coast, on shady hills on the banks of the Kana-Kana river; and Bay of Islands. A slender shrub, 2 feet high. Leaves sessile. Flowers white, spicately racemose. Calyx equal. Segments of corolla acutish. Said to be very like *V. angustifòlia*, Richard.; but the racemes in that plant are slender, pedunculate, and axillary, and more than twice as long as the leaves; the segments of the calyx are obtuse, and not half so long as the tube of the corolla; and the leaves are linear-lanceolate, acute, and glaucescent beneath.

Privet-leaved Speedwell. Shrub 2 feet.

78 V. DIOSMÆFÒLIA (R. Cunningh. in bot. mag. under no. 3461.) shrubby, erect; leaves decussate, lanceolate, acute, quite entire or serrulated, petiolate, concave and smooth above, and of a different colour beneath: serratures simply cut, remote; corymbs axillary or terminal, many-flowered; bracteas ovate, about half the length of the pedicels; calycine segments oval, obtuse, equal in length to the middle of the tube of the corolla. ♄. F. Native of New Zealand, in dense woods near the source of the river Wycaddi; at the Bay of Islands, and elsewhere on the south coast, where it is called *Piriti* by the natives. A slender twiggy shrub, about 3-12 feet, with the habit of *Trachymène*. Leaves 9 lines long, keeled beneath. Flowers white. Capsule elliptic, acute, compressed, 3 times as long as the calyx, which is ciliated.

Diosma-leaved Speedwell. Shrub 3 to 12 feet.

SECT. V. HE'BE (a mythological name, the daughter of Juno.) Capsule ovate, or oval, or oblong, acute, or obtuse, compressed. Racemes lateral and axillary. Leaves quite entire. Plants natives of New Holland, Van Diemen's Land, and New Zealand.

79 V. PARVIFLÒRA (Vahl, symb. 3. p. 4. enum. 1. p. 67.) leaves linear-lanceolate, quite entire, glabrous, mucronate; stem shrubby. ♄. F. Native of New Zealand. V. floribúnda, R. Br. in herb. Smith. Plant glabrous. Leaves approximate, sessile, stiff, 2 inches long. Racemes erect, $1\frac{1}{2}$ inch long, many-flowered; bracteas minute. Segments of corolla obtuse. Capsule oval, twice as long as the calyx.

Small-flowered Speedwell. Fl. June, July. Clt. 1822. Shrub 1 foot.

80 V. MACROCA'RPA (Vahl, symb. 3. p. 4. enum. 1. p. 67.) leaves lanceolate, quite entire, glabrous, flat; racemes erect; stem shrubby. ♄. F. Native of New Zealand. Branches articulated. Leaves 4 inches long, nerveless. Racemes length of leaves. Bracteas minute. Tube of corolla twice as long as the calyx; segments obtuse. Capsule ovate, acute, 3 times as long as the calyx.

Large-fruited Speedwell. Shrub.

81 V. SALICIFÒLIA (Forst. prod. no. 11. Vahl, symb. 3. p. 4.) leaves lanceolate, attenuated at both ends, quite entire; racemes drooping; stem shrubby. ♄. F. Native of New Zealand. Glabrous. Leaves 2-3 inches long, subundulated. Racemes longer than the leaves; pedicels capillary. Calyx equal. Tube of corolla twice as long as the calyx; segments acute. Capsule oblong, acute, twice as long as the calyx.

Willow-leaved Speedwell. Shrub 2 to 3 feet.

82 V. ELLI'PTICA (Forst. prod. no. 10.) leaves elliptic, lanceolate, quite entire, glabrous; racemes short, few-flowered, corymbose. ♄. F. Native of New Zealand. Very nearly allied to *V. decussàta*.

Elliptic-leaved Speedwell. Shrub 1 to 2 feet.

83 V. DECUSSA'TA (Ait. hort. kew. ed. 1. vol. 1. p. 20. ed. 2d. vol. 1. p. 68.) glabrous; leaves permanent, elliptic, quite entire, decussate; racemes few-flowered; stem shrubby. ♄. F. Native of the Falkland Islands, and the Straits of Magellan. Curt. bot. mag. t. 242. Hèbe Magellánica, Juss. in Gmel. syst. p. 27. Leaves mucronate, stiff, with cartilaginous margins. Racemes shorter than the leaves. Bracteas ovate, ciliated. Corolla funnel-shaped, blue.

Decussate-leaved Speedwell. Fl. June, Aug. Clt. 1776. Shrub 1 to 2 feet.

84 V. PERFOLIA'TA (R. Br. prod. 434.) glabrous; leaves quite entire, ovate, acuminated, connate at the base; racemes lateral, pedunculate, many-flowered. ♃. G. Native of New South Wales, about Port Jackson. Sims. bot. mag. 1936. Plant glaucous. Leaves sometimes furnished with a few teeth. Racemes long, secund; pedicels hardly the length of the calyxes, which are 4-parted and unequal. Corolla purple or blue. Capsule oblong, oval. Flowers blue.

Perfoliate-leaved Speedwell. Fl. July, Aug. Clt. 1815. Pl. 1 to 2 feet.

85 V. FORMÒSA (R. Br. prod. p. 434.) leaves evergreen, decussate, lanceolate, quite entire, quite glabrous, acute at the base; racemes bifariously pilose; corymbs axillary, few-flowered; stem shrubby. ♄. F. Native of Van Diemen's Land.

Showy Speedwell. Shrub 1 to 2 feet.

86 V. GRA'CILIS (R. Br. prod. p. 435.) quite glabrous; leaves linear-lanceolate, entire; stems nearly simple; corymbs lateral, few-flowered. ♃. G. Native of New South Wales, about Port Jackson. Flowers blue.

Slender Speedwell. Fl. May, July. Clt. 1820. Pl. ¼ to ½ foot.

SECT. VI. CHAMÆ'DRYS (name of Germander.) Capsule compressed, emarginate at apex or obcordate. Seeds compressed, flat on one side, and convex on the other. Racemes lateral and axillary.

§ 1. *Leaves quite entire.*

87 V. BILLARDIE'RI (Vahl, enum. 1. p. 70.) leaves lanceolate-oblong, quite entire, hoary as well as the stem, which is prostrate; racemes 2-3 inches long; bracteas length of flowers. ♃.? H. Native of Syria, Labillardiere. Stems numerous, filiform, villous as well as the leaves, which are nearly sessile. Calycine segments linear, equal. Capsule obcordate, compressed, length of calyx.

La Billardier's Speedwell. Pl. prostrate.

§ 2. *Leaves serrated, crenated, or denticulated.*

* *Species natives of New Holland, New Zealand, &c.*

88 V. CATARA'CTÆ (Forst. prod. no. 9. Vahl, enum. 1. p. 67.) glabrous; leaves lanceolate, serrated; racemes loose, flexuous; stem shrubby. ♄. F. Native of New Zealand. Leaves an inch long, of a different colour beneath. Racemes a hand long. Capsule oblong, longer than the calyx. In New Holland Labillardiere collected a plant which he considers identical with that of Foster; to which he appends the following diagnosis: "Leaves sessile, lanceolate, acuminated, 3 inches long, with short-acute teeth; racemes strict; bracteas subulate, twice as long as the pedicels; calyx 4-cleft, unequal; capsule ovate, entire, turgid."

Cataract Speedwell. Pl. ascending.

89 V. LABIA'TA (R. Br. prod. p. 434.) leaves broad-lanceolate, long-acuminated, unequally and sharply serrated; racemes axillary, opposite, very long. ♃. G. Native of the south coast of New Holland, and Van Diemen's Land. Sims, bot. mag. 1660. Hook. bot. mag. 3461. V. Derwéntii, Andr. bot. rep. t. 531. Plant glabrous. Flowers pale blue. Calyx 4-parted, rather unequal. Ovarium emarginate. Corolla bilabiate, spreading; upper lip undivided: lower one 3-parted; middle lobe the smallest. Bracteas as long as the pedicels.

Lipped-flowered Speedwell. Fl. April, July. Clt. 1802. Pl. 1 to 2 feet.

90 V. CALYCI'NA (R. Br. prod. 435.) leaves broadly ovate, subcordate, wrinkled, unequally serrate-crenated, petiolate, and are hairy as well as the creeping stems; racemes lateral, few-flowered, much longer than the leaves; calyxes pilose, ciliated, longer than the capsule. ♃. G. Native of New Holland and Van Diemen's Land. R. Br.; New Zealand, on the banks of the river Keri-Keri, among grass, R. Cunningh. "Stems 5-6 feet, creeping or decumbent. Leaves opposite, hispid or discoloured beneath. Calyx 4-parted, longer than the capsule, which is roundish, compressed, emarginate or obcordate," ex Cunningh. in bot. mag. under no. 3461.

Large-calyxed Speedwell. Pl. creeping.

91 V. PLEBE'IA (R. Br. prod. p. 435.) leaves ovate, unequally and deeply serrated, glabrous; stem clothed with fine down; lower petioles one half longer than the leaves; racemes lateral, loose. ♃. G. Native of New Holland. Flowers blue.

Plebeian Speedwell. Fl. June, July. Clt. 1820. Pl. 1 foot?

92 V. DI'STANS (R. Br. prod. p. 435.) leaves ovate, broadly serrated, glabrous; petioles ciliated; stem decumbent, bifariously pilose; corymbs lateral, pedunculate, few-flowered. ♃. G. Native of New Holland. Flowers blue.

Distant-flowered Speedwell. Fl. May, June. Clt. 1825. Pl. decumbent.

93 V. BRÓWNEI (Rœm. et Schultes, syst. 1. p. 118.) leaves ovate-lanceolate, glabrous, unequally serrated; stem bifariously pubescent; lower petioles 3 times shorter than the leaves; racemes lateral, loose. ♃. H. Native of New South Wales, about Port Jackson. V. argùta, R. Br. prod. p. 435. Nearly allied to *V. plebèia*. There is a plant in Smith, herb. under this name, which has cordately-reniform, sharply-toothed leaves, which he there proposes to call *V. vitifòlia*.

Brown's Speedwell. Pl. 1 foot?

94 V. NÒVÆ-HOLLA'NDIÆ (Poir. encycl. 8. p. 526.) leaves ovate, deeply crenated, petiolate; racemes lateral; flowers on long pedicels; stems downy. ♃. G. Native of New Holland. Very like *V. Chamæ'drys*. Calyx glabrous. Bracteas ovate. Capsule obcordate, compressed, shorter than the calyx.

New Holland Speedwell. Pl. diffuse.

* * *Species natives of Europe.*

95 V. OFFICINA'LIS (Lin. spec. p. 14.) creeping, hairy; leaves oval or oblong, serrated; petioles sheathing at the base; racemes spicate, alternate or opposite; calyx 4-parted, nearly equal; bracteas longer than the pedicels. ♃. H. Native of Europe and North America, in woods and dry sandy banks; plentiful in Britain. Vahl, enum. 1. p. 74. Gærtn. fruct. 1. p. 257. t. 56. f. 7. Fl. dan. t. 248. Curt. fl. lond. fasc. 3. t. 1. Woodv. t. 219. Smith, engl. bot. 765. Bull. herb. t. 293. Plenck. off. t. 12. Lam. ill. t. 13. f. 2. Poit. et Turp. fl. par. 1. p. 12. t. 8. Svensk, bot. t. 59.—Riv. mon. irr. t. 93. Stem procumbent, rooting at the base. Corollas small, pale blue, with deeper veins. Capsule obcordate, compressed, downy, larger than the calyx. This species is recommended as a sort of medicinal tea; and Simon Paullix, an old Danish botanist, contended it was the identical tea of China. The flavour is astringent and bitter, and by no means agreeable.

Var. β; leaves obovate-roundish, pubescent. ♃. H. V. Tournefórtii, Schmidt, boh. no. 12.

Var. γ; leaves obovate or obovate-roundish, almost glabrous. ♃. H. V. Allióni, Schmidt, l. c. Hook. scot. 7. excluding the synonyme. Found on the mountains of Scotland and Ireland.

Var. δ, albiflòra; flowers white.

Var. ε, plena; flowers double.

Var. ζ, variegàta; leaves variegated with white or yellow.

Officinal Speedwell. Fl. April, July. Britain. Pl. creeping.

96 V. TOURNEFÓRTII (Vill. dauph. 2. p. 9.) creeping, hairy; leaves ovate, entire at the base, and serrated at apex, narrowed into the short petioles at the base; racemes spicate, opposite; calyx 4-parted. ♃. H. Native of the South of France. Stem procumbent. Corolla blue. Hardly distinct from *V. officinàlis*.

Var. β, dùbia (D. C. fl. fr. 3. no. 2395.) leaves glabrous, ovate, toothed; stem rooting at the base, ascending; hairs spreading, or disposed in 2 rows. ♃. H. This variety differs from *V. chamæ'drys*, in the stems being procumbent: from *V. officinàlis*, in the leaves being glabrous; and in the calyxes being longer; and from *V. Allióni*, in the stem and peduncles being villous; and from *V. pilòsa*, in the leaves being entire at the base, and in the calyxes being equal.

Tournefort's Speedwell. Fl. May, June. Clt. 1821. Pl. creeping.

97 V. ALLIÒNI (Vill. dauph. 2. p. 8.) glabrous, creeping, procumbent; leaves oblong, stiff, shining, slightly crenated; racemes spicate, crowded; calyx 4-parted. 4. H. Native of Switzerland, South of France, Italy, on the Alps. Vahl, enum. 1. p. 74. Smith, in Lin. trans. 1. p. 190. D. C. fl. fr. 3. p. 463. V. pyrenàica, All. ped. 1. p. 73. no. 265. V. rèpens, All. spec. 1. t. 4. f. 3. V. officinàlis, β, Lin. This species differs from *V. officinàlis* in the rigidity and smoothness of the parts. Flowers blue, crowded into a short ovate spike.

Allioni's Speedwell. Fl. June, Aug. Clt. 1748. Pl. creeping.

98 V. SETI'GERA (D. Don, rar. pl. scot. p. 4.) very hairy; hairs stiff, glandular; stems ascending; leaves elliptic-lanceolate, serrated, subcrenated; racemes elongated; calyx 4-parted; capsule abrupt, undivided. 4. H. Native of Scotland, in Ayrshire, in heathy parts of Garick. V. hirsùta, Hopk. fl. glott. p. 9. Link, enum. 1. p. 24. Leaves small. Bracteas longer than the flowers. Corolla very pale blue. Capsule ovate, compressed, glabrous. Perhaps only a small hispid variety of *V. officinàlis*.

Setigerous Speedwell. Fl. April, July. Scotland. Pl. ¼ foot.

99 V. MULLERIA'NA (Vest. in litt. ex Rœm. et Schultes, syst. 1. mant. 1. p. 108.) leaves elliptic, quite entire, obtuse, hairy, ciliated, on short petioles; stems short, prostrate, rooting; racemes lateral; flowers and capsules erect. 4. H. Native of Upper Styria. Pedicels length of bracteas. Calyx 4-cleft. Nearly allied to *V. officinàlis*, *V. Alliòni*, and *V. Tournefórtii*, but the flowers are larger.

Muller's Speedwell. Fl. June, July. Clt. 1825. Pl. prostrate.

100 V. APHY'LLA (Lin. spec. 14.) villous; stems creeping; leaves radical, roundish or oblong, slightly crenated; peduncles scape-formed, usually 3-flowered. 4. H. Native of the southern alps of Europe. Vahl, enum. 1. p. 68. V. subacaúlis, Lam. ill. no. 171.—Seguier, pl. veron. 1. p. 241. t. 3. f. 2.—Bocc. mus. t. 10. t. 9.—Pluck. alm. t. 114. f. 3. Plant hairy. Scapes 1-2 inches long, bearing each 2-4 large blue flowers. Capsule large, violaceous, thrice as long as the calyx, obovate, compressed, more or less emarginate, downy.

Var. β, *Kamtchática* (Lin. suppl. p. 83.) leaves ovate or oblong, serrated, hairy; scapes hairy, 3-5-flowered. 4. H. Native of Kamtschatka. V. grandiflòra, Gærtn. nov. comm. petrop. 14. t. 18. f. 1. Racemes lateral, loose. Stem ascending, stoloniferous.

Var. γ, *nudicaúlis* (Lam. ill. no. 181.) capsule obtuse, not emarginate. 4. H. V. nudicaúlis, Pers. ench. 1. p. 11.

Leafless-stemmed Speedwell. Fl. May, July. Clt. 1775. Pl. ⅛ foot.

101 V. MONTA'NA (Lin. spec. p. 17.) leaves cordate-ovate, petiolate, obtuse, coarsely serrated; stem and petioles hairy; racemes elongated, filiform, loose, axillary. 4. H. Native of Europe, in groves; in Britain, in woods, chiefly in moist calcareous soil, but not very common. Vahl, enum. 1. p. 68. Jacq. fl. austr. 2. p. 6. t. 109. Fl. dan. t. 1201. Curt. fl. lond. 4. t. 2. Hoffm. fl. germ. t. 1. Poit. et Turpin, fl. par. 1. p. 14. t. 10. Smith, engl. bot. t. 766. V. procúmbens, Riv. mon. irr. t. 93. Stems weak, procumbent, rooting at the joints, villous. Leaves usually villous, with generally purplish margins. Corolla pale blue or white, variegated with purplish veins. Calyx 4-parted, unequal. Capsule orbicular, compressed, emarginate at both ends, ciliated, didymous; cells 4-seeded.

Mountain Speedwell, or Mountain Madwort. Fl. June, July. Britain. Pl. prostrate.

102 V. CHAMÆ'DRYS (Lin. spec. 17.) downy or hairy; leaves deeply and unequally serrated: lower ones petiolate, ovate: upper ones cordate-ovate, sessile; stems bifariously pilose, creeping at the base; racemes axillary, exceeding the stems. 4. H. Native of Europe, common on dry banks, and in groves, meadows, pastures, and hedges. Vahl, enum. 1. p. 77. Lam. ill. t. 13. f. 1. Curt. fl. lond. 1. t. 2. Martyn, fl. rust. t. 66. St. Hil. pl. fr. t. 8. Smith, engl. bot. 623. Fl. dan. t. 448. Poit. et Turp. fl. par. 1. p. 13. t. 9. Svensk, bot. t. 239. Teùcrium V. Clus. hist. p. 350.—Riv. mon. irr. t. 94. Chamæ'drys, Brunsf. herb. 1. p. 125. f. 1. Herb pale green. Stems more or less ascending, 1-2 feet long. Flowers large, blue, rarely flesh-coloured or white. Calyx 4-cleft, lanceolate. Capsule compressed, obcordate, shorter than the calyx. There are many varieties of this plant. Some take this for the true German *Forget-me-not*.

Var. β, *lamiifòlia*; leaves cordate, cuneated at the base, obtuse: lower ones sessile, the rest petiolate. 4. H. Native country unknown. V. lamiifòlia, Hayne, in mag. amic. hist. nat. berol. 7. (1805.) p. 132. V. Rudolphiàna, Hayne, l. c. p. 133.

Germander Speedwell. Fl. July, Aug. Britain. Pl. ½ to 1 foot.

103 V. MICRA'NTHA (Hoffm. et Link, fl. port. p. 286. t. 57.) downy and canescent, soft; leaves nearly sessile, ovate, obtuse, coarsely crenated, hairy; racemes axillary; flowers rather crowded. 4. H. Native of Portugal. V. Teùcrium, Brot. fl. lus. 1. p. 13. V. móllis, Zea. ex Rœm. et Schultes, syst. 1. p. 112. V. mollíssima, Hort. Hairs of plant curled. Bracteas linear, longer than the pedicels. Calycine segments 4, lanceolate, acute, nearly equal. Corolla small, white, with a purplish ring in the throat. Capsule compressed, emarginate, shorter than the calyx, with ciliated edges. Very like *V. chamæ'drys*; but the flowers are smaller, and the whole plant hoary.

Small-flowered Speedwell. Fl. May, July. Clt. 1819. Pl. ½ foot.

104 V. PLICA'TA (Pohl, tent. fl. boh. p. 15. f. 1.) leaves cordate-ovate, plicate, deeply toothed, clothed with white hairs as well as the stems; racemes axillary, alternate; flowers imbricate, nearly sessile. 4. H. Native of Bohemia, on hills. V. pilòsa, Schmidt, 1. p. 17. Willd. spec. 1. p. 66. Root creeping. Stem bifariously pilose. Lower leaves petiolate: upper ones sessile. Calyx unequal. Bracteas linear, length of pedicels. Flowers blue.

Plicate Speedwell. Fl. May, Aug. Clt. 1817. Pl. ¼ to ½ foot.

105 V. UMBRÒSA (Bieb. fl. cauc. 1. p. 11. fl. ross. 1. t. 7.) lower leaves ovate, coarsely serrated: superior ones oblong, subserrated; racemes lateral, few-flowered; stems creeping; calyx nearly equal in length to the corolla. 4. H. Native of Tauria, in woods about Karassubasar. Plant loosely tufted. Pedicels elongated. Corolla showy. The leaves of sterile branches are sometimes nearly entire.

Shaded Speedwell. Pl. creeping.

106 V. PEDUNCULA'RIS (Bieb. casp. 126. append. no. 2. fl. cauc. 1. p. 11.) downy; leaves ovate, deeply and doubly serrated; racemes loose; stem hairy, with 2 more dense rows of hairs; pedicels capillary, twice as long as the bracteas. 4. H. Native of Caucasus, in shady groves. V. pedunculàta, Vahl, enum. 1. p. 77. Pers. ench. 1. p. 12.—Buxb. cent. 1. p. 26. t. 41. f. 1. Flowers blue. This plant differs from *V. Chamæ'drys* in the stems being villous all over, and also having 2 lines of more dense hairs; in the leaves being more villous on both surfaces, and more deeply cut, in the pedicels being slender and elongated, and in the calycine segments being blunter.

Var. β; stems flaccid; leaves more deeply cut. 4. H. Native of Caucasus, in groves.

Var. γ; humble, prostrate; leaves small, obtuse, crenated. ♃. H. Native of Caucasus, on rocks; and about Chinalug. V. némorum, Pall. Very like *V. petræ`a*. Bracteas all toothed.

Peduncular Speedwell. Fl. May, June. Clt. 1826. Pl. ½ to 1 foot.

107 V. PETRÆ`A (Stev. in mem. mosc. vol. 3. p. 250, and 5. p. 340.) stems creeping, much branched, prostrate, densely leafy; leaves elliptic, obtuse, subcrenated, and are, as well as the stems, hairy; racemes subcorymbose, many-flowered; pedicels filiform, longer than the calyx, which is 4-parted. ♃. H. Native of Caucasus, on the alps of Schuchdagh and Tyfendagh; also in stony places about the Terek. Bieb. suppl. cauc. p. 12. V. pedunculàris, γ, Bieb. fl. canc. 1. p. 27. Capsule hispid, obcordate, a little shorter than the calyx. This plant differs from the preceding in all its parts being pubescent, in the leaves being smaller and much firmer, and narrower, in the stems being short and prostrate. Calyx nearly equal. Corolla blue.

Rock Speedwell. Fl. May, June. Clt. 1821. Pl. prostrate.

108 V. PILÒSA (Lin. spec. p. append. 1663. syst. 59. Willd. spec. 1. p. 66.) leaves ovate, obtuse, plicate, deeply toothed; racemes axillary; stems prostrate, bifariously pilose. ♃. H. Native of Bohemia. See Smith in Lin. trans. 1. p. 191. Lower leaves petiolate: upper ones sessile, pilose; lower teeth elongated. Bracteas pilose, longer than the pedicels. Calyx unequal. Segments of corolla acute, connivent. Leaves smaller than those of *V. Chamæ`drys*. This is a very doubtful plant, and probably only a variety of *V. Chamæ`drys*, or *V. prostràta*, or *V. plicàta*.

Pilose Speedwell. Fl. May, June. Clt. 1819. Pl. prostrate.

109 V. MINU`TA (Meyer, verz. pflanz. p. 105.) rather pilose; stems filiform, branched, diffuse; leaves obovate-lanceolate, obtuse, crenated or quite entire; racemes lateral, few-flowered; pedicels capillary, longer than the bracteas, which are spatulate; calyx 4-parted, with obtuse segments; capsule reniform: lobes orbicular. ♃. H. Native of the alpine regions of Caucasus, in stony places. Said to be nearly allied to *V. pilòsa*.

Minute Speedwell. Pl. diffuse.

110 V. CA`NA (Wall. cat. no. 401. Benth. scroph. ind. p. 45.) procumbent at the base; stem pilose, or woolly; leaves petiolate, ovate, deeply crenated, hoary from hairs, at length glabrous; racemes few, axillary and terminal; calyx unequally 4-parted; capsule broadly and rhomboidally dilated, entire. ♃. H. Native of Gosainsthan, and Nipaul, Wall.; Kanaour, Royle.

Hoary Speedwell. Pl. procumbent.

111 V. DELTI'GERA (Wall. cat. no. 402. Benth. scroph. ind. p. 45.) procumbent at the base; stem glabrous, bifariously woolly under the leaves; leaves sessile, ovate-lanceolate, crenately serrated, glabrous; racemes few, alternate, downy; calyx 4-parted; immature capsules rhomboidally dilated, emarginate. ♃. H. Native at Gosainsthan, Wall.

Delta-bearing Speedwell. Pl. proc.

112 V. LA'XA (Benth. scroph. ind. p. 45.) sparingly pilose; leaves nearly sessile, ovate, or ovate-oblong, deeply serrated, rather pilose; racemes alternate; calyx 4-parted; capsule roundish, emarginate, hairy. ♃. H. Native of the Himalaya, at Kidarkonta, Royle.

Loose-flowered Speedwell. Pl.

113 V. PU'RSHII; glabrous, creeping; leaves reniformly cordate, deeply crenated; racemes spicate, lateral, pedunculate, short, oblong; calyx 5-cleft, unequal. ♃. H. Native on the banks of the Missouri. V. renifórmis, Pursh, fl. amer. sept. 1. p. 10, but not of Rafin. Leaves on long petioles. Stem creeping, rooting at the joints. Peduncles alternate, length of leaves. Bracteas oblong, crenated. Flowers large, crowded, pale blue. Filaments length of corolla.

Pursh's Speedwell. Pl. creeping.

114 V. ACUTIFLÒRA (Lapeyr. abr. suppl. p. 7. Rœm. et Schultes, syst. 1. p. 112.) pilose; leaves linear, obtuse: lower ones deeply serrated, pilose: upper ones lanceolate, nearly entire, rugose; racemes elongated; segments of corolla acuminated. ♃. H. Native of Tolosa, at La fontaine d'amour, among rushes. Pedicels longer than the bracteas. Corollas red. Very nearly allied to *V. Chamæ`drys* and *V. pilòsa*.

Acute-flowered Speedwell. Fl. May, June. Clt. 1821. Pl. 1 foot.

115 V. MICHAU'XII (Lam. ill. no. 163. Poir. encycl. 8. p. 532.) stems a little fistular, clothed with clammy villi; leaves half stem-clasping, oblong-lanceolate, denticulated, smooth; racemes spicate, short, on axillary, stiff peduncles; calyx 4-cleft: segments ovate, acutish. ♃. H. Native of the Levant. Leaves 1½ inch long, and 6 lines broad. Corollas middle sized.

Michaux's Speedwell. Pl. ¼ to ½ foot.

116 V. DEPAUPERA`TA (Waldst. et Kit. hung. 3. p. 273. t. 245.) creeping and ascending, pilose; leaves obovate, obtuse, subserrated; peduncles axillary, subracemose; calyx 4, rarely 3-5-cleft. ♃. H. Native of Hungary and Liptavia, on calcareous rocks. Corolla blue, upper segments emarginate. Capsule obcordate-ovate. Probably the V. aphýlla, var. β, Baumg. trans. 1. p. 22, of which he gives the following diagnosis. Sterile stems creeping; leaves crowded in a rosulate manner at apex, hairy, subdentate; scapes half an inch high, hairy, very simple, leafy at the base, ascending, terminating in 2-3-flowered racemes; pedicels a little drooping in the flower-bearing state; bracteas oblong, bluntish. Corolla pale blue. Calyx unequally 4-parted.

Impoverished Speedwell. Fl. April, July. Clt. 1823. Pl. creeping.

117 V. SYRI`ACA (Rœm. et Schultes, syst. 1. p. 116.) erect; leaves ovate, serrated: lower ones petiolate: superior ones sessile; pedicels spreading, 3 times longer than the bracteas; capsule ciliated. ⊙. H. Native of Syria, near Damascus, on a mountain called Dgebelcher. V. pedunculàta, Labill. pl. syr. dec. 5. p. 8. t. 5. f. 2, exclusive of the synonymes of Buxb. and Bieb. Leaves subciliated. Pedicels rather pilose, 2 to 4 times longer than the bracteas, which are lanceolate and ciliated. Calycine segments equal, obtuse. Capsule compressed.

Syrian Speedwell. Pl. ½ to ¾ foot.

118 V. DIVARICA`TA (Tausch. bot. zeit. 1821. p. 562.) stem decumbent, bifariously pilose, much branched; branches opposite, divaricate; leaves all petiolate, cordate, smooth, doubly crenated; racemes axillary, about equal in length to the stems; pedicels capillary; calyx 4-parted, nearly equal. ♃. H. Native of Savoy, in shady valleys, particularly at Petersgrund. Root creeping. Leaves pilose, most so beneath, 3 times the size of those of *V. Chamæ`drys*, not wrinkled. Racemes opposite. Flowers remote, pale blue, larger than those of *V. Chamæ`drys*. Pedicels twice as long as the bracteas.

Divaricate Speedwell. Pl. prostrate.

119 V. STOLONI'FERA (Lehm. sem. hort. hamb. 1820. ex Linnæa, 3. p. 8.) stolons creeping, hairy; hairs at length distinct; leaves petiolate, cordate-ovate, coarsely serrate-toothed, rather hairy; racemes axillary; calyx foliaceous, longer than the capsule. ♃. H. Native of North America.

Stoloniferous Speedwell. Fl. June, July. Clt.? Pl. creeping.

120 V. MA'XIMA (Stev. in mem. mosc. 2. p. 173. Bieb. cauc. 3. p. 13.) leaves ovate, almost sessile, coarsely serrated, pilose; racemes lateral; calyxes and capsules ciliated. ⊙. H. Native of Iberia, in mountain meadows.—Buxb. cent. 1. p. 23. t. 34. Plant hairy. Calyx 4-parted, exceeding the capsule. Corolla

small, blue, hardly exceeding the calyx. Capsule compressed, obcordate.

Largest Speedwell. Fl. May, July. Clt. 1824. Pl. 1 to 2 feet.

121 V. URTICÆFÒLIA (Lin. syst. p. 60.) erect, pilose; leaves sessile, cordate-ovate, acute, coarsely serrated; racemes lateral, slender, few-flowered. ♃. H. Native of the South of Europe, in shady places, and of Bithynia. Vahl, enum. 1. p. 77. D. C. fl. fr. no. 2388. Jacq. fl. austr. 1. p. 37. t. 59. Bertol. amœn. p. 324. Guss. pl. rar. p. 5. V. galeopsifòlia, Gilib. V. latifòlia, Lam. fl. fr. 2. p. 441, exclusive of the syn. of Vill. but not of Lin. V. circæoìdes, G. Don, in Loud. hort. brit. p. 7. V. máxima, Dalech. hist. 1165. f. 1.—Mor. hist. 2. p. 322. sect. 3. t. 23. f. 18.—Buxb. cent. 2. p. 23. t. 34. Stems simple. Leaves with rufescent nerves, those in the middle of the stem broad. Pedicels longer than the branches. Calyx 4-parted, equal. Corollas small, red, or pink. This species has much the habit of a species of *Circæ'a*.

Nettle-leaved Speedwell. Fl. May, June. Clt. 1776. Pl. ½ to 1 foot.

122 V. MELISSÆFÒLIA (Poir. encycl. 8. p. 526.) leaves sessile, subcordate-ovate, crenately cut, downy beneath; racemes spicate, lateral, opposite. ♃. H. Native country unknown. Stem erect, downy, slender. Leaves obtuse, an inch long, and 10 lines broad. Bracteas ovate, hardly the length of the calyx. Calyx equal. Corollas small, pale blue, or white. Capsule glabrous, obcordate. Seeds red.

Balm-leaved Speedwell. Fl. May, June. Clt. 1826. Pl. 1 foot.

123 V. VESTIA'NA (Rœm. et Schultes, syst. 1. mant. 1. p. 111.) stems hoary, villous; leaves coarsely serrated, petiolate: cauline ones ovate: rameal ones oblong; style thicker than the filaments; racemes spicate, elongated; bracteas filiform, exceeding the calyxes a little. ♃. H. Native country unknown. V. melissæfòlia, Vest. in litt. Leaves entire at the base, usually subcordate. Calyx rather unequal.

Vest's Speedwell. Pl. 1 foot.

124 V. PROSTRA'TA (Lin. spec. p. 17.) canescent and pubescent; leaves sessile, oblong, obtuse, serrated: superior ones lanceolate, flat; racemes axillary, opposite, elongated; floriferous stems ascending: barren ones prostrate. ♃. H. Native of Germany, Italy, and Switzerland, on hills. Vahl, enum. 1. p. 75. Mœnch. hass. t. 1. V. Teùcrium, β, Savi, bot. etrusc. 1. p. 12. V. canéscens, Bastard, suppl. fl. Main et Loire, p. 21.—Bauh. hist. 3. p. 287, with a good figure. Flowers blue. Capsule compressed, glabrous. Calyx unequal, nearly glabrous.

Var. β, *mìnor* (Riv. mon. t. 95.) plant smaller.

Var. γ, *satureifòlia* (Poit. et Turp. fl. par. p. 22.) racemes exceeding the prostrate stems: lower leaves oblong, serrated at top: middle ones subdenticulated: the rest linear, and quite entire.

Var. δ, *álba*; flowers white, wrinkled.

Prostrate Speedwell. Fl. May, June. Clt. 1774. Pl. pros.

125 V. TEU'CRIUM (Lin. spec. p. 16.) downy; lower leaves ovate-oblong, half stem-clasping, obtuse, coarsely serrated: superior leaves sessile, narrower, serrated; racemes axillary, opposite, on long peduncles; stems ascending, or prostrate. ♃. H. Native of Italy, Switzerland, Germany, in argillaceous soil. Vahl, enum. 1. p. 76. Schmidt, fl. bohem. p. 16. D. C. fl. fr. 2290. Lodd. bot. cab. 425.—Lob. icon. 473. Verònica montàna, Riv. mon. t. 95. Pall. itin. 2. p. 522. V. Teùcrium, var. intermèdia, Led. fl. alt. 1. p. 40. V. latifòlia, β, mìnor, Schrad. fl. germ. 1. p. 36. Racemes rather dense. Calyx 4-5-parted, unequal. Corollas blue, larger than those of *V. latifòlia*. Capsule compressed, emarginate, nearly glabrous, slightly ciliated, shorter than the unequal calyx. There is in gardens a stiffer variety, with rather broader leaves, and having capsules longer than the calyx. V. flórida, of Schmidt, fl. boh. cent. 1. p. 23, is probably also a variety of this, but the stems are said to be bifariously pilose, and the leaves equally serrated.

Germander-leaved Speedwell. Fl. May, June. Clt. 1596. Pl. 1 to 1½ foot.

126 V. CHAI'XI (Lapeyr. pyr. abr. suppl. 1. p. 6.) leaves sessile, wrinkled, elongated, deeply toothed; racemes lateral; calyx 4-parted, unequal. ♃. H. Native of the Pyrenees, on the Pic de Gerard. V. latifòlia, γ, dùbia, Lapeyr. abr. p. 9. V. dùbia, Chaix, herb. et fl. fr. no. 2395. Plant smaller than *V. latifòlia*. Leaves narrower, more acute; calyxes and bracteas more elongated. The whole plant pilose. Flowers large, blue.

Var. β, *mìnor* (Lapeyr. l. c.) leaves obtuse, somewhat pinnatifid at the base. ♃. H. Native of the Pyrenees.

Chaix's Speedwell. Fl. June, July. Clt. 1825. Pl. 1 foot.

127 V. LUTETIA'NA (Rœm. et Schultes, syst. 1. mant. 1. p. 109.) leaves lanceolate, quite glabrous, a little toothed, obtuse; racemes lateral, very long. ♃. H. Native country unknown. V. nítida, Hort. par. ex Poir. suppl. 5. p. 467, but not of Ehrh. Perhaps only a variety of *V. Teùcrium*, having the stems hardly downy, and the leaves deep green and shining, and almost entire. Corollas pale blue. Capsule glabrous, compressed.

Lutetian Speedwell. Pl. 1 foot.

128 V. LATIFÒLIA (Lin. spec. p. 18. Ait. hort. kew. ed. 1. p. 24. ed. 2d. vol. 1. p. 33.) downy; stems erect; leaves subcordate-ovate, sessile, half stem-clasping, bluntly serrated; racemes axillary, opposite, dense; calyx 5-parted. ♃. H. Native of Sweden, Switzerland, and Germany, and of Siberia, &c. Vahl, enum. 1. p. 76. Schrad. fl. germ. 1. p. 35. Sweet, fl. gard. t. 23. Link, enum. 1. p. 25. V. Teùcrium, Poll. pal. no. 13. Hoppe, cent. sic. 1. no. 76, and of many other authors. V. Teùcrium, α, latifòlia, Led. fl. atl. 1. p. 40. V. chamæ'drys, Patrin, mss. V. pseùdo-chamæ'drys, Jacq. fl. austr. 1. p. 37. t. 60.—Weinm, phyt. t. 1005. a. Flowers dense. Bracteas a little longer than the pedicels. Capsule compressed, emarginate, downy. Corollas blue, with deeper veins. There is a dwarf variety of this, having leaves so deeply serrated, as to be almost jagged. The variations of the five preceding species run so gradually into each other, as hardly to be distinguished; in *V. latifòlia*, however, the leaves are perfectly ovate, and broad in the middle; in *V. Teùcrium* they are ovate-oblong, broad at the base; and in *V. prostràta* the leaves are elliptic to nearly linear.

Broad-leaved Speedwell. Fl. May, June. Clt. 1748. Pl. 2 feet.

129 V. HIMALE'NSIS (D. Don, prod. fl. nep. p. 92. Benth. scroph. ind. p. 44.) pubescently hairy, but at length glabrous; leaves sessile, ovate, or ovate-oblong, deeply crenated, hairy while young; racemes opposite, on long peduncles; calyx unequally 5-parted; capsule ovate, acute, exceeding the calyx. ♃. H. Native of Nipaul, at Gosainsthan, Wall. V. grandiflòra, Wall. cat. no. 403. Bracteas lanceolate, longer than the pedicels. Calycine segments ciliated. Flowers azure blue. Said to be very nearly allied to *V. Teùcrium*.

Himalaya Speedwell. Pl. ½ to ¾ foot.

130 V. CRINÌTA (Kit. in Schultes, fl. austr. ed. 2d. vol. 1. p. 26.) erect, downy; leaves nearly sessile, ovate-lanceolate, unequally serrated; racemes axillary, twice as long as the leaves; calyx 5-parted, unequal. ♃. H. Native of Hungary, on hills. Stem tomentose. Lower leaves obtuse: upper ones acute, quite entire at base and apex. Bracteas longer than the pedicels. Capsule emarginate, compressed. Perhaps a variety of *V. Teùcrium*, or *V. latifòlia*.

Hairy Speedwell. Fl. July, Aug. Clt. 1822. Pl. 1 foot.

131 V. DENTA'TA (Schrad. fl. germ. 1. p. 37, exclusive of the dentata of Schmidt.) ascending, nearly glabrous; leaves dark green, oblong-lanceolate, or lanceolate, acutish, remotely serrated; racemes axillary, elongated; calyx 5-parted. ♃. H. Native of the South of Europe, and Siberia, on dry hills. Besser. fl. gal. no. 26. V. Teùcrium, Host, syn. p. 8. Wahl. fl. carp. p. 7. no. 14, exclusive of the synonymes of Lin. V. prostràta, Geners, elench. scep. no. 13. Bieb. cauc. 1. p. 10. ex Wahl. V. Teùcrium, β, angustifòlia, Vahl, enum. 1. p. 76.? Led. fl. alt. 1. p. 40. D. C. fl. fr. 3. no. 2390. β. V. angustifòlia, Bernh. Teùcrium IV. tertia species, Clus. hist. p. 349. Very like a narrow-leaved variety of *V. Teùcrium*, but of more humble growth. Leaves glabrous to the naked eye, but being examined by a lens they will be found to be ciliated; they are sessile, almost all lanceolate.

Toothed-leaved Speedwell. Fl. May, June. Clt. 1818. Pl. ascending, 1 foot.

132 V. SCHMI'DTII (Rœm. et Schultes, syst. 1. p. 115.) nearly glabrous, dark green, ascending, or erect; leaves narrow-lanceolate, remotely serrated, and linear, quite entire, with revolute edges; racemes axillary, opposite, elongated; calyx 5-parted. ♃. H. Native of Bohemia. Link, enum. 1. p. 25. V. dentàta, Schmidt. fl. boh. cent. 1. p. 20. V. paniculàta, Willd. spec. 1. p. 71. enum. 1. p. 23, exclusive of the syn. of Pall. Leaves usually opposite, but sometimes 3 in a whorl. Lower bracteas longer than the flowers: superior ones length of pedicels. Calyx unequal, hairy, ciliated. Corollas large, showy, deep blue. Stems prostrate, sub-tomentose, ex Link.

Schmidt's Speedwell. Fl. May, June. Clt. 1820. Pl. pros.

133 V. MACROSTA'CHYA (Vahl, enum. 1. p. 71.) hoary and villous; leaves linear-oblong, deeply serrated outside; racemes axillary; stems prostrate. ♃. H. Native of Syria, Labill. Stem filiform. Leaves sessile, obtuse. Calyx 4-cleft. Capsule obcordate, compressed, length of calyx. In cultivated plants of this species the stems are a foot and a half long, and the racemes 2 feet long.

Long-spiked Speedwell. Pl. prostrate.

§ 3. *Leaves pinnatifid, or bipinnatifid, or pectinately toothed.*

134 V. PECTINA'TA (Vahl, enum. 1. p. 71.) leaves oblong, pectinately serrated; stems prostrate; racemes elongated, leafy at the base. ♃. H. Native about Constantinople.—Buxb. cent. 1. t. 39. f. 1. Stem shrubby at the base, and branched, ascending, and, like the whole plant, canescent from pubescence. Leaves subpetiolate, acute at the base.

Pectinate-leaved Speedwell. Fl. May, June. Clt. 1819. Pl. prostrate.

135 V. PARVIFÒLIA (Vahl, enum. 1. p. 72.) ascending, pubescent; leaves small, pinnatifid; racemes many-flowered; bracteas equal in length to the pedicels. ♃. H. Native of Cappadocia, and Armenia, in grassy places.—Buxb. cent. 1. t. 41. f. 2. Leaves all deeply pinnatifid, except the upper ones. Flowers and capsules 3-4 times smaller than those of *V. orientàlis*. Capsule compressed, obcordate.

Small-leaved Speedwell. Pl. ascending.

136 V. RO'SEA (Desf. fl. atl. 1. p. 13.) downy; stem shrubby, ascending; leaves pinnatifid, on short petioles, acute, with 2-3 segments on each side; racemes elongated, axillary; bracteas equal in length to the pedicels. ♄. G. Native of Mount Atlas, near Tlemsen. Pedicels capillary. Calyx unequal. Corollas rose-coloured, size of those of *V. latifòlia*.

Rose-coloured-flowered Speedwell. Shrub ascending.

137 V. ORIENTA'LIS (Ait. hort. kew. ed. 1. vol. 1. p. 23. ed. 2d. vol. 1. p. 32.) procumbent, downy; leaves linear-lanceolate: lower ones pectinately pinnatifid: superior ones entire; racemes axillary, elongated. ♃. H. Native of Armenia and Iberia. Vahl, enum. 1. p. 73. Bieb. fl. cauc. 1. p. 12. Willd. spec. 1. p. 69. Lodd. bot. cab. t. 419. V. Austrìaca, β, Lin. spec. no. 17. V. heterophýlla, Sal. par. lond. p. 7. t. 4. Pedicels longer than the bracteas. Flowers blue. Calyx unequal, 5-parted.

Oriental Speedwell. Fl. June, Aug. Clt. 1748. Pl. proc.

138 V. TAU'RICA (Willd. spec. 1. p. 70.) procumbent; leaves crowded, tridentate at apex, or linear, and pinnatifidly toothed, rather pilose; pedicels longer than the bracteas; calyx downy, 4-parted, unequal. ♃. H. Native of Tauria. Lodd. bot. cab. 914. V. orientàlis, β, Vahl, enum. 1. p. 72. Bieb. fl. cauc. 1. p. 12. Flowers blue.

Taurian Speedwell. Fl. May, July. Clt. 1820. Pl. pros.

139 V. JACQUI'NI (Schott. ex Rœm. et Schultes, syst. 1. p. 108. Baumg. fl. trans. 1. p. 26.) hairy or downy, erectish; lower leaves sessile, bipinnatifid: superior ones pinnatifid; racemes long, filiform, axillary: lower bracteas trifid, longer than the pedicels; calyx 5-cleft, unequal. ♃. H. Native of Austria, Carniola, Croatia, and Tauria. V. Austrìaca, and V. multìfida, Jacq. austr. 4. p. 16. t. 329, exclusive of the synonymes of Bauh. and Buxb. V. multífida, Scop. fl. carn. ed. 2d. p. 16. no. 15, exclusive of the synonymes of Lin. Ait. hort. kew. 1. p. 23, but not of Lin. V. Austrìaca, Willd. spec. 1. p. 70, exclusive of the syn. of Jacq. vind. Crantz, Bauh. and Morison. Hoffm. fl. germ. p. 8. Vahl, enum. 1. p. 73, exclusive of the syn. of Lin. Bauh. Crantz. V. tenuifòlia, Schrad. fl. germ. 1. p. 39, exclusive of the syn. of Host, Schrank, Schmidt, Morison, and Bauhin. Pers. ench. 1. p. 12, and Bieb. fl. cauc. p. 13, exclusive of the syn. of Morison. Besser. fl. gall. 1. p. 35, exclusive of var. α. Ait. hort. kew. ed. 2d. vol. 1. p. 32. Plant ascending. Stems terete, much branched, clothed with minute, white, short hairs. Leaves rather pilose, multifidly parted; segments pinnatifid, linear, acute, toothed: lower ones longer, divaricate. Racemes filiform, erect, long, pilose. Lower bracteas trifid, or bifid, the rest entire, ciliated. Flowers blue. Capsules glabrous.

Jacquin's Speedwell. Fl. May, June. Clt. 1748. Pl. 1 foot.

140 V. TRICHOCA'RPA (Rœm. et Schultes, syst. 1. mant. 1. p. 106.) stems erectish; lower leaves bipinnatifid; pedicels longer than the bracteas; capsules hairy. ♃. H. Native country unknown. V. pilocárpa, Link, enum. 1. p. 25. V. orientàlis, Willd. enum. 1. p. 22, but not of Ait. Very nearly allied to *V. Jacquìni*, but the capsule is hairy. Calyx 5-parted.

Hairy-fruited Speedwell. Fl. May, July. Clt. 1820. Pl. ½ foot.

141 V. AUSTRI'ACA (Lin. spec. p. 17.) plant weak, trailing, or ascending; leaves sessile, lanceolate, deeply serrated, and pinnatifid: racemes lateral, elongated; calyx 4-parted; bracteas entire, shorter than the pedicels. ♃. H. Native near Vienna, and of Bohemia, also of Spain. Jacq. enum. vind. p. 3. Schultes, fl. austr. ed. 2d. vol. 1. p. 27, exclusive of the syn. of Jacq. Krok. fl. siles. p. 23, exclusive of the syn. of Riv. Schwenkf. and Jacq. Mill. dict. no. 9. Host, syn. p. 9, exclusive of all syn. Link, enum. 1. p. 25. V. polymórpha, Willd. enum. suppl. p. 2. Schweig. enum. hort. regiom. p. 78. V. laciniàta, Mœnch.—Bauh. hist. 3. p. 287.—Mor. hist. 2. sect. 3. t. 23. f. 12. V. Austrìaca, foliis tenuissime laciniatis, Tourn. inst. p. 144. V. praténsis, var. α. Crantz, austr. p. 344, exclusive of the syn. of Tourn. V. multífida, Schmidt, fl. boh. p. 21, exclusive of the syn. of Lin. and Jacq. Plant downy. Flowers blue.

Austrian Speedwell. Fl. May, June. Clt. 1748. Pl. 1 foot.

142 V. ORSINIA'NA (Tenore, prod. append. 5. ex Linnæa, 3. p. 97.) stems erectish, villous, with 2 lines of more dense villi; leaves oblong, obtuse, pectinately sub-pinnatifid; calyx 5-parted, with linear segments; pedicels capillary, about equal in

length to the bracteas. ♃. H. Native of Abruzzo, on the mountains. Plant canescent from pubescence. It differs from *V. Austrìaca* in the calyx being 5-parted, in the leaves being less cut, and in the whole habit; and from *V. pedunculàris* in the calyx being 5-parted, in the segments being narrower, in the leaves being oblong, and in the pedicels being shorter.

Orsin's Speedwell. Pl. 1 foot.

143 V. CAUCA'SICA (Bieb. fl. cauc. 1. p. 13. suppl. p. 14.) erectish, nearly glabrous; leaves bipinnatifid; segments lanceolate and linear; racemes axillary, few-flowered; pedicels capillary; calyx large, 4-parted, nearly equal. ♃. H. Native of Caucasus and Iberia. Lodd. bot. cab. 1369. Calyx 4-cleft. Pedicels much longer than the bracteas, pendulous in the fructiferous state. Flowers pale red, or white, variegated by deeper veins. There are varieties of this, having the segments of the leaves narrower and broader. In mem. soc. nat. mosc. 2. p. 180. no. 8. Steven defines a variety of this, or a new species nearly allied, under the name of "*V. ossética*; leaves bipinnatifid; bracteas shorter than the pedicels, and are, as well as linear calycine segments, downy."

Caucasian Speedwell. Fl. June, July. Clt. 1816. Pl. ½ foot.

144 V. TENUIFÒLIA (Stev. ex Bieb. cauc. 1. p. 13.) ascending; leaves pinnatifid, with linear, filiform segments; racemes axillary; calyx unequal. ♃. H. Native of Iberia. Very nearly allied to *V. multífida*, but the stems are more elongated, the leaves less compound; the pedicels are equal in length to the bracteas, or longer. The 3 superior segments of calyx are small. Perhaps the same as V. parviflòra, Vahl.? but the flowers are never smaller than those of *V. orientàlis*, *V. multífida*, &c.

Fine-leaved Speedwell. Fl. May, July. Clt. 1821. Pl. ½ foot.

145 V. MULTI'FIDA (Lin. spec. 17.) procumbent, rather woody at the base, canescent; leaves bipinnatifid, with lanceolate, or linear segments; racemes axillary. ♃. H. Native of Siberia, on hills; also of Tauria and Caucasus; and between Smyrna and Bursa. Bieb. fl. cauc. 1. p. 12. Willd. spec. 1. p. 69. Smith, in Lin. trans. 1. p. 191. Sims, bot. mag. 1679. Calycine segments unequal, subulate. Corollas pale blue. Pedicels equal in length to the bracteas, or shorter.

Var. β, hirsùta; plant more hairy; corollas rose-coloured. ♃. H. Amm. ruth. p. 25. no. 33.

Multifid-leaved Speedwell. Fl. May, June. Clt. 1748. Pl. procumbent.

SECT. VII. SCUTELLA'TA (from *scutella*, a little saucer; shape of valves of capsule.) Capsule orbicular, deeply 2-lobed, compressed. Seeds compressed on one side, and convex on the other. Aquatic plants with opposite leaves, and loose, axillary racemes of flowers.

146 V. SCUTELLA'TA (Lin. spec. p. 16.) erectish, creeping, and rooting at the base; leaves linear-lanceolate, nearly entire; racemes axillary, alternate, loose; pedicels pendulous, or spreading; calyx 4-parted, equal. ♃. H. Native of Europe, Siberia, and North America, in inundated places, particularly in watery spongy bogs, chiefly on a sandy soil. Vahl, enum. 1. p. 70. Fl. dan. t. 209. and t. 1561. Curt. lond. t. 56. Smith, engl. bot. t. 782. Poit. et Turp. fl. par. 1. p. 15. f. 13. Riv. mon. irr. 96. f. 1. Root creeping. Leaves sessile, nearly connate, rarely furnished with a few teeth. Racemes alternate, longer than the leaves; pedicels longer than the bracteas. Corolla of a pale flesh colour, the smaller segment palest. In the American plant the peduncles are opposite, and shorter than the leaves, and the flowers are nearly sessile.

Var. α, glàbra; leaves subovate-lanceolate, denticulated, and are, as well as the stem, glabrous. ♃. W. H. Gesn. icon. aen. t. 10. f. 87.

Var. β, pilòsa (Vahl, l. c.) plant pilose, or villous; leaves linear-lanceolate, sub-denticulated. ♃. H. V. villòsa, Schum. fl. saell. 1. p. 7. Serrature glandular.

Var. δ, latifòlia (Rosen, et Weber, hols. no. 13.) leaves ovate, lanceolate. ♃. H. Lapeyr. pl. pyr. suppl. ined. (Stem pilose.) V. parmulària, Poit. et Turp. fl. par. t. 14, ex Lois.

Saucer-capsuled Speedwell. Fl. June, Aug. Britain. Pl. 1 to 2 feet.

147 V. PARMULA'RIA (Tratt. fl. austr. t. 20.) stem erectish, hairy; leaves narrow-lanceolate, denticulated, ciliated. ♃. W. H. Native of Austria. Very nearly allied to *V. scutellàta*; and differs from it only in the leaves being acute, not acuminated, hardly length of the internodes, not longer. Bracteas bluntish. Probably only a slight variety of *V. scutellàta*.

Small-shielded Speedwell. Fl. June, Aug. Clt. 1824. Pl. 1 to 2 feet.

148 V. CAROLINIA'NA (Poir. encycl. 8. p. 520.) glabrous; stem erect, dichotomous at top; leaves ovate-oblong, obtuse, nearly entire: lower ones petiolate. ♃. W. H. Native of Carolina, in water. Leaves rather fleshy, 6 lines long and 3 broad. Racemes loose, leafy; bracteas petiolate, longer than the pedicels. Calycine segments ovate. Capsule obcordate. Perhaps this is *V. scutellàta* of American authors.

Carolina Speedwell. Fl. June, July. Clt. 1821. Pl. ½ to 1 foot.

SECT. VIII. BECABU'NGA (the name *Becabúnga* comes from the German Bach-pungen; bach meaning a rivulet; in Yorkshire and Norfolk a beck.) Capsule inflated, entire, or emarginate, subdidymous. Seeds oblong, or globose. Aquatic plants.

149 V. BECABU'NGA (Lin. spec. p. 16.) glabrous, shining; stems procumbent, rooting at the base; leaves elliptic, oval or oblong, obtuse, on short petioles, crenately serrulated or entire; racemes loose, axillary. ♃. W. H. Native throughout Europe, Siberia, and North America, in ditches and rivulets of clear water, and in running streams; plentiful in Britain. In Nipaul, Hamilt., and Kanaour, Royle. Vahl, enum. 1. p. 69. Fl. dan. t. 511. Curt. fl. lond. 2. t. 3. Woodv. t. 7. Smith, engl. bot. t. 655. Svensk, bot. t. 127. V. punctàta, D. Don, prod. fl. nep. p. 93.—Bocc. mus. p. 22. t. 6.—Riv. mon. irr. t. 100. f. 1. Stems terete. Leaves running into the short petioles. Bracteas narrow, lanceolate, shorter than the pedicels. Calyx 4-parted. Corolla blue, veined with red. Capsule entire, or hardly emarginate. The Nipaul plant differs from the European, in the bracteas and calyxes being obtuse; and in the capsule being entire. This plant is considered medicinal, being included in *Pharmacopœias*.

Brook-lime Speedwell. Fl. May, July. Britain. Pl. ½ to 2 feet.

150 V. TE'NUIS (Ledeb. fl. ross. alt. ill. t. 217. fl. alt. 1. p. 39.) stem erect, strict, and are, as well as the leaves, glabrous; leaves oblong-lanceolate, acutish, serrulated; racemes axillary: intermediate ones opposite; calyx 4-parted; capsule elliptic-obovate, obtuse, entire. ☉. H. Native of the North of Persia. Leaves opposite, nearly connate. Racemes axillary, opposite. Pedicels twice as long as the bracteas. Seeds minute, globose, not flat on one side, and convex on the other, as in *V. scutellàta*.

Slender Speedwell. Pl. ½ to 1 foot.

151 V. ANAGALLOI'DES (Guss. pl. rar. p. 5. t. 3.) erect, glabrous; leaves linear-lanceolate, stem-clasping, entire; racemes lateral; calyx 4-parted, about equal in length to the corolla; capsules elliptic, obtuse. ☉. H. Native of the East of the Calabria, in low marshy places near Catanzaro. Stem rooting at bottom. Pedicels longer than the bracteas. Corolla pale blue or white. Capsule rather emarginate. Seeds roundish. Very like *V. anagállis*.

Var. β; stem downy; hairs glandular at top.

Anagallis-like Speedwell. Pl. ½ to 1 foot.

152 V. ANAGA'LLIS (Lin. spec. p. 16.) glabrous, erect, rooting at the base; leaves oblong-lanceolate or lanceolate, serrated, acute, cordately stem-clasping or subconnate; racemes opposite, many-flowered, longer than those of *V. Becabúnga*. ⊙. W. H. Native of Europe, Siberia, Levant, Virginia, Japan, in rivulets and ditches, and muddy water; also of Nipaul, Silhet, Hindostan, and Kanaour. Vahl, enum. 1. p. 69. Fl. dan. t. 903. Curt. lond. fasc. 5. t. 2. Smith, engl. bot. t. 721.? 781. St. Hil. pl. fr. 37. t. 6. Svensk, bot. 127. V. undulàta, Wall. in Roxb. fl. ind. 1. p. 147. Stem subtetragonal; superior leaves sessile. Flowers pale blue, or white lined with blue. Calycine segments 4, acute. Capsules roundish, emarginate.

Var. β, *mìnor* (Vahl. l. c.) stem and leaves much shorter. ⊙. H. V. Anagállis, β, pusílla, Poir.—Tabern. icon. 1718.

Var. γ, *tenérrima* (Schmidt, boh. cent. 1. no. 23.) leaves ovate, flat, quite entire; stem erect; racemes terminal and axillary. ⊙. H.

Var. δ; raceme solitary; leaves lanceolate, crenated. ⊙. H.

Pimpernell-like Speedwell. Fl. July. Britain. Pl. 1 to 2 feet.

SECT. IX. COCHLIDIOSPE'RMA (from κοχλος, *kochlos*, a shell; and σπερμα, *sperma*, a seed; in reference to the shape of the seeds.) Rchb. Capsule compressed, obcordate. Seeds navicular.—Annual herbs, with axillary 1-flowered pedicels. Floral leaves alternate.

153 V. BI'LOBA (Lin. mant. p. 172.) stem erectish, downy; leaves nearly sessile, oblong or lanceolate, quite entire or serrated; calyxes 4-parted, exceeding the corolla; capsule 2-lobed: lobes longer than the style, and shorter than the calyx. ⊙. H. Native of the Himalaya, on Mount Choor, Royle; Cappadocia, in corn-fields; Caucasus, on Mount Schahdagh, Steven. Vahl, symb. 1. p. 1. Rchb. icon. 645.—Buxb. cent. 1. t. 36. Floral leaves longer than the peduncles. Corolla blue.

Two-lobed-capsuled Speedwell. Fl. April, May. Clt. 1819. Pl. ¼ to ½ foot.

154 V. AGRE'STIS (Lin. spec. p. 18.) stem procumbent, downy; leaves petiolate, ovate, crenately-serrated; pedicels 2-3 times longer than the capsule, reflexed in the fructiferous state; capsule obcordate: lobes turgid, approximate, obsoletely keeled. ⊙. H. Native of Europe, in cultivated fields; and of Asia, at Saharampore. Vahl, enum. 1. p. 80. Curt. fl. lond. 1. t. 1. Borrer, engl. bot. suppl. 2603. Rchb. icon. cent. 3. p. 66. t. 227. f. 440. St. Hil. pl. fr. p. 39. t. 3. V. pulchélla, Batard, ex D. C. fl. fr. suppl. 308. Corollas pale and deep blue, shorter than the calyx. Seeds about 6 in each cell.

Field Speedwell. Fl. March, July. Britain. Pl. procumbent.

155 V. POLI'TA (Fries. ex Borrer, in engl. bot. supp. under 2603. ed. 2d. t. 19.) procumbent, hairy; leaves cordate-ovate, petiolate, deeply serrated, shorter than the peduncles; calycine segments ovate, acute; capsule obcordate: lobes turgid, approximate, not keeled; seeds many in each cell. ⊙. H. Native of Britain, particularly in the North, in gardens. Rchb. icon. t. 247. V. agréstis, Smith, engl. bot. 783. Corolla bright blue, shorter than the calyx.

Polished Speedwell. Fl. March, July. Britain. Pl. procumbent.

156 V. FILIFÓRMIS (Vahl, enum. 1. p. 82.) stem procumbent, filiform, rather villous; leaves roundish-cordate, crenated: peduncles very long, reflexed in the fruit-bearing state; capsule obcordate, rather turgid; calyx 4-cleft, unequal. ⊙. H. Native of the south of Europe and Caucasus. Bieb. fl. cauc. 1. p. 39. Rchb. icon. t. 644. Ver. orientàlis foliis hederæ terrestris, flore magno, Tourn. cor. 7.—Buxb. cent. 1. p. 25. t. 40. f. 1. Leaves furnished with scattered pili. Calycine segments lanceolate. Corolla large, pale blue. Stems long, procumbent. Perhaps the same as *V. Buxbaúmii*.

Filiform-stemmed Speedwell. Fl. May, July. Britain. Pl. trailing.

157 V. BUXBAU'MII (Tenore, fl. neap. p. 7. no. 7. t. 1.) procumbent, hairy; leaves ovate-cordate, deeply crenated, petiolate; peduncles drooping in the fructiferous state, rather longer than the leaves; corollas larger than the calyx, which is 4-parted; capsule compressed, 2-lobed: lobes divaricate, keeled. ⊙. H. Native of Europe, in fields; in England, in Kent. Rchb. icon. t. 268. V. Tournefórtii, Gmel. fl. bad. 1. p. 39. V. híspida, Hort. V. cymbalariæfòlia, Schmidt. V. agréstis, var. Byzantìna, Smith, fl. græc. t. 8. V. Pérsica, Poir. encycl. 8. p. 542.—Buxb. cent. 1. p. 22. t. 40. f. 6. Much larger than *V. agréstis*. Stems much branched, bifariously pilose. Corollas blue.

Buxbaum's Speedwell. Fl. April, June. Clt. 1800. Pl. procumbent.

158 V. GLAU'CA (Sibth. et Smith, fl. græc. 1. p. 5. t. 7. prod. 1. p. 9.) procumbent, hairy; leaves cordate, deeply serrated, petiolate: peduncles capillary; calyx 4-cleft, with toothed segments. ⊙. H. Native near Athens, on Mount Hamettos. Much branched. Stem bifariously pilose. Leaves glaucous. Corolla blue, bordered with white, larger than the calyx.

Glaucous-leaved Speedwell. Pl. prostrate.

159 V. ARVE'NSIS (Lin. spec. p. 18.) erect, hairy; lower leaves petiolate, cordate-ovate, serrated; cauline ones crenated; floral ones lanceolate, sessile, entire, longer than the peduncles; flowers nearly sessile; calyx 4-cleft, unequal; capsule obcordate, compressed. ⊙. H. Native of Europe and North America, in cultivated fields. Vahl, enum. 1. p. 81. Fl. dan. t. 515. Curt. fl. lond. 2. t. 2. Smith, engl. bot. t. 734. Drev. et Heyne, 2. t. 11. V. acinacifòlia, Willd. enum. no. 41. V. Romàna, Schmidt, fl. boh. no. 45. V. polyánthos, Thuill. par. ed. 2. p. 9. Alýssum, Column. phyt. p. 28. with a good figure. Corolla smaller than the calyx, pale blue.

Corn-field Speedwell. Fl. April, July. Britain. Pl. ¼ to ½ foot.

160 V. PULCHE'LLA (Bernh. ex Rœm. et Schultes, syst. 1. p. 126.) procumbent, pilose; leaves petiolate, broad-cordate, deeply crenated; peduncles filiform, hardly shorter than the leaves; calyx 4-cleft, unequal. ⊙. H. Native country unknown. Habit of *V. Pérsica*, but smaller and less pilose; the leaves more oblong and firmer. Corolla shorter than the calyx, white, except the upper segment, which is rose-coloured.

Pretty Speedwell. Fl. April, May. Clt. 1819. Pl. procumbent.

161 V. CERATOCA'RPA (Meyer, verz. pflanz. p. 106.) puberulous; stems branched, diffuse; leaves ovate, acutish, serrated; peduncles longer than the leaves; calyx 4-parted, with lanceolate, acute, nearly equal segments; capsule compressed, broadly obcordate: lobes lanceolate. ⊙. H. Native of Caucasus, in meadows, between Sallian and Leukoran. Allied to *V. filifórmis*.

Horned-capsuled Speedwell. Pl. diffuse.

162 V. DI'DYMA (Tenore, prod. fl. neap. p. 6.) procumbent? downy; leaves deeply crenated; peduncles reflexed in the fructiferous state; capsule didymous, roundish. ⊙. H. Native of Naples.

Didymous-fruited Speedwell. Pl. procumbent.

163 V. AMŒ'NA (Stev. in Bieb. fl. cauc. 1. p. 12.) spreading,

hairy? leaves ovate, crenated; floral leaves oblong, quite entire, shorter than the peduncles; calyx 4-cleft, with linear segments. ⊙. H. Native of Iberia, in fields. Size of *V. arvénsis;* but the floral leaves are dissimilar to the cauline ones, minute and quite entire. Corollas large, blue, with a white bottom. This is said to be the prettiest species of the genus.

Pleasant Speedwell. Fl. April, May. Clt. 1824. Pl. procumbent.

164 V. ACINACIFÒLIA (Lin. spec. p. 19.) erectish, glabrous; lower leaves petiolate, ovate, serrated or crenated: floral ones nearly sessile, about equal in length to the peduncles; calyx 4-cleft, unequal. ⊙. H. Native of Germany, France, and Italy, in muddy fields; and of Chili, about Conception. Vahl, enum. 1. p. 85. Willd. spec. 1. p. 75. exclusive of *V. præ`cox*. V. Romàna, All. pedem. t. 85. Poit. et Turp. fl. par. 1. p. 22. t. 33. f. 3. V. Burdigalénsis, Laterr. fl. bord. ed. p. 87.—Bocc. mus. p. 19. t. 102.—Vaill. par. t. 33. f. 3. Stem drooping at top, usually branched. Leaves sessile, connate, usually glabrous: floral ones smaller and narrower. Corolla pale blue, marked by more obscure veins. Capsule obcordate, rather turgid, compressed.

Acinus-leaved Speedwell. Fl. April, May. Clt. 1788. Pl. ½ to 1 foot.

165 V. PRÆ`COX (Allioni, auct. p. 5. t. 1. f. 1.) the whole plant clothed with glandular and simple hairs; stem erectish; lower leaves petiolate, cordate-ovate, serrated: floral ones nearly sessile, shorter than the peduncles, which are incurved in the fructiferous state; calyx 4-cleft; capsule obovate, emarginate, turgid. ⊙. H. Native of France, Germany, and Italy, in fields. Vahl, enum. 1. p. 40. D. C. fl. fr. 2402. Willd. spec. 1. p. 76. under *V. acinacifòlia*. V. ocymifòlia, Thuil. fl. par. p. 10. no. 18. V. segetàlis, Pers. in Úst. ann. 14. p. 37. V. acinacifòlia, Schleich. cat. p. 53. V. víscida, Waldst. mss. Stem branched at the base. Leaves purplish beneath. Flowers small, blue. Capsule downy. There is a variety of this species almost glabrous; and another with more or less deeply cut leaves. Habit of *V. triphýlla*.

Early Speedwell. Fl. March, May. Clt. 1775. Pl. ¼ foot.

166 V. CYMBALA`RIA (Bertol. soc. med. d em. di gen. 1. p. 74. pl. gen. p. 3. giorn. de litt. 2. p. 2. 1805.) procumbent, glabrous; leaves petiolate, reniformly subcordate, with 5-9, but usually 7 obtuse crenæ or teeth, rather fleshy; peduncles longer than the leaves; calyx 4-cleft, equal, with ovate obtuse segments, spreading in the fructiferous state; capsule hairy, depressed, obcordate. ⊙. H. Native about Genoa, on garden walls; Island of Chio; Constantinople; Tunis, in fields. Sibth. et Smith, fl. græc. t. 9. Viv. fragm. 1. t. 16. f. 1. V. cymbalariæfòlia, Vahl, enum. 1. p. 81. Gmel. tubing. p. 6. V. hederæfòlia, β, Lin. spec. p. 19.—Buxb. cent. 1. p. 25. t. 39. f. 2. bad. Corolla larger than the calyx, with a white limb and greenish-yellow throat. Cells of capsule 2-seeded.

Cymbalaria-leaved Speedwell. Fl. April, May. Clt. 1821. Pl. procumbent.

167 V. HEDERÆFÒLIA (Lin. spec. p. 19.) procumbent, downy; leaves petiolate, roundish-cordate, 5-lobed: upper ones 3-lobed; peduncles shorter than the leaves; calyx 4-lobed, tetraquetrous, and conniving in the fructiferous state; calycine segments cordate, acute; capsule obcordate, turgid, few-seeded. ⊙. H. Native throughout Europe, among rubbish, in gardens and fields; plentiful in Britain. Vahl, enum. 1. p. 82. Smith, engl. bot. t. 784. Curt. fl. lond. 2. t. 1. Poit. et Turp. fl. par. 1. p. 23. t. 26. Fl. dan. 428. Leaves reniformly cordate, rather fleshy. Corolla pale blue, sometimes white.

Var. β, *Lappàgo* (Schmidt, fl. boh. no. 39.) leaves alternate, cordate, acutish, 3-4-lobed, petiolate; stem erectish, much branched; peduncles axillary, shorter than the petioles. ⊙. H. Native of Bohemia. Calycine segments hastate. Flowers small, red. This variety remains constant in cultivation.

Ivy-leaved Speedwell. Fl. March, June. Britain. Pl. procumbent.

168 V. TRIPHY'LLOS (Lin. spec. p. 19.) clothed with clammy down; stem erect, spreading; lower leaves undivided: middle ones digitately parted: superior ones trifid; peduncles longer than the calyx, length of leaves; calyx 4-cleft. ⊙. H. Native of Europe, in fields; plentiful in some parts of Britain. Vahl, enum. 1. p. 83. D. C. fl. fr. no. 2405. Curt. lond. 4. t. 2. Fl. dan. 627. Smith, engl. bot. 26. Sibth. et Smith, fl. græc. 1. p. 8. t. 10. V. digitàta, Lam. fl. fr. ed. 2d. vol. 2. p. 445. but not of Vahl.—Lob. icon. 464. f. 1. Lower leaves petiolate: upper ones sessile. Corolla small, blue, veiny; throat white. Capsule didymous, subciliated, turgid, obcordate. Seeds convex on one side and flat on the other.

Three-leaved Speedwell. Fl. April, May. Britain. Pl. ¼ to ½ foot.

169 V. DIGITA`TA (Vahl, symb. 1. p. 84.) stem pilose at top, branched; leaves all digitately parted; flowers sessile; calyx 4-cleft, length of capsule. ⊙. H. Native of Spain, and about Montpelier. Willd. spec. 1. p. 75. exclusive of V. succulénta, Schmidt, which is referrible to *V. vérna*. V. chamæpithyoìdes, Lam. ill. 1. p. 47. Branches height of stem. Leaves petiolate: lower ones trifid, with ovate segments; the lateral segments narrower and shorter: lower floral ones 5-parted, upper 3-parted, with linear segments. Capsule obcordate.

Digitate-leaved Speedwell. Fl. May, July. Clt. 1805. Pl. ¼ foot.

170 V. VE'RNA (Lin. spec. p. 19.) erect, downy; leaves pinnatifidly 3-5-parted: upper floral ones undivided; pedicels shorter than the calyx; calyx 4-cleft, unequal, with acute segments. ⊙. H. Native throughout Europe, in exposed places; plentiful in some parts of Britain. Vahl, enum. 1. p. 83. Fl. dan. t. 252. Smith, engl. bot. t. 25. Poit. et Turp. fl. par. 1. p. 21. t. 22. V. Dillènii, Crantz, austr. p. 352.—Dill. geiss. append. p. 38. V. pinnatifida, Lam. ill. t. 22. f. 4. V. succulénta, Schmidt, et All. fl. ped. t. 22. f. 4. Peduncles much shorter than the bracteas. Corolla small, blue, with a green ring. Capsule obcordate, compressed, ciliated. Seeds minute, scrobiculate.

Var. β; leaves almost quite entire. ⊙. H. V. polygonoìdes, Lam. ill. 1. p. 47. V. Bellárdi, All. pedem. 1. p. 77. t. 85. f. 1. Hairy. Flowers solitary, nearly sessile. Leaves alternate, oblong, lanceolate, or linear. Stem simple, bearing flowers from bottom to top. Corolla smaller than the calyx.

Spring Speedwell. Fl. April, May. Britain. Pl. ⅛ to ½ foot.

171 V. DEPRE'SSA (Kit. in Schultes, fl. austr. ed. 2d. p. 32.) branches procumbent; leaves ovate, nearly sessile; flowers sessile, aggregate. ⊙. H. Native of Hungary, in dry pastures.

Depressed Speedwell. Pl. procumbent.

172 V. RENIFÓRMIS (Rafin. journ. de bot. 1808. vol. 1. p. 228.) procumbent, hispid; leaves sessile, reniform, crenated, villous; flowers nearly sessile; calyx 4-cleft, with ovate acutish segments. ⊙. H. Native of New Jersey, in sandy places. Leaves alternate, nearly sessile. Corolla whitish blue. Capsule glabrous, compressed.

Reniform-leaved Speedwell. Pl. procumbent.

173 V. RE`PENS (Clar. in D. C. syn. fl. gall. no. 2407. fl. fr. 3. p. 727.) creeping, glabrous; leaves ovate, roundish, crenated, about equal in length to the peduncles. ⊙. H. Native of Corsica, on the mountains. Lois. fl. gall. t. 1. V. tenélla, Viv. fl. cors. and perhaps All. ped. t. 22. f. 1.? Plant very small. Leaves nearly sessile. Calyx 4-cleft, equal; segments ovate-lanceolate, obtuse. Corolla pale purple, twice as long as the

calyx. Capsule obcordate, ciliated, longer than the calyx. Seeds many, smooth, rather flat.

Creeping Speedwell. Pl. creeping.

174 V. PEREGRÌNA (Lin. spec. p. 28.) erect, glabrous; leaves subserrated; flowers sessile, shorter than the leaves; calyx 4-cleft, with narrow segments, which are a little longer than the capsule. ⊙. H. Native of Europe, in gardens and fields; North America, and Buenos Ayres. Vahl, enum. 1. p. 85. Fl. dan. t. 407. V. Marylándica, Murr. comm. gött. 1782. t. 3. V. Romàna, Lin. mant. p. 317. V. Caroliniàna, Walt. fl. car. p. 61. V. carnósula, Lam. ill. 1. p. 47. V. læ'vis, Lam. fl. fr. ed. 2d. vol. 5. p. 44. V. palléscens, Gater. fl. montaub. p. 27. Stem simple or branched. Radical leaves obovate, running into the petioles. Corollas small, blue or white. Capsule obcordate, compressed.

Var. β, Xalapénsis; stems downy; calycine segments broader. ⊙. H. Native of Mexico, near Xalapa, in forests of *Liquidambar*. V. Xalapénsis, H. B. et Kunth, nov. gen. amer. 2. p. 389.

Foreign Speedwell. Fl. March, June. Clt. 1680. Pl. ¼ to ¾ foot.

175 V. CHILLE'NSIS (H. B. et Kunth, nov. gen. 2. p. 390.) stem creeping, downy; leaves oblong-spatulate, serrated, glabrous; flowers nearly sessile, shorter than the leaves, reflexed in the fructiferous state; calyx 4-parted, with lanceolate-acute segments, which are longer than the capsule. ⊙. H. Native of Quito, near Chillo, at the altitude of 1340 hexapods. Leaves sessile, obtuse: floral ones alternate, narrow. Corolla white. Capsule compressed, obcordate. Seeds oblong.

Chillo Speedwell. Pl. creeping.

† *Species not sufficiently known.*

176 V. KOELE'RI (Rœm. et Schultes, syst. 1. p. 127.) stem erect, downy; cauline leaves quite entire, opposite, or 3 in a whorl: floral ones alternate, shorter than the peduncles. ⊙. H. Native country unknown. V. nòva, Koeler de veron. in recuil. d' mem. soc. Mayence, p. 184. Rœm. coll. 1. p. 306.

Koeler's Speedwell. Pl. erect.

177 V. ROTUNDIFÒLIA (Ruiz. et Pav. fl. per. 1. p. 6. Vahl, enum. 1. p. 81.) plant hairy; stems slender, creeping; leaves orbicularly reniform, crenated, petiolate, subpeltate; peduncles twice as long as the petioles. ♃. G. Native of Peru, in bogs. Stems purplish. Leaves 2 or 3, but usually solitary at the joints. Corolla of a rosy purple colour. Stamens 3, length of tube. There is a variety of this having a 5-cleft corolla, and 4 stamens. Certainly not a species of *Verónica*.

Round-leaved Speedwell. Pl. creeping.

†† *The following names occur in the gardens, but they are probably synonymous with those described above.*

1. V. diversifòlia, Mœnch. 2. V. melancólica, Hort. par. 3. V. paludòsa, Lejeune. 4. V. Pannónica, Mill. 5. V. pinnatífida, Willd. 6. V. spadàna, Lejeune. 7. V. Waldsteiniàna, Schott. 8. V. præálta, Hort.

Cult. The hardy, herbaceous, perennial species of *Verónica* are generally grown in flower borders, for which they are well fitted on account of their beauty; they are of the most easy culture, and are readily increased by division at the root. The annual kinds, having rather a weed-like appearance, are only grown in botanical gardens; the seeds of them only require to be sown in the open ground. The species natives of New Holland, Van Diemen's Land, and New Zealand, being rather tender, require to be treated as greenhouse plants; the shrubby kinds of these are propagated by cuttings; the others by divisions of the root.

LXVII. DIPLOPHY'LLUM (from διπλοος, *diploos*, double; and φυλλον, *phyllon*, a leaf; in reference to the two-leaved calyx.) Lehm. in berl. mag. an. 4. p. 2.—Verónica species, Stev.

LIN. SYST. *Diándria, Monogýnia.* Calyx of 2 sepals, compressedly closed; sepals cordate, serrated, 2-lobed. Corolla subrotate, 4-cleft; the 2 opposite lobes the smallest. Stamens 2, shorter than the corolla, without any rudiments of sterile ones; anthers didymous. Stigma simple. Capsule roundish, compressed, obcordate, 2-celled, 4-valved, 4-seeded.—An annual plant, with the habit of the species of *Verónica* belonging to section *Cochlidiospérma*. Stems many, subdichotomously branched, decumbent, nearly terete, furnished with 2 rows of spreading hairs. Leaves cordate-ovate, bluntly serrated, pale green, hairy. Pedicels solitary, axillary, declinate while bearing the fruit, about equal in length to the leaves, or exceeding them a little. Calyx downy, finely ciliated. Corolla pale blue, much shorter than the calyx. Capsule inclosed, ex Bieb.; glabrous, ex Lehm. Seeds large, wrinkled, black. Navicular.

1 D. VERONICÆFÓRME (Lehm. l. c.) ⊙. H. Native of shady woods about the Cuban. Verónica, Cristagálli. Stev. in mem. soc. gorenki, icon. ined. Lin. trans. 11. p. 408. t. 31. Bieb. suppl. p. 19. Link, enum. 1. p. 27.

Speedwell-formed Diplophyllum. Fl. April, May. Clt. 1813. Pl. trailing.

Cult. The seeds of this plant only require to be sown in early spring, in the open ground. A dry light soil suits it best.

LXVIII. LEPTA'NDRA (from λεπτος, *leptos*, slender; and ανηρ ανδρος, *aner andros*, a male; in reference to the slender stamens.) Nutt. gen. amer. 1. p. 7. Verónica species, Lin. and others. Veronicástrum species, Heist. helmst. 205. Mœnch.

LIN. SYST. *Diándria, Monogýnia.* Calyx 5-parted, bibracteate; segments acuminated. Corolla tubularly campanulate; limb 4-lobed, sub-ringent: lower segment the narrowest. Genitals exserted; filaments and base of the tube of the corolla downy. Capsule ovate, acuminated, 2-celled, many-seeded.—Robust plants, with broad, rather wrinkled, verticillate, serrated leaves, and terminal, solitary spikes of flowers, and sometimes there are short spikes from the axils of the upper leaves.

1 L. VIRGÍNICUS (Nutt. l. c.) leaves 4-5 in a whorl, ovate-lanceolate, petiolate, acuminated. ♃. H. Native of Virginia and Japan. ? Verónica Virgínica, Lin. spec. p. 13. Vahl, enum. 1. p. 56. Hoffm. in comm. gott. 15. p. 112. t. 1. phyt. bl. p. 89. t. 9. f. 1. Thunb. jap. p. 20. ? Veronicástrum álbum, Mœnch.—Knip. cent. 10. p. 97.—Plukn. phyt. t. 70. f. 2. Stem beset with rufous hairs. Lower leaves 5 in a whorl: upper ones 4, rarely 3, dirty green, downy. Corollas white. Capsule tetragonal, 4-valved. Seeds wrinkled.

Var. β, incarnàtus; flowers purple, or flesh-coloured. ♃. H. Verónica Virgínica, β, Pursh. fl. amer. sept. 1. p. 10.

Virginian Leptandra. Fl. July, Aug. Clt. 1714. Pl. 4 to 5 feet.

2 L. SIBI'RICUS (Nutt. l. c.) leaves 5-6-9 in a whorl, lanceolate, sessile, acuminated. ♃. H. Native of Dauria. Verónica Sibírica, Lin. spec. p. 12. Vahl, enum. 1. p. 55.—Amm. ruth. p. 20. t. 4. Veronicástrum rubéllum, Mœnch. Stem hairy. Leaves 2-3 inches long, much broader than those of *L. Virgínicus*. Corollas blue.

Siberian Leptandra. Fl. July, Aug. Clt. 1779. Pl. 4 feet.

3 L. MEYE'RI, glabrous; leaves scattered, nearly linear acute, sharply serrulated; raceme terminal, dense; corolla tubular. ♃. H. Native of Dahuria, in humid meadows. Verónica tubiflòra, Fisch et Meyer, rem. hort. petrop. 1836. p. 53. Calyx unequal. Corolla blue; segments oblong, bluntish. Capsule small oblong. Seeds minute, elliptic.

Meyer's Leptandra. Fl. ? Clt. 1836. Pl. 1 to 2 feet.

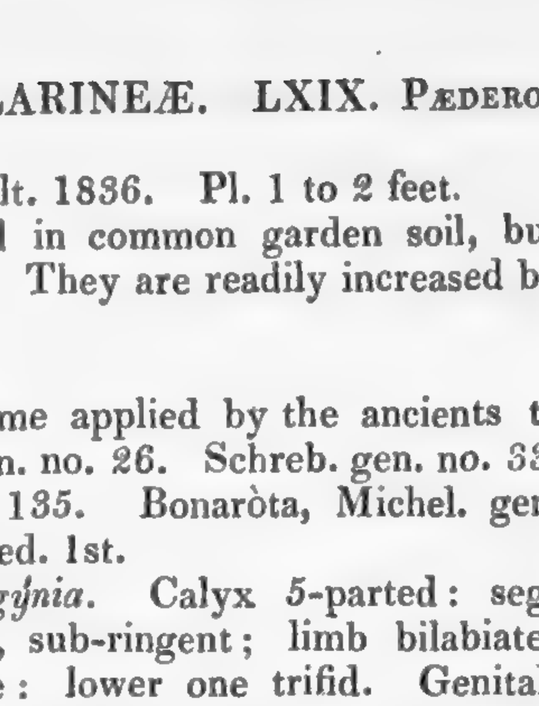
Cult. The species grow well in common garden soil, but prefer peat or vegetable mould. They are readily increased by division.

LXIX. PÆDERO'TA (a name applied by the ancients to a species of *Acánthus*.) Lin. gen. no. 26. Schreb. gen. no. 33. Juss. gen. p. 120. ed. Usteri. p. 135. Bonaròta, Michel. gen. 15. Verónica, Spec. Lin. spec. ed. 1st.

Lin. syst. *Diándria, Monogýnia.* Calyx 5-parted: segments linear. Corolla tubular, sub-ringent; limb bilabiate: upper lip entire, or emarginate: lower one trifid. Genitals exserted; filaments filiform. Capsule ovate, 4-valved, 2-celled, opening at top. Seeds roundish.—Dwarf alpine herbs with opposite leaves, and axillary, or terminal spicate flowers.

1 P. Age'ria (Lin. syst. p. 61. mant. 171.) stem leafy; leaves nearly sessile, unequally and sharply serrated: superior leaves long-acuminated; calyxes length of corolla; capsule ovate-oblong, acuminated. 4. H. Native of Carinthia, Carniola, and Italy, among rocks. Willd. spec. 1. p. 77. P. lùtea, Lin. suppl. p. 84. P. Bonaròta, Jacq. hort. vind. 2. t. 121. P. urticæfòlia, Brign. fasc. pl. forog. p. 8. Wulfènia Agèria, Smith, in Lin. trans. 6. p. 96. Bonaròta chamædrifòlia, Scop. carn. ed. 2. vol. 1. p. 22. Lower leaves the smallest, roundish: the upper ones lanceolate, acuminated: the middle ones longer than the others, ovate-lanceolate. Raceme spicate, terminal. Bracteas twice as long as the pedicels. Corolla sulphur coloured; throat tomentose; superior lip bifid, or emarginate (fig. 55).

FIG. 55.



Ageria Pæderota. Fl. May, June. Clt. 1824. Pl. 1 to 1½ foot.

2 P. Zaniche'lli (Brign. fasc. pl. forog. p. 9.) stem leafy; leaves nearly sessile, subcordate, serrated: lower ones roundish obtuse: superior ones ovate, acuminated; calyx glabrous, one half shorter than the corolla; capsule ovate, obtuse. 4. H. Native of Carnia, on the Alps near the limits of perpetual snow. Bonaròta montàna Italica chamæ'drys folio, minus crenato, spicâ luteâ, ex Monte Cavallo, Michel. gen. p. 19. no. 3. Leaves less deeply and irregularly serrated than *P. Agèria*, pilose. Raceme ½ to 1 inch long, dense. Bracteas hardly longer than the pedicels. Corolla yellow; throat glabrous; upper lip entire.

Zanichell's Pæderota. Pl. 1 to 3 inches.

3 P. Bonaro'ta (Lin. spec. p. 20. syst. p. 61.) stem leafy; leaves petiolate, roundish-ovate, serrated; calyx shorter than the corolla; capsule acuminated. 4. H. Native of Austria and Carniola, on the alps. Jacq. austr. 5. p. 49. t. 39. Brign. fasc. pl. forog. p. 6. Wulfènia Bonaròta, Smith, in Lin. trans. 6. p. 96. P. cærùlea, Lin. suppl. p. 84. Pæderòta, no. 1, Michel, gen. p. 19. t. 15. f. 1. Verónica Bonaròta, Lin. spec. ed. 1st. p. 11. Bonaròta chamædrifòlia, Scop. carn. ed. 2. vol. 1. p. 22. Racemes 1 to 1½ inch long. Calyx hairy. Corolla violaceous; throat glabrous; upper lip undivided.

Bonarota's Pæderota. Fl. May, June. Clt. 1818. Pl. ½ foot.

4 P. chamædrifo'lia (Brign. fasc. pl. forog. p. 9.) stem leafy; leaves nearly sessile, roundish, obtuse, serrated; calyx tomentose, two of the segments shorter than the rest. 4. H. Native of Carnia. P. Bonaròta, Vittm. summ. 1. p. 36. Bonaròta, no. 2. Michel, gen. p. 19. t. 15. f. 2. Leaves downy. Bracteas length of pedicels. Corolla violaceous; upper lip undivided, and sometimes emarginate.

Germander-leaved Pæderota. Pl. 2 to 3 inches.

Cult. The species of *Pæderòta* are pretty little alpine or rock plants. They should be grown in pots, and placed among other alpine plants. They are increased by division and seeds.

LXX. CALORHA'BDOS (from καλος, *kalos*, beautiful; and ῥαβδος, *rhabdos*, a twig, in reference to the beauty of the plant.) Benth. scroph. ind. p. 44.

Lin. syst. *Diándria, Monogýnia.* Calyx 5-parted. Corolla tubular, incurved; limb erect, obliquely 2-3-cleft: lower segment the smallest. Stamens 2, inserted at the sides of the upper corolline segment, without any vestiges of lower ones; anthers 2-celled; cells parallel, confluent at top. Stigma hardly thickened. Valves of capsule bipartite. Seeds numerous, girded by a curled membrane.

1 C. Brunonia'na (Benth. l. c.)—Native of Nipaul. Verónica ? Brunoniàna, Wall. cat. no. 405. An erect, glabrous, nearly simple herb, 1 to 2 feet high. Leaves oblong-lanceolate, deeply and acutely serrated, narrowed into the short petioles at the base. Spikes half a foot long. Flowers sessile, glomerate.

Brown's Calorhabdos. P. 1½ to 2 feet.

Cult. For culture and propagation see *Leptándra*.

LXXI. WULFE'NIA (so named in honour of the Rev. Francis Xavier Wulfen, author of "Plantæ Rariores Carinthiacæ" in Jacquin's Miscellanea.) Jacq. misc. 2. p. 62. t. 8. Schreb. gen. no 34. Smith, in Lin. trans. 6. p. 96. Benth. in scroph. ind. p. 46, but not of Wall.

Lin. syst. *Diándria, Monogýnia.* Calyx 4-5-parted. Corolla tubular, declinate; limb 4-5-cleft; segments straight, or hardly spreading: upper one emarginate, or bifid: lateral ones entire: lower one entire, or broadly crenated. Stamens two, placed at the sides of the upper corolline segment, destitute of any vestiges of lower ones. Anthers 2-celled; cells at length confluent at apex. Style simple; stigma truncate, or thickened and 2-lobed. Valves of capsule septiferous in the middle, bifid at apex.—Almost stemless herbs. Radical leaves petiolate. Scapes naked, many-flowered, erect. Flowers unilateral, pendulous, on short pedicels, solitary in the axils of the bracteas.

1 W. Amherstia'na (Benth. scroph. ind. p. 46.) leaves oblong, narrowed at the base, doubly and deeply crenated; tube of corolla straight; segments of the limb all acute. 4. H. Native of Kamaon, Wall.; Kanaour, Royle. Pæderòta Amherstiàna, Wall. cat. no. 410. Habit of *W. Carinthìaca*. Flowers blue.

Lady Amherst's Wulfenia. Pl. 1½ foot.

2 W. Carinthi'aca (Jacq. misc. 2. p. 62. t. 8. f. 1. icon. rar. 1. t. 2.) leaves oblong, narrowed at the base, doubly crenated; tube of corolla gibbous above the base; segments of the limb roundish: lower one crenated. 4. H. Native of Carinthia, on the alps. Lin. syst. p. 865. Reiner, et Hohenw. itin. bot. 1. p. 73. t. 1. Sweet, fl. gard. vol. 3. icone. Pæderòta Wulfènia, Lam. ill. t. 13. f. 2. Flowers blue.

Carinthian Wulfenia. Fl. July, Aug. Clt. 1817. Pl. 1½ foot.

3 W. reniformis (Dougl. mss. ex Benth. scroph. ind. p. 46.) leaves reniform, doubly crenated: tube of corolla straight; segments of the limb roundish: lower one crenated. 4. H. Native of North-west America, on mountains near the river Columbia. Flowers blue. ?

Reniform-leaved Wulfenia. Pl. 1 foot.

Cult. The species of *Wulfènia* are very showy while in blossom, and are well fitted for decorating flower borders. They grow well in any light rich soil, and are readily increased by division and by seeds. A duplicate plant, or two of each kind should be grown in pots, so that they may be placed under shelter with more ease in winter, as they are liable to rot at that season, if they are allowed to remain in the open air.

LXXII. GYMNA'NDRA (from *γυμνος, gymnos*, naked; and *ανηρ ανδρος, aner andros*, a male.) Pall. itin. 3. p. 710. append. no. 60. t. A. f. 1. Willd. in mag. gess. naturf. freund. berol. 390. t. 9-10. Benth. scroph. ind. p. 46.—Lagòtis, Gærtn. nov. comm. petrop. 14. p. 533. t. 18. f. 2. Verónica species, Gmel. Bártsia species, Lin. fil.

Lin. syst. *Diándria, Monogýnia.* Calyx spathaceous, cleft on one side, or bipartite; segments entire, or toothed. Corolla tubular; limb sub-bilabiate; upper lip entire, emarginate, or bifid: lower one 2-4-cleft; segments all flat. Stamens 2, placed at the sides of the upper lip, without any vestiges of lower ones; anthers 2-celled; cells sub-confluent at apex. Stigma truncate, or thickened and capitate. Capsule 2-celled; cells 1-seeded. Seeds oblong, a little curved, ex Cham. et Schlecht, under *G. Gmelìni*.—Erect, glabrous herbs, becoming black on drying. Stems many, simple, rising from the neck. Radical leaves petiolate: cauline ones smaller: the uppermost ones usually scale-formed. Flowers sessile in the axils of the bracteas, disposed in terminal crowded spikes.

1 G. Kunawure'nsis (Royle, mss. ex Benth, scroph. ind. p. 47.) radical leaves ovate, rather deeply toothed, rounded, or narrowed at the base; stamens very short at the base of the upper lip of corolla; style equal in length to the stamens; stigma 2-lobed. 4. H. Native of Kanaour (Kunawur), Royle. The lower lip of the corolla is probably always 4-cleft. Said to be allied to *G. Gmelìni*, Cham. et Schlecht, but the spike is more slender. Corollas blue.

Kanaour Gymnandra. Pl. ½ foot.

2 G. Cashmeria'na (Royle, ill. bot. himal. t. 73. f. 3.) radical leaves oblong, coarsely crenated, and quite entire, narrowed a long way at the base; spike short, ovate; corolla incurved at apex; stamens rather exceeding the superior lip; style shorter than the stamens. 4. H. Native of Cashmere, Royle. Corollas blue. Lower lip of corolla usually bifid.

Cashmere Gymnandra. Pl. ½ foot.

3 G. Gmeli'ni (Cham. et Schlecht, in Linnæa, 2. p. 561.) radical leaves roundish, or elongately-ovate, rather attenuated at the base, bluntish, coarsely and unequally crenated; stamens not above half the length of the superior lip; style shorter than the stamens. 4. H. Native of Kamtschatka, Bhering's Island, Unalaschka, and most of the Aleutian Islands. G. ovàta, Willd. l. c. 5. p. 395. t. 10. f. 8. Willd. herb. no. 262. G. renifórmis, Willd. l. c. p. 396. t. 10. f. 9. Lagòtis glaúca, Gærtn. in nov. comm. petrop. 14. p. 534. t. 18. f. 2. Gymnàndra boreàlis, var. ex Kamtschatka et Insula Beeringii, Pall. itin. 3. p. 712. Verónica, foliis inferioribus ovatis crenatis, superioribus rotundis mucronatis, caule spicâ terminato, Gmel. fl. sib. 3. p. 219. The whole plant glabrous and succulent. Spikes short, dense. Corolla blue; lower lip bifid, or trifid.

Gmelin's Gymnandra. Pl. ¼ to 2 feet.

4 G. Stelle'ri (Cham. et Schlecht, l. c. p. 563.) radical leaves oblong, attenuated at both ends, but most so at the base, acute, unequally and bluntly serrated; stamens almost the length of the upper lip; style longer than the stamens. 4. H. Native of Siberia, between the river Lena and the ocean, Steller; Bay of St. Lawrence, Cham.; and probably in the Island of St. Lawrence. G. mìnor, Willd. l. c. p. 393. t. 9. f. 3. herb. no. 258. G. dentàta, Willd. l. c. p. 394. t. 9. f. 4. herb. no. 260. G. gràcilis, Willd. l. c. p. 394. t. 9. f. 5. G. elongàta, Willd. l. c. Gymnándra boreàlis var. inter Lenam et Oceanum lecta, Pall. itin. 3. p. 712. Plant slender, quite glabrous. Spikes slender. Corolla blue; lower lip 2-3-parted.

Steller's Gymnandra. Pl. ½ to 1 foot.

5 G. Palla'sii (Cham. et Schlecht, l. c. p. 564.) radical leaves roundish, or elongately ovate, acutish, attenuated at the base, quite entire, or obsoletely crenated; stamens not above half the length of the superior lip; style longer than the stamens. 4. H. Native of Davuria, on the tops of the alps; and of arctic Siberia. C. integrifòlia, Willd. l. c. p. 392. t. 9. f. 1. herb. no. 255. G. Altàica, Willd. l. c. p. 395. t. 10. f. 7. herb. no. 257. Gymnándra boreàlis ex arcto et alpibus Davuriæ, Pall. itin. 3. p. 712. t. A. f. 1. Bártsia Gymnándra, Lin. fil. Flowers blue. Lower lip of corolla constantly 2-lobed. All the segments of the corolla are narrow.

Pallas's Gymnandra. Pl. ¼ to 1 foot.

Cult. For culture and propagation see *Wulfènia*, p. 580. Pretty alpine plants.

§ 2. *Stamens 4, didynamous.*

LXXIII. PICRORHI'ZA (from *πικρος, picros*, bitter; and *ῥιζα, rhiza*, a root; in reference to the bitterness of the root.) Royle, ill. bot. himal. t. 71. Benth. scroph. ind. p. 47.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, about equally 5-cleft. Corolla campanulate, shorter than the calyx, about equally 4-cleft; segments quite entire. Stamens 4, inserted at the throat of the corolla, nearly equal, diverging, much exserted; anthers 2-celled: cells confluent at top. Stigma hardly thickened. Valves of capsule septiferous in the middle, bipartite; dissepiment duplicate. Seeds nearly inclosed in an aril-formed vesiculose membrane.

1 P. Kurro'a (Royle, ill. bot. himal. t. 71.)—Native of Gosainsthan and Kamaon, Wall.; Kidarconta, Royle. Verónica Lindleyàna, Wall. cat. no. 404. Herb almost stemless. Radical leaves oblong, narrowed into the petioles at the base, serrately crenated at top, or beset with a few short scattered hairs. Scapes naked, erect. Flowers sessile, densely spicate.

Kurroa Picrorhiza. Pl. ½ foot.

Cult. For culture and propagation see *Wulfènia*, p. 580.

LXXIV. GEOCHO'RDA (from *γη, ge*, the earth; and *χορδη, chorde*, a cord; in reference to the whip-like, creeping stems.) Cham. et Schlecht, in Linnæa, 3. p. 11. Herpéstis species, Spreng.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, equal. Corolla funnel-shaped; limb nearly equal, 4-parted. Stamens 4, nearly equal, a little exserted; anthers oblong, 2-celled; cells opposite, fixed by the middle. Capsule oblong, inclosed in the calyx, which is permanent, 2-celled, with a loculicidal dehiscence; dissepiment from the involute margin of the valves; placenta central, stipitate.—Root rather woody. Stems articulated, terete, prostrate, rooting at the joints. Leaves opposite or 3-4 in a whorl, furnished with young branches in the axils, hence the leaves appear fascicled; from obovate to roundish, cuneated, and tapering into the petioles, lobed; lobes crenated, or irregularly and sometimes doubly crenated, quite entire in the cuneated part. Young stems, nodi, petioles, peduncles, and calyxes covered with long, curled, articulated hairs. Pedicels axillary, twin from the 4-leaved nodi, and shorter than the leaves; the rest very variable in length, usually very short, filiform, terete, 1-flowered. Calyx bractless.

1 G. cunea'ta (Cham. et Schlecht, l. c.) 4. ? ♄. F. Native of the South of Brazil, in the provinces of Rio Grande do

Sul and Montevideo, Sello. Herpéstis glechomoìdes, Spreng. syst. 4. p. 234.

Cuneated-leaved Geochorda. Pl. creeping.

Cult. For culture and propagation see *Wulfènia*, p. 581.

Tribe VI.

BUCHNE'REÆ (this tribe contains plants agreeing with Buchnèra in the characters given below.) D. Don, in edinb. phil. journ. vol. 19. July 1835. Benth. in Hook, comp. 1. p. 356. Calyx tubular, striated, 5-cleft, or 5-toothed. Corolla salver-shaped; limb 5-cleft, or unequally 4-cleft, sometimes bilabiate; segments all flat. Stamens 4, didynamous, ascending, rarely only 2, approximate; anthers usually 1-lobed from the cells being continuous, with a thick, elevated connective. Stigma undivided. Capsule 2-valved; valves entire, or bifid, rarely fleshy and indehiscent; dissepiment simple. Placenta narrow, columnar, adnate, longitudinally, or at length free. Seeds minute, smooth, or scrobiculate; testa membranous. Albumen fleshy. Embryo much shorter than the seeds. —Herbs or sub-shrubs mostly native of the Cape. Leaves opposite, or alternate. Flowers terminal, spicately racemose, white or red.

LXXV. STRI'GA (so named from the strigose habit of some species.) Lour. coch. p. 22. Benth. in Hook, comp. 1. p. 361. Buchnèra species, Lin. and other authors.—Campanulèia, Pet. nov. gen. mad. p. 23.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx short, tubular, with 5-15 elevated ribs, and membranous between the ribs, 5-toothed, or semiquinquefid at apex, rarely 4-toothed by abortion; teeth generally subulately acuminated. Corolla salver-shaped, with a slender tube, which is abruptly incurved in the middle, or above the middle; limb bilabiate, the upper lip usually shorter, entire, emarginate or bifid: lower lip trifid. Stamens didynamous, inclosed. Capsule straight; valves somewhat coriaceous, entire, dehiscing elastically at maturity, septiferous in the middle.—Scabrous, Asiatic, and African herbs, becoming blackish on drying, sometimes parasitical in the manner of *Orobánche*. Lower leaves opposite: superior ones alternate, sometimes scale-formed, usually linear, quite entire, rarely few-toothed: floral ones conform to the others, but becoming gradually smaller as they ascend. Flowers axillary, solitary, sessile, disposed in terminal spikes, generally minutely bibracteate. Corolla white, purplish, or red.

* *Leaves scale-formed.*

1 S. orobanchioìdes (Benth, l. c. p. 361. t. 19.) glabrous, branched; leaves minute, scale-formed: floral ones lanceolate, shorter than the calyx. ♃. S. Native of Senegambia, Endlicher; Abyssinia, Brown; south-east Africa, in the district of Uitenhage, Ecklon; to Delagoa Bay, Forbes; East Indian Peninsula, Wight, and plains as far as Saharumpur, Royle. Buchnèra orobanchioìdes, R. Br. Endl. in bot. zeit. 1832. 2. p. 388. t. 2. Benth. scroph. ind. p. 40. Buchnèra Hydrabadénsis, Roth, nov. pl. 292. Buchnèra gesnerioìdes, Willd. spec. 3. p. 338. Orobánche I'ndica, Spreng. syst. 2. p. 816, but not of Roxb. Plant parasitic. Root tuberous. Scales and bracteas lanceolate. Calyx 4-5-cleft. Corollas white, or pale yellow. Stem none, unless the unbranched portion of the scape may be considered as such; it is covered by scales. The whole plant is covered with short stiff hairs. Flowers sessile, surrounded by 3 bracteas.

Orobanche-like Striga. Pl. ½ foot.

** *Leaves elongated. Calyx with 5 elevated stripes. Corolla incurved towards the apex.*

2 S. humifu'sa (Benth. l. c. p. 362.) prostrate, scabrous; leaves obovate-oblong, obtuse; spikes short, few-flowered; calyx 5-striped; ? tube of corolla glabrous. ♃. G. Native of Arabia, on the mountains of Hadge, Forsk. Browállia humifùsa, Forsk. pl. ægypt. arab. p. 12. Buchnèra humifùsa, Vahl, symb. 3. p. 81. The form of the leaves and procumbent stem, Bentham says, will distinguish this from all other species, notwithstanding he has not been able to ascertain whether the calyx be 5-ribbed or not, from the specimens he has examined being so imperfect.

Trailing Striga. Pl. trailing.

3 S. parviflo'ra (Benth. l. c.) small, very scabrous; leaves linear, quite entire, strict; calyx 5-striped; corolla downy, with an entire upper lip, which is hardly half the length of the lower lip. ♃. G. Native of New Holland, on the east coast, in Keppel Bay. Buchnèra parviflòra, R. Br. prod. p. 294. Plant but little branched. Flowers smaller than those of other species.

Small-flowered Striga. Pl. small.

4 S. á'spera (Benth. l. c.) leaves linear, quite entire, strict, and are, as well as the branches, covered with callous tubercles, and ciliated with rigid spreading hairs; calyx 5-striped; corolla glabrous, with an elongated, slender tube, and an emarginate upper lip, which is about half the length of the lower lip. ♃. S. Native of Guinea. Euphràsia áspera, Willd. spec. 3. p. 197. Buchnèra áspera, Schum. pl. guin. p. 280. This differs from *S. pusílla* in the flowers being twice the size, and in the more regular and greater hispidity of the plant.

Rough Striga. Pl. ½ foot.

5 S. curviflo'ra (Benth. l. c.) very scabrous; leaves long-linear, quite entire, spreading a little; calyx 5-striped; tube of corolla pubescent; upper lip retuse, thrice as short as the lower lip, which is tripartite. ♃. S. Native of New Holland, on the north coast, within the tropic, and of Java, ex Blum. bijdr. 740. Buchnèra curviflòra, R. Br. prod. p. 294. Allied in habit to *S. euphrasioìdes* and *S. coccínea*, and differs from the first by the calyx, and from the last by both calyx and corolla.

Curved-flowered Striga. Pl. ½ to 1 foot.

6 S. multiflo'ra (Benth. l. c. p. 363.) scabrous, much branched; leaves long-linear, spreading; spikes long, loose; calyx 5-ribbed; corolla glabrous; upper lip bifid, a little shorter than the lower one, which is tripartite. ♃. S. Native of New Holland, of the Islands west of Goulbourn's Island, on the north coast, Cunningham. Distinct in the long decumbent habit, and in the form of the flowers, which are the size of those of *S. coccínea*.

Many-flowered Striga. Pl. decumbent.

7 S. densiflo'ra (Benth. l. c.) humble, rather glabrous, very scabrous; leaves lanceolate-linear, somewhat squarrose; flowers dense, approximate; calyx ovate, 5-striped; corollas glabrous; upper lip emarginate, 2 or 3 times shorter than the lower lip. ♃. S. Native of the Indian Peninsula, Heyne; and the plains of India as far as Saharampur, Royle. Buchnèra Asiática, Vahl, symb. 3. p. 81.? Lin. spec. 879. part. Buchnèra densiflòra, Benth. scroph. ind. p. 41. Plant small, rigid, but little branched, in some respects resembling *S. Thunbérgii*. Flowers smaller; the lobes of the limb shorter and broader. It also differs from that species in the remarkably spreading, often recurved leaves.

Dense-flowered Striga. Pl. ¼ to ½ foot.

8 S. Thunbe'rgii (Benth. l. c.) hispid, scabrous, strict, nearly simple; leaves lanceolate-linear, erect: floral ones lanceolate, adpressed, the middle nerve beneath, and margins ciliately hispid; spike dense; calyx 5-striped; tube of corolla downy, recurved and inflated at top; lips of limb nearly equal: lobes oblong. ♃. G. Native of the Cape of Good Hope, in the district of Uitenhage, and in Caffreland, and Tambukiland, Eck-

lon, and Drege, &c. Guinea, in the valley of Friderikoberg, Thonning. Buchnèra Asiática, Lin. spec. p. 879. partly. Buchnèra bilabiàta, Thunb. fl. cap. p. 465. Buchnèra linearifòlia, Schum. pl. guin. 279.? Easily distinguished from the other species by the imbricate floral leaves, and the remarkably dilated apex of the tube of the corolla. Flowers from 6 to 8 lines long. Plant taller and more erect than *S. densiflòra*. Corollas red.

Var. β, grandiflòra (Benth. l. c.) flowers larger. ♃. G. Native of Caffreland, Drege and Ecklon.

Thunberg's Striga. Pl. ½ to 1 foot.

* * * *Leaves elongated. Calyx* 10-15*-striped. Corolla incurved towards the top.*

9 S. E'LEGANS (Benth. l. c.) hairy, very scabrous, strict, nearly simple; leaves lanceolate-linear, erect, rather adpressed, hispid: floral ones similar, about equal in length to the calyxes; calyx 10-striped; tube of corolla downy; lobes of limb oblong; upper lip bifid, a little shorter than the lower one. ♃. G. Native of the Cape of Good Hope; in Caffreland, Drege. Stature and habit almost of *S. Thunbérgii, β*, but less rigid; the flowers rather larger, and like *S. lùtea*. The whole plant is very hairy, and scarcely turns black on drying.

Elegant Striga. Pl. ½ to 1 foot.

10 S. LU'TEA (Lour. coch. p. 22.? Benth. l. c.) hairy, very scabrous; leaves long-linear, spreading: lower ones lanceolate; spikes elongated; calyx 10-15-striped; corolla glabrous: lobes of the limb obovate: upper lip emarginate, about half the length of the lower lip. ♃. G. Native of the Indian Peninsula, Wight; Bengal, Wall.; Saharampur, Royle; Macao, ex herb. Banks; Canton, Lour. Buchnèra hirsùta, Wall. Benth. scroph. ind. p. 41. Buchnèra Asiática, Lin. spec. 879. partly. Habit loose and branchy, or when young more stiff and simple, seldom turning black on drying. Corolla yellow.

Yellow-flowered Striga. Pl. ½ to 1 foot.

11 S. PHŒNÍCEA (Benth. l. c.) humble, villous, very scabrous; leaves lanceolate, obtuse, spreading; spikes dense; calyx 10-striped; corolla glabrous: lobes of the limb obovate: upper lip emarginate, about half the length of the lower lip. ♃. S. Native of the Indian Peninsula. Buchnèra phœnícea, Wall. ex Benth. scroph. ind. p. 41. Very nearly allied to *S. lùtea*, but the flowers are said to be red.

Red-flowered Striga. Pl. ½ to 1 foot.

12 S. COCCI'NEA (Benth. l. c. p. 364.) smoothish, scabrous; leaves long-linear; calyx oblong, 10-striped; spikes loose; corolla glabrous: lobes of the limb obovate: upper lip emarginate, about half the length of the lower lip. ♃. S. Native of Tropical Africa, and Southern Asia; Sierra Leone; Caffreland; near Port Natal and Omcomas, Drege; Mosambique, Forbes; Mauritius, Telfair; Indian Peninsula, Heyne; Macao, herb Banks. Campulèia coccínea, Hook, exot. fl. 3. t. 203. Buchnèra coccínea, Benth. scoph. ind. p. 40. Corollas scarlet. Habit of *S. lùtea*, but much more glabrous, and usually dries black. This is supposed by Hooker to be the one described by Petit Thours as parasitical; but Bentham says it has less that appearance than *S. lùtea* or *S. Thunbérgii*, which latter has also red flowers.

Scarlet-flowered Striga. Pl. ½ to 1 foot.

13 S. GLABRA'TA (Benth. l. c.) nearly glabrous, scabrous; leaves long-linear; calyx oblong, 10-15-striped; spike slender; corolla glabrous: lobes of limb oblong: upper lip emarginate, about half the length of the lower one. ♃. S. Native of the East Indies, Nipaul, and mountains of Ava, Wall.; also in the Peninsula, Wall. Buchnèra Asiática, Benth. scroph. ind. 40. Lin. spec. 879, partly. This species evidently comes near the following, but is distinguished by the glabrous corolla. The flowers are said to be bluish.

Glabrous Striga. Pl. ½ to 1 foot.

14 S. EUPHRASIOI'DES (Benth. l. c.) smoothish, scabrous; leaves long-linear, quite entire, and few-toothed; calyx oblong, somewhat 15-striped; tube of corolla downy. ♃. G. Native of the East Indies, from the Peninsula to the mountains of the north; and of Java, ex Blum. bijdr. p. 740. Buchnèra euphrasioìdes, Vahl, symb. 3. p. 81. Buchnèra angustifòlia, D. Don, prod. fl. nep. p. 91. Buchnèra Asiática, Lin. spec. 879, partly. Distinguished from all other species of the present section by the pubescent corolla, and long striated calyx.

Euphrasia-like Striga. Pl. ½ to 1 foot.

15 S. MASU'RIA (Benth. l. c.) tall, very scabrous; leaves quite entire, linear, adpressed, strict; calyx somewhat 15-striped, elongated; tube of corolla elongated, finely downy; limb ample. ♃. S. Native of the East Indies, on the mountains of Morang, Hamilt. Prome, Wall. Buchnèra Masùria, Hamilt. ex Benth. scroph. ind. p. 41. Flowers twice the size of those of *S. euphrasioìdes*.

Masuria Striga. Pl. 1 to 2 feet.

16 S. FORBE'SII (Benth. l. c.) tall, very scabrous, downy; leaves linear-lanceolate, toothed; calyx deeply cleft, 10-striped, with linear, foliaceous segments; tube of corolla elongated, clothed with fine down, incurved towards the apex. ♃. S. Native of Madagascar and Mosambique, Forbes. Nearly allied to the preceding, but less rigid, and leaves broader; calyx 7-8 lines long; but the corolla is about the same size; and in the var. β. nearly as large as in *Rhamphicárpa tubiflòra*.

Var. β, grandiflòra (Benth. l. c.) flowers larger.

Forbes's Striga. Pl. 1 to 2 feet.

* * * * *Corolla abruptly incurved at the middle.*

17 S. HERMÓNTHICA (Benth. l. c. p. 365.) rather pilose, scabrous: leaves linear: floral ones lanceolate, ciliated; calyx 5-striped; tube of corolla smoothish, incurved at the middle: limb ample. ♃. G. Native of Western Africa; Upper Egypt, near Silsileh, Jordan; Mosambique, Forbes. Buchnèra hermónthica, Delile, fl. ægypt. t. 25. f. 1. A handsome species, a foot high, with a long spike of large red flowers.

Hermonthic Striga. Pl. 1 foot.

Cult. For culture and propagation see *Buchnèra*, p. 585.

LXXVI. BUCHNE'RA (in honour of Jean Godefroy Buchner, who in 1743 gave observations of many plants of Voigtland, in Saxony.) Lin. gen. no. 772. Schreb. gen. no. 1035. Juss. gen. p. 100. ed. Usteri, p. 112. Gærtn. fruct. t. 55. Benth. in Hook. comp. 1. p. 364. Perípea, Aubl. guian. 2. p. 628. t. 253.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx short, tubular, obscurely 10-nerved, with 5 short teeth at apex. Corolla salver-shaped; with a slender exserted tube, which is straight or a little incurved; limb spreading, nearly equal, 5-cleft; segments oblong or obovate. Stamens didynamous, inclosed. Capsule straight, with rather coriaceous, entire valves, which dehisce elastically at maturity, septiferous in the middle.—African, Asiatic, or American herbs, usually scabrous, becoming black on drying. Lower leaves opposite: upper ones alternate: lower ones the broadest: upper ones narrower, remote, and, for the most part, quite entire: floral ones bractea-formed, usually shorter than the calyx. Flowers solitary, sessile, bibracteate, disposed in a terminal spike.

* *Spikes loose or dense, but not imbricated.* With the exception of the *B. júncea*, distinguished by its peculiar habit; *B. hìspida* by its long hairs; and *B. macrántha* by its flowers; the other

species contained in this section are all so much alike, and run into each other by such minute or vague characters, that Mr. Bentham would have been disposed to consider them as only varieties of each other, had he been better acquainted with the American species, or had he been possessed of more numerous specimens.

1 B. ju'ncea (Cham. et Schlecht, in Linnæa, 2. p. 590.) stem simple, rushy, clothed with 4 rows of adpressed leaves; panicle short, contracted, terminal. ♃. S. Native of tropical Brazil. Leaves inflexed at apex, with scabrous margins.

Rushy Buchnera. Pl. 2 to 3 feet.

2 B. palu'stris (Spreng. syst. 2. p. 805.) scabrous, nearly glabrous; stem slender, a little branched; leaves narrow-linear, quite entire, or the lower ones are small and obovate; spike loose, few-flowered, with lanceolate-linear bracteas; tube of corolla about twice as long as the calyx; fructiferous calyx erect. ♃. S. Native of Guiana. Perípea palústris, Aubl. guian. 2. p. 628. t. 258. Flowers purplish.

Marsh Buchnera. Pl. 1 foot.

3 B. elonga'ta (Swartz, fl. ind. occ. 2. p. 1061.) scabrous from strigæ; stem nearly simple, leafy at base; leaves oblong, quite entire: superior ones linear; spike loose, few-flowered; tube of corolla about twice the length of the calyx; fructiferous calyx erect. ♃. S. Native of America, from Carolina on the north, to Rio Grande do Sul on the south; and the West India Islands.—Plum. icon. 19. t. 17. Erìnus Americànus, Mill. dict.? Corolla violaceous, or purplish blue.

Elongated Buchnera. Pl. 1 to 2 feet.

4 B. tene'lla (R. Br. prod. 437.) scabrous, rather glabrous; stem slender, a little branched; leaves narrow-linear, quite entire; spikes rather loose; bracteas ovate-lanceolate, ciliated; corolla small, with a slender tube, which is about twice as long as the calyx; fructiferous calyx hardly incurved. ♃. S. Native of New Holland, on the north coast. Calyx glabrous or downy.

Slender Buchnera. Pl.

5 B. linea'ris (R. Br. prod. 437.) scabrous; leaves oblong: superior ones linear, obtuse, quite entire; spike loose; lower bracteas linear: superior ones ovate-lanceolate; calyx downy, hardly incurved; tube of corolla a little exserted. ♃. S. Native of New Holland, within the tropic, Carpentaria.

Linear-leaved Buchnera. Pl.

6 B. pube'scens (Benth. in Hook. comp. 1. p. 365.) scabrous; lower leaves oblong: superior ones linear, all quite entire, obtuse; spikes many-flowered; bracteas ovate-lanceolate, subciliated; calyxes downy, a little incurved: fructiferous ones with an oblique mouth; tube of corolla a little exserted. ♃. G. Native of New Holland, in marshy lands on the Endeavour River, north coast, Cunningham.

Downy Buchnera. Pl.

7 B. ramosi'ssima (R. Br. prod. 438.) scabrous, much branched; rameal leaves quite entire, linear-lanceolate; spikes elongated, many-flowered; bracteas ovate-lanceolate, subciliated; tube of corolla more than one half longer than the calyx, which is incurved in the floriferous state, pilosely hispid at top, straightish in the fructiferous state. ♃. S. Native of New Holland, on the east and north coast, within the tropic.

Much-branched Buchnera. Pl.

8 B. du'ra (Benth. l. c. p. 366.) glabrous, or a little hispid at the base; stem a little branched; lower leaves obovate: superior ones oblong, quite entire: upper ones linear; spike dense at apex, many-flowered; bracteas ovate-lanceolate, subciliated; tube of corolla exserted; capsule equal in height to the calyx, which is straight in the fructiferous state. ♃. G. Native of the Cape of Good Hope, as in Uitenhage and Caffreland, Ecklon and Drège.

Hard Buchnera. Pl.

9 B. glabra'ta (Benth. l. c.) glabrous, or hardly hispid at the base; stems erect, nearly simple; lower leaves broad: superior ones linear or oblong; spikes dense, short; bracteas ovate-lanceolate; tube of corolla exserted; capsule one half longer than the straight calyx. ♃. G. Native of the Cape of Good Hope, near Rondebosch, Ecklon; Katberg, Drège.

Glabrous Buchnera. Pl. ½ to 1 foot.

10 B. gra'cilis (R. Br. prod. 437.) stem simple, glabrous; lower leaves obovate: superior ones oblong, all obtuse and entire; spike loose; bracteas ciliated, one half shorter than the calyx; top of capsule exserted. ♃. G. Native of New South Wales, near Port Jackson.

Slender Buchnera. Pl.

11 B. aspera'ta (R. Br. prod. p. 438.) very scabrous; lower leaves lanceolate-oblong, few-toothed: superior ones linear-lanceolate, quite entire; bracteas lanceolate-ovate, one half shorter than the calyx; fructiferous calyx oblique at top; capsule inclosed. ♃. S. Native of New Holland, on the north coast, within the tropic.

Var. β, angustifòlia (Benth. l. c.) leaves narrower. ♃.? S. Native of Goulburn Island, Cunningham.

Var. γ, tomentòsa; plant rather tomentose; lower leaves oblong, obtuse, coarsely toothed: superior ones linear, obtuse, quite entire; stem much branched.—Native of Java, in grassy inundated places. Buchnèra tomentòsa, Blum. bijdr. p. 740.

Rough Buchnera. Pl. 1 to 2 feet.

12 B. urticæfòlia (R. Br. prod. 437.) scabrous, smoothish or pubescent; lower leaves approximate, oblong, obtuse, toothed, as well as the middle ones, which are lanceolate and distant; spike loose; bracteas lanceolate, ciliated, one half shorter than the calyx; tube of corolla about twice as long as the calyx; top of capsule exserted. ♃. S. Native of New Holland, on the east coast, about Port Curtis, within the tropic.

Nettle-leaved Buchnera. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 feet.

13 B. hi'spida (Hamilt. ex D. Don, prod. fl. nep. p. 91.) hispid from long hairs, nearly simple, leafy at the base; leaves oblong, toothed a little: superior ones linear; spike lax, many-flowered; tube of corolla hardly exserted. ⊙. S. Native of Gambia, ex herb. Hook.; mountains of the East Indies, Wall., Royle, &c.

Hispid Buchnera. Fl. July, Oct. Clt. 1818. Pl. 1 foot.

14 B. America'na (Lin. spec. 879.) pilosely hispid, very scabrous, or at length glabrous; stem nearly simple, leafy at the base; leaves oblong or lanceolate, a little toothed: superior ones linear; spike rather loose; tube of corolla about twice the length of the calyx; fructiferous calyx straight. ⊙. G. Native of North America; Southern States, to St. Louis, Drummond; Mexico and Panama. Plant very variable.

American Buchnera. Fl. June, Aug. Clt. 1733. Pl. 1 foot.

15 B. macra'ntha (Benth. l. c. p. 366.) pubescently scabrous; leaves lanceolate, subdentate, remote; spike rather loose; tube of corolla hairy, 5 times longer than the calyx. ⊙. S. Native of Sierra Leone. Habit of *B. Americàna*. Calyx covered with clammy hairs. Corolla about an inch long; lobes of the limb large and broad.

Long-flowered Buchnera. Pl. 1 to 1½ foot.

16 B. pusi'lla (H. B. et Kunth, nov. gen. amer. 2. p. 340.) hispidly scabrous; stem nearly simple, and nearly terete; leaves nearly opposite: lower ones obovate-oblong: superior ones linear, quite entire, 1-nerved; spike solitary, calyx shorter than the tube of the corolla, but exceeding the capsule. ⊙. H. Native of New Granada. Flowers subdistich.

Least Buchnera. Pl. 1 to 4 inches.

17 B. argu'ta (Juss. in nov. ann. du. mus. 3. p. 374.) hispidly scabrous; stem branched, terete; radical leaves lanceolate-oblong, obtuse, subrepand: rameal ones linear, entire, sessile, obtuse, alternate and nearly opposite; spikes solitary, terminal; bracteas ovate, acute, one half shorter than the cylindrical arched calyx. ⊙. H. Native of the island of Timor. Corolla glabrous, bluish-purple. Said to be nearly allied to *B. tomentòsa*, Blume.

Sharp Buchnera. Pl. 2 to 3 feet.?

18 B. di'sticha (H. B. et Kunth, l. c.) hispidly scabrous; stem branched, subtetragonal; leaves nearly opposite, linear, quite entire, 1-nerved; spike solitary, distich; calyx equalling the tube of the corolla. ⊙. S. Native near Santa Fe de Bogota. Corollas blue.

Distich-flowered Buchnera. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

19 B. longifòlia (H. B. et Kunth, l. c. p. 340.) smoothish; stem branched, terete, rather scabrous; lower leaves opposite, narrow-linear, elongated, quite entire, 3-nerved, rough from callosities; spike solitary; calyx shorter than the tube of the corolla. ⊙. S. Native along with the preceding. Corolla blue. Leaves 4-5 inches long.

Long-leaved Buchnera. Pl. 2 to 3 feet.

20 B. lithospermifòlia (H. B. et Kunth, l. c. p. 341.) hispidly scabrous; stem simple, nearly terete, somewhat trigonal at top; lower leaves nearly opposite, linear, almost quite entire, 3-nerved; spike solitary; calyx 3 times shorter than the corolla, and about equal in length to the capsule. ⊙. S. Native on the dry banks of the river Magdalena, near Melgar and Picala; also on the plains of Santa Fe de Bogota. Corolla blue or violaceous.

Lithospermum-leaved Buchnera. Pl. $1\frac{1}{2}$ foot.

21 B. ternifòlia (H. B. et Kunth, l. c. p. 341.) hispidly scabrous; stem simple, trigonal; lower leaves 3 in a whorl, lanceolate, linear, remotely serrated towards the apex, 3-nerved; spike solitary; tube of corolla exceeding the calyx a little. ⊙. S. Native along with the preceding. Corolla violaceous.

Tern-leaved Buchnera. Pl. $1\frac{1}{2}$ foot.

22 B. virga'ta (H. B. et Kunth, l. c. p. 342.) hispidly scabrous; stem branched at the base; branches twiggy, somewhat tetragonal; leaves opposite, lanceolate-linear, quite entire, 3-nerved; spikes panicled; calyx one half shorter than the tube of the corolla, but about twice as long as the capsule. ♃.? ⊙.? S. Native of New Andalusia, on the mountains of Cocollar and Tumeriquiri, at the altitude of 540 hexapods. Corolla blue.

Twiggy Buchnera. Pl. 1 to $1\frac{1}{2}$ foot.

23 B. ròsea (H. B. et Kunth, l. c.) hispidly scabrous; stems somewhat tufted, simple, nearly terete; lower leaves opposite, lanceolate, bluntish, a little toothed at top, 3-nerved; spikes numerous, crowded. ♃. S. Native of temperate places near Caraccas, at the altitude of 430 hexapods. Corolla rose-coloured.

Rose-coloured-flowered Buchnera. Pl. $1\frac{1}{2}$ to 2 feet.

24 B. macroca'rpa (H. B. et Kunth, l. c.) hispidly scabrous; stem simple, nearly terete; lower leaves opposite, lanceolate, acute, narrowed at the base, remotely toothed towards the apex; spike solitary; calyx shorter than the tube of the corolla and capsule. ♃. S. Native of New Andalusia. Leaves 3-nerved. Corolla blue.

Long-fruited Buchnera. Pl. 2 feet.

25 B. amethy'stina (Cham. et Schlecht, in Linnæa, 2. p. 588.) hispidly scabrous; stem simple, leafy at bottom; spike loose, few-flowered; outer bractea ovate, acute; teeth of calyx short, nearly equal. ♃. S. Native of tropical Brazil, Sello. Bracteas equal, acute: lateral ones lanceolate. Stem nearly naked at top, but leafy at bottom. Corollas blue.

Amethyst-flowered Buchnera. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

26 B. lobelioi'des (Cham. et Schlecht, l. c. p. 589.) hispidly scabrous; stem simple, leafy at bottom; spike loose, many-flowered; outer bractea lanceolate, very acute; teeth of calyx unequal: the two front ones the largest. ♃. H. Native of tropical Brazil, Sello. Upper part of stem naked. Leaves in some specimens toothed, and in others quite entire.

Lobelia-like Buchnera. Pl. $\frac{3}{4}$ to $1\frac{1}{2}$ foot.

27 B. lavandula'cea (Cham. et Schlecht, l. c.) stem simple, leafy at bottom; leaves quite entire, somewhat plicately nerved; spike dense-flowered. ♃. H. Native of tropical Brazil, Sello.

Lavender-leaved Buchnera. Pl. 1 to 3 feet.

* * *Spike dense, imbricate, tetragonal.*

28 B. stri'cta (Benth. in Hook. comp. p. 367.) smoothish; leaves linear, erect, strict; spike tetragonal, imbricated, nearly glabrous; bracteas ovate-lanceolate, acute, naked, about equal in length to the calyx. ♃. G. Native of China, Lord Mulgrave, in herb. Banks. This species has not the large lower leaves of the 3 following; the stem is simple, ex Benth.

Strict Buchnera. Pl. $\frac{3}{4}$ foot.

29 B. crucia'ta (Hamilt. ex D. Don, prod. fl. nep. p. 91.) downy; radical leaves obovate: lower cauline ones oblong: superior cauline ones linear; spike tetragonal, imbricated, downy; bracteas ovate, ciliated, shorter than the calyx. ♃. G. Native of the mountains of Nipaul and Prome, Wall. Stem and leaves of *B. hispida*. Calyx nearly cylindrical. Spike about an inch long. Radical leaves toothed: cauline ones entire.

Cruciate Buchnera. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

30 B. tetra'sticha (Wall. ex Benth. scroph. ind. p. 41.) pubescent or smoothish, tall; leaves oblong or lanceolate, obtuse, quite entire; spike tetragonal, imbricated; bracteas broad-ovate, about equal in length to the calyx. ♃. S. Native of Burma, at Moalmyne, on the banks of the Salian, Wall. Calyx much depressed. Leaves numerous. Spikes 2 inches long.

Four-rowed-spiked Buchnera. Pl. 2 feet.

31 B. tetragòna (R. Br. prod. p. 437.) glabrous, tall; leaves oblong or lanceolate, few-toothed; spike tetragonal, imbricate, glabrous; bracteas broad-ovate, exceeding the calyx. ♃. G. Native of New Holland, on the north coast, within the tropic, R. Br.; Goulburn Island, Cunningh. This differs from *B. tetrásticha* besides its smoothness, in the spike being much less densely imbricate, and the leaves more distant on the stem, ex Benth.

Tetragonal-spiked Buchnera. Pl. 1 to 2 feet.

Cult. All the species grow freely in any light rich soil, and are readily increased by cuttings and seeds.

LXXVII. RHAMPHICA'RPA (from ῥαμφος, *rhamphos*, a beak; and καρπος, *carpos*, a fruit; in reference to the mucronate or beaked capsule.) Benth. in Hook. comp. 1. p. 368. Buchnèra species, Wall.—Gerárdia species, Lin. suppl. 279.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-cleft. Corolla with a long, exserted, slender tube; limb spreading, 5-parted; segments obovate, nearly equal. Stamens didynamous, inclosed. Capsule obliquely mucronate or beaked; valves coriaceous, entire.—Erect, branched, glabrous herbs, becoming black on drying. Lower leaves opposite: superior ones alternate, narrow, entire, or pinnate. Flowers on short pedicels, racemose, usually bractless.

1 R. longiflòra (Benth. l. c.) leaves pinnate, narrow, linear; tube of corolla straight, much longer than the limb; beak of capsule a little recurved. ⊙. S. Native of Senegal, in the Isle of St. Louis; Indian Peninsula, Jacquemont. Buchnèra longiflòra, Wight, mss. A small, erect, branching annual.

Segments of leaves few and distant. Peduncles usually shorter than the calyx, and naked, sometimes longer, with a pair of bracteas. Corolla white, drying bluish; tube 1½ inch long; lobes of limb short, broad, truncate or emarginate.

Long-flowered Rhamphicarpa. Pl. ½ foot?

2 R. tubulòsa (Benth. l. c.) leaves lanceolate-linear, entire; limb of corolla a little shorter than the tube, which is a little incurved; capsule truncate, with a short beak. ⊙.? G. Native of the Cape of Good Hope, in the eastern portion of the Uitenhage district, Ecklon, Drège, &c. Plant glabrous, erect, a little branched. Peduncles rather longer than the calyx. Corolla white, drying bluish; tube an inch long, slightly curved about the middle; lobes of limb obovate, entire, ex Benth.

Tubular-flowered Rhamphicarpa. Pl. 1 foot.

3 R. curviflòra (Benth. l. c.) leaves lanceolate-linear, entire; limb of corolla rather shorter than the tube, which is incurved; capsule acinaciform. ⊙.? S. Native of Madagascar and Mosambique, Forbes. Habit of *R. tubulòsa*. Leaves narrower. Divisions of the calyx longer; tube of corolla more curved, with a larger limb. Capsule very oblique.

Curved-flowered Rhamphicarpa. Pl. 1 foot.?

Cult. For culture and propagation see *Polycarèna*, p. 588.

LXXVIII. CY'CNIUM (probably from κυκνος, *cycnos*, a swan; but the application is not evident.) E. Meyer, mss. ex Benth. in Hook. comp. 1. p. 368.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx bibracteate at the base, long-tubular, 5-cleft at apex. Corolla with a cylindrical, straight tube, and a deeply 5-cleft spreading limb; segments ovate, entire. Stamens didynamous, inclosed. Capsule fleshy, indehiscent.?—Rigid scabrous herbs, natives of South Africa, becoming blackish on drying. Leaves opposite, or the superior ones are alternate, coarsely toothed. Flowers axillary, or racemose.

1 C. Addone'nse (E. Meyer, mss. ex Benth. l. c.) stem procumbent; leaves ovate, or oblong; flowers sessile, axillary; tube of corolla more than twice as long as the calyx. ⊙.? G. Native of the Cape of Good Hope, in the Addo country, in the Uitenhage district, Drège and Ecklon. The whole plant covered with stiff short hairs. Leaves sessile, cuneated at the base. Calyx more than an inch long, opening at the base as the capsule swells; divisions foliaceous. Corolla white, tube 2½ inches long; limb flat, 1½ inch in diameter. Capsule oval, half an inch long, ex Bentham.

Addo Cycnium. Pl. 1 foot. *?*

2 C. racemòsum (Benth. l. c.) stem erect; leaves lanceolate; flowers pedicellate, racemose; tube of corolla hardly equal in length to the calyx. ⊙.? G. Native of the Cape of Good Hope, near Siloh, on the Klipplaat river, on the eastern side of the Witsenberg, in Tambukiland. Habit resembling *Melásma scàbra*, or *Rhamphicárpa tubulòsa*. Stem nearly simple, scabrous. Leaves 1½ to 2 inches long, with a few teeth, contracted at the base, nearly all alternate. Pedicels short. Bracteas linear. Tube of calyx 9-10 inches long, striated; lobes lanceolate-subulate. Limb of corolla 1½ inch in diameter, ex Benth.

Racemose-flowered Cycnium. Pl. 1 foot.

Cult. For culture and propagation see *Polycarèna*, p. 588.

LXXIX. NYCTERI'NIA (from νυκτερινος, *nycterinos*, of, or belonging to the night; the flowers expand, and are very fragrant in the evening.) D. Don, in Sweet, fl. gard. n. s. vol. 3. t. 239. Benth. in Hook, comp. 1. p. 369.—Erìnus species of Lin. and other authors.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx ovate-tubular, shortly 5-toothed, bilabiate, or bipartite. Corolla permanent; tube elongated, at length cleft at the base; throat equal, often hispid; limb spreading, almost equally 5-parted; segments bifid, or entire. Stamens didynamous: superior ones inclosed in the tube, with oblong, erect anthers: lower ones inserted at the throat, with smaller, transverse, usually sterile anthers,which are sometimes altogether abortive. Capsule coriaceous, or membranous; valves bifid at apex.—Herbs or under shrubs natives of South Africa, more or less clammy, and often becoming blackish on drying. Lower leaves opposite: superior ones alternate, usually few-toothed: floral ones often smaller, entire, adpressed to the calyx, or sometimes adnate to it. Flowers sessile, interruptedly or densely spicate.

§ 1. *Segments of corolla bifid; tube clothed with fine down. Leaves oblong, linear, or lanceolate.*

1 N. coria'cea (Benth. l. c.) suffruticose; floral leaves broad-lanceolate, obtuse, toothed, thick, coriaceous, villous, about twice as long as the calyx, which is coriaceous and villous; spike elongated. ♄. G. Native on mountains about Cape Town. In habit it comes near to *N. divaricàta*, but is much larger and more rigid, and has the flowers of *N. spathàcea*. Capsule larger than in any other species, and almost woody.

Coriaceous-calyxed Nycterinia. Shrub ½ to 1 foot.

2 N. spatha'cea (Benth. l. c.) suffruticose, erect; leaves obovate, or oblong-spatulate: lower ones 3-nerved: floral ones stem-clasping, broad-lanceolate, or oblong, obtuse, almost quite entire, 1-nerved, all coriaceous, pubescent on the margins and nerves, the rest glabrous; spike elongated; calyx elongated, a little shorter than the floral leaves. ♄. G. Native of the Cape of Good Hope, in Tambukiland, near Siloh, east of the Winterberg, and on the Katriviersberg, Ecklon. At the top of the Witberg, Drège. Floral leaves spathe-formed, near an inch long, apparently coloured. Spike much lengthened after florescence. Tube of corolla 1½ inch long.

Spathaceous-leaved Nycterinia. Shrub 1 foot.

3 N. marí'tima (Benth. l. c.) suffruticose, erect, nearly glabrous; leaves lanceolate, or oblong, obtuse, almost quite entire: floral ones broad-lanceolate, exceeding the calyxes a little, all rather coriaceous, glabrous; spike elongated, dense, many-flowered. ♄. G. Native of the Cape of Good Hope, in the Uitenhage district; and on the sea-coast near the Zeekoe river, Thunberg; near Kachu, Drège. Erìnus marítimus, Lin. suppl. 287. syst. 571. Thunb. fl. cap. 474. Flowers colour of those of *N. lychnídea*. This species comes near *N. spathàcea*, but is taller. Perhaps a variety of *N. lychnídea*.

Sea-side Nycterinia. Shrub ½ to 1 foot.

4 N. lychni'dea (D. Don, in Sweet, fl. gard. n. s. vol. 3. t. 239.) suffruticose: branches clothed with adpressed villi; leaves oblong-linear, few-toothed, and quite entire, 1-nerved, smoothish: floral ones stem-clasping, broad-lanceolate, or oblong, obtuse, few-toothed, and quite entire, having the margins and nerves ciliated; spike elongated; calyxes shorter than the floral leaves. ♄. G. Native of the Cape of Good Hope, probably along the sea-coast; in the Amaponda country, between the river Uintenda and Umzimcoolu, Drège. Erìnus lychnídeus, Lin. suppl. 287. Ker. bot. reg. 748. Sims, bot. mag. 2504. Leaves more or less fleshy, the larger ones always toothed. Corolla yellowish, white inside, but purplish outside.

Lychnidea Nycterinia. Fl. May, July. Clt. 1776. Shrub ½ to 1 foot.

5 N. Cape'nsis (Benth. l. c. p. 370.) herbaceous, hard; stem erect, adpressedly villous; lower leaves lanceolate: superior ones or all linear, few-toothed, or quite entire, 1-nerved; margins and nerves usually ciliated: floral leaves oblong-lanceolate, quite entire, hardly exceeding the calyxes; spikes oblong. ⊙.? G. Native of the Cape of Good Hope, on hills from the Cape to Fort Beaufort, in the neutral territory, Ecklon and Drège,

&c.; also northward, in Namaqualand and New Hantam, Drège. Erìnus Capénsis, Lin. mant. 252. Erìnus Æthiòpicus, Thunb. fl. cap. 473. This is apparently a very common species, distinguished from *N. lychnídea* by its herbaceous, probably annual root, upright stems, and smaller leaves. Spikes usually short, and few-flowered, occasionally the central one acquires a considerable length. Corolla slender, hardly an inch and a quarter long, ex Benth.

Var. α, *hirsùta* (Benth. l. c.) branches more villous; leaves hairy on both surfaces. ⊙. ? G.

Var. β, *glabrúscula* (Benth. l. c.) leaves smoothish. ⊙. ? H.

Var. γ, *foliòsa* (Benth. l. c.) leaves smaller, more numerous; spike few-flowered.

Var. δ, *tenuifòlia* (Benth. l. c.) leaves narrow-linear, and more glabrous.

Cape Nycterinia. Pl. ½ to 1 foot.

6 N. longiflòra (Benth. l. c.) herbaceous; stem adpressedly pilose; leaves linear, pinnatifidly toothed: floral ones lanceolate, toothed, clothed with rather clammy down; spike short. ♃. ? G. Native of the Cape of Good Hope, in Kamiesbergen, in the north Clanwilliam district, Drège. This differs from *N. Capénsis* by its deeply toothed leaves, and from *N. dentàta* by their narrowness, from both by the corolla being 18-20 lines long.

Long-flowered Nycterinia. Pl. ½ to 1 foot.

7 N. dentàta (Benth. l. c.) herbaceous, erect; stem adpressedly pilose; leaves oblong-lanceolate, or elliptic, narrowed at the base, coarsely toothed, or half pinnatifid, clothed with clammy pubescence, as well as the floral ones, which are broad-lanceolate; spike short, dense. ♃. ? G. Native on the mountains near Cape Town and Paarl, Ecklon and Drège, &c. Habit of *N. Capènsis*, but is distinguished from it by its broad, deeply toothed leaves, often narrowed into the petioles at the base.

Var. β, *hùmilis* (Benth. l. c.) plant more humble. ♃. ? G. Native on the Zwarteberg, Ecklon; and Nieuweveld mountains, Drège.

Toothed-leaved Nycterinia. Pl. ½ to 1 foot. ?

8 N. ovàta (Benth. l. c.) suffruticose, ? divaricate, or procumbent, clothed with clammy villi; leaves ovate, coarsely toothed, villous on both surfaces, as well as the floral ones, which are oblong; spike short. ♄. G. Native of Caffreland, at Witbergen. Leaves very blunt, narrowed at the base. Spike apparently interrupted. Corolla 1½ inch long.

Ovate-leaved Nycterinia. Shrub procumbent.

9 N. pùmila (Benth. l. c.) humble, much branched; leaves oblong-linear, deeply and remotely toothed: floral ones similar, twice or thrice longer than the corolla, somewhat dilated at the base; flowers axillary, hardly spicate; tube of corolla hardly downy; capsules ovate, coriaceous.—Native of the Cape of Good Hope, in the Nieuweveld or Kowp, Drège. A remarkable species, with somewhat the appearance of *Castillèja fissifòlia*, scarcely 3 inches high, ex Benth.

Dwarf Nycterinia. Shrub ¼ foot.

§ 2. *Segments of corolla bifid; tube glabrous. Leaves spatulate.*

10 N. selaginoìdes (Benth. l. c.) humble, branched at the base; leaves spatulate: floral ones dilated at the base; throat of corolla crowned by rigid hairs; lower stamens abortive. ⊙. G. Native of the Cape of Good Hope, on the sandy plains on the west coast from the Cape flats northward, Ecklon. Erìnus selaginoìdes, Thunb. fl. cap. p. 475. Erìnus Africànus, Herb. un. itin. p. 301, but not of Lin. A low annual, generally 3-5 inches high, usually covered with spreading, clammy hairs, and dries less black than the species of the first section. Lower leaves obovate: upper ones oblong, or linear-spatulate, entire, or with a very few teeth: floral ones adhering at the base to the calyx, spreading at top. Flowers rather distinct, especially at the base of the spike. Calyx and capsules membranous. Corolla 9-11 lines long, ex Benth.

Var. α, *villòsa* (Benth. l. c.) villous.

Var. β, *glàbra* (Benth. l. c.) glabrous. ⊙. G. On the Olifants and Zwartdoorn rivers, Drège.

Var. δ, *parviflòra* (Benth. l. c.) corolla scarcely 5 lines long, concealed under the floral leaves. ⊙. G. Native of the Cape of Good Hope, but the locality is not mentioned.

Selago-like Nycterinia. Pl. ¼ to ½ foot.

11 N. Africàna (D. Don, in Sweet, fl. gard. n. s. vol. 3. p. 239.) humble, branched at the base; leaves opposite: floral ones oblong-spatulate; throat of corolla scarcely pilose; stamens 4, all antheriferous. ⊙. ? G. Native of the Cape of Good Hope, in the Carro and Carroid districts; Hexriver; Winterbergen and Sneeuwebergen, Ecklon, Drège; Hermanns Kraal, in Albany, Ecklon. Erìnus Africànus, Lin. spec. 878. Thunb. fl. cap. 474.—Burm. afr. p. 139. t. 50. f. 1. Habit of *N. selaginoìdes*. Leaves rather more collected at the base of the stem. Spike more dense, with the floral leaves more prominent, and readily distinguished by the 2 lower anthers slightly projecting from the mouth of the tube.

African Nycterinia. Pl. ½ to 1 foot.

§ 3. *Segments of the limb of the corolla entire; tube glabrous.*

12 N. divarìcata (Benth. l. c.) humble, stiff, branched at the base, pubescently hairy; lower leaves on long petioles, obovate: upper floral leaves lanceolate, toothed; spikes elongated. ♄. ? G. Native of the Cape of Good Hope, on sandy hills and plains near Cape Town. Manùlea divaricàta, Thunb. fl. cap. 468. A common plant in collections, drying black. Corolla slender, about 10 lines long. Capsule rather coriaceous.

Divaricate Nycterinia. Pl. dwarf.

13 N. pedunculàris (Benth. l. c.) humble, leafy at the base, branched; lower leaves petiolate, ovate: cauline leaves few, lanceolate, a little toothed; spikes on long peduncles, head formed, few-flowered.—Native of the Cape of Good Hope; Theopolis, in Albany, Ecklon. Leaves almost all collected at the base of the stem, which is scape-formed. Branches 4-6 inches long. Flowers like those of *N. divaricàta*. Capsule somewhat coriaceous.

Var. α, *hirsùta* (Benth. l. c.) plant hairy.

Var. β, *glabriúscula* (Benth. l. c.) plant nearly glabrous. Native at Haazenkraalsrivier, Drège.

Peduncled Nycterinia. Pl. dwarf.

14 N. pusílla (Benth. l. c.) erect, nearly simple; leaves almost all radical, petiolate, broadly ovate: floral ones oblong-linear, or spatulate; flowers few, distant, or rather approximate.—Native of the Cape of Good Hope, between Hol river and Micrencasteel, in the North Clanwilliam district. More slender than *N. pedunculàris*, and the branches are not scape-formed. Buchnèra divaricàta, Lin. soc. herb. ?

Small Nycterinia. Pl. ¼ to ½ foot. ?

15 N. villòsa (Benth. l. c.) stem erect, branched, leafy; leaves oblong-linear, obtuse, almost quite entire; spikes interrupted at the base, dense at apex.—Native of the Cape of Good Hope; Haazenkraalsrivier, Drège. Erìnus villòsus, Thunb. fl. cap. 474. ? Taller than the three last, and scarcely blackens on drying. Capsule almost membranous. Stamens all antheriferous and inclosed, as in the three last species, ex Benth.

Villous Nycterinia. Pl. ¼ to ½ foot. ?

Cult. All the species of *Nycterínia* are worth cultivating for the sake of the beauty and sweet scent of their flowers. They grow well in a mixture of peat and sand, or vegetable mould;

and cuttings will strike root readily in the same kind of earth under a hand glass; or they may be increased by seeds.

LXXX. POLYCARE'NA (from *πολυς, polys*, many; and *καρηνον, karenon*, a head, in reference to the heads of flowers.) Benth. in Hook. comp. 1. p. 371. Buchnèra and Manùlea species, Lin. and Thunb.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx membranous, bilabiate, bipartite in the fructiferous state. Corolla permanent; tube at length cleft; throat broader; limb spreading, nearly equally 5-cleft. Stamens didynamous, inserted towards the top of the tube; anthers all similar, exserted. Capsule membranous.—Small annual herbs, natives of South Africa, usually much branched, more or less clammy, hardly becoming blackish on drying. Spikes terminal, usually capitate in the floriferous state, but generally elongated in the fructiferous state. Flowers almost sessile. Floral leaves adnate to the very short pedicels.

* *Tube of corolla 2 or 3 times longer than the calyx.*

1 P. Cape'nsis (Benth. l. c.) clothed with clammy down; leaves linear, or oblong, entire, and few-toothed; spikes rather loose, numerous, corymbosely panicled; tube of corolla 3 times as long as the calyx. ⊙. G. Native of Cape District, Ecklon, Drège, &c. Buchnèra Capénsis, Lin. mant. 88. Manùlea Capénsis, Thunb. fl. cap. 467. Flowers yellow. Tube of corolla ½ an inch long; limb larger than in any of the other species. Generally all 4 anthers are exserted.

Cape Polycarena. Pl. ½ foot.

2 P. gilioìdes (Benth. l. c. p. 372.) clothed with clammy pubescence; leaves linear, a little toothed: floral ones about equal in length to the calyxes; spikes downy, few-flowered; tube of corolla twice as long as the calyx. ⊙. G. Native of the Cape of Good Hope, in sands near Paarl, Drège. Habit of *Gìlia laciniàta*, more slender than *P. Capénsis*, with the flowers hardly half the size, Benth.

Gilia-like Polycarena. Pl. ¼ to ½ foot.

* * *Tube of corolla rather shorter than the calyx.*

3 P. au'rea (Benth. l. c.) clothed with clammy pubescence; leaves linear, quite entire, or a little toothed: floral ones linear-lanceolate, about equal in length to the calyxes; spikes short, dense, pubescent; limb of corolla longer than its tube. ⊙. G. Native of the Cape of Good Hope. Buchnèra aúrea, Herb. Banks, mss. Manùlea Æthiòpica, Thunb. fl. cap. 467,? exclusive of the syn. of Lin. Flowers golden yellow, above twice the size of those of *P. pubèscens*, by which it differs from that species, as well as in its narrow, erect leaves.

Golden-flowered Polycarena. Pl. ½ foot.

4 P. pube'scens (Benth. l. c.) erect, small, clothed with clammy pubescence; lower leaves subovate: superior ones oblong, or linear, quite entire, and toothed: floral ones ovate, or lanceolate, about equal in length to the flowers; bracteas and capsules downy; limb of corolla about equal in length to its tube. ⊙. G. Native of the Cape of Good Hope, at Rodesand, Haazenkraalsrivier, and Zilverfontein, in Namaqualand. Varies in the leaves being entire and toothed. Spikes short, and dense.

Downy Polycarena. Pl. ½ foot.?

5 P. capilla'ris (Benth. l. c.) smoothish; lower leaves obovate, or oblong: rameal ones linear: floral ones linear, obtuse, equalling the calyxes in length, and capsules, glabrous; fructiferous spikes loose. ⊙. G. Native of the Cape Flats and Zwarteland. Manùlea capillàris, Lin. syst. 569. suppl. 285. Thunb. fl. cap. p. 468. Branches slightly pubescent. Calyx about a line long. Flowers small, yellow.

Capillary Polycarena. Pl. ½ foot.

6 P. rariflòra (Benth. l. c.) clothed with fine pubescence; leaves narrow-linear, almost quite entire, or the lower ones are oblong: floral ones exceeding the flowers; spikes few, few-flowered, nearly glabrous; limb of corolla shorter than its tube. ⊙. G. Native of the Cape of Good Hope. Habit of the preceding, but the leaves are narrower, and the flowers much smaller.

Few-flowered Polycarena. Pl. ¼ to ½ foot.

7 P. plantagi'nea (Benth. l. c.) erect, small, clothed with clammy pubescence; lower leaves obovate: superior ones oblong, quite entire, and few toothed: floral ones lanceolate, obtuse, exceeding the calyxes; corolla small, having the limb shorter than its tube. ⊙. G. Native of the Cape of Good Hope, on rocks at Modderfontein and Zilverfontein, in Namaqualand, Drège. Spikes forming small leafy heads, with a few, detached, axillary flowers, lower down in the stem. Flowers smaller than in any other plant belonging to tribe *Buchnèreæ*.

Plaintain-like Polycarena. Pl. ¼ foot.

8 P. interte'xta (Benth. l. c.) procumbent, clothed with clammy pubescence; leaves petiolate, small, ovate-toothed, downy: floral ones ovate-oblong, obtuse, scarcely exceeding the calyx; spikes globosely capitate, somewhat fastigiate. ⊙. G. Native of the Cape of Good Hope. Manùlea intertéxta, Banks, herb. Flowers very small. Leaves more deeply toothed than any other species.

Interwoven Polycarena. Pl. procumbent.

Cult. The species are all beautiful tender annuals. The seeds of them should be reared on a hot-bed in early spring, and about the middle or end of May some of the young plants may be set out in the open border, in a warm, sheltered situation; and others may be grown in pots, and placed in the green-house.

LXXXI. PHYLLOPO'DIUM (from *φυλλον, phyllon*, a leaf; and *πους ποδος, pous podos*, a foot; in reference to the floral leaves being adnate to the pedicels or flower stalks.) Benth. in Hook. comp. 1. p. 372.—Manùlea species, Lin. and Thunb.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx nearly equally 5-parted; segments sub-connate at the base, with membranous margins. Corolla funnel-shaped; tube shorter than the calyx; limb 5-parted; segments entire, nearly equal. Stamens didynamous, exserted; anthers all similar. Capsule membranous.—Harsh annual herbs, natives of South Africa, generally procumbent at the base, rarely erect, usually becoming blackish on drying. Floral leaves adnate to the pedicels, which are very short. Flowers small, sessile, orange-coloured, or usually bluish or purplish.? Spikes terminal, usually capitate, more or less elongated in the fructiferous state.

1 P. cuneifòlium (Benth. l. c. p. 373.) stem pubescently hairy; lower leaves petiolate, ovate, or obovate, deeply toothed: superior ones oblong, cuneated: floral ones hardly exceeding the calyxes; floriferous spikes capitate: fructiferous ones oblong-cylindrical, dense, many-flowered. ⊙. G. Native of the Uitenhage district, about Algoa Bay. Stem woody, though annual. Leaves thickish, glabrous. Divisions of calyx joined to the middle by a membrane. Habit of *Selàgo*, Benth.

Wedge-leaved Phyllopodium. Pl. ½ foot.

2 P. capita'tum (Benth. l. c.) stem hairy; leaves ovate-lanceolate, or oblong, hairy: superior ones small, linear: floral ones ovate-lanceolate, hairy: outer ones exceeding the calyxes; spikes capitate, nearly globose, or at length oblong, dense, many-flowered. ⊙. G. Native of the Cape of Good Hope, in the western districts, from Cape Town to Olifant's river in Clanwilliam. Manùlea capitàta, Lin. syst. 569. suppl. 285. Thunb. fl. cap. 469. More hairy and less branchy than the preceding. Leaves narrower, and less toothed. Spikes very dense, and

hardly bigger than a large pea. External floral leaves forming a kind of involucrum to the young heads of flowers. Divisions of the calyx obtuse, deeply cleft. Corolla minute, reddish?

Capitate-flowered Phyllopodium. Fl. July, Aug. Clt. 1820. Pl. $\frac{1}{2}$ to 1 foot.

3 P. HETEROPHY'LLUM (Benth. l. c.) plant small, hairy, branched at the base; branches erect; lower leaves petiolate, ovate, a little toothed: superior ones few, linear: floral ones linear-lanceolate: outer ones exceeding the ciliated calyxes; spikes capitate, becoming at length oblong and rather loose in the fructiferous state; stamens shorter than the limb of the corolla. ⊙. G. Native near the Cape, from Zwartland to Caledon. Manùlea heterophýlla, Lin. syst. 569. suppl. 285. Thunb. fl. cap. 469. Perhaps a variety of the preceding; but much more slender, with looser heads of flowers. Corolla apparently yellow, Benth.

Various-leaved Phyllopodium. Pl. $\frac{1}{2}$ foot.

4 P. PU'MILUM (Benth. l. c.) erect, smoothish; leaves petiolate, ovate: superior ones oblong: floral ones ovate, very blunt, downy, equal in length to the calyxes; spikes capitate, few-flowered; stamens equalling the limb of the corolla. ⊙. G. Native of the Cape of Good Hope, at Groen river, in Clanwilliam. More slender than the last, with smaller heads, and rather larger flowers.

Dwarf Phyllopodium. Pl. $\frac{1}{2}$ foot.

5 P. DIFFU'SUM (Benth. l. c.) smoothish, or scarcely hairy, much branched; leaves ovate or oblong, toothed, narrowed a long way into the petioles: floral ones linear, hardly exceeding the calyxes; spikes elongated, loose. ⊙. G. Native of the Cape of Good Hope, in the Uitenhage district. Branches procumbent. Flowers not so small as in the other species.

Diffuse Phyllopodium. Pl. procumbent, a foot long.

6 P. BRACTEA'TUM (Benth. l. c.) much branched, diffuse; branches downy; leaves petiolate, ovate, toothed, glabrous: floral ones similar; spikes long; flowers all remote; calyxes hardly longer than the petioles of the floral leaves. ⊙. G. Native of the Cape of Good Hope, in the Uitenhage district, near Addo and Enon, Drège; Olifant's river, Ecklon. This species is remarkable for its long loose branches, and especially for the broadly expanded limb of the floral leaves, Benth.

Bracteate-flowered Phyllopodium. Pl. diffuse.

Cult. For culture and propagation see *Polycarèna*, p. 588.

LXXXII. SPHENA'NDRA (from *σφην, sphen*, a wedge; and *ανηρ ανδρος aner andros*, a male; in allusion to the wedge-shaped anthers.) Benth. in Hook. comp. 1. p. 373.—Manùlea species, Thunb. et Lin.—Buchnèra species of Ait.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla deciduous; tube very short; limb rotate; segments 5, roundish, nearly equal. Stamens 4, exserted, somewhat ascending; anthers cuneated, all similar.—An erect shrub, clothed with clammy pubescence. Leaves for the most part opposite, oblong-lanceolate, few-toothed: floral ones free, much shorter than the pedicels, ovate, quite entire, very acute. Stamens by pairs, nearly equal.

1 S. VISCÒSA (Benth. l. c.) ♄. G. Native of the Cape of Good Hope, in the Carro desert and Carroid districts. Buchnèra viscòsa, L'her. stirp. 2. t. 34. Ait. hort. kew. ed. 1st. vol. 2. p. 357. Curt. bot. mag. 7. t. 217. Manùlea viscòsa, Willd. enum. 652. Manùlea cærùlea, Thunb. fl. cap. 467. Flowers purple, bluish, or red. Style exserted.

Clammy Sphenandra. Fl. June, Nov. Clt. 1774. Shrub 1 to 2 feet.

Cult. For culture and propagation see *Nycterínia*, p. 587.

LXXXIII. CHÆNO'STOMA (from *χαινω, chaino*, to gape; and *στομα, stoma*, a mouth; in reference to the wide throat of the corolla.) Benth. in Hook. comp. 1. p. 374.—Manùlea species of Thunb. and Vent.—Buchnèra species, Andr. and Pers.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla deciduous, funnel-shaped or salver-shaped, rarely with a short subcampanulate tube; throat dilated; limb almost equally 5-cleft; segments obovate or roundish. Stamens didynamous; anthers all similar, equal in height to the throat, or exserted.—Herbs or under-shrubs, natives of South Africa, not becoming blackish on drying. Leaves nearly all opposite, toothed, rarely quite entire: floral ones similar, or bractea-formed, free from the pedicels. Flowers axillary or racemose, on longish pedicels. Capsule glabrous.

* *Tube of corolla hardly exserted, or shorter than the calyx.*

1 C. ROTUNDIFÒLIUM (Benth. l. c.) suffruticose, smoothish; leaves small, petiolate, roundish-obovate, deeply toothed, thickish, green on both surfaces; pedicels axillary, a little longer than the glabrous calyx; corolla funnel-shaped; tube shorter than the calyx. ♄. G. Native of the Cape of Good Hope. Branches apparently procumbent. Flowers few, small, towards the summits of the branches.

Round-leaved Chænostoma. Shrub procumbent.

2 C. PAUCIFLÒRUM (Benth. l. c.) suffruticose, pubescent; leaves petiolate, obovate-roundish, toothed, downy on both surfaces; pedicels axillary, rather longer than the calyx, which is hispid; corolla funnel-shaped: tube shorter than the calyx. ♄. G. Native of South Africa, at Nieuweveldsbergen, in Beaufort, Drège; Krakakamma, in Uitenhage, Ecklon.—Nearly allied to *C. rotundifòlia*, but the flowers are nearly twice the size. Drège's specimens are more hairy than Ecklon's, Benth.

Few-flowered Chænostoma. Shrub procumbent?

3 C. CAMPANULA'TUM (Benth. l. c.) suffruticose, villous; leaves ovate, toothed; racemes loose, many-flowered; calyx hispid, with linear-lanceolate segments; corolla subcampanulate, with a very short tube, about twice as long as the calyx. ♄. G. Native of South Africa, at Zuurebergen and Zwartehoogden, in Uitenhage and Albany, Ecklon and Drège; on the Key river, in Tambukiland, Ecklon. Leaves about half an inch long, generally irregularly toothed, and contracted at the base. Stamens very unequal in length; the longer pair rather shorter than the corolla, which appears to be blue.

Campanulate-flowered Chænostoma. Shrub.

4 C. CALYCI'NUM (Benth. l. c.) suffruticose, smoothish; leaves oblong-lanceolate, toothed, glabrous or canescent beneath; calyx smoothish, with subulate segments, hardly one half shorter than the subcampanulate corolla. ♄. G. Native of South Africa, in the Amakosa country, between the rivers Gehau and Bashe, Drège.—Habit almost of *Sphenándra viscòsa*, but more slender, and flowers more numerous. Corolla like that of *C. campanulàtum*, but smaller.

Var. β, laxiflòrum (Benth. l. c.) flowers more loose; calyx much smaller. ♄. G. Native on the rivers Bashe and Windvogelberg. Perhaps a distinct species.

Large-calyxed Chænostoma. Shrub.

5 C. PROCU'MBENS (Benth. l. c.) suffruticose, humble, much branched; leaves oval-oblong, a little toothed, obtuse, green on both surfaces, thickish; racemes few-flowered; pedicels longer than the calyxes; corolla funnel-shaped: tube equal in length to the calyx, or hardly exceeding it. ♄. G. Native of the Cape of Good Hope, on the Fish river, Drège. Branches

apparently prostrate, slightly pubescent towards the extremity; the calyx has also a few hairs, but the rest of the plant is quite glabrous.

Procumbent Chænostoma. Shrub prostrate.

6 C. laxiflòrum (Benth. l. c.) suffruticose, procumbent, subcanescent; branches ascending, fastigiate; leaves oblong-ovate, a little toothed, narrowed a long way at the base, flat; racemes loose; flowers on long pedicels; calyxes glabrous or canescent; corolla funnel-shaped: tube equalling the calyx, or hardly exceeding it. ♄. G. Native of the Cape of Good Hope, near the Keiskamma, Drège. Probably a mere variety of the preceding; but the flowers are larger.

Loose-flowered Chænostoma. Shrub procumbent.

7 C. halimifòlium (Benth. l. c. p. 375.) suffruticose, humble; branches numerous, erect, white; leaves oval-oblong or lanceolate, a little toothed, hoary on both surfaces, flat; racemes loose; flowers on long pedicels; corolla funnel-shaped: tube equalling the calyx in length, or hardly exceeding it. ♄. G. Native of the Cape of Good Hope, in the Karroo desert, near Graafreynet, Ecklon; Steelkloof, Hamerkuil, and plains near Aasvogelberg, Drège. Habit of *Manùlea incàna*. Branches densely leafy at the base. Racemes almost leafless; the floral leaves being very small and entire.

Halimum-leaved Chænostoma. Shrub.

8 C. polya'nthum (Benth. l. c.) herbaceous or suffruticose, much branched at the base; branches downy at top, panicled; leaves ovate, toothed, cuneated at the base: upper ones oblong, glabrous or canescent beneath; racemes loose; calyx hispid; corolla funnel-shaped: tube hardly exceeding the calyx. ♄. G. Native of South Africa, on the Zwartkops river, in Uitenhage, Ecklon; Algoa Bay, Hook. herb. Habit and corolla of *C. laxiflòrum*. Leaves and calyx of *C. campanulàtum*.

Many-flowered Chænostoma. Shrub.

9 C. pu'milum (Benth. l. c.) plant suffruticose, of many stems, glabrous; leaves oblong: superior ones linear, quite entire, or few-toothed; flowers racemose; corolla funnel-shaped: tube hardly longer than the calyx. ♄. G. Native of South Africa, in Uitenhage district, Ecklon; and probably from Algoa Bay. Branches many, erect. Leaves slightly revolute on the margins. Pedicels longer than the calyxes, which are nearly glabrous. Corolla very open, as in all the species of this section.

Dwarf Chænostoma. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

10 C. denuda'tum (Benth. l. c.) suffruticose; branches glabrous, ascending; leaves distant, linear, quite entire, with revolute edges, glabrous; racemes few-flowered; calyx hispid, hardly shorter than the tube of the corolla, which is funnel-shaped. ♄. G. Native of South Africa, at Langekloof, in George district, Ecklon and Drège. Habit almost of *Aspérula cynánchica*. Calyx of *C. campanulàtum*. Corolla of *C. pùmilum*. Capsule oblong, longer than the calyx.

Naked Chænostoma. Shrub ascending.

* * *Tube of corolla twice or thrice the length of the calyx.*

11 C. revolu'tum (Benth. l. c.) suffruticose, greyish or pubescent; leaves linear, quite entire, with revolute edges; flowers racemose; pedicels hardly longer than the calyx; segments of calyx linear or subulate, about equal in length to the capsule, which is ovate, but 2 or 3 times shorter than the tube of the corolla. ♄. G. Native of South Africa, under the Zwartebergen, from the river Zondereinde to Gaurite river, Ecklon and Drège; and on the Fish river, Dr. Gill. Manùlea revolùta, Thunb. fl. cap. 467. Much branched.

Var. α, glabriúsculum (Benth. l. c.) plant smoothish.

Var. β, pubéscens (Benth. l. c.) plant pubescent. ♄. G. Native on the Cedarbergen, and near Boschkloof, Drège.

Revolute-leaved Chænostoma. Shrub 1 foot.

12 C. glabra'tum (Benth. l. c.) suffruticose, glabrous; leaves linear, quite entire, with revolute margins; flowers racemose; pedicels more than twice as long as the calyx; segments of calyx lanceolate-subulate, rather downy, shorter than the oblong capsule; tube of corolla twice or thrice as long as the calyx. ♄. G. Native of South Africa, at Kerg river, in Tambukiland; and Kannaland, in Zwellendam, Ecklon; and elsewhere, Drège. This differs from *C. linifòlium* in its narrower leaves, longer capsules, and is almost always perfectly glabrous.

Glabrous Chænostoma. Shrub.

13 C. linifòlium (Benth. l. c.) suffruticose; branches hairy at top; leaves oblong-lanceolate, or linear, quite entire, and few-toothed, with subrevolute edges, hairy or smoothish; flowers racemose; pedicels more than twice as long as the calyx; calycine segments glabrous, or scarcely hairy, linear, exceeding the capsule a little, but 3 times shorter than the tube of the corolla. ♄. G. Native of the Cape of Good Hope, on mountains in the Cape district, near Worcester, and near Brackfontein, in Clanwilliam, Ecklon and Drège. Manùlea linifòlia, Thunb. fl. cap. 466. ? An intermediate species between *C. glabràtum* and *C. Æthiópicum*; and probably only a variety of the latter.

Flax-leaved Chænostoma. Fl. July, Aug. Clt. 1820. Shrub $\frac{1}{2}$ to 1 foot.

14 C. Æthiópicum (Benth. l. c.) suffruticose; branches numerous, floriferous, fastigiate; leaves oblong or ovate, few-toothed, smoothish; racemes short, loose, subcorymbose; calyx hispid, 2-3 times shorter than the tube of the corolla. ♄. G. Native of South Africa, in the Cape district. Buchnèra Æthiópica, Lin. mant. 251. but not of Thunb. Intermediate between *C. linifòlium* and *C. fastigiàtum*.

Æthiopian Chænostoma. Shrub.

15 C. fastigia'tum (Benth. l. c. p. 376.) suffruticose; branches numerous, erectish; leaves linear, or oblong-cuneated, deeply few-toothed at apex; flowers capitately racemose at the tops of the branches; pedicels usually shorter than the calyx; calyx hispid, 2 or 3 times shorter than the tube of the corolla. ♄. G. Native of the Cape of Good Hope, in Caledon. Manùlea cephalòtis, Thunb. fl. cap. 470. ? A low shrub, with leaves very much like those of *Sálvia dentàta*, remarkable for the compact racemes, consisting of from 3 to 7 flowers, with very hispid calyxes.

Var. α, hirsùtum; branches and leaves hairy.

Var. β, glabràtum (Benth. l. c.) plant glabrous.

Fastigiate-branched Chænostoma. Shrub.

16 C. subspica'tum (Benth. l. c.) suffruticose, quite glabrous; branches numerous, erectish; leaves half stem-clasping, oblong, deeply few-toothed; flowers spicately racemose; calyxes glabrous, or very shortly ciliated, 2-3 times shorter than the tube of the corolla. ♄. G. Native of the Cape of Good Hope; but the precise locality is unknown. Spikes of flowers leafy, about an inch long. All the pedicels very much shorter than the calyx.

Subspicate-flowered Chænostoma. Shrub.

17 C. marifòlium (Benth. l. c.) suffruticose, procumbent; branches clothed with hoary pubescence; leaves ovate, crenated, with subrevolute edges, clothed with hoary tomentum beneath, or on both surfaces; flowers on very short pedicels, opposite or subracemose; tube of corolla twice as long as the calyx. ♄. G. Native of South Africa, in the Uitenhage district. Manùlea virgàta, Thunb. fl. cap. 470. ? Branches long, twiggy. Leaves almost sessile, and very white, which does not agree with Thunberg's description, Benth.

Cat-Thyme-leaved Chænostoma. Shrub procumbent.

18 C. integrifòlium (Benth. l. c.) suffruticose, loosely much branched, nearly glabrous; leaves ovate, with subrevolute, quite entire, or few-toothed margins, glabrous; flowers axillary, pedicellate: superior ones loosely racemose; tube of corolla slender, 3 times longer than the calyx. ♄. G. Native of South Africa, in the Cape district. Manùlea integrifòlia, Lin. syst. p. 569. suppl. 285.? Thunb. fl. cap. 467.? Habit almost of *C. híspidum;* but the leaves are smaller, less toothed, and the whole plant is nearly or quite glabrous.

Var. β, parvifòlium (Benth. l. c.) leaves smaller. ♄. G. Native of the Cape of Good Hope, on the Tygerberg, Drège.

Entire-leaved Chænostoma. Shrub ½ foot?

19 C. cunea'tum (Benth. l. c.) suffruticose, procumbent; branches hairy; leaves nearly sessile, obovate-roundish, cuneated, deeply toothed, green on both surfaces, hairy; flowers axillary at the tops of the branches, or subracemose; tube of corolla 2 or 3 times as long as the calyx. ♄. G. Native of South Africa, in Hottentots' Holland and Palmietriver mountains, in Stellenbosch, Ecklon. Habit almost of *C. marifòlium*, but very different in leaves and inflorescence; in the latter character it represents *C. híspida*, Benth. Leaves as broad as long, with 3-5 deep teeth, ex Benth.

Cuneate-leaved Chænostoma. Shrub procumbent.

20 C. hi'spidum (Benth. l. c.) suffruticose; branches procumbent or divaricate, hairy; leaves ovate or oblong, coarsely toothed, narrowed or cuneated at the base, pubescent; flowers axillary, pedicellate: superior ones loosely racemose; calyx hairy, 3 times shorter than the tube of the corolla. ♄. G. Native of the Cape of Good Hope; plentiful in the neighbourhood of Cape Town. Manùlea híspida, Thunb. fl. cap. 473. Manùlea oppositiflòra, Vent. jard. malm. 15. t. 15. A very variable plant, especially in the degree of hairiness and size of leaves. Corolla white.

Hispid Chænostoma. Fl. June, Aug. Clt. 1816. Shrub procumbent.

21 C. floribu'ndum (Benth. l. c.) branches erect? pubescent; leaves ovate, coarsely toothed, cuneated at the base, finely pubescent; racemules subcorymbose, disposed in a many-flowered, terminal panicle; calyxes on short pedicels, hairy, 3 times shorter than the tube of the corolla. ♄.? G. Native of South Africa, at Port Natal, Drège. Leaves almost like those of *C. híspidum*, but larger; the flowers are also almost the same. The plant is remarkable for its size and inflorescence.

Bundle-flowered Chænostoma. Shrub.

22 C. corda'tum (Benth. l. c. p. 377.) herbaceous; branches prostrate, somewhat radicant, hairy; leaves petiolate, ovate-roundish, toothed, truncate at the base or cordate, pubescent; flowers axillary, pedicellate; calyxes hispid, hardly half the length of the tube of the corolla. ♃. G. Native of South Africa, at Krakakamma and Olifantshock, in Uitenhage, Ecklon. Ruigtevalei, Drège. Manùlea cordàta, Thunb. fl. cap. 473. This plant is remarkable for its long trailing stems, and form of leaves. Corolla shorter than that of *C. híspida*.

Var. β, hirsùtus (Benth. l. c.) plant more hairy. ♃. G. Native of the Cape of Good Hope, on the Witbergen, Drège.

Cordate-leaved Chænostoma. Fl. June, Aug. Clt. 1816. Pl. trailing.

23 C. racemòsum (Benth. l. c.) herbaceous? branches erect, pubescent; leaves petiolate, broad-ovate, toothed, finely pubescent: floral ones small; flowers on long pedicels, racemose; tube of corolla twice as long as the calyx. ♃.? G. Native of the Cape of Good Hope, on Zuurebergen, Drège. Leaves ½ an inch long, rounded or wedge-shaped at the base: floral ones sessile. Calyx nearly glabrous, unequally cleft; segments subulate at ends.

Racemose-flowered Chænostoma. Pl. ½ to 1 foot.?

24 C. fœ'tidum (Benth. l. c.) annual? erect, branched, nearly glabrous; leaves on long petioles, ovate, deeply toothed; peduncles axillary, 1-3-flowered: superior ones subracemose; tube of corolla slender, 2-3 times longer than the calyx. ☉. G. Native of the Cape of Good Hope, in the eastern portion of Worcester and Clanwilliam districts, &c. Buchnèra fœ'tida, Andr. bot. rep. t. 80. Manùlea fœ'tida, Pers. ench. 2. p. 148. Manùlea alternifòlia, Hort. par. Pers. ench. 2. p. 148. Leaves ½ to 1 inch long. Lower pedicels almost always bearing a small corymb of about 3 nearly sessile flowers: the upper ones usually simple, forming an irregular leafy raceme. Corollas white.

Stinking Chænostoma. Fl. June, Sept. Clt. 1794. Pl. 1 to 1½ foot.

25 C. pedunculòsum (Benth. l. c.) herbaceous, much branched, procumbent, clothed with clammy pubescence; leaves petiolate, ovate, deeply toothed or pinnatifid: superior ones small; peduncles axillary, very long, filiform; tube of corolla slender, one half longer or almost twice as long as the calyx; limb ample. ♃. G. Native of South Africa, at Zilverfontein, in Namaqualand. This species is remarkable for its intricate leafy stems; its numerous peduncles, often 2 inches long; and for the form of the flowers, which appear like those of *Lypèria*. The corolla dries yellowish; with a dark-coloured throat.

Peduncled Chænostoma. Pl. procumbent.

Cult. For culture and propagation see *Nycterínia*, p. 587.

LXXXIV. LYPE'RIA (λυπηρος, *lyperos*, sad or sorrowful; from the dull heavy colour of the flowers; and also from their expanding and becoming sweet-scented at night; but are closed and scentless throughout the day-time.) Benth. in Hook. comp. 1. p. 377.—Erìnus species, Lin., Ait., and Thunb. Manùlea species, Lin., Pers., and Link. Buchnèra species, Andr. Lychnídea species, Burm.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted; segments linear, subfoliaceous. Corolla deciduous, with an elongated tube, which is clammy outside, and gibbous or incurved on the upper side at the apex; limb spreading, 5-cleft; segments approximating into 2 lips. Stamens didynamous, inclosed.—Herbs, subshrubs, or shrubs, natives of South Africa. Lower leaves opposite: superior ones alternate, entire, toothed, or deeply pinnatifid, or multifid, usually with the young leaves in fascicles, in the axils of the old ones. Flowers sessile, or generally pedicellate, axillary, racemose, or spicate. The corollas, and sometimes the whole plant, becomes black on drying. Capsules usually exserted, ovoid, or oblong, more or less clammy.

* *Flowers nearly sessile, spicate.*

1 L. fruticòsum (Benth. l. c.) clothed with clammy pubescence; leaves ovate, oblong, or subcordate, quite entire, and few-toothed: floral ones similar, exceeding the calyxes; capsule oblong, about equal in height to the calyx. ♄. G. Native of the Cape of Good Hope, on the Zwartdoorn river, in Clanwilliam and Modderfontein, and the Gariep plains, in Namaqualand, &c. More of a shrub than any of the other species. Leaves sessile, from 4 lines to an inch in length, always drying black, as well as the flower spikes.

Shrubby Lyperia. Shrub.

2 L. amplexicau'lis (Benth. l. c.) herbaceous? erect, clothed with clammy pubescence, or villous; leaves broad-ovate, toothed, cordately stem-clasping at the base: floral ones similar, exceeding the calyxes; spikes elongated, many-flowered; tube of corolla hardly exceeding the calyx: limb small. ♃.? G. Native of South Africa, in Namaqualand, Ecklon; Given river, in Clanwillian, Drège. Flowering branches about a foot long,

of which the greater part is occupied by the leafy spike. Capsule nearly glabrous, hardly as long as the calyx.

Stem-clasping-leaved Lyperia. Pl. 1 foot.

3 L. trí'stis (Benth. l. c. p. 378.) herbaceous, erect, very clammy; lower leaves petiolate, ovate or oblong, toothed and cut: superior ones oblong-lanceolate: floral ones lanceolate, quite entire: upper ones shorter than the capsules; floriferous spikes dense: fructiferous ones elongated; capsule twice as long as the calyx. ♃. G. Native of the Cape of Good Hope. Erìnus trístis, Lin. syst. 571. suppl. 287. Thunb. fl. cap. 476. Stems thick, rigid, branched. Tube of corolla about an inch long; segments of the limb emarginate. Capsule 4-5 lines long. The flowers of a dull dirty purple colour.

Sad-flowered Lyperia. Fl. May, June. Clt. 1825. Pl. 1 to 1½ foot.

4 L. fra'grans (Benth. l. c.) suffruticose, erectish, clammy; leaves oblong-lanceolate, toothed at top, narrowed at the base, quite entire: superior ones narrower, and nearly entire: floral ones rather shorter than the calyx; floriferous spike dense: fructiferous one elongated; capsule hardly twice as long as the calyx. ♄. G. Native of the Cape of Good Hope; plentiful. Erìnus fràgrans, Ait. hort. kew. ed. 1. vol. 2. p. 357. Erìnus lychnídeus, Thunb. fl. cap. 474.? exclusive of many synonymes. Ker. bot. reg. 748. Selàgo lycnídea, Lin. spec. 877. amœn. 6. p. 89. Lychnídea villòsa, &c., Burm. pl. afr. 13. t. 49. f. 4. Leaves very numerous at the base of the stem; and the whole plant is slightly pubescent, and dries very black. Capsule 4-5 lines long.

Var. α; limb of corolla dirty lurid purple.

Var. β; limb of corolla dirty yellow.

Fragrant Lyperia. Fl. May, June. Clt. 1776. Shrub ½ to 1 foot.

5 L. macroca'rpa (Benth. l. c.) suffruticose? stem smoothish; leaves oblong, linear, obtuse, quite entire, narrowed at the base, finely pubescent: floral ones equal in length to the calyxes; spikes elongated; capsule about 3 times longer than the calyx. ♄. G. Native of South Africa, probably of the Cape district. Habit of *L. fràgrans;* but the leaves are entire, and the capsules about an inch long.

Long-fruited Lyperia. Shrub.

6 L. si'mplex (Benth. l. c.) herbaceous, erect, nearly simple; lower leaves petiolate, ovate, a little toothed: superior and floral ones oblong or lanceolate, quite entire; spikes elongated; capsule clothed with clammy pubescence, hardly exceeding the calyx. ♃. G. Native of South Africa, in the Cape district; Karroo desert, and False Bay, &c. Erìnus símplex, Thunb. fl. cap. 474.? Differing from the three preceding species by the short thick capsule; and in the flowers, and especially the capsules, being more distant from each other. Mr. Bentham is doubtful whether this be the same as Thunberg's plant.

Simple-stemmed Lyperia. Pl. ½ foot?

* * *Herbs. Leaves not fascicled. Flowers pedicellate, racemose.*

7 L. tenuiflòra (Benth. l. c.) small, erect, clothed with fine clammy pubescence; leaves oblong or lanceolate, quite entire, and few-toothed; pedicels a little longer than the calyxes. ♃.? G. Native of the Cape of Good Hope; but the particular station is unknown. Flowers 8-10 lines long.

Thin-flowered Lyperia. Pl. ¼ to ½ foot.

8 L. racemòsa (Benth. l. c.) erect, very clammy; leaves petiolate, ovate, sharply toothed, narrowed a long way at the base; flowers pedunculate, racemose; limb of corolla ample, longer than the half of the tube. ♃. G. Native of South Africa, in the north of Clanwilliam district; and at the mouth of the Gariep, in Namaqualand, Ecklon and Drège. Tube of corolla about 9 lines long; lobes of the limb broad, shortly bifid.

Racemose-flowered Lyperia. Pl. 1 foot.

9 L. glutinòsa (Benth. l. c.) herbaceous, erect, very clammy; leaves petiolate, ovate, sharply toothed, roundly truncate at the base; flowers pedicellate, racemose; limb of corolla shorter than the half of the tube. ♃. G. Native of the Cape of Good Hope, near the Gariep. Not so tall, and more clammy than the preceding. Leaves shorter. Corolla more slender; with a much smaller limb. Calyx very clammy, rather longer than the capsule.

Clammy Lyperia. Pl. ½ to 1 foot.

10 L. viola'cea (Benth. l. c. p. 379.) decumbent or erectish, smoothish; leaves petiolate, oblong, toothed; flowers few, subracemose; limb of corolla much shorter than the half of the tube; capsule ovate, villous, twice as long as the calyx. ♃. G. Native of the Cape of Good Hope. Manùlea violàcea, Link, enum. 2. p. 142. Manùlea crystallìna, Weinm. syll. pl. soc. rat. 1. p. 221.? Erìnus pàtens, Thunb. fl. cap. 475.? Branches smooth. Leaves ½ inch long. Corolla 7-8 lines long, of a purplish-violet colour; segments of the limb entire. According to Link, the plant is beset with short curled hairs.

Violaceous-flowered Lyperia. Fl. June, Nov. Clt. 1820. Pl. 2 feet.

* * * *Subshrubs or shrubs. Leaves usually fascicled in the axils. Pedicels axillary and subracemose.*

11 L. inci'sa (Benth. l. c.) suffruticose, humble, much branched; leaves petiolate, obovate or ovate, deeply toothed, villous on both surfaces, as well as the branches; flowers few, subracemose; tube of corolla about 6 times longer than the calyx: limb short. ♄. G. Native of the Cape of Good Hope. Erìnus incìsus, Thunb. fl. cap. 476. Corolla above an inch long.

Cut-leaved Lyperia. Shrub dwarf.

12 L. cane'scens (Benth. l. c.) suffruticose, decumbent, much branched; leaves petiolate, subfasciculate, oblong, deeply toothed, hoary beneath or on both surfaces; flowers subracemose; racemes panicled; pedicels short, stiff; limb of corolla short; capsule one half longer than the calyx. ♄. G. Native of South Africa, in inundated land, on the Gariep, Drège. Nearly allied to *L. argéntea*, but the branches are less divaricate, and more rigid; pedicels shorter. Flowers more numerous and smaller.

Canescent Lyperia. Shrub decumbent.

13 L. argé'ntea (Benth. l. c.) suffruticose, divaricately branched; leaves petiolate, subfasciculate, ovate or oblong, deeply toothed, rather hoary from scabrous pubescence beneath, or on both surfaces; pedicels axillary, filiform, or the upper ones are subracemose; limb of corolla one half shorter than the tube. ♄. G. Native of South Africa, in the Uitenhage district; and in the Amakosa country, Ecklon and Drège. Manùlea argéntea, Lin. syst. p. 570. suppl. 286. Thunb. fl. cap. 472. Lower leaves ½ inch long: upper ones smaller.—A plant very variable in pubescence, and generally drying rather blackish, seldom deserving the name of *argéntea*, Benth.

Var. α; leaves white beneath.

Var. β; leaves greenish on both surfaces.

Var. γ; more scabrous, and leaves blunter.

Silvery Lyperia. Fl. June, Nov. Clt. 1801. Shrub 1 foot.

14 L. peduncula'ta (Benth. l. c.) suffruticose, divaricately branched, finely pubescent; leaves petiolate, subfasciculate, obovate-cuneated, deeply toothed; pedicels elongated, axillary, filiform; calyx 3-4 times shorter than the tube of the corolla; limb of corolla a little shorter than the tube. ♄. G. Native of the Cape of Good Hope; but the locality is not mentioned. Buchnèra pedunculàta, Andr. bot. rep. t. 84. Manùlea pedunculàta,

Pers. ench. 2. p. 184. Habit of *L. argéntea*. Resembles also *L. cuneàta*; but the leaves are several times larger, and stalked; and the pedicels above an inch long. Corollas white.

Long-peduncled Lyperia. Fl. June, Nov. Clt. 1790. Shrub $1\frac{1}{2}$ foot.

15 L. phlogiflòra (Benth. l. c.) suffruticose, decumbent, much branched; leaves fascicled, petiolate, oblong, deeply toothed or pinnatifid, finely pubescent or glabrous; racemes loose, clothed with clammy pubescence; limb of corolla ample, with emarginate segments, about equal in length to the tube. ♄. G. Native of South Africa, on the Keiskamma, Drège. Differs from *L. argéntea* chiefly by the leaves, which are smaller and more deeply toothed; and by the large expanded limb of the corolla.

Phlox-flowered Lyperia. Shrub decumbent.

16 L. crassicau'lis (Benth. l. c.) suffruticose, decumbent at the base, much branched; branches strict, stiff, scabrous; leaves petiolate, ovate, pinnate: segments oblong, wedge-shaped, entire, or 2-3-cleft, scabrous; racemes strict; pedicels a little shorter than the calyx; limb of corolla short, with emarginate segments. ♄. G. Native of South Africa, on Wildshutsberg and Witbergen. Dries black, and is covered with glandular dots, which become white on drying.

Thick-stemmed Lyperia. Shrub $\frac{1}{2}$ to 1 foot.

17 L. móllis (Benth. l. c. p. 380.) suffruticose, clothed with soft villi; branches elongated, procumbent; leaves subfasciculate, petiolate, ovate, deeply pinnatifid or pinnate: segments ovate, entire or cut; pedicels axillary, filiform; tube of corolla hardly twice as long as the calyx. ♄. G. Native of South Africa, at Graham's Town, in Albany; and Zaureberg, in Uitenhage, Ecklon; Colesberg, Drège. Branches slender. Pedicels 8-10 lines long. Corolla 4-5 lines long.

Soft Lyperia. Shrub procumbent.

18 L. filicau'lis (Benth. l. c.) suffruticose, pubescent; branches elongated, slender, procumbent; leaves subfasciculate, petiolate, obovate-roundish, deeply pinnatifid: segments obovate, very blunt; pedicels axillary, filiform. ♄. G. Native of South Africa, on the Witbergen. Allied, but distinct from the preceding.

Thread-stemmed Lyperia. Shrub procumbent.

19 L. pinnati'fida (Benth. l. c.) suffruticose, decumbent, much branched; leaves pinnate: segments oblong-cuneated, entire, toothed or pinnatifid; flowers subracemose; tube of corolla 3-4 times longer than the calyx. ♄. G. Native of South Africa, in the Karroo desert and Karroid places; from Beaufort to the Fish River, Ecklon. Manùlea pinnatífida, Lin. syst. p. 570. suppl. 285. Thunb. fl. cap. 473. Plant very variable. Leaves from 3 to 6 lines long, usually convolute or conduplicate. Pedicels few, rather stiff. Tube of corolla 4-5 lines long; limb 2-3 lines long; segments obtuse, or very slightly emarginate. Some of the following varieties may prove to be species.

Var. α, *canescéns* (Benth. l. c.) capsule hardly one half longer than the calyx.

Var. β, *subcanéscens* (Benth. l. c.) capsule about twice the length of the calyx.

Var. γ, *viscòso-pubéscens* (Benth. l. c.) capsule about twice as long as the calyx; corollas smaller.

Var. δ, *subbipinnatisécta* (Benth. l. c.) corolla larger.

Var. ε, *microphýlla* (Benth. l. c.) clothed with clammy pubescence.

Pinnatifid-leaved Lyperia. Shrub decumbent.

20 L. multi'fida (Benth. l. c.) suffruticose, procumbent, much branched; leaves subfasciculate, bipinnate; segments for the most part petiolate, oblong-cuneated, entire, cut or pinnatifid; racemes few-flowered; calycine segments linear-spatulate, hardly a half shorter than the tube of the corolla. ♄. G. Native of South Africa, at Sternbergspruit and Stormbergen, Drège. Leaves much more divided; and the flowers much smaller than in *L. pinnatífida*, ex Benth.

Multifid-leaved Lyperia. Shrub procumbent.

21 L. foliolòsa (Benth. l. c.) shrubby, divaricately much branched; leaves small, fascicled, linear-cuneate, toothed or pinnatifid, canescent on both surfaces; flowers subracemose; tube of corolla about thrice as long as the calyx. ♄. G. Native of South Africa, in karroid places. Zartehopf and Langekloof, Ecklon; between the little Fish river and Brak river, Drège. Leaves 1 to 3 lines long, much narrower, less cut, and whiter than in *L. pinnatífida*, var. ε, which it much resembles.

Leafy Lyperia. Shrub.

22 L. cunea'ta (Benth. l. c.) shrubby, much branched; leaves minute, fascicled, bi-tridentate at apex, rarely quite entire, smoothish, or finely pubescent; flowers subracemose; tube of corolla 3-4 times longer than the calyx. ♄. G. Native of South Africa, on the Gauritz river, Drège. Leaves intermediate between those of *L. foliolòsa* and *L. atropurpùrea*. Differs from *L. pedunculàta* by the minute sessile leaves, and in the peduncles, which are seldom half an inch long.

Cuneate-leaved Lyperia. Shrub.

23 L. atropurpu'rea (Benth. l. c.) shrubby, much branched; leaves minute, fascicled, linear, quite entire, or rarely unidentate; flowers subracemose; tube of corolla 6-7 times longer than the calyx. ♄. G. Native of the Cape of Good Hope, in the Karroo and Karroid districts, Ecklon and Drège. Manùlea atropurpùrea, Banks, herb. Leaves glabrous or downy, 1-2 lines long. Corolla near an inch long. Capsule larger than in the neighbouring species. Leaves longer in the cultivated plant.

Dark-purple-flowered Lyperia. Shrub.

24 L. aspalathoi'des (Benth. l. c. p. 381.) shrubby, much branched; leaves minute, fascicled, oblong or linear, quite entire; flowers racemose; tube of corolla 2-3 times longer than the calyx. ♄. G. Native of South Africa, at Grassrugg and Krakakamma, in the Uitenhage district, Ecklon. Leaves smaller than in the preceding, and narrower than those of the following, and not imbricated. Corolla $\frac{1}{2}$ an inch long. Branches downy. Leaves glabrous.

Aspalathus-like Lyperia. Shrub.

25 L. microphy'lla (Benth. l. c.) shrubby, much branched; leaves minute, ovate, quite entire, fascicled in the axils: those of the younger branches imbricating in 4 rows; flowers few, towards the tops of the branches. ♄. G. Native of South Africa, in Karroid districts; Zwartkops river, Ecklon; near Garip, and between Addo and Zondag river, Drège. Manùlea microphýlla, Lin. syst. 569. suppl. 285. Thunb. fl. cap. 466. Leaves scarcely $\frac{1}{2}$ a line long. Flowers about half an inch long. Segments of the limb broad, obovate.

Small-leaved Lyperia. Shrub.

Cult. For culture and propagation see *Nycterínia*, p. 587.

LXXXV. MANU'LEA (from *manus*, the hand; in allusion to the divisions of the corolla.) Benth. in Hook. comp. 1. p. 381.—Nèmia, Berg.—Manúlea species, Lin., Thunb., and other authors. Selàgo species of authors.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted; segments linear or subulate. Corolla deciduous; tube elongated, glabrous or tomentose outside, erectish at top; limb 5-parted, equal, or the 4 superior segments are more approximate. Stamens didynamous, inclosed.—Herbs, rarely subshrubs, natives of South Africa. Leaves generally approximate at the base of the stems: floral ones small, bractea-formed. Flowers racemose; racemes sometimes simple and naked, or minutely bracteate; sometimes compound, composed of many-flowered

peduncles. Corolla usually orange-coloured or yellow, not becoming black on drying. Capsule glabrous.

* Racemòsæ. *Pedicels* 1-*flowered. Segments of corolla bifid, obcordate, obovate, or rarely oblong, obtuse. Leaves almost radical. Peduncles scape-formed, simple, naked, or minutely bracteate, racemose at apex.*

1 M.? nervòsa (E. Meyer, mss. Benth. l. c. p. 381.) leaves petiolate, obovate-oblong or ovate, quite entire, glabrous; calycine segments broad-lanceolate; segments of corolla broad, emarginate: the 2 upper ones combined beyond the middle, quite entire. ♄.? G. Native of South Africa, at Zilverfontein, in Namaqualand, Drège. The calycine segments are broader and thicker; tube of corolla shorter; limb larger, and less deeply cleft than in any other species. Perhaps a separate genus, ex Benth.

Nerved Manulea. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

2 M. silenoi'des (E. Meyer, mss. ex Benth. l. c.) annual; leaves petiolate, ovate, quite entire, or obscurely toothed; calycine segments linear, while young connected by a membrane, and exceeding the capsule in the fructiferous state; segments of corolla emarginately bifid. ☉. G. Native of South Africa, at Karakuis. More slender than *M. nervòsa*. Tube of corolla longer; limb smaller, with narrow segments.

Var. β, mìnor (E. Meyer, l. c.) ☉. G. Native of South Africa, between Micrenkasteel and Zwartdoorn river, in Clanwilliam; and Modderfontein, in Namaqualand.

Catchfly-like Manulea. Pl. 3 to 4 inches.

3 M. androsa'cea (E. Meyer, mss. ex Benth. l. c.) leaves obovate-oblong, glabrous, quite entire, or subcrenated; peduncles glabrous; racemes subcapitate; calycine segments oblong-linear, glabrous, equalling the capsule in length; tube of corolla 3 or 4 times longer than the calyx; segments of the limb obovate, retuse. ☉.? G. Native of South Africa, in sands near Noagas, Drège. Rather taller than *M. silenoìdes*. Leaves rather longer and narrower. Flowers nearly sessile, mostly forming a compact head, which is sometimes elongated in the manner termed proliferous, Benth.

Androsace-like Manulea. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

4 M. corymbòsa (Thunb. fl. cap. 472. Benth. l. c.) leaves ovate-oblong, obovate, quite entire and toothed, glabrous, or finely downy; peduncles scape-formed, sometimes furnished with 1-2 leaves; fructiferous racemes elongated; calycine segments linear, longer than the capsule, membranously ciliated at the base; segments of corolla broad, obovate.—Native of South Africa, in the Cape district. Flowers often reflexed. Tube of corolla 3 lines long; orifice hairy.

Corymbose-flowered Manulea. Pl. $\frac{1}{2}$ to 1 foot.

5 M. alti'ssima (Lin. syst. 569. suppl. 286. Thunb. fl. cap. 472.) leaves oblong-elliptic, lanceolate, or toothed, finely pubescent; peduncles very long, sometimes furnished with 1-2 leaves; fructiferous racemes oblong, dense; calycine segments longer than the capsule, clothed with scabrous pubescence.—Native of South Africa, in the Cape district. Peduncles or flowering stems often a foot and a half high, sometimes with one or two branches.

Very-tall Manulea. Pl. 2 feet?

6 M. longifòlia (Benth. l. c. p. 382.) leaves oblong-lanceolate, quite entire, or obscurely toothed, smoothish; floriferous branches elongated, branched, nearly naked, or few-leaved at the base; fruit-bearing racemes elongated; calyxes on short pedicels, with lanceolate, hispid segments, which rather exceed the capsules.—Native of South Africa, at Ebenezer, Drège. Perhaps a variety of *M. altíssima;* but besides the branched stems, narrow racemes, &c. the corolla appears to be much smaller.

Long-leaved Manulea. Pl. 2 feet?

7 M. bellidifòlia (Benth. l. c.) leaves obovate or oblong, a little crenated, glabrous, or finely pubescent; fructiferous racemes elongated; capsules remote; calycine segments lanceolate, nearly glabrous; segments of corolla oblong-ovate.—Native of South Africa, in the Uitenhage district, Katrivierberg, Addo, and Quaggsvlakte, Ecklon; Klipplaats river, Drège. It comes near *M. corymbòsa*, but is readily distinguished by the calyx. Leaves of *Béllis sylvéstris*.

Daisy-leaved Manulea. Pl. 2 feet.?

* * Thyrsiflòræ. *Racemes compound; pedicels fasciculately many-flowered. Segments of corolla entire, oblong, obtuse. Stems usually leafy*, Benth.

8 M. inca'na (Thunb. fl. cap. 468. Benth. l. c.) suffruticose, humble, much branched; leaves approximate at the base of the branches, petiolate, oblong, obtuse, toothed at apex, narrowed at the base, hoary on both surfaces; floriferous branches erect, nearly naked, racemose; peduncles very short, 1-3-flowered; calyxes hoary, scarcely shorter than the tube of the corolla. ♄. G. Native of South Africa, near the Cape. Habit of *Chænóstoma halimifòlium*. Calyx 3-4 lines long, cleft to the middle only. Divisions of corolla narrow-oblong, Benth.

Hoary Manulea. Shrub dwarf.

9 M. crassifòlia (Benth. l. c.) perennial; leaves nearly radical, oblong-elliptic or spatulate, obtuse, or bluntly subdentate, quite glabrous on both surfaces; stems nearly naked; racemes elongated, interrupted; flowers fascicled; segments of calyx connected by a membrane, lanceolate-linear at apex, about equal in length to the calyx; tube of corolla 2-3 times longer than the calyx. ♃. G. Native of South Africa, at Moogplats and Witbergen, Drège. Very smooth, and almost glaucous.

Thick-leaved Manulea. Pl. $\frac{1}{4}$ to 1 foot.

10 M. ju'ncea (Benth. l. c.) perennial, quite glabrous, glaucous; branches strict, erect, rushy, few-leaved; leaves oblong-linear, remotely toothed or pinnatifid: superior ones linear, quite entire; racemes compound, short, few-flowered; segments of the calyx subulate, exceeding the capsule a little; tube of corolla 4-5 times longer than the capsule. ♃. G. Native of South Africa, at Giftbergen, Drège. Racemes 2-7 inches long. Calyx slightly downy. Tube of corolla about $\frac{1}{2}$ inch long.

Rushy Manulea. Pl. 2 feet.

11 M. ri'gida (Benth. l. c.) erect, clothed with scabrous pubescence; branches divaricate; leaves lanceolate, deeply toothed or pinnatifid; racemes elongated; flowers subfasciculate, on very short pedicels; calycine segments subulate at apex, twice the height of the capsule; tube of corolla scarcely twice the length of the calyx. ♃.? G. Native of South Africa, in Clanwilliam district; Olifant's river and Brackfontein, Ecklon; Wupperthal, Drège. Stature of *M. júncea*, but branchy in the upper part. Leaves sessile, or embracing the stem, often erect, with the midrib very prominent. Pedicels 1-5-flowered. Corolla of *M. júncea*, ex Benth.

Stiff Manulea. Pl. 2 feet.

12 M. densiflòra (Benth. l. c.) perennial, branched; cauline leaves oblong-linear, almost quite entire, and toothed; racemes dense, subspicate; calycine segments subulate, exceeding the capsule a little; tube of corolla thickish. ♃. G. Native of North Africa, in Clanwilliam district; Olifant's river, and Brackfontein, Ecklon. Inflorescence of *M. júncea*, but different in habit and foliage.

Dense-flowered Manulea. Pl. 2 feet.?

13 M. parviflòra (Benth. l. c. p. 383.) perennial; stem erect, a little branched, few-leaved, pubescent; leaves radical, oblong-spatulate or obovate: cauline ones linear, quite entire or few-toothed; racemes elongated, slender, many-flowered, with

a downy rachis; calyx minute, with linear segments, shorter than the capsule, which is truncate. ♃. G. Native of South Africa, near the Omtata, in the Amaponda country, Drège. Nearly allied to *M. rùbra* and *M. leiόstachys*, but much more slender, and tube of the corolla scarcely 2 lines long.

Small-flowered Manulea. Pl. 1 to 2 feet. ?

14 M. LEIÓSTACHYS (Benth. l. c.) perennial; stem erect, pubescent at the base; leaves pubescent: lower ones on long petioles, oblong, toothed: superior ones oblong-spatulate or linear, few-toothed; racemes many-flowered, elongated, and are, as well as the top of the stem, quite glabrous; segments of calyx linear, obtuse, scarcely shorter than the capsule. ♃. G. Native of South Africa, at Cedarbergen, in Clanwilliam and Gnadenthal, Drège. Taller and more erect than *M. rùbra*, with more numerous and slender flowers, and readily distinguished by the glabrous and almost glaucous surface of the upper part of the plant, ex Benth.

Smooth-spiked Manulea. Pl. 1 to 2 feet.

15 M. RU`BRA (Lin. syst. p. 570. suppl. 286. Thunb. fl. cap. p. 472.) perennial; stem erect, decumbent at the base, villous; leaves oblong-lanceolate, dentate, narrowed at the base, downy on both surfaces, or villous; raceme interrupted, a little branched; calycine segments linear-oblong, obtuse, about a half shorter than the capsule; corolla 3-4 times longer than the calyx. ♃. G. Native of South Africa, in the Cape flats and downs, and Hottentotsholland; very common in Cape collections. Nèmia rùbra, Berg. fl. cap. 160. Manùlea angustifòlia, Link et Otto. pl. sel. hort. berol. 7. t. 20. This species is very variable in the number of flowers and degree of hairiness. Flowers half an inch long, or rather shorter, at first golden yellow, but at length of a reddish orange-colour.

Red-flowered Manulea. Fl. April, Sept. Clt. 1790. Pl. 1 to 2 feet.

16 M. OBOVA`TA (Benth. l. c.) perennial; stem decumbent at the base, pubescent; radical leaves ovate: cauline ones obovate or oblong, coarsely crenated or somewhat cut, pubescent on both surfaces; racemes elongated, many-flowered, a little branched; calycine segments linear, obtuse, rather shorter than the capsule; tube of corolla 2-3 times longer than the calyx. ♃. G. Native of South Africa, in Algoa Bay, Forbes and Ecklon. This plant varies in the breadth of the leaves. Flowers much more numerous than in *M. rùbra;* the corollas and capsules not half the size.

Obovate-leaved Manulea. Pl. decumbent.

17 M. TOMENTÒSA (Lin. symb. p. 569. mant. 420. Thunb. fl. cap. 470.) stem decumbent, humble, branched, tomentosely villous; leaves obovate or oblong, toothed, thick, densely tomentose on both surfaces; racemes short, dense; segments of calyx lanceolate-linear, villously tomentose, about equal in length to the capsule. ♃. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 322. bad. Link et Otto. pl. sel. hort. berol. 45. t. 19. good. Selàgo tomentòsa, Lin. spec. 877.—Plukn. phyt. t. 319. f. 2. Branches short and stiff. Racemes 2-3 inches long. Flowers at first greenish-yellow, but at length becoming orange-coloured (fig. 56).

FIG. 56.

Tomentose Manulea. Fl. May, Nov. Clt. 1744. Pl. 1 foot.

18 M. THYRSIFLÒRA (Lin. syst. p. 569. suppl. 285. Thunb. fl. cap. 471.) stem erect, flexuous, branched, finely pubescent; leaves obovate, coarsely toothed, smoothish; raceme panicle-formed, many-flowered; peduncles loosely cymose; calycine segments linear; tube of corolla slender, 3-4 times longer than the calyx; segments of the limb oblong-linear, obtuse. ♃. ? G. Native of South Africa, in the Cape district. Raceme or panicle above half a foot long. Lower cymes opposite: upper ones alternate, all loosely dichotomous. Corolla slender; tube about 3 lines long.

Thyrse-flowered Manulea. Pl. 1 foot.

19 M. PANICULA`TA (Benth. l. c.) erect, tall, branched, clothed with hoary pubescence; leaves ovate or obovate, coarsely crenated; panicle large; racemes numerous, leafy at base, many-flowered; peduncles cymose; calycine segments oblong-linear, obtuse; tube of corolla 3 times longer than the calyx; segments of the limb ovate. ♃. ? G. Native of South Africa, at Stormbergen, and near the Krai river. Stem thick and hard. Panicle a foot long; branches erect; cymes much denser than in *M. thyrsiflòra*, ex Benth.

Panicled-flowered Manulea. Pl. tall.

20 M. TURRI`TIS (Banks, herb. mss. ex Benth. l. c.) stem and branches erect, hairy; leaves petiolate, ovate or oblong, deeply toothed, narrowed at the base, hairy on both surfaces; racemes elongated, slender; flowers fascicled; segments of calyx linear, obtuse; tube of corolla slender, 5-6 times longer than the calyx; segments linear-oblong, obtuse. ♃. ? G. Native of South Africa, on rocks of Nieuwekloof, Drège; and in the Cape district. This species is remarkable for the white hairs of the stem. Racemes and flowers almost like those of *M. leiόstachys*, but the foliage and habit are very different. It has the appearance of being occasionally shrubby at the base, ex Benth.

Tower Manulea. Pl. 1 to 2 feet.

* * * ACUTIFLÒRI (from *acutus*, acute; and *flos*, a flower; in reference to the segments of the corolla being acute.) Benth. l. c. *Racemes compound, or almost simple. Segments of the corolla all, or the upper ones are subulately acuminated*, ex Benth.

21 M. STELLA`TA (Benth. l. c. p. 384.) stem ascending, pubescent, sparingly branched; leaves petiolate, broad-ovate, deeply serrated, pubescent; raceme elongated, compound, loose, many-flowered; calycine segments linear-subulate; tube of corolla 3 times longer than the calyx. ♄. ? G. Native of South Africa, on the mountains of the Cape and South Worcester districts, Ecklon. An elegant species, with slender, orange-coloured flowers, 3 to 7 on each peduncle.

Stellate Manulea. Pl. 1 to 2 feet. ?

22 M. EXALTA`TA (Banks, herb. mss. ex Benth. l. c.) stem erect, divaricately branched, pubescent; leaves petiolate, broad-ovate, deeply toothed, pubescent; racemes very slender, few-flowered, interrupted, leafy at the base; segments of calyx linear-subulate, but one half shorter than the tube of the corolla. ♃. ? G. Native of South Africa, in the Cape and Clanwilliam districts, Olifant's river, Brackfontein, and Berg-valei, Ecklon. Branches slender. Peduncles very short, 1-3-flowered, remote. Flowers half as large as those of *M. stellàta*.

Exalted Manulea. Pl. 2 to 3 feet?

23 M. CHEIRA´NTHUS (Lin. mant. 88. syst. 569. Benth. l. c.) leaves nearly radical, ovate, obovate, or oblong; peduncles scape-formed, erect, simple; racemes compound; tube of corolla hardly exserted: upper segments of the limb very long and subulate. ☉. or ♂. G. Native of South Africa, in various places in the western districts from the Cape to Gariep river in Namaqualand. M. rhynchántha, Link, enum. 2. p.

142. Nèmia cheiránthus, Berg. cap. 160. Lobèlia cheiránthus, Lin. spec. 1319. Cheiránthus Africànus, flore luteo, Comm. hort. 2. p. 83. t. 42. Corolla deep yellow. It is the great disproportion in length of the 5 divisions of the corolla of this species that was the origin of the generic name.

Hand-flower Manulea. Fl. June, Aug. Clt. 1795. Pl. 1 foot.

24 M. pusi'lla (E. Meyer, mss. ex Benth. l. c.) leaves nearly radical, obovate, or oblong, a little toothed; peduncles numerous, scape-formed, erectish; racemes nearly simple; tube of corolla hardly exserted; segments of the limb scarcely unequal, rather shorter than the tube. ♂. G. Native of South Africa, at Zilverfontein in Namaqualand. Very nearly allied to *M. cheiránthus*, but much smaller, and with very much smaller flowers.

Small Manulea. Pl. ¼ to ½ foot.?

25 M. Gariepi'na (Benth. l. c.) leaves nearly radical, ovate, obovate, or oblong; peduncles scape-formed, erect, a little branched; racemes compound, many-flowered; tube of corolla more than twice the length of the calyx; segments of the limb unequal. ♂.? G. Native of South Africa, on the plains of the Gariep, in Namaqualand. This species also comes near *M. cheiránthus*, but differs in the flowers. In both this and the preceding species the lower segments of the corolla are frequently, and sometimes perhaps all of them, obtuse, so as to connect the present section with the two first, ex Benth.

Gariep Manulea. Pl. 1 foot.?

† *Species described by Thunberg, which Mr. Bentham, who has written a monograph on the present tribe, has not been able to refer to any of the above.*

26 M. antirrhinoìdes (Lin. syst. 569. suppl. 286. Thunb. fl. cap. 469.) leaves ovate-lanceolate, serrated, villous; heads globose; stem erect. ♂.? G. Native of the Cape of Good Hope.

Snap-dragon-like Manulea. Pl. 1 foot.?

27 M. virga'ta (Thunb. fl. cap. 470.) leaves obovate, serrated, villous; branches panicled; flowers alternate, remote. ♂. G. Native of the Cape of Good Hope. Said to be nearly allied to *M. turrìtis*.

Twiggy Manulea. Pl. 1 foot.?

28 M. cephalòtes (Thunb. l. c.) leaves oblong, erosely serrated, glabrous; flowers subumbellate. ♂.? G. Native of the Cape of Good Hope.

Headed Manulea. Pl. 1 foot.?

29 M. hi'rta (Thunb. l. c. 471.) leaves obovate, doubly serrated, hairy; flowers axillary. ♂.? G. Native of the Cape of Good Hope.

Hairy Manulea. Pl. 1 foot.?

30 M. Thunbe'rgii; leaves oblong, serrated, tomentose; stem erect, hairy. ♂. G. Native of the Cape of Good Hope. Erìnus tomentòsus, Thunb. fl. cap. p. 478.

Thunberg's Manulea. Pl. 1 foot.?

Cult. For culture and propagation see *Nycterínia*, p. 587.

LXXXVI. ERI'NUS (ερινος, *erinos*, of Dioscorides, and *Erineon* of Pliny; derivation unknown.) Lin. gen. no. 771. Schreb. gen. no. 1034. Juss. gen. 100. ed. Usteri. p. 112. Gærtn. fruct. 1. p. 261. t. 55.—Ageràtum, Tourn. inst. 422.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, 5-parted, permanent. Corolla funnel-shaped; limb equal, 5-parted; segments obcordate. Stamens 4, didynamous; anthers small. Stigma of 2 roundish lobes. Capsule small, grooved on one side, 2-valved, 2-celled; valves bifid; dissepiment double, formed by the vent in edges of the valves. Seeds ovate, rugged from crowded tubercles.—Small, alpine, tufted plants. Radical leaves rosulate: cauline ones alternate. Stems simple; the side ones barren or surculose. Flowers alternate, each rising from the axil of a bractea, disposed in terminal simple racemes. Corollas purple or red.

1 E. alpi'nus (Lin. spec. 878.) leaves tufted, spatulate, deeply serrated, hairy; racemes sub-corymbose. ♃. H. Native of the alps of Europe; as of Germany, Switzerland, Pyrenees, South of France. Curt. bot. mag. 3. t. 310. Corollas purple.

Var. β, albiflòra; plant smaller; flowers white. ♃. H.—Barrel. icon. 1192.

Alpine Erinus. Fl. March, June. Clt. 1739. Pl. ¼ foot.

2 E. Hispa'nicus (Pers. ench. 2. p. 147.) plant smaller than the preceding, branched, and glabrous; leaves tufted, bluntly serrated; racemes elongated. ♃. H. Native of Spain, near Pancorvo, Clemente. Corollas purple.

Spanish Erinus. Fl. March, June. Clt. 1739. Pl. ¼ foot.

Cult. These are pretty little alpine plants, and are, therefore, very desirable for the decoration of rockwork or old walls, for which purposes no plants can be better fitted, as they grow in close tufts, and produce their numerous purple blossoms during most of the summer months. They are either propagated by division or by seeds; but they succeed best when allowed to scatter their seeds.

Tribe VII.

BUDDLIE'Æ (this tribe only contains the genus *Buddlèa.*) D. Don. in edinb. phil. journ. vol. 19. July, Oct. 1835. Calyx campanulate, 5-toothed. Corolla tubular; limb 4-5-cleft, equal, spreading. Stamens 4-5, nearly equal, inclosed; anthers composed of 2 parallel, distinct cells. Stigma clavate, 2-lobed. Capsule crustaceous; dissepiment constituted from the inflexed edges of the valves, inserted in the thick spongy placenta. Seeds angular, scobiform; testa loose, membranous. Albumen fleshy. Embryo almost the length of the seeds; cotyledons oblong, compressed; radical very short.—Shrubs with usually quadrangular branches. Leaves opposite, reticulately-veined. Flowers terminal, capitate, spicate, or panicled, usually orange-coloured. This tribe is analogous in habit to many *Verbenàceæ*.

LXXXVII. BUDDLE'A (named by Houston after Adam Buddle, who is often mentioned in Ray's synopsis. His dried collection of British plants is preserved in the British Museum.) Houst. phil. trans. et reliq. houst. t. 3. Lin. gen. no 140. Schred. gen. no. 184. Juss. gen. 118. ed. Usteri, p. 132. Gærtn. fruct. 1. p. 226. t. 49. H. B. et Kunth, nov. gen. amer. 2. p. 345.

Lin. syst. *Tetrándria, Monogýnia.* Character the same as that of the tribe.

§ 1. *Flowers axillary, verticillate.*

1 B. sessiliflòra (H. B. et Kunth, nov. gen. amer. 2. p. 345. t. 182.) branches terete, glabrous; branchlets and leaves clothed with hoary tomentum; leaves lanceolate, narrowed at both ends, acuminated, quite entire, nearly sessile; flowers axillary, glomerate. ♄. G. Native near the town of Mexico, at the altitude of 1160 hexapods. Leaves 2-3 inches long, rusty beneath. Glomerules 3-5-flowered, on short peduncles. Capsule obovate, pilose at top. Corolla twice as long as the calyx, yellow.

Sessile-flowered Buddlea. Tree.

2 B. scordioìdes (H. B. et Kunth, l. c. t. 183.) branches terete, and are, as well as the leaves, clothed with white tomentum; leaves sessile, oblong, obtuse, crenated, wrinkled, rusty beneath; flowers axillary, verticillate. ♄. G. Native along with the preceding. Habit of *Teùcrium scórdium*. Leaves greenish above, nearly an inch long, with the scent of sage. Whorls of flowers globose, size of a large pea. Corolla campanulate, yellow.

Scordium-like Buddlea. Shrub 3 to 4 feet. ?

3 B. VERTICILLA'TA (H. B. et Kunth, l. c. p. 346. t. 184.) branches terete, glabrous; branchlets and leaves clothed with hoary tomentum; leaves oblong, acute, narrowed at the base, on short petioles, rusty beneath, quite entire; flowers axillary, verticillate. ♄. G. Native of Mexico, between Acaguisotla and Chilpancingo, at the altitude of 680 hexapods. Branches clothed with stellate hairs. Leaves 2-3 inches long. Whorls of flowers globose, dense, size of a sloe. Corolla campanulate, pale yellow.

Whorled-flowered Buddlea. Shrub.

4 B. BRASILIE'NSIS (Jacq. fl. ex Spreng, syst. 1. p. 430. Graham, bot. mag. 2713.) branches tetragonal, clothed with white tomentum, as well as the under sides of the leaves; leaves oblong, running down the petioles, connate, crenately toothed; flowers axillary, crowded, verticillate; spicate toward the top. ♄. G. Native of Tropical Brazil. B. Neémda, Hort. Link, enum. 1. p. 125. Corollas orange-coloured (fig. 57).

FIG. 57.

Brasilian Buddlea. Fl. Oct. Nov. Clt. 1822. Shrub 10 feet.

5 B. DIVERSIFÒLIA (Vahl, symb. 3. p. 15.) branches divaricate, tetragonal; ? leaves broad-ovate, entire, or repand, glabrous on both surfaces, or the younger ones are clothed with rusty tomentum; glomerules axillary, 3-5-flowered, shorter than the leaves. ♄. S. Native of Java. Wall. cat. no. 6416. Benth. scroph. ind. p. 43. B. I'ndica, Lam. dict. 1. p. 508.

Diverse-leaved Buddlea. Fl. ? Clt. 1823. Shrub.

§ 2. *Flowers capitate; heads usually disposed in terminal panicles.*

6 B. GLOBÒSA (Lam. dict. 1. p. 507. ill. t. 69. f. 2.) branches sub-tetragonal, clothed with hoary tomentum, as well as the under sides of the leaves; leaves lanceolate, acuminated, petiolate, crenated; heads terminal, globose, pedunculate. ♄. H. Native of Chili, in humid places. Ruiz. et Pav. fl. per. 1. p. 52. t. 83. Curt. bog. mag. 174. Hope, acad. harl. 20. p. 417. t. 11. B. capitàta, Jacq. coll. 2. p. 332. icon. rar. t. 307.—Palquin, Feuill. per. 2. p. 71. t. 38. Leaves 6 inches long, on short petioles, which are connate at the base, wrinkled, glabrous, and green above. Heads large; corollas of an orange, or honey colour.

Globose-flowered Buddlea. Fl. May, June. Clt. 1774. Shrub 15 to 20 feet.

7 B. PERFOLIA'TA (H. B. et Kunth, l. c.) stem herbaceous; branches quadrangular, and are, as well as the leaves, tomentose; leaves hoary above, and rusty beneath, oblong-lanceolate, acute, crenated, connate at the base; heads terminal, globose. ♃. ? G. Native between lake Chalco and the city of Mexico, at the altitude of 1170 hexapods. Leaves nearly 3 inches long. Heads of flowers size of a sloe.

Perfoliate-leaved Buddlea. Pl. 2 to 3 feet.

8 B. CONNA'TA (Ruiz. et Pav. fl. per. 1. p. 52. t. 81. f. B.) branches tetragonal, clothed with white tomentum, as well as the under sides of the leaves; leaves lanceolate, connate at the base, crenated, acute, scabrous, and green above; heads terminal, pedunculate, globose. ♄. G. Native of Peru, about Chancay. Hook. in bot. mag. t. 2853. Stems numerous, straight. Bracteas linear-subulate. Corollas copper-coloured, with a villous mouth.

Connate-leaved Buddlea. Fl. May. Clt. 1826. Shrub 5 to 6 feet.

9 B. SPHÆRA'NTHA (Schlecht. et Cham. in Linnæa, 5. p. 104.) branches compressedly tetragonal, clothed with soft velvety tomentum, as well as the leaves; leaves connate at the base, sessile, lanceolate, acuminated, crenated, wrinkled, especially beneath; heads of flowers bibracteate, pedunculate, axillary. ♄. G. Native of Mexico, in Llanos de Perote. Leaves like those of sage, 2 or $2\frac{1}{2}$ inches long. Heads clothed with golden tomentum, as well as outsides of corolla. Corollas glabrous inside.

Round-flowered Buddlea. Shrub.

10 B. POLYCE'PHALA (H. B. et Kunth, l. c.) stem herbaceous, ? twining, tetragonal, and is, as well as the under sides of the leaves, clothed with rusty tomentum; leaves ovate, lyrate, acuminated, crenated, connate at the base; heads terminal, panicled, globose. ♃. ? G. Native of Peru, in woody places near Ayavaca, at the altitude of 1400 hexapods. Leaves lyrate and connate at the base, beset with rusty hairs above, 7-8 inches long. Heads size of a cherry. Corolla hardly longer than the calyx, clothed with rusty tomentum. Capsule obovate. Panicle simple. Said to be nearly allied to *B. connàta*, Ruiz. et Pav.

Many-headed Buddlea. Pl. twining.

11 B. PICHINCHE'NSIS (H. B. et Kunth, l. c. p. 347.) branches terete, glabrous; branchlets tetragonal, and under sides of leaves clothed with rusty tomentum; leaves lanceolate, acuminated, crenated, on short petioles; heads terminal, panicled, globose. ♄. G. Native on the eastern declivity of Mount Pichincha, between the cataract of Cantuna and the plains of Verdecuchu, at the altitude of 1780 hexapods. Leaves glabrous above, 2 inches or more long. Heads size of small cherries, disposed in a simple panicle. Corolla campanulate, a little longer than the calyx, with reflexed segments. Very like *B. globòsa*.

Pichincha Buddlea. Shrub.

12 B. DIFFU'SA (Ruiz. et. Pav. fl. per. 1. p. 52. t. 80. f. A.) subscandent; branches terete, clothed with yellowish tomentum, as well as the under sides of the leaves; leaves sub-petiolate, ovate, and subcordate, acute, pubescent above; peduncles axillary and terminal; flowers capitate. ♄. G. Native of Peru, on the margins of fields, where it is always in flower. Stems diffuse, much branched, yellowish. Leaves deflexed, quite entire, or furnished with one or two teeth, running into the petioles. Common peduncles solitary, twin, or tern, sessile. Stipulas reniform, reflexed. Corolla yellow, with a villous throat.

Diffuse Buddlea. Shrub diffuse.

13 B. RUGÒSA (H. B. et Kunth, l. c.) branches terete, and are, as well as the leaves, clothed with rusty tomentum, glabrous above, wrinkled, lanceolate, acute, crenated, on short petioles; heads terminal. ♄. G. Native of New Grenada, in rugged, frigid places in Parama de Saraguru, near Ona, at the altitude of 1500 hexapods. Branchlets tetragonal. Leaves 8 inches long, and $\frac{1}{2}$ an inch broad. Heads size of a sloe, disposed in a branched panicle. Corolla campanulate, a little longer than the calyx; segments roundish, reflexed.

Wrinkled-leaved Buddlea. Shrub.

14 B. INCA'NA (Ruiz. et Pav. fl. per. 1. p. 52. t. 80. f. B.) branches bluntly tetragonal, and are, as well as under sides of leaves, clothed with white tomentum; leaves oblong and lanceolate, crenated, petiolate; peduncles terminal, panicled; flowers capitate. ♄. G. Native of Peru, on the banks of rivers. Peduncles trichotomously divided. Corollas yellow. Stipulas semicircular.

Hoary Buddlea. Tree 30 to 40 feet.

15 B. E'LEGANS (Cham. et Schlecht, in Linnæa, 2. p. 594.) branches terete, tomentose; leaves lanceolate, acute, bluntly

toothed, wrinkled and glabrous above, but tomentose beneath; panicle terminal, leafy; heads hemispherical, terminal. ♄. G. Native of the South of Brazil, Sello. Branches obsoletely and bluntly tetragonal. Leaves running into the short petioles at the base: largest ones 5½ inches long. Panicle simple. Heads loose, about the size of cherries. Tube of corolla equal in height to the calycine segments; limb obtuse, expanded. Capsule cylindrical. The tomentum of the whole plant is rusty in the dried state.

Elegant Buddlea. Shrub.

§ 3. *Panicle terminal. Flowers spicate, racemose, glomerate, or solitary.*

16 B. INTERRU'PTA (H. B. et Kunth, l. c. p. 348.) branches terete, and are, as well as the under sides of the leaves, clothed with rusty tomentum, the upper surfaces being hoary; leaves oblong-lanceolate, acuminated, quite entire; spikes panicled, verticillate, spreading. ♄. G. Native of the Andes of Quito. Leaves 3 inches, or longer. Petioles 2 lines long. Panicle simple, half a foot long, clothed with rusty tomentum. Whorles of flowers globose, distant, size of large peas. Capsule nearly globose, glabrous, equal in length to the calyx.

Interrupted-spiked Buddlea. Shrub.

17 B. BETONICÆFÒLIA (Lam. ill. 1. p. 291. no. 1488.) branches obscurely tetragonal; leaves petiolate, ovate-oblong, crenulated, much wrinkled; spikes panicled, interrupted, verticillate. ♄. G. Native of Peru. Stems tubercled. Leaves tomentose beneath. Branches of panicle opposite; glomerules verticillate. Flowers sessile, pubescent.

Betony-leaved Buddlea. Shrub.

18 B. BULLA'TA (H. B. et Kunth, l. c.) branches tetragonal, smoothish; leaves lanceolate-oblong, acute, rounded at the base, crenated, wrinkled, glabrous, and shining above, but clothed with hoary tomentum beneath; panicle terminal, branched; flowers glomerate. ♄. G. Native along with the preceding. Leaves 4-5 inches long; petioles ½ an inch. Panicle trichotomous, sessile, 4 inches long, spreading; flowers glomerate at the tops of the branches, on short pedicels. Corolla a little longer than the calyx; segments roundish, spreading. Nearly allied to *B. incàna*, Ruiz. et Pav.

Blistered-leaved Buddlea. Shrub.

19 B. CORDA'TA (H. B. et Kunth, l. c. t. 185.) branches quadrangular, smoothish; branchlets and under surfaces of leaves clothed with rusty tomentum; leaves ovate, acute, cordate, crenulated, glabrous above; panicle terminal, spreading; flowers glomerate. ♄. G. Native of Mexico, in the valley of Guanaxato, near Marfil, at the altitude of 1050 hexapods. Leaves quite entire at the base, 3-4 inches long; petioles 1 inch long. Panicle sessile, trichotomous. Flowers glomerate at the tops of the branches.

Cordate-leaved Buddlea. Shrub, or small tree.

20 B. LONGIFÒLIA (H. B. et Kunth, l. c. p. 349. t. 186.) branches quadrangular, smoothish; branchlets and under sides of leaves clothed with rusty tomentum; leaves oblong-lanceolate, acuminated at both ends, serrately crenulated, glabrous above; panicle terminal; flowers glomerate. ♄. G. Native of the Andes of Peru, between Villa Montan and Santa Cruz, at the altitude of 1400 hexapods. Leaves 7-8 inches long, on short petioles, quite entire towards the base and apex. Panicle sessile, trichotomous. Flowers sweet-scented. Corolla a little longer than the calyx. Ovarium and stigma pilose.

Long-leaved Buddlea. Shrub 18 to 20 feet.

21 B. MÓLLIS (H. B. et Kunth, l. c.) branchlets tetragonal, clothed with hoary tomentum; leaves oblong-lanceolate, acute at both ends, undulately crenulated, glabrous above, but clothed with fuscescent tomentum beneath; panicle terminal, much branched, spreading; flowers glomerate. ♄. G. Native of the province of Quito, in exposed places near Hambato, at the altitude of 1390 hexapods. Leaves 6-7 inches long, on very short petioles. Panicle sessile, trichotomously branched; glomerules 6-10-flowered, on short peduncles. Corolla yellow, a little longer than the calyx.

Soft Buddlea. Tree 12 to 18 feet.

22 B. ACUMINA'TA (H. B. et Kunth, l. c. t. 187.) branches tetragonal, clothed with hoary tomentum; leaves ovate-oblong, acuminated, acute at the base, serrated, glabrous above, but clothed with rusty tomentum beneath; panicle terminal, spreading; flowers glomerate. ♄. G. Native of Mexico, near Santa Rosa de la Sierra, at the altitude of 1340 hexapods. Leaves 3-4 inches long, on short petioles. Panicle sessile, trichotomous. Flowers on short pedicels. Very nearly allied to the preceding, and differs from it principally in the leaves being shorter, acuminated, and serrated.

Acuminated-leaved Buddlea. Shrub.

23 B. DECU'RRENS (Schlecht, et Cham. in Linnæa, 5. p. 105.) branches tetragonal, clothed with golden tomentum; leaves elliptic, acuminated, running a long way into the petioles at the base, somewhat crenately serrated, glabrous above, but clothed with golden yellow tomentum beneath; panicles terminal, spreading; flowers glomerate. ♄. G. Native of Mexico, at San Andres. Allied to *B. acuminàta*, and is distinguished from it in the leaves running into the petioles at the base, in the tomentum being more loose, and as if it were furfuraceous or floccose, yellow in the young state.

Decurrent-leaved Buddlea. Shrub.

24 B. INTERME'DIA (H. B. et Kunth, l. c. p. 350.) branches tetragonal, pubescent; leaves oblong, acuminated at both ends, serrated, rather pilose above, but clothed with rusty tomentum beneath; panicle terminal, branched; branches short, spreading; flowers glomerate. ♄. G. Native along with the preceding. Leaves narrowed into the petioles, green, and beset with stellate hairs above, 2 or 2½ inches long. Panicle sessile, 2-3 inches long. Flowers sessile. Corolla twice as long as the calyx. An intermediate plant between *B. acuminàta* and *B. occidentàlis*.

Intermediate Buddlea. Shrub.

25 B. OCCIDENTA'LIS (Lin. spec. 162.) branches bluntly tetragonal; branchlets and under sides of leaves clothed with fuscescent tomentum; leaves oblong-lanceolate, acuminated at both ends, entire; spikes panicled; flowers glomerate. ♄. G. Native of Peru, near Guamcabamba, in temperate places, Humb. et Bonpl.; about Carthagena, Houston; West Indies, in gullies and other sheltered places. Gærtn. fruct. 1. p. 266. t. 49. Ruiz. et Pav. fl. per. 1. p. 53. t. 82. a. H. B. et Kunth, nov. gen. 2. p. 350. Lam. ill. t. 69. f. 1. Ophióxylon, Plukn. alm. 270. t. 210. f. 1. Branches twiggy. Leaves 5-6 inches long. Corolla white, ex Lin. et Bonpl., but yellow according to Ruiz. et Pav.; but the plant of Lin. and Ruiz. et Pav. are most probably the same, notwithstanding the difference in the colour of the flowers. Spikes disposed in a terminal panicle.

Western Buddlea. Shrub.

26 B. CALLICARPOÌDES (H. B. et Kunth, l. c.) branches a little compressed; branches and leaves clothed with hoary tomentum; leaves ovate-oblong, acuminated, sharply serrated; spikes panicled, sub-fastigiate; flowers glomerate. ♄. G. Native of Mexico, between Xalapa and the river Chachalacas, at the altitude of 700 hexapods. Leaves 3-4 inches long, beset with stellate pili above. Spikes disposed in terminal panicles; glomerules opposite, on short peduncles. Corolla a little longer than the calyx. This species is very nearly allied to *B. occidentàlis* and *B. Americàna*, but is distinguished from both by the size of the leaves, thinner, hoary tomentum; in the panicle

being 3 times shorter, and in the spikes being approximate and subfastigiate.

Callicarpa-like Buddlea. Shrub.

27 B. Americà'na (Lin. spec. 162. amœn. 5. p. 394.) branchlets rather compressed, clothed with hoary tomentum; leaves ovate, acuminated, narrowed at the base, serrately crenated, rather pilose above, but clothed with yellowish tomentum beneath; spikes panicled; flowers glomerate. ♄. G. Native of Peru, on the mountains, Humb. et Bonpl.; West Indies, Houston and P. Browne. Ruiz. et Pav. fl. per. 1. p. 53. t. 82. H. B. et Kunth, nov. gen. 2. p. 351.—Sloane, jam. 139. hist. 2. p. 29. t. 173. f. 1.—Browne, jam. p. 144. Branches subtetragonal. Leaves green above, 4-8 inches long, and nearly 2-4 broad; petioles an inch long. Spikes disposed in a terminal panicle, nearly a foot long; glomerules nearly globose, size of a sloe, on short peduncles. Corollas yellow. Browne says, that in Jamaica it is used in emollient baths and fomentations, and is thought to have all the properties of *Mullien.*

American Buddlea. Fl. Aug. Clt. 1826. Shrub 8 to 12 feet.

28 B. verbascifò'lia (H. B. et Kunth, l. c. p. 351.) branches tetragonal, compressed at the nodi, and are, as well as the under sides of the leaves, clothed with yellow tomentum; leaves glabrous above, ovate-elliptic, acute at both ends, doubly serrated; spikes panicled; flowers glomerate, dense. ♄. G. Native at the foot of Mount Quindiu, near Ibaque, at the altitude of 750 hexapods. Leaves 7-8 inches long, and 4-5 broad, on short petioles. Spikes about 3 inches long, thickness of the little finger, disposed in a terminal panicle, which is a span long, and diffuse. Corolla yellow, twice as long as the calyx; segments ovate, acute. Capsule ovate, obtuse. Very nearly allied to the preceding, but differs in the form of the leaves.

Mullien-leaved Buddlea. Shrub.

29 B. floribu'nda (H. B. et Kunth, l. c. p. 352.) branches tetragonal, smoothish; branchlets and under sides of leaves clothed with hoary tomentum; leaves smoothish above, ovate, acuminated, narrowed at the base, serrated; panicles terminal, branched, divaricate; flowers densely glomerate. ♄. G. Native of Mexico, near Tasco and Tehuilotepec, at the altitude of 920 hexapods. Leaves green above, 3 inches long; petioles 1-2 lines long. Nearly allied to *B. callicarpoides* and *B. Americàna.*

Bundle-flowered Buddlea. Shrub.

30 B. denta'ta (H. B. et Kunth, l. c.) branches terete; branchlets and under sides of leaves clothed with rusty tomentum; leaves glabrous above, ovate-oblong, acuminated, very narrow at the base, sharply toothed; spikes panicled; flowers glomerate. ♄. G. Native of humid places, on the banks of the Guayre, near the town of Caraccas, at the altitude of 416 hexapods, where it is called *Oja de Quesco* by the natives. Leaves 6-7 inches long; petioles half an inch long. Spikes 2-3 inches long, disposed in a terminal, sessile panicle; glomerules opposite, sessile. Corolla longer than the calyx. Capsule ovate. This species differs from all others in the toothed leaves.

Toothed-leaved Buddlea. Shrub 3 to 4 feet.

31 B. parviflò'ra (H. B. et Kunth, l. c. p. 353.) branches obsoletely tetragonal, striated, glabrous; branchlets pubescent; leaves ovate-oblong, acute, narrow at the base, crenately serrated, smoothish above, but clothed with fuscescent tomentum beneath; panicle terminal, trichotomously much branched, divaricate; flowers usually solitary, on short pedicels. ♄. G. Native of Mexico, on mountains near the town of Guernavaca. Leaves 2 inches long, on very short petioles, pubescent above in the young state. Panicle sessile, 6-8 inches long, with opposite branches and branchlets. Flowers small. Corolla white, longer than the calyx.

Small-flowered Buddlea. Shrub or Tree.

32 B. heterophy'lla (Lindl. bot. reg. 1259.) branches terete, woolly; leaves woolly beneath: lower ones cordate-oblong, acuminated, denticulated: superior ones ovate-lanceolate, almost quite entire; racemes terminal, panicled, thyrsoid, composed of few-flowered peduncles. ♄. G. Native of South America. Flowers yellow. Flowering shoots pendulous.

Variable-leaved Buddlea. Fl. May. Clt.? Shrub 10 to 12 feet.

33 B. microphy'lla (H. B. et Kunth, l. c.) branches terete, glabrous; branchlets and under sides of leaves clothed with rusty tomentum; leaves rather scabrous above, ovate-oblong, acute at both ends, serrated towards the apex; panicles terminal, coarctate; flowers glomerate. ♄. G. Native of Mexico, in arid places on the burning mount Jorullo, at the altitude of 430 hexapods. B. parvifò'lia, Willd. herb. no. 2918. Leaves hardly an inch long, on very short petioles. Glomerules size of peas. Corollas white.

Small-leaved Buddlea. Shrub.

34 B. abbrevia'ta (H. B. et Kunth, l. c.) branches terete, glabrous; branchlets tomentose: floriferous ones short; leaves oblong-lanceolate, acute at both ends, serrated, rather scabrous above, and clothed with rusty tomentum beneath; panicles terminal, spreading; flowers crowded. ♄. G. Native of Mexico, in grassy places between Pachuca and Real del Moran, at the altitude of 1340 hexapods; and between San Miguel del Soldado, and La Joya. Cham. et Schlecht, in Linnæa, 8. p. 246. B. brevifò'lia, Willd. herb. no. 2918. Branchlets downy, or clothed with rusty tomentum. Leaves green above, 1 to 1½ inch long; petioles 2-3 lines long. Panicle sessile, sub-trichotomously branched, oblong, 1½ inch long. Flowers on short pedicels, sweet-scented. Corolla white, twice as long as the calyx. Very nearly allied to the preceding.

Short-panicled Buddlea. Shrub 5 to 6 feet.

35 B. Sunda'ica (Blum. bijdr. p. 743.) leaves petiolate, lanceolate, acuminated at both ends, serrulated: upper ones quite entire, clothed with white tomentum beneath; spikes panicled, interrupted, terminal, elongated; flowers on short pedicels; glomerules generally 3-flowered. ♄. G. Native of Java, in woods, on the mountains in the province of Tjanjor. Said to be allied to *B. occidentàlis.*

Sunda Buddlea. Shrub.

36 B. acuminatíssima (Blum. bijdr. p. 743.) leaves on short petioles, lanceolate, acuminated, acute at the base, finely denticulated, clothed with white tomentum beneath: upper ones quite entire; spikes terminal, interruptedly glomerate; glomerules approximate, usually 3-flowered; flowers on short pedicels. ♄. S. Native of Java, on the mountains. Allied to *B. Sundàica,* and only differs from it in the leaves being more acuminated, and in the pedicels being shorter.

Very-acuminated-leaved Buddlea. Shrub.

37 B. Missiò'nis (Wall. cat. no. 6405. Benth. scroph.) branches pubescent; leaves oblong, narrowed at both ends, quite entire, coriaceous, glabrous and smooth above, and pubescent beneath; panicle ovate-pyramidal, many-flowered; racemules opposite; glomerules nearly sessile; corollas slender, glabrous. ♄. G. Native of the Peninsula of India, at Wynad.

Mission Buddlea. Shrub.

38 B. panicula'ta (Wall. in Roxb. fl. ind. ed. Car. 1. p. 412.) arboreous; branches terete, divaricate, densely tomentose; leaves lanceolate-oblong, quite entire, rounded or cuneated at the base, thick, wrinkled, clothed with rusty tomentum beneath, or on both surfaces while young; racemes short, dense, a little branched; flowers sessile; glomerules dense, sub-pedicellate. ♄. G. Native of Nipaul. Leaves 4-5 inches long. Petioles

connected by an elevated line running across the branch. Racemes short and stout, the lowermost ones from the terminal axils, about 2-3 inches long, the others shorter and more simple, until they become a terminal, elongated raceme; the whole forming an elegant, crowded, attenuated, sessile panicle or thyrse. Flowers fragrant, white, each glomerule furnished with a pair of elongated, subulate bracteas, besides some smaller ones under the exterior calyxes. Tube of corolla 3 times longer than the calyx.

Panicled-flowered Buddlea. Fl. Feb. April. Shrub or Tree.

39 B. ACUMINA'TA (Poir. suppl. 1. p. 745.) branches subquadrangular, downy; leaves ovate, acuminated, loosely toothed, downy beneath; racemes terminal, very short, tomentose, panicled. ♄. G. Native of India, ex herb. Juss. Leaves sub-petiolate: lower ones dilated at the base, glabrous above, almost quite entire. Racemes panicled, clothed with rusty tomentum. Corolla downy, with an elongated tube, and short segments. Capsule small, ovate.

Acuminated-leaved Buddlea. Shrub.

§ 4. *Racemes or spikes simple, or a little branched at the base, interrupted.*

40 B. THYRSOI'DEA (Lam. ill. 1. p. 291. no. 1489. encyc. bot. 9. p. 744.) branches terete, yellowish, downy at top; leaves lanceolate-linear, acuminated, serrated, sessile, attenuated at the base, woolly beneath and shining above; raceme thyrsoid, spicate, terminal, tomentose. ♄. G. Native of the South of Brazil; Rio Grande do Sul; Monte Video plentiful. Cham. et Schlecht, in Linnæa, 2. p. 594. B. salicifòlia, Vahl, symb. 3. p. 14.—A very elegant shrub. Leaves 4-5 inches long. Capsules ovate, pedicellate. Floral leaves quite entire. Corolla twice as long as the calyx. Flowers glomerate, nutant.

Thyrsoid-flowered Buddlea. Fl.? Clt. 1823. Shrub 5 to 6 feet.

41 B. SPICA'TA (Ruiz. et. Pav. fl. per. 1. p. 53. t. 81. f. A.) leaves ovate, acute at both ends, serrated; spikes very long, simple. ♄. G. Native of Peru, in arid places of Munna. Branches bluntly tetragonal, clothed with white tomentum. Leaves petiolate. Flowers verticillate. Bracteas subulate. Corolla yellow, tomentose outside; throat hispid.

Spicate-flowered Buddlea. Shrub.

42 B. GRANDIFLÒRA (Cham. et Schlecht, in Linnæa, 2. p. 596.) branches bluntly tetragonal, tomentose; leaves narrow-lanceolate, bluntly toothed, wrinkled and tomentose on both surfaces; raceme terminal, leafy; peduncles 3-flowered. ♄. G. Native of the South of Brazil, in the provinces of Monte Video and Rio Grande do Sul, in many places, Sello. Habit of *B. élegans*. Leaves $5\frac{1}{2}$ inches long, and 9 lines broad. Peduncles rising from the axils of the leaves of the raceme; flowers sessile on the tops of the peduncles. Corolla tomentose, with lanceolate, obtuse, erect segments; tube length of calyx.

Great-flowered Buddlea. Shrub.

43 B. STACHYOI'DES (Cham. et Schlecht, in Linnæa, 2. p. 597.) branches tetragonal: angles a little winged, tomentose; leaves sessile, cuneated at the base, quite entire, coarsely toothed, tomentose beneath, downy above; raceme terminal; floral leaves reflexed. ♄. G. Native of the South of Brazil, Sello. Leaves 6 inches long, and $2\frac{1}{2}$ inches broad, clothed with stellate down above, sessile, and rather connate at the base. Inflorescence exactly of *Stàchys Germánica*, 2-3 inches long, reflexed. Lower flowers subverticillate. Corolla twice as long as the calyx; with oval-obtuse segments. Capsule elliptic.

Stachys-like-racemed Buddlea. Shrub erect.

44 B. BRACHIA'TA (Cham. et Schlecht, in Linnæa, 2. p. 599.) scandent; branches brachiate, almost terete, smoothish; leaves ovate, obsoletely and unequally toothed, glabrous above, but clothed with fine tomentum beneath; racemes or spikes slender, terminal and axillary; glomerules distinct. ♄. ◡. G. Native of tropical Brazil, Sello. Branches compressed at the nodi. Leaves 3 inches long, and 1 to $1\frac{1}{2}$ broad, tapering into the petioles at base, acute or subacuminated. Spikes slender, 6 inches long, falsely verticillate, sessile; peduncles 3-flowered, opposite, propped by reflexed bracteas. Corolla a little longer than the calyx, with ovate-acute segments. Tomentum rusty. Ovarium glabrous.

Armed Buddlea. Shrub climbing.

45 B. MACROSTA'CHYA (Benth. in Wall. cat. no. 6407. scroph. ind. p. 42.) branches acutely tetragonal, or winged, hardly tomentose; leaves oblong-lanceolate, narrowed at both ends, serrated at apex, glabrous above, but clothed with hoary tomentum beneath; spikes interrupted, simple, tomentose; flowers sessile: lower ones glomerate: superior ones scattered. ♄. G. Native of Silhet.

Long-spiked Buddlea. Shrub.

46 B. CUNEA'TA (Cham. et Schlecht, in Linnæa, 8. p. 17.) branches obsoletely angular, tomentose, densely leafy, strict; leaves opposite, rarely 3 in a whorl, erect, sessile, cuneate-obovate, acutely acuminated, coarsely toothed or crenated in front, rather wrinkled, glabrous and shining above, but clothed with white tomentum beneath; heads of flowers disposed in a spicate raceme, which is terminal, continuous, and simple or branched at the base; bracteas equal in length to the heads; limb of corolla glabrous. ♄. G. Native of Brazil, Sello. Largest leaves 2 inches long, and 1 broad. Heads 4-12-flowered, on short peduncles, or nearly sessile. Flowers usually tetrandrous, but in luxuriant plants pentandrous and hexandrous.

Cuneate-leaved Buddlea. Shrub 2 to 3 feet.

47 B. VE'TULA (Cham. et Schlecht, in Linnæa, 8. p. 18.) branches bluntly tetragonal, loose, densely leafy, tomentose upwards; leaves sessile, loose, lanceolate, acute or obtuse, narrowed at the base: lower ones of the branches cuneate-obovate; very blunt, finely and obsoletely serrated, wrinkled, glabrous and shining above, and tomentose beneath; heads of flowers racemose; raceme leafy, terminal; limb of corolla tomentose outside. ♄. G. Native of Brazil, Sello. Heads dense-flowered, nearly globose. Tube of corolla hardly exceeding the calycine teeth.

Old Buddlea. Shrub.

48 B. CESTRIFLÒRA (Cham. et Schlecht, in Linnæa, 8. p. 20.) branches tetragonal, tomentose; leaves dilated into a connately funnel-shaped base, lanceolate-acute, crenated, membranous, obsoletely wrinkled, tomentose beneath, at length naked above; heads racemose; flowers loose, pedicellate; racemes terminal, leafy; teeth of calyx acuminated, elongated; corolla exceeding the calyx, tomentose outside and glabrous inside. ♄. G. Native of Brazil, Sello. Leaves 7 inches long. Raceme simple or branched at the base; heads 6-10-flowered, pedunculate.

Cestrum-flowered Buddlea. Shrub.

49 B. DI'SCOLOR (Roth, nov. spec. 83.) arboreous; branches almost terete, compressed at the nodi, tomentose; leaves lanceolate, acuminated, subserrated, glabrous above, pale beneath, or clothed with white tomentum; spikes interrupted, slender, simple or panicled; bracteas lanceolate-linear; flowers nearly sessile, subglomerate; capsules reflexed. ♄. G. Native of Nipaul; Oude; Rungpur, &c. Wall. cat. no. 1491. B. salicìna, Lam. ill. 1. p. 291.? Blum. bijdr. p. 742. B. Neémda, β, Benth. in Wall. cat. no. 6401. H. O. Leaves green above. Capsule glabrous.?

Two-coloured-leaved Buddlea. Shrub.

50 B. NEE'MDA (Hamilt. in Roxb. fl. ind. ed. car. 1. p. 411.) arboreous; branches almost terete, compressed at the axils, tomentose; leaves lanceolate, subserrated, clothed with fine down above and white tomentum beneath; spikes interrupted, simple;

bracteas ovate-lanceolate; flowers sessile, glomerate; capsules erectly spreading. ♄. S. Native of the Peninsula of India, Oude, Penang, Wall. Deyra Dhoun, Royle. B. serrulàta, Roth, nov. spec. p. 82. B. subserràta, D. Don, prod. fl. nep. p. 92. Leaves 4-8 inches long, on short petioles, which are joined by a connecting membrane. Spike long, with generally a small one on each side at the base. Flowers small, pure white, generally 3-fold. Capsule ovate-oblong. The specific name is an alteration of the vernacular name, *Nimda*, of the plant in Chittagong.

Neemda Buddlea. Fl. June, July. Clt. 1824. Shrub 15 feet.

51 B. Madagascarie'nsis (Vahl, symb. 3. p. 14.) arboreous; branches nearly terete, densely tomentose; leaves petiolate, ovate-lanceolate, almost quite entire, rounded at the base, thick, wrinkled, glabrous above, but densely clothed with tomentum beneath; racemes almost simple; peduncles scattered, 3-5-flowered. ♄. G. Native of Madagascar. Hook. bot. mag. t. 2824. Lam. ill. 1. t. 69. f. 3. Tomentum ferruginous. Leaves 2 inches long, petiolate. Racemes furnished with one or two small ones at the base. Corolla orange-coloured, with roundish segments.

Madagascar Buddlea. Fl.? Clt. 1824. Shrub 10 to 12 feet.

52 B. cri'spa (Benth. in Wall. cat. no. 6494. scroph. ind. 43.) branches divaricate, densely tomentose; leaves ovate-lanceolate, crenately curled: lower ones cordate at the base: superior ones rounded, all thick and wrinkled, clothed with soft tomentum on both surfaces; racemes short, dense, a little branched; flowers sessile; glomerules dense, subpedicellate. ♄. G. Native of Oude and Silhet, Wall.; mountains of Syen, Royle.

Curled-leaved Buddlea. Shrub.

53 B. Asia'tica (Lour. coch. p. 72.) leaves lanceolate-linear, wrinkled, glabrous, subserrated; spikes long, terminal, full. ♄. G. Native of Cochinchina. Branches ascending. Leaves subserrated. Flowers white, disposed in a long uninterrupted spike. Segments of calyx subulate. Corolla campanulate, with rounded segments. Stigma longish, bifid. Capsule oblong.

Asiatic Buddlea. Shrub 3 feet.

54 B. densiflòra (Blum. bijdr. 743.) leaves on short petioles, lanceolate, acuminated, acute at the base, acutely serrulated: upper ones quite entire, with revolute edges, canescent, clothed with white tomentum beneath; racemes terminal, solitary, or by threes; pedicels many-flowered, drooping. ♄. G. Native of Java, on the higher parts of Mount Tjeremai, where it is called *Sambung-luna*. Allied to *B. salicifòlia* and *B. serrulàta*.

Dense-flowered Buddlea. Shrub.

* * * *Species natives of the Cape of Good Hope.*

55 B. salvifòlia (Ait. hort. kew. 1. p. 150.) stem tetragonal, tomentose; leaves ovate-lanceolate, acute, cordate, crenated, wrinkled, tomentose beneath; panicle composed of interrupted racemes. ♄. F. Native of the Cape of Good Hope. Jacq. hort. schœnb. 1. p. 12. t. 28. Lantàna salvifòlia, Lin. spec. 875. Mill. dict. no. 12. Stipulas 2, roundish. Thyrse terminal. Flowers fascicled. Corolla tomentose, with a red tube and pale limb; throat bearded. Ovarium beset with stellate hairs.

Sage-leaved Buddlea. Fl. Aug. Sept. Clt. 1760. Shrub 3 feet.

56 B. sali'gna (Willd. enum. 1. p. 159.) leaves linear-lanceolate, quite entire, with revolute edges, tomentose beneath; corymbs terminal, branched, coarctate; flowers fascicled. ♄. G. Native of the Cape of Good Hope. B. salicifòlia, Jacq. hort. schœnbr. 1. p. 12. t. 29. Schultes, obs. bot. p. 23. Leaves on short petioles, sinuately undulated, with scabrous margins. Flowers on short pedicels. Corolla white, with a square red spot at the base, sometimes purplish. Stamens exserted. Scent of plant heavy.

Willowy-leaved Buddlea. Shrub.

57 B. virga'ta (Thunb. prod. 1. p. 30. fl. cap. 1. p. 542.) leaves linear-oblong, obtuse, entire; racemes terminal. ♄. G. Native of the Cape of Good Hope, in Carro, beneath Roggeveld, about river banks. Willd. spec. 1. p. 633. Habit of *Hyssòpus*. Branches filiform, and are, as well as the leaves, clothed with white tomentum. Leaves from a nail to an inch long.

Twiggy Buddlea. Shrub 4 to 6 feet.

58 B. incómpta (Lin. supp. 123. Thunb. l. c.) leaves in fascicles, ovate, hoary; racemes terminal; branches flexuous, stiff. ♄. G. Native of the Cape of Good Hope, on the top of Roggeveld. Leaves silky, entire, minute.

Undecked Buddlea. Shrub 1 foot.

† *Species hardly known.*

59 B. terna'ta (Lour. coch. p. 72.) leaves ternate, acuminated; peduncles 1-flowered. ♄. G. Native of Cochinchina. Poir. suppl. 1. p. 746. Leaves lanceolate, serrated. Flowers white, on axillary, solitary peduncles. Segments of corolla ovate. Stigma bifid. Nectarium pilose. Capsule 2-celled, many-seeded.

Ternate-leaved Buddlea. Shrub 2 feet.

60 B. volu'bilis (Lam. ill. 1. p. 291. no. 1492.) leaves linear, acute, quite entire; cymes axillary, clothed with rusty tomentum; stem twining. ♄. ◠. S. Native of the Island of Bourbon. Poir. suppl. 1. p. 745. Corolla with a very short tube, and deep 4-parted limb.

Twining Buddlea. Shrub twining.

Cult. The species of *Buddlèa* are all showy when in blossom; they are, therefore, worth cultivating for ornament. The *B. globòsa* and *B. salvifòlia* are the only species ascertained to be almost hardy; they requiring only a little protection in severe frosts. A light rich soil answers them best; and cuttings of all strike root readily in mould, under a hand-glass; those of the stove species in heat. All the species are abundant flowerers; and the flowers of all are sweet-scented.

Tribe VIII.

CALCEOLARIE'Æ. Calyx 4-parted, valvate in æstivation. Corolla irregular, bilabiate. Stamens 2-4, inserted in the throat. Cells of anthers diverging at the base, and confluent at apex. Stigma undivided, capitate. Capsule membranous; dissepiment constituted from the inflexed margins of the valves; placentas 2, stipitate, or adnate to the dissepiment. Seeds minute, with a mucrone-formed umbilicus; testa membranous. Albumen fleshy. Embryo terete, about half the length of the albumen.—Herbs or subshrubs, natives of South America and the Cape of Good Hope, usually clothed with glandular pubescence. Leaves opposite, generally undivided, but sometimes pinnate and pinnatifid. Flowers terminal, usually corymbosely panicled or racemose, generally yellow, rarely purple. This very natural tribe forms an osculant group between the *Scrophularineæ* and the *Gesneriàceæ*, in the æstivation of the calyx being valvate; in the valves of the capsule being revolute and placentiferous; in the very minute seeds, furnished with a longer umbilical funicle; in habit, inflorescence, and opposite, usually wrinkled, crenated leaves, and albuminous seeds. The *Calceolària petio-*

làris, and some others, have sometimes irregular tubular corollas.

LXXXVIII. CALCEOLA'RIA (from *calceolus*, a little slipper; in allusion to the form of the corolla.) Feuill. per. 3. p. 12. t. 7. Lin. syst. p. 61. Schreb. gen. no. 39. Gærtn. fruct. 1. p. 290. t. 62. Juss. gen. p. 120. ed. Usteri, p. 135. H. B. et Kunth, nov. gen. amer. 2. 378. Lam. ill. t. 15.

Lin. syst. *Diándria, Monogýnia.* Calyx 4-parted, nearly equal; upper segment generally a little broader than the rest. Corolla with a very short tube; limb bilabiate; upper lip short, truncately rounded, entire: lower lip large, concave, slipper-shaped. Stamens 2, inserted in the base of the tube, short; cells of anthers divaricate (one of which is sometimes sterile.) Stigma simple. Capsule ovate-conical, propped by the permanent calyx, 2-celled, septicidally 2-valved; valves bifid; placentas adnate to the dissepiment. Seeds sulcately angular.—Shrubs, subshrubs, or herbs, rarely stemless. Leaves opposite, sometimes 3 in a whorl, rarely alternate. Peduncles 1 or many-flowered, alar, axillary or terminal, corymbose. Corolla generally yellow, rarely purple.

§ 1. *Leaves opposite, pinnate or pinnatifid. Stems leafy. One of the cells of the anthers separated from the transverse connective: the other sterile or wanting. Herbaceous plants.*

1 C. pinna'ta (Lin. syst. 65. mant. 171. act. holm. 1770. p. 286. t. 8.) herbaceous, clothed with clammy hairs; leaves pinnate; leaflets or segments toothed: lower ones pinnatifidly toothed; peduncles twin or tern, panicled. ⊙. H. Native of Peru, in humid places. Curt. bot. mag. t. 41. Vahl, enum. 1. p. 189. exclusive of the synonymes. Plant much branched. Leaves petiolate. Calycine segments ovate-cordate, much spreading. Corolla sulphur-coloured. Ovarium hairy.

Pinnate-leaved Slipperwort. Fl. July, Sept. Clt. 1773. Pl. 2 to 3 feet.

2 C. chelidonioi'des (H. B. et Kunth. nov. gen. 2. p. 379.) herbaceous, hairy; leaves pinnate at base and pinnatifid at top, rather hispid above, and glabrous beneath; leaflets pinnatifidly cut, sharply serrated, glandularly ciliated; lateral flowers twin, and terminal ones subumbellate. ⊙. H. Native at the foot of Mount Javirac, near Quito, at the altitude of 1500 hexapods. C. concínna, Willd. herb. Erect, dichotomously branching; branches tetragonal. Leaves subpetiolate. Corolla yellow, glabrous, size of those of *C. pinnàta*. Ovarium glabrous.

Swallow-wort-like Slipperwort. Pl. 2 to 3 feet.

3 C. gra'cilis (H. B. et Kunth. l. c. p. 379.) herbaceous, clothed with clammy hairs; lower leaves pinnate or ternate: superior ones nearly simple, serrated, hispid above, but beset with white hairs beneath; lateral flowers axillary, twin: terminal ones subcorymbose. ⊙. H. Native of Quito, on the banks of the river San Pedro, near Chillo, at the altitude of 1340 hexapods. Herb slender, dichotomously branched; young branches red. Leaves petiolate. Corolla pale yellow. Ovarium glabrous.

Slender Slipperwort. Pl. 1 foot.

4 C. tripartì'ta (Ruiz. et Pav. fl. per. 1. p. 14. t. 22. f. a.) herbaceous, hairy; leaves tripartite: lobes ovate, serrated; peduncles terminal, corymbose; pedicels 5-6. ⊙. H. Native in the groves of Panatahua. Stem terete, branched. Leaves petiolate; the middle lobe the largest. Corolla pale yellow.

Tripartite-leaved Slipperwort. Pl. 1 to 2 feet.

5 C. scabiosæfòlia (Rœm. et Schultes, syst. 1. p. 185.) prostrate; lower leaves pinnate: superior ones pinnatifid, 3-lobed or simple: the terminating segment always the largest; peduncles terminal, corymbose. ♃. F. Native of Peru. Sims, bot. mag. 2405. C. heterophýlla, Willd. enum. 1. p. 29. C. pinnàta, Ruiz. et Pav. fl. per. 1. p. 14. t. 19. Calceolària foliis scabiosæ vulgàris, Feuill. per. 3. t. 12. f. 1. C. pinnàta, β, Willd. spec. 1. p. 106. Plant rather hairy. Corollas pale yellow: lower lip large, ventricose.

Scabious-leaved Slipperwort. Fl. May, Oct. Clt. 1822. Pl. trailing.

§ 2. *Leaves entire or toothed, radical, usually rosulate. Peduncles scape-formed. Herbaceous plants.*

6 C. plantagi'nea (Smith, icon. ined. 1. t. 2. Vahl, enum. 1. p. 172. exclusive of the syn. of Jovellàna scapiflòra) stemless, pubescent; leaves radical, ovate, rhomboid, rosulate, serrated, nerved; scapes generally 2-3-flowered, pilose; lower lip of corolla large, hemispherical: upper one small, bifid. ♃. F. Native of the Straits of Magellan; and of Chili, on the Cordilleras, &c. Hook. bot. mag. 2805. C. biflòra, Lam. ill. p. 52. Corollas yellow.

Plantain-like Slipperwort. Fl. Aug. Clt. 1826. Pl. 1 foot.

7 C. na'na (Smith, icon. ined. 1. t. 1.) nearly stemless; leaves oblong-ovate, almost quite entire; peduncles scape-formed, 1-flowered; upper lip of corolla large, pendulous. ♃. F. Native of the Straits of Magellan. C. uniflòra, Lam. ill. t. 15. f. 3. Plant decumbent. Leaves hardly ½ an inch long. Peduncles solitary or numerous, 2 inches high. Corolla large, yellow.

Var. β; leaves larger, a little toothed; flowers larger. ♃. H. Native along with the species.

Dwarf Slipperwort. Pl. decumbent.

8 C. Fothergi'llii (Ait. hort. kew. 1. p. 30. t. 1.) leaves spatulate, quite entire, pilose above; peduncles scape-formed, 1-flowered. ♃. F. Native of the Falkland Islands. Lam. ill. t. 15. f. 1. Curt. bot. mag. t. 348. Cav. icon. 5. t. 442. f. 1. Tratt. tab. t. 405. C. Neeàna, Spreng. syst. 1. p. 44. Stem a little divided near the root. Leaves hardly an inch long, connate at the base. Peduncles solitary or twin, villous, clammy. Segments of calyx ovate-acute. Upper lip of corolla yellowish: lower lip 4 times the size of the upper ones, sulphur coloured, having the margins spotted with red. Cavanilles's plant is said to have the leaves crenated.

Fothergill's Slipperwort. Fl. May, Aug. Clt. 1777. Pl. ¼ to ½ foot.

9 C. polyrrhi'za (Cav. icon. 5. p. 25. t. 441.) plant almost stemless; leaves cuneiform, serrated a little, acute; peduncles scape-formed; pedicels umbellate. ♃. F. Native of the Falkland Islands, in humid places. Under each umbel of flowers there are 2 small leaves. Segments of the calyx ovate, each furnished with 3 stripes. Corolla yellow, dotted with red: lower lip almost an inch long, incurved at top.

Many-rooted Slipperwort. Pl. ½ to 1 foot.

10 C. monta'na (Cav. icon. 5. p. 27. t. 443. f. 1.) plant almost stemless; leaves obovate, unequally toothed, wrinkled, hoary; scape dichotomous. ♃. F. Native of the Cordillera of Chili. Scapes 1½ foot high, reddish, twice bifid, with a solitary 1-flowered pedicel in the second fork; lateral peduncles 4-flowered. There are 2 opposite small leaves under each division. Calycine segments 3-nerved.

Mountain Slipperwort. Pl. 1½ foot.

11 C. pinifòlia (Cav. icon. 5. p. 26. t. 442. f. 2.) plant almost stemless; leaves linear, with revolute edges; peduncles scape-formed, dichotomous; pedicels umbellate. ♃. F. Native on the Cordillera of Chili. Root thick. Stem hardly an inch, divided near the base. Leaves approximate, an inch long. Peduncles 2 inches long, twice bifid, furnished with 2 leaves under each division; middle pedicels 1-flowered: lateral ones 2-flowered. Corolla yellow; lower lip narrowed to the base.

Pine-leaved Slipperwort. Pl. ½ foot.

§ 3. *Leaves entire or toothed: radical ones broad, usually rosulate. Stems few-leaved, corymbosely many-flowered. Herbaceous plants.*

12 C. racemòsa (Cav. icon. 5. p. 29. t. 448.) leaves oblong, toothed, wrinkled, tomentose; peduncles terminal, bifid; pedicels racemose. ♃. F. Native of the Falkland Islands. Stems terete, tomentose, few-leaved. Radical leaves numerous, rosulate. Lateral peduncles bifid, 2-flowered, with the middle pedicel 1-flowered. Lower lip of corolla ovate.

Racemose-flowered Slipperwort. Pl. $\frac{1}{2}$ to 1 foot.

13 C. ca'na (Cav. icon. 5. p. 27. t. 443. f. 2.) leaves cuneiform, hoary, tomentose, quite entire; stems ascending; peduncles dichotomous. ♃. F. Native of Peru. Root thick. Leaves densely tomentose, 2 a little above the others. Corollas small, yellow: lower lip narrowed to the base.

Hoary Slipperwort. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

14 C. crenatiflòra (Cav. icon. 5. p. 28. t. 446.) leaves obovate-oblong, unequally serrated, rather tomentose; lower lip of corolla crenated. ♃. F. Native of Chili, in humid places. Hook, bot. mag. 3255. Lindl. bot. reg. 1609. C. anómala, Pers. ench. 1. p. 16. C. péndula, Sweet, brit. fl. gard. t. 155. Stem bifid at top. Radical leaves many: cauline ones few: 2 lower ones subpetiolate: superior ones sessile. Pedicels racemose, 1-flowered. Calycine segments ovate. Corolla yellow; lower lip spotted with red. Capsule papery, fulvous. There are several hybrids between this and other species. See Sweet, fl. gard. 262.

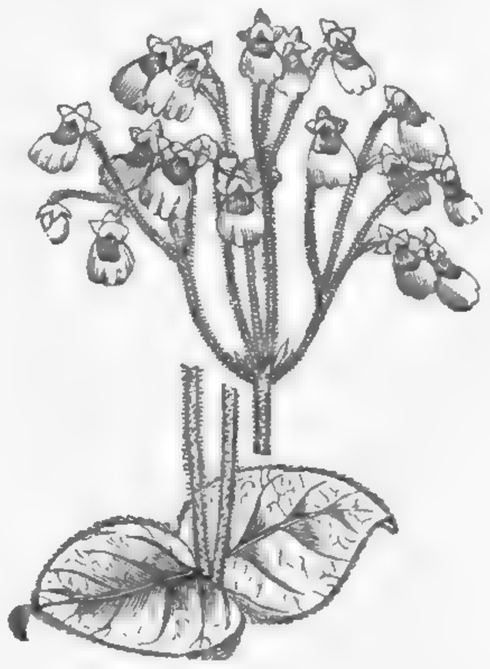
Notched-flowered Slipperwort. Pl. $1\frac{1}{2}$ foot.

15 C. para'lia (Cav. icon. 5. p. 29. t. 447.) leaves unequally toothed: radical ones cuneated: superior ones oblong, connate, and are, as well as the capsules, tomentose. ♃. F. Native of Chili. C. Paralénsis, Spreng. syst. 1. p. 45. Peduncles axillary and terminal, dichotomous. Corolla yellow: lower lip of corolla narrowed towards the throat.

Paralia Slipperwort. Pl. 2 feet.

16 C. corymbòsa (Ruiz. et Pav. fl. per. 1. p. 14. t. 20. f. b.) radical leaves ovate and cordate, petiolate, doubly crenated: cauline leaves few, cordate, half stem-clasping. ♃. F. Native of Chili, in shady places. Ker. bot. reg. 723. Hook, bot. mag. 2418. Plant hairy. Radical leaves broad, rosulate, white beneath. Stems leafless at bottom, but dichotomous and leafy at top. Flowers corymbose, yellow, marked with purple dots and lines. There are several garden hybrids reared, between this and several other species. 1. C. Gellaniàna, Penny, with dusty copper coloured flowers. This is a hybrid between *C. corymbòsa* and *C. purpúrea*. 2. C. hìans, Penny, with yellow flowers. 3. C. Hopeàna, Morrison, with yellow flowers, a hybrid between *C. corymbòsa* and *C. plantagínea*. 4. C. polyántha, Penny, with yellow flowers; a hybrid between *C. corymbòsa* and *C. petiolàris*. 5. C. Yoúngii, Penny, in bot. reg. 1448, with ochraceous and dirty purple flowers; a hybrid between *C. corymbòsa* and *C. arachnóidea*. (fig. 58.)

FIG. 58.



Corymbose-flowered Slipperwort. Fl. May, Oct. Clt. 1822. Pl. 1 to $1\frac{1}{2}$ foot.

17 C. purpu'rea (Graham, in edinb. phil. journ. 1827. bot. mag. 2775.) herbaceous; stems numerous, erect, branched; leaves wrinkled, hispid: radical ones cuneate-spatulate, serrated, quite entire behind, petiolate, acutish: cauline leaves cordate, decussate: superior ones smaller, and quite entire; corymbs terminal, many-flowered. ♃. F. Native of Chili, on the Cordilleras. Lindl. bot. reg. 1621. Stems many from the same root, downy. Leaves with a few long scattered hairs on their surfaces. Calyx downy. Corolla rather small, of an uniform reddish violet colour. Habit of *C. corymbòsa*. There are several hybrids between this and other species. See Sweet, fl. gard. n. s. t. 244.

Purple-flowered Slipperwort. Fl. July, Sept. Clt. 1827. Pl. 1 foot.

18 C. oblónga (Ruiz. et Pav. fl. per. 1. p. 15. t. 24. f. b.) leaves oblong, serrated, petiolate; peduncles trifid, with 3-6-flowered branches; stem simple. ⊙. F. Native of the groves of Panatahua. Root fascicled. Radical leaves numerous: cauline ones few, on short petioles. Calyx hairy. Corolla yellow, dotted with red inside; lower lip large, tricrenate at the top.

Oblong-leaved Slipperwort. Pl. $1\frac{1}{2}$ foot.

19 C. puni'cea (Ruiz. et Pav. fl. per. 1. p. 15. t. 24. f. a.) hairy; stems creeping; leaves oval, serrated; peduncles terminal, bifid, 7-8-flowered; pedicels umbellate. ♃. F. Native of the groves of Panatahua. Root fascicled. Leaves glabrous above, on short petioles. Corollas scarlet, glabrous, form of those of *C. oblónga*.

Scarlet-flowered Slipperwort. Pl. 1 to 2 feet.

§ 4. *Leaves toothed, crenated, or serrated, petiolate; petioles naked. Stems leafy.*

* *Herbaceous plants. Leaves opposite.*

20 C. serra'ta (Lam. ill. 1. p. 51.) erect; branches clothed with tomentose pubescence; leaves petiolate, ovate, acute, acutish at the base, sharply serrated, finely downy, canescent beneath; corymbs terminal, sub-trichotomous; pedicels pubescent. ♃. F. Native of Quito, near Chillo, Humb. et Bonpl. Peru in Canta, Ruiz. et Pav. H. B. et Kunth, nov. gen. 2. p. 381. C. infléxa, Ruiz. et Pav. fl. per. 1. p. 16. t. 25. f. a.? Herb erect, branched. Leaves $1\frac{1}{2}$ inch long, and 9 lines broad. Calycine segments ovate, acute. Corolla glabrous, yellow; lower lip reflexed, narrowed at the base.

Serrated-leaved Slipperwort. Pl. 2 to 3 feet.

21 C. divarica'ta (H. B. et Kunth, nov. gen. 2. p. 381.) twining; branches divaricate, glabrous; leaves petiolate, ovate, acute, cordate, coarsely and crenately-serrated, ciliated, glabrous, downy on the veins beneath; panicles terminal, leafy; flowers corymbose; pedicels clothed with glandular pili. ♃. F. Native of Peru, in temperate places near Succhubamba and Ayavaca, at the altitude of 1400 hexapods. Leaves $1\frac{1}{2}$ inches. Calyx clothed with glandular hairs, with ovate, acute segments. Corolla yellow. Ovarium clothed with glandular hairs.

Divaricate Slipperwort. Pl. twining.

22 C. rotundifòlia (H. B. et Kunth, l. c. p. 382.) stems simple, 1-2-3-flowered, and are, as well as the leaves, pubescent; leaves petiolate, roundish, obtuse, coarsely crenated, convex, thick. ⊙. H. Native of Peru, in cold places between Chulucana and Guamcabamba. Stems simple, fleshy. Leaves $\frac{1}{2}$ inch long. Calyx downy. Corolla yellow; throat hairy.

Round-leaved Slipperwort. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

23 C. sibthorpioìdes (H. B. et Kunth, l. c.) stems procumbent; branches hispidly pilose; leaves petiolate, ovate-roundish, acutish, cordate, crenately cut, hairy on both surfaces; flowers terminal, corymbose; peduncles clothed with glandular hairs. ♃. F. Native of Peru, in icy places on mount Gual-

gayoc, near the mines of Micuipampa, at the altitude of 1840 hexapods. Leaves membranous. Calyx clothed with glandular hairs; segments ovate-oblong, bluntish. Corolla yellow.

Sibthorpia-like Slipperwort. Pl. procumbent.

24 C. saxa'tilis (H. B. et Kunth, l. c.) erect; branches villous; leaves on short petioles, ovate, bluntish, rounded at the base, subcordate, deeply crenated, hairy above, but clothed with hoary tomentum beneath; corymbs terminal; pedicels pilose. ♃. F. Native in stony places on Mount Chimborazo, at the altitude of 1750 hexapods. Leaves 9-10 lines long. Flowers about the size of those of *C. pinnàta*, copper-coloured. Calycine segments ovate, acute.

Stone Slipperwort. Pl. 1 foot.

25 C. lamiifòlia (H. B. et Kunth, l. c. p. 383.) stem erectish, and is, as well as the branches, pilose; leaves petiolate, ovate, acute, truncately rounded at the base, coarsely serrate-crenated, beset with adpressed hairs on both surfaces, white beneath; peduncles terminal, generally twin, pilose. ♃. F. Native near the town of Quito, at the altitude of 1490 hexapods. Leaves 1 to 1½ inch long. Calyx pilose, with roundish-ovate, acute segments. Corollas large, yellow, glabrous. This species is said hardly to differ from *C. bícolor*.

Dead-nettle-leaved Slipperwort. Pl. 1½ to 2 feet.

26 C. ova'ta (Smith, icon. ined. 1. t. 3. Vahl, enum. 1. p. 182.) erect, branched, beset with long, white hairs; leaves ovate, obsoletely crenated, or serrated, on short petioles; peduncles twin, filiform, longer than the leaves. ☉. F. Native of Peru. C. integrifòlia, Lin. suppl. 86, but not of his systema. C. dichótoma, Lam. ill. p. 52. C. biflòra, Ruiz. et Pav. fl. per. 1. p. 16. t. 20. f. a. Pers. ench. 1. p. 16. Lower branches opposite: superior ones alternate, dichotomous. Leaves 1 inch long, obscurely crenated, or quite entire. Peduncles usually by twos, filiform, longer than the leaves. Corollas small.

Ovate-leaved Slipperwort. Pl. ½ to 1 foot.

27 C. bicrena'ta (Ruiz. et Pav. fl. per. 1. p. 15. t. 23. f. b.) erect, branched; leaves on short petioles, ovate, doubly serrated, or crenated, tomentose beneath; peduncles axillary and terminal, furnished with 2 leaves at top; pedicels umbellate, hairy, unequal. ♃. ? F. Native of Peru, on the mountains of Cuchero. Leaves wrinkled. Calyx villous. Corolla large. Upper lip inflexed: lower one large, both tricrenate at top.

Twice-crenated-leaved Calceolaria. Pl. 2 to 3 feet.

28 C. heterophy'lla (Ruiz. et Pav. fl. per. 1. p. 16. t. 21. f. b.) very hairy, erect; leaves petiolate, ovate-elliptic and subcordate, serrated; peduncles very long, dichotomous. ♃. G. Native of Peru, in groves. Hairs rusty, some of them long and bristle like, and others shorter and glandular. Stems quadrangular; branches purplish. Leaves roundish, or oblong, often doubly serrated. Peduncles from the superior axils, clammy at top; pedicels 1-flowered, 2 from each fork. Corolla half open: lower lip large, ventricose.

Various-leaved Slipperwort. Pl. 1 to 1½ foot.

29 C. loba'ta (Cav. icon. 5. p. 26. t. 443. f. 1.) erect; leaves cordate, lobate, serrated, clothed with hoary tomentum beneath; stem dichotomous, reddish, pilose; peduncles terminal, 4 in number, 2 centre ones 1-flowered, and the 2 lateral ones 3-flowered. ♃. F. Native of Peru, in dry places. Leaves petiolate, 5-lobed, villous above; lobes short. Petioles very hairy, a little longer than the leaves. Calycine segments ovate, 3-furrowed. Corolla yellow; lower lip lined lengthwise, large.

Lobed-leaved Slipperwort. Pl. 2 feet.

* * *Shrubby plants. Leaves opposite.*

30 C. lana'ta (H. B. et Kunth, nov. gen. 2. p. 383.) suffruticose, densely clothed with white tomentum; leaves petiolate, ovate-deltoid, acute, cordate, doubly crenated; corymbs terminal, fastigiate. ♄. G. Native of Quito, in temperate places between Alausi and Pomallacta, at the altitude of 1300 hexapods. Leaves 2-3 inches long. Corolla large, yellow, smoothish.

Woolly Slipperwort. Shrub.

31 C. stricta (H. B. et Kunth, l. c. p. 380.) shrubby; branchlets rather clammy, erect; leaves petiolate, lanceolate-oblong, acuminated, narrowed at the base, denticulated, glabrous; corymbs terminal, sub-dichotomous; pedicels clammy. ♄. G. Native of New Granada, in temperate places between the river Vinajacu and the city of Loxa, at the altitude of 1100 hexapods. Branches smooth, reddish, clammy while young. Leaves glabrous, paler, and rather clammy beneath, 4 inches long. Calyx rather clammy. Corolla yellow, glabrous. Ovarium glabrous.

Strict Slipperwort. Shrub.

32 C. padifòlia (H. B. et Kunth, l. c.) shrubby; branchlets rather clammy; leaves petiolate, oblong, or ovate oblong, acuminated, acute at the base, toothed, glabrous; flowers terminal, corymbose; pedicels rather clammy. ♄. G. Native of Peru, near Ayavaca, at the altitude of 1400 hexapods. Branches tetragonal, smooth, glabrous. Leaves about 2 inches long, pale beneath. Calycine segments ovate, acute. Corolla yellow, glabrous. Capsule glabrous.

Bird-cherry-leaved Slipperwort. Shrub.

33 C. defle'xa (Ruiz. et Pav. fl. per. 1. p. 18. t. 30. f. b.) shrubby; branchlets clammy, purplish; leaves ovate-lanceolate, serrated, canescent beneath; peduncles axillary and terminal; pedicels umbellate, villous. ♄. G. Native of Peru, in Caxatamba, near water falls. Leaves deflexed, on short petioles, shining above: floral ones quite entire. Peduncles twin. Corolla of a coppery yellow colour; lower lip ventricose, incurved.

Deflexed-leaved Slipperwort. Shrub 3 to 4 feet.

34 C. viscòsa (Ruiz. et Pav. fl. per. 1. p. 18. t. 30. f. a.) the whole plant resinous and clammy; leaves petiolate, ovate, acute, serrated, canescent beneath; peduncles axillary and terminal; pedicels umbellate; calyx tomentose. ♄. G. Native of Peru, on the Alps. The plant is bitter, with the scent of *Teùcrium Màrum*. Pedicels and calyxes tomentose: middle ones 1-flowered: lateral ones 3-flowered. Corollas yellow.

Clammy Slipperwort. Shrub 2 to 3 feet.

35 C. flexuòsa (Ruiz. et Pav. fl. per. 1. p. 17. t. 26. f. a.) shrubby, rough, beset with glandular villi; branches flexuous; leaves cordate, unequally and bluntly crenated, petiolate, remote, rough above; peduncles axillary and terminal, many-flowered; pedicels umbellate. ♄. G. Native of Peru, among the debris of rocks, in the valley of Canta. Corolla yellow: lower lip large, ventricose.

Flexuous Slipperwort. Shrub.

36 C. niva'lis (H. B. et Kunth, nov. gen. 2. p. 381.) shrubby; branches and leaves glabrous; leaves petiolate, ovate, acute, acutish at the base, crenately serrated, rather coriaceous, yellowish beneath; corymbs terminal; flowers umbellately fascicled; pedicels hairy. ♄. G. Native on Mount Assuay, near Los Paredones, and the plains of El Pullal, at the altitude of 1980 hexapods, in frigid places. Leaves 9-11 lines long; petioles hairy. Calyx hairy, with ovate, acute segments. Corolla yellow, glabrous. Capsule glabrous.

Snowy Slipperwort. Shrub 3 feet.

37 C. sca'bra (Ruiz. et Pav. fl. per. 1. p. 19. t. 29. f. a.) shrubby, hispid, of a rusty colour; leaves nearly sessile, oblong, lined, toothed, hispid; peduncles axillary and terminal, solitary, 1-flowered, length of leaves. ♄. G. Native of Peru, among broken rocks. Stem rough, twiggy. Leaves approximate, with revolute edges. Corolla yellow; both lips incurved: lower one large.

Scabrous Slipperwort. Shrub 3 feet.

38 C. Herbertia'na (Lindl. bot. reg. t. 1313.) shrubby, much branched; leaves oblong, wrinkled, crenated, pubescent, petiolate, same colour on both surfaces; peduncles terminal, corymbose, pilose. ♄. F. Native of Chili. Stem pilose. Lower leaves ovate-oblong, obtuse, petiolate: upper ones sessile. Lower lip of corolla very large. Corolla yellow, spotted inside.

Herbert's Slipperwort. Fl. June, Sept. Clt.? Shrub 2 to 3 feet.

39 C. pulverule'nta (Ruiz. et Pav. fl. per. 1. p. 19.) shrubby; branches clothed with rough canescent powder; leaves on short petioles, oblong-lanceolate, dentately serrated; peduncles axillary, solitary, generally 4-flowered. ♄. G. Native of Peru, in Canta, among broken rocks.

Powdery Slipperwort. Shrub 6 feet.

40 C. salicifòlia (Ruiz. et Pav. fl. per. 1. p. 18. t. 19. f. b.) shrubby, quite glabrous; leaves ovate-lanceolate, serrated, shining, and clammy above, but wrinkled and grey beneath; peduncles terminal, twin; pedicels 4: middle ones 1-flowered, and lateral ones 3-flowered. ♄. G. Native of Peru, in boggy and stony places. Branches clammy and resinous. Leaves spreading, or deflexed, very like those of *Sálvia officinàlis*. Corolla large, clothed with glandular villi: lower lip crenated at top.

Willow-leaved Slipperwort. Shrub 6 feet.

41 C. cuneifórmis (Ruiz. et Pav. fl. per. 1. p. 19. t. 27. f. b.) shrubby; branches scabrous, rusty; leaves approximate, cuneiform-ovate, deeply serrated, lined above, and clothed with hoary tomentum beneath; corymbs terminal. ♄. G. Native of the alps of Canta, Tarma, &c. Calyx yellowish. By chewing the leaves the saliva becomes yellow.

Wedge-formed-leaved Slipperwort. Shrub 2 feet.

42 C. involu'ta (Ruiz. et Pav. fl. per. 1. p. 15. t. 23. f. a.) shrubby; leaves on short petioles, ovate, acute, serrated, glabrous; peduncles axillary and terminal, 1-flowered; corolla involute. ♄. G. Native of Panatahua, in forests. Plant glabrous. Peduncles 2-3 together from the axils of the superior leaves. Calyx reflexed. Corolla yellow, large, covering the calyx.

Involute-flowered Slipperwort. Shrub 3 feet.

* * * *Shrubby plants. Leaves opposite, and 3 in a whorl.*

43 C. bícolor (Ruiz. et Pav. fl. per. 1. p. 16. t. 25. f. b.) shrubby; leaves petiolate, opposite, and 3 in a whorl, ovate, biserrated, wrinkled; peduncles axillary and terminal, subdichotomous. ♄. G. Native of Peru, in the valley of Canta. Plant hairy. Branches dependent, bluntly tetragonal, of a rusty purple colour. There are 2-3 sessile leaves under the peduncles, and 2 under the pedicels, which are clothed with glandular villi. Corolla with a white base, and yellow apex: lower lip inflexed, narrowed at the base.

Two-coloured-flowered Slipperwort. Fl. Aug. Sept. Clt. 1829. Shrub 2 feet.

44 C. diffu'sa (Lindl. bot. reg. 1374.) suffruticose, procumbent; leaves cordate-ovate, coarsely and doubly serrated, petiolate, opposite, or 3 in a whorl, hoary beneath; peduncles terminal and axillary, corymbose. ♄. F. Native of Peru, at Canta, Cruckshanks. C. bícolor, Graham, in edinb. phil. journ. oct. 1830. p. 366, but not of Ruiz. et Pav. Branchlets and leaves rather downy. Pedicels pilose. Corolla having the lower lip bent over the upper, with a white base and yellow apex. This is probably nothing more than the *C. bícolor* of Ruiz. et Pav.

Diffuse Slipperwort. Fl. Aug. Sept. Clt. 1829. Shrub proc.

45 C. uniflòra (Ruiz. et Pav. fl. per. 1. p. 16. t. 20. f. c.) shrubby, much branched; leaves on short petioles, opposite, and 3 in a whorl, ovate, serrated, downy; peduncles axillary, solitary, 1-flowered, each furnished with 2 quite entire leaves in the middle. ♄. G. Native of Peru, in Tarma, at Cura. C. monánthos, Poir. suppl. 1. One side of branches purplish. Leaves generally 3 in a whorl. Flowers small.

One-flowered Slipperwort. Shrub.

46 C. denta'ta (Ruiz. et Pav. fl. per. 1. p. 18. t. 29. f. b.) shrubby; branchlets hairy; leaves opposite, and 3 in a whorl, ovate, sharply and doubly toothed, glabrous in the adult state; peduncles terminal, twin, bifid, with a 1-flowered pedicel in the fork; pedicels racemose, secund. ♄. G. Native of Chili, in woods. Corollas yellow, form of those of *C. scàbra*. Shrub much branched, clammy, with the taste of Peruvian bark.

Toothed-leaved Slipperwort. Shrub.

47 C. virga'ta (Ruiz. et Pav. fl. per. 1. p. 20. t. 31. f. a.) shrubby; branches twiggy, purplish; leaves on short petioles, opposite, and 3 in a whorl, ovate, bluntly serrated, pubescent; peduncles axillary and terminal, many-flowered. ♄. G. Native of Peru, on the route to Canta. Stem purple. Branches opposite, or 3 in a whorl, twiggy, brittle, purplish. Leaves spreading, obtuse. Corolla small, villous at the base.

Twiggy Slipperwort. Shrub 2 feet.

48 C. angustiflòra (Ruiz. et Pav. fl. per. 1. p. 17. t. 28. f. a.) shrubby; leaves on short petioles, opposite, or 3 in a whorl, ovate-lanceolate, sharply-serrated, pubescent; peduncles axillary and terminal, opposite, or 3 in a whorl, generally 4-flowered, shorter than the leaves; upper lip of corolla very narrow at the base. ♄. G. Native of Peru, in the valley of Canta, towards Obrasillo. Hook. bot. mag. 3094. Much branched; branches opposite, or 3 in a whorl. Peduncles collected into a terminal panicle. Corolla small, dotted with purple inside.

Narrow-flowered Slipperwort. Fl. July. Clt. 1830. Shrub 1 to 2 feet.

49 C. verticilla'ta (Ruiz. et Pav. fl. per. 1. p. 17.) shrubby, glabrous; leaves 3 in a whorl, cordate, acute, serrated, on short petioles; peduncles 4-flowered, axillary. ♄. G. Native of Peru, among broken rocks in the valley of Canta. Branches chaff-coloured. Peduncles furnished with a single leaf under each twin pedicel.

Whorled-leaved Slipperwort. Shrub 4 to 6 feet.

50 C. terniflòra (Cav. icon. 5. p. 30. t. 450. f. 2.) shrubby; leaves petiolate, 3 in a whorl, ovate-lanceolate, serrated; peduncles axillary and terminal, 3-flowered. ♄. G. Native of Peru. Stem brownish-violet; branches 3 in a whorl. Leaves glaucous: superior ones sessile; 2 at the base of the pedicels. Calyx larger than in the preceding. Lower lip of corolla narrowed to the base Perhaps not distinct from *C. glaúca*.

Tern-flowered Slipperwort. Shrub 3 feet.

51 C. gemelliflòra (Cav. icon. 5. p. 30. t. 450. f. 1.) shrubby; leaves petiolate, 3 in a whorl, ovate-serrated, nearly sessile; peduncles axillary and terminal, 2-flowered, shorter than the leaves. ♄. G. Native of Peru, among stones. Stem branched. Leaves acute, glaucous, 2 at the base of the pedicels. Lower lip of corolla narrowed towards the throat. Perhaps not distinct from *C. angustiflòra*.

Twin-flowered Slipperwort. Shrub 2 feet.

52 C. multiflòra (Cav. icon. 5. p. 29. t. 449.) shrubby, villous; leaves 3 in a whorl, ovate, serrated, nearly sessile; peduncles branched, terminal, panicled. ♄. G. Native of Peru, in dry places towards Lima. Branches obscure, purple. Leaves subcordate. Panicle a foot long. Segments of calyx 3-nerved. Lower lip of corolla narrowed towards the throat.

Many-flowered Slipperwort. Shrub 4 to 6 feet.

53 C. glau'ca (Ruiz. et Pav. fl. per. 1. p. 17. t. 27. f. c.) shrubby; leaves opposite, and 3 in a whorl, lanceolate, unequally serrated; peduncles 3-4, umbellate, 3-flowered, furnished

with narrow-lanceolate leaves at the base. ♄. G. Native of Peru, on the route to Canta. Branches opposite, and 3 in a whorl, purplish. Leaves on short petioles, glaucous above. Corolla yellow, spotted with purple inside. Filaments broad at the base.

Glaucous-leaved Slipperwort. Shrub 2 to 3 feet.

54 C. trífida (Ruiz. et Pav. fl. per. 1. p. 17. t. 26. f. b.) shrubby; leaves cordate-ovate, bluntly serrated, canescent beneath: lower ones opposite, petiolate: upper ones 3 in a whorl, sessile, and beset with glandular villi; peduncles axillary and terminal; 3-8-flowered. ♄. G. Native of Peru, in shady places near the waters of Cheuchin. Stem almost glabrous. Petioles connate.

Trifid Slipperwort. Shrub 2 to 3 feet.

§ 5. *Leaves serrated, or toothed, petiolate; petioles membranaceously winged. Stem leafy.*

55 C. perfòliata (Lin. suppl. 86. Smith, icon. ined. 1. p. 4. t. 4.) herbaceous; branches pilose; leaves triangularly sagittate, acute, doubly serrated, cut, hairy above, but clothed with tomentose pubescence beneath, and hoary; petioles membranously winged, connate; corymbs terminal, sub-dichotomous; pedicels pilose. ♃. or ♂. G. Native of New Granada and Peru. Ruiz. et Pav. fl. per. 1. p. 15. t. 21. f. a. Mutis amer. 1. t. 3. H. B. et Kunth, nov. gen. amer. 2. p. 384. Leaves 1½ to 2 inches long. Corollas yellow, glabrous. Ovarium pilose. The plant of Ruiz. et Pav. is said by them to be clothed with clammy villi; and the leaves are said to be spatulately sagittate.

Perfoliate-leaved Slipperwort. Pl. 2 to 3 feet.

56 C. tomentòsa (Ruiz. et Pav. fl. per. 1. p. 15. t. 22. f. b.) herbaceous; branches downy; leaves spatulately cordate, unequally serrated, tomentose beneath; petioles membranously winged, connate; corymbs terminal, downy. ♃.? ♂ G. Native of Tarma and Cuchero, in Peru. Stem glabrous, branched. Leaves pubescent above. Pedicels umbellate. Corolla large, yellow.

Tomentose Slipperwort. Pl. 3 to 4 feet.

57 C. petiola'ris (Cav. icon. 5. p. 30. t. 445.) plant herbaceous, branched, downy; lower leaves tapering into the winged petioles, doubly toothed: superior ones ovate, subcordate, sessile, connate, dentately serrated: floral ones quite entire; racemes solitary and axillary, or terminal and twin, or by threes; pedicels, calyxes, and ovarium, clothed with glandular villi; both lips of corolla nearly equal. ♂. or ♃. G. Native of South America, in Guayaquil. C. connàta, Hook. bot. mag. 2876. C. floribúnda, Lindl. bot. reg. 1214. but not of Kunth. C. paniculàta, Herbert. Bœ'a alàta, Pers. ench. 1. p. 15. Plant more downy at top than bottom, clammy. Leaves 7 inches long, and 4 broad, ovate, acutish. Common peduncles bifid below the middle, and each branch is again cleft. Corolla pale yellow, downy.

Petiolar Slipperwort. Fl. July, Aug. Clt. 1824. Pl. 2 to 4 feet.

58 C. rugòsa (Ruiz. et Pav. fl. per. 1. p. 19. t. 28. f. b.) shrubby; leaves lanceolate, unequally serrated, wrinkled, downy; petioles winged, connate; corymbs terminal. ♄. G. Native of Chili. C. scabiosæfòlia, Nee. Plant downy at top. Leaves attenuated at both ends. Corolla yellow. Habit of *Sálvia officinàlis*. Lower lip of corolla narrowed at the base.

Wrinkled-leaved Slipperwort. Fl. July, Aug. Clt. 1822. Shrub 2 feet.

59 C. arachnoídea (Graham, in edind. phil. journ. sept. 1828.) stem herbaceous, branched, spreading, clothed with white cobwebbed wool, as well as the leaves and other parts, except the corolla; leaves lingulately-oblong, a little toothed, narrowing downwards into long winged petioles, which are connate at the base; peduncles terminal, twin, elongated, dichotomous. ♄. G. Native of Chili. Hook. bot. mag. 2874. Lindl. bot. reg. 1454. C. tinctòria, Gillies, mss. Leaves with the petioles 5 inches long, wrinkled; the 2 uppermost leaves smaller than the others, sessile, cordate-ovate, placed at the origin of the peduncles. Corolla of a uniform dull purple. There are several hybrids between this and other species. See Sweet, fl. gard. n. s. t. 227.

Cobwebbed Slipperwort. Fl. June, Sept. Clt. 1827. Pl. 1 foot.

60 C. integrifòlia (Lin. in act. holm. 1770. syst. ed. 13th. p. 61.) shrubby; leaves ovate-lanceolate, or lanceolate, denticulated, wrinkled, opaque, rusty beneath; petioles winged, connate; stem and calyxes downy; panicles terminal, corymbose, pedunculate. ♄. G. Native of Chili. Corolla yellow.

Var. β, integrifòlia (Hook. et Arn. in Beech, voy. pt. bot. p. 39.) leaves ovate-lanceolate, sharply denticulated. ♄. G. Native of Chili. C. integrifòlia, Lindl. bot. reg. 744. C. rugòsa, Hook. bot. mag. 2523. exot. bot. 99, but not of Ruiz. et Pav. C. salviæfòlia, Pers. ench. 1. p. 15. Cham. et Schlecht, in Linnæa, 2. p. 565. Chacaul, Feuill. per. 13. t. 7.

Var. γ, angustifòlia (Lindl. bot. reg. 1083.) leaves attenuated at both ends, coarsely denticulated; panicles on long peduncles. ♄. G. Native of Chili, about Valparaiso.

Var. δ, viscosíssima (Hook. bot. mag. t. 8214.) the whole plant clothed with viscid pubescence; leaves larger and broader. ♄. G. Native of Chili. C. viscosíssima, Lindl. bot. reg. 1611.

Entire-leaved Slipperwort. Fl. Aug. Sept. Clt. 1822. Shrub 2 to 3 feet.

61 C. asce'ndens (Lindl. bot. reg. 1215.) suffruticose, ascending; leaves ovate, petiolate, wrinkled, denticulated, pubescent: lower ones acute at the base; petioles winged, connate; corymbs umbellate, few-flowered, branched a little, on long peduncles. ♄. G. Native of Chili, on the Cordilleras. Stem pilose. Upper leaves sessile. Flowers large, of an orange yellow colour. Calyxes roundish, tomentose. Said to be nearly allied to *C. integrifòlia* and *C. rugòsa*.

Ascending Slipperwort. Fl. June, Sept. Clt. 1826. Shrub 1 to 1½ foot.

62 C. Chiloe'nsis (Lindl. bot. reg. 1476.) shrubby; stem, calyxes, and bracteas beset with glandular hairs; cauline leaves oblong-lanceolate, undulated, sharply toothed, downy on both surfaces, tapering into the petioles, which are winged and connate at the base: superior leaves quite entire, ovate, acuminate, sessile; inflorescence cymose, many-flowered, axillary and terminal. ♄. F. Native of the Island of Chiloe, on the south coast of Chili. Corollas yellow.

Chiloe Slipperwort. Fl. July, Sept. Clt. 1831. Shrub 2 feet.

63 C. polifòlia (Hook. bot. mag. 2897.) suffruticose, clothed with white wool in every part; leaves ovate, or oblong, crenated, tapering into the petioles, which are connate at the base; peduncles elongated, terminal, dichotomous; flowers corymbose. ♄. G. Native of Chili, on the Cordilleras, and elsewhere in the same country. Upper lip of corolla small, pale yellow: under one deep yellow. Calyxes 3-nerved.

Polium-leaved Slipperwort. Fl. July, Sept. Clt. 1826. Shrub 1 foot.

§ 6. *Leaves sessile. Stems leafy.*

64 C. se'ssilis (Ruiz. et Pav. fl. per. 1. p. 18.) suffruticose; leaves lanceolate, acuminated, crenated, wrinkled, canescent beneath; corymbs panicled, terminal, dichotomous; lips of corolla nearly equal, ventricose. ♄. G. Native of Chili, in arid places. Lindl. bot. reg. 1628. Sweet, fl. gard. n. s. 3. t. 220. Stem branched. Pedicels elongated. Corolla yellow, glandular.

Sessile-leaved Slipperwort. Shrub 2 feet.

65 C. crena'ta (Lam. dict. 1. p. 556.) shrubby; branches villous; leaves cordate-lanceolate, sessile, crenated, hoary beneath, and villous above; peduncles axillary and terminal, longer than the leaves, clothed with clammy villi, like the pedicels and calyxes; pedicels scattered, subcymose. ♄. G. Native of Peru. Leaves 1½ inch long, similar to those of *Rhinánthus cristagálli*.

Crenated-leaved Slipperwort. Shrub.

66 C. amplexicau'lis (H. B. et Kunth, nov. gen. amer. 2. p. 384. t. 171.) suffruticose branches; leaves stem-clasping, ovate oblong, acuminated, cordate, crenately-serrated, and are, as well as the pedicels, pilose; corymbs terminal; flowers umbellately fascicled. ♄. G. Native on the banks of the river San Pedro, between Chillo and Conocato, at the altitude of 1340 hexapods. Leaves pale beneath, about 3 inches long, at length reflexed. Corollas yellow, glabrous. Ovarium glandular.

Stem-clasping-leaved Slipperwort. Shrub 3 to 4 feet.

67 C. floribu'nda (H. B. et Kunth, l. c. p. 385.) suffruticose; branches and pedicels beset with glandular clammy hairs; leaves stem-clasping, lanceolate, acuminated, cordate, denticulated, hairy beneath; racemes bifid, panicled, or corymbose; flowers usually twin. ♄. G. Native near the town of Quito, at the altitude of 1490 hexapods. Leaves smoothish, and green above, and pale beneath, and clammy, 2 inches long. Flowers small, sub-secund. Calyx villous. Corolla glabrous, orange yellow. Ovarium pilose.

Bundle-flowered Slipperwort. Shrub.

68 C. thyrsiflòra (Graham, in edinb. phil. journ. sept. 1828. bot. mag. 2915.) shrubby, branched, clammy, glabrous; leaves linear, attenuated at both ends, lined, serrate-toothed, sessile; thyrse terminal, crowded; peduncles compound, umbellate. ♄. G. Native of Chili, about Mendoza. Branches rather rough, and obscurely glandular. Leaves 2 inches long, and 2 lines broad, distinctly serrated; teeth reflexed. Flowers yellow, crowded, glabrous outside, and downy within.

Thyrse-flowered Slipperwort. Fl. June, Sept. Clt. 1827. Shrub 1 to 2 feet.

§ 7. *Leaves entire, or quite entire. Stem leafy.*

69 C. rosmarinifòlia (Lam. dict. 1. p. 556.) suffruticose; branchlets pilose; leaves sessile, connate at the base, linear, narrowed at apex, with quite entire and revolute edges, rather coriaceous, glabrous above, and clothed with golden tomentum beneath; flowers umbellately corymbose, paniculately disposed; pedicels beset with glutinous hairs. ♄. G. Native at the foot of Mount Chimborazo, near the Lake Ganacoche, at the altitude of 1800 hexapods; and of Chili, on the Cordilleras. H. B. et Kunth, nov. gen. 2. p. 385. C. ferruginea, Cav. icon. 5. p. 27. t. 445. f. 1. Branches terete, violaceous. Calyx pilose, clammy. Corolla yellow, glabrous: lower lip large.

Rosemary-leaved Slipperwort. Shrub 2 to 3 feet.

70 C. graminifòlia (H. B. et Kunth, nov. gen. 2. p. 386.) suffruticose, erect; branches nearly glabrous; leaves sessile, linear, narrow-acuminated, with quite entire and revolute edges, glabrous and rather clammy above, but clothed with hoary tomentum beneath; corymbs terminal, trifidly sub-dichotomous; pedicels hairy. ♄. G. Native of Quito, in the valley of Tarquo. Branches terete, compressed at the nodi. Leaves 4-5 inches long, and 2½ lines broad. Calyx hairy. Corolla glabrous, yellow. Very like the preceding.

Grass-leaved Slipperwort. Shrub 4 to 6 feet.

71 C. lavandulæfòlia (H. B. et. Kunth, l. c.) suffruticose; branchlets hairy; leaves sessile, linear, bluntish, with quite entire and revolute margins, smoothish above, but clothed with hoary tomentum beneath; flowers terminal, corymbose; pedicels clammy. ♄. G. Native in hollows or valleys on Mount Pichincha, and Paramo de Assuay, at the altitude of 1560 hexapods. Branches terete. Leaves 9-10 lines long, and 1 to 1½ lines broad. Corolla yellow, glabrous. Only to be distinguished from the preceding by the size of the leaves.

Lavender-leaved Slipperwort. Shrub.

72 C. hyssopifòlia (H. B. et Kunth. l. c.) shrubby; branchlets and pedicels beset with clammy hairs; leaves almost sessile, narrow-linear, bluntish, with entire and revolute edges, glabrous on both surfaces, clammy above; flowers terminal, corymbose. ♄. G. Native at the foot of Mount Chimborazo, near Calpi and in the plains of Luisa, at the altitude of 1640 hexapods.—Much branched; branches terete. Leaves pale beneath, 9-10 lines long. Distinguished from the preceding by the leaves being glabrous on both surfaces.

Hyssop-leaved Slipperwort. Shrub 4 to 5 feet.

73 C. helianthoi'des (H. B. et Kunth, l. c. p. 387.) shrubby; branches and pedicels clothed with canescent down; leaves nearly sessile, and nearly oblong, acute at both ends, quite entire, glabrous; flowers terminal, subcorymbose. ♄. G. Native of Paramo de Saraguru, in cold places between the river Uduchapa and the city of Loxa. Leaves oblong or lanceolate-oblong, 6-9 lines long, and 2½ to 4 lines broad, pale beneath. Pedicels puberulous. Corolla yellow, glabrous.

Sunflower-like Slipperwort. Shrub 1 to 1½ foot.

74 C. ericoi'des (Juss. ex Vahl, enum. 1. p. 190.) shrubby, much branched; branches crowded, and are, as well as the leaves, hairy on both surfaces; leaves small, sessile, linear, with entire and revolute edges; peduncles axillary and terminal, 1-3-flowered, hairy. ♄. G. Native of Quito, in stony places on Mount Pichincha, at the altitude of 1780 hexapods. Leaves 4-5 lines long. Corollas small, yellow, downy. Ovarium hairy.

Heath-like Slipperwort. Shrub 2 to 3 feet.

75 C. linea'ris (Ruiz. et Pav. fl. per. 1. p. 19.) shrubby, much branched; leaves linear, with quite entire and revolute edges, sessile; peduncles axillary, 1-flowered, pubescent. ♄. G. Native of Peru, on the declivities of the hills of Xauxa. Leaves shining above. Calyx rather tomentose. Corolla yellow.

Linear-leaved Slipperwort. Shrub.

76 C. arge'ntea (H. B. et Kunth, nov. gen. 2. p. 387. t. 170.) shrubby, and clothed with white tomentum; leaves petiolate, nearly oblong, acute at both ends, quite entire; flowers terminal and axillary, usually solitary. ♄. G. Native of Peru, in Paramo de Guamami, between Gualcaquillo and Guamcabamba, in shady places. Branches purple. Leaves 4-6 lines long. Corolla large, yellow, glabrous.

Silvery Slipperwort. Shrub 1 foot.

77 C. lanceola'ta (Cav. icon. 5. p. 27. t. 444. f. 1.) branched a little; leaves linear-lanceolate, quite entire: radical ones petiolate: cauline ones sessile, acute at both ends; peduncles terminal, solitary, 1-flowered. ♃. F. Native of the Maclove Islands. Corolla yellow; upper lip very short: lower one long, and narrowed to the base.

Lanceolate-leaved Slipperwort. Pl. ¼ foot.

78 C. a'lba (Ruiz. et Pav. fl. per. 1. p. 19. t. 27. f. b.) suffruticose, clammy and resinous, simple; leaves linear, remotely serrated; peduncles racemose, dichotomous. ♄. G. Native of Chili, on arid hills. Leaves frequently very narrow and sessile, scabrous on the margins, with fascicles of leaves in the axils. Peduncles elongated: partial ones opposite, twice or thrice divided. Pedicels solitary in the first division, twin in the second, and three in the third. Corollas white. Odour of rosemary.

White-flowered Slipperwort. Shrub.

79 C. alternifòlia (Cav. icon. 5. p. 28. t. 445. f. 2.) stem and under sides of leaves tomentose; leaves linear, alternate,

with entire, revolute edges; peduncles axillary, 3-flowered. ♃.? G. Native of Peru. Leaves sessile, hardly an inch long. Peduncles towards the tops of the branches; with 2 leaves at the base of the pedicels. Lower lip of corolla gradually narrowing towards the base.

Alternate-leaved Slipperwort. Pl. 2 feet.

Cult. Calceolària is a genus of very showy plants, and great favourites at present with gardeners and others. Some of them are annual, others perennial, but the greater mass are shrubby. All of them thrive well in light rich soil, or a mixture of loam, sand, and peat; giving them the treatment of other greenhouse plants. They readily increase by young cuttings, under a hand-glass; and also by seed, which ripens plentifully in this country. By impregnating the stigma of one sort with the pollen of another, many very beautiful hybrids have been reared in the gardens. The seeds of the annual kinds should be reared in a hot-bed, in spring; and when the plants are of sufficient size, they should be set separately in pots; and others may be planted out in the open ground, in a warm, sheltered situation.

LXXXIX. JOVELLA'NA (named after D. Casparo Melchiori de Jovellanos, a promoter of the Flora Peruviàna.) Ruiz. et Pav. fl. per. 1. p. 13. t. 18. f. b.—Bæ'a species, Pers. ench. 1. p. 15. Calceolària species of authors.

Lin. syst. *Diándria, Monogýnia.* Calyx 4-parted. Both lips of corolla nearly equal: upper one concave: lower one inflated. Stamens 2, inserted at the base of the tube, short; cells of anthers confluent. Stigma capitate, emarginate. Capsule ovate-conical, 2-furrowed, 2-celled, 2-valved at apex; valves bifid; placentas adnate to the dissepiment. Seeds angular.—Plants with the habit of *Calceolària.*

1 J. scapiflòra (Ruiz. et Pav. fl. per. 1. p. 13. t. 18. f. b.) leaves ovate, serrated, downy; scapes downy, unequal, 1-flowered. ♃. F. Native of the Andes of Peru. Bæ'a plantagínea, Pers. ench. 1. p. 15.? Leaves an inch long. Corolla yellow: lower lip spotted with purple.

Scape-flowered Jovellana. Fl. Aug. Clt. 1827. Pl. 1 foot.

2 J. puncta'ta (Ruiz. et Pav. fl. per. 1. p. 12. t. 18. f. a.) shrubby; branches slender, glanduliferous; leaves petiolate, oblong-ovate, biserrated, glabrous; peduncles axillary and terminal, cymose; pedicels umbellate. ♄. G. Native of Peru and Chili, in woods. Calceolària punctàta, Vahl, enum. 1. p. 177. Bæ'a punctàta, Pers. ench. 1. p. 15.—Feuill. per. 3. p. 21. t. 16. Leaves white beneath: floral ones quite entire, all dotted with purple on both surfaces. Corolla of a whitish-violet colour, variegated with a pale mark and yellow spots. Stigma emarginate.

Dotted-flowered Jovellana. Shrub 3 feet.

3 J. viola'cea; shrubby; branches violaceous; leaves petiolate, ovate, coarsely serrated, white beneath; peduncles terminal by threes, corymbose; pedicels 1-2-flowered. ♄. G. Native of Talcahuana, on the sea shore; and of Chili, about Conception. Bæ'a violàcea, Pers. ench. 1. p. 15. Calceolària violàcea, Cav. icon. 5. p. 31. t. 452. Leaves length of petioles. Corolla pale violet, spotted with deeper violet beneath. Lips of corolla spreading in a campanulate manner; limb villous.

Violaceous-flowered Jovellana. Shrub 4 to 6 feet.

4 J.? tria'ndra (Cav. icon. 5. p. 32. t. 453.) shrubby; branches, peduncles, and edges of calyx beset with glandular villi; leaves deeply pinnatifid, glaucous beneath, petiolate; peduncles dichotomous; flowers triandrous. ♄. G. Native of Peru. Bæ'a triándra, Pers. ench. 1. p. 15. Bark of branches dark purple. Petioles shorter than the leaves, clasping the stem by a membrane at the base. Filaments 3, very short. Ovarium tomentose. This will probably form a distinct genus, which we would propose calling *Porodittia triándra*, from the triandrous flowers; and in the cells of the anthers being confluent, and opening by a pore at the apex.

Triandrous-flowered Jovellana. Shrub 3 to 4 feet.

Cult. Singular and beautiful plants, with the habit of *Calceolària;* the culture of them is also similar.

XC. BÆ'A (meaning not explained by the author.) Comm. ex Lam. dict. 1. p. 401. ill. t. 15. Juss. gen. p. 121. ed. Usteri, p. 135.

Lin. syst. *Diándria, Monogýnia.* Calyx 5-parted. Corolla with a short tube and a spreading bilabiate limb; upper lip 3-lobed: lower one 2-parted; lips not inflated. Stamens 2, thick, arched, in the middle of the corolla; anthers connivent. Capsule long, corniculate, twisted, 2-celled, 4-valved; the twisting of the valves throwing out the seeds.—An herb, with the habit of the stemless species of *Calceolària.* Leaves radical. Scapes 1 or many-flowered. Flowers subumbellate.

1 B. Magella'nica (Lam. l. c.) ♃. F. Native of the Straits of Magellan, among humid rocks. B. Praliniàna, St. Hil. Leaves petiolate, 2-3 inches long, elliptic-ovate, obtuse, subserrated, quite entire at the base, soft, greenish, canescent. Scapes erect, shorter than the leaves. Calyx villous. Corollas blue. Capsule acuminated, longer than the calyx.

Magellan Bæa. Pl. ¼ foot.

Cult. This singular and pretty plant requires the same treatment as the perennial, herbaceous species of *Calceolària,* p. 607.

XCI. HEMI'MERIS (from ἡμι, *hemi,* half; and μερις, *meris,* a part; in reference to the upper lip of corolla being nearly obsolete.) Lin. fil. suppl. 45. Schreb. gen. 1016. Thunb. nov. gen. 74. Juss. gen. 120. ed. Usteri, 134. but not of others.

Lin. syst. *Diándria, Monogýnia;* or *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla rotate, ringent, with a very short, intruded, white tube, and a bilabiate limb; upper lip cloven, with a kind of bag at the base, composed of little nectareous pits: lower lip concave, blunt. Stamens 2-4, filiform, inserted in the base of the lower lip; anthers very small, cordate, cohering, yellow. Ovarium acute, smooth. Stigma simple, acutish. Capsule ovate, acute, didymous, gibbous at the base on one side, 2-celled, 2-valved. Seeds many, smooth.—Herbs, with opposite or alternate leaves. Flowers terminal and axillary, usually solitary.

§ 1. Diste'mon (from δις, *dis,* twice; and στημων, *stemon,* a stamen; in reference to the stamens only being two.) Flowers diandrous.

1 H. monta'na (Lin. suppl. 280.) leaves opposite, ovate, serrated; stem erect. ♃. G. Native of the Cape of Good Hope. Lam. ill. t. 532. f. 1.—Plukn. alm. 9. t. 331. f. 3. Pæderòta racemòsa, Houtt. pflanz. syst. 5. p. 89. t. 38. f. 1.

Mountain Hemimeris. Pl. ¼ to ½ foot.?

2 H. sabulòsa (Lin. suppl. 280.) leaves opposite, pinnatifid; stem prostrate. ♃. G. Native of the Cape of Good Hope. Lam. ill. t. 532. f. 2.

Sand Hemimeris. Pl. prostrate.

§ 2. Tetraste'mon (from τετρα, *tetra,* four; and στημων, *stemon,* a stamen; in reference to the 4 stamens.) Flowers tetrandrous; stamens didynamous.

3 H. diffu'sa (Lin. suppl. 280.) leaves alternate and opposite, pinnatifid; stems spreading. ♃.? G. Native of the Cape of Good Hope. Pæderòta Bòna Spèi, Lin. spec. p. 20. amœn. acad. 6. afr. 1.—Plukn. phyt. t. 320. f. 5.

Duffuse Hemimeris. Pl. diffuse.

4 H. unilabia'ta (Thunb. prod. 105.) leaves opposite, pinnatifid; stem panicled. ♃.? G. Native of the Cape of Good Hope. Probably not distinct from the preceding.

One-lipped Hemimeris. Pl.

Cult. For culture and propagation see perennial, herbaceous species of *Calceolària*, p. 608.

XCII. THYLACA'NTHA (from *θυλακος*, *thylacos*, a sack; and *ανθος*, *anthos*, a flower; base of lower lip of corolla.) Mart. in nov. act. bonn. 11. p. 45.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx 5-parted, short. Corolla bilabiate; upper lip very short, bifid: lower one 3-lobed, saccate at the base, large. Stamens 4, didynamous; filaments dilated; cells of anthers placed one above the other: upper cell exceeding the truncate apex of the filament. Stigma simple, acute, hooked, longer than the stamens. Capsule valveless, 2-celled, rather resinous, roundish; dissepiment thin, at length separating from the placenta, which is central. Seeds numerous, angular, with a thick, spongy, bullate testa.—An erect plant, with opposite, ovate-oblong leaves; but the floral leaves are lanceolate. Flowers axillary, solitary, violaceous, spotted with deep purple, on slender pedicels.

1 T. campe'stris (Mart. l. c.) ♃. S. Native of Brazil, near Tamburil and Velos, in fields. Angelònia campéstris, Mart. nov. act. bonn. 11. p. 44. Stem tetragonal; angles obtuse. Leaves on short petioles, unequally serrated, with hispid edges, triple-nerved; nerves pilose; floral leaves narrower, sessile, entire.

Field Thylacantha. Pl. 3 to 4 feet.

Cult. For culture and propagation see *Angelònia*, below.

XCIII. ANGELO'NIA (Angelon is the vernacular name of the first species.) Humb. et Bonpl. pl. æquin. 2. p. 92. t. 108. H. B. et Kunth, nov. gen. amer. 2. p. 377.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx deeply 5-parted, equal. Corolla with a very short tube, a concave bottom, and a bilabiate spreading limb: superior lip bifid: lower lip larger, saccately excavated, trifid; segments nearly equal. Stamens didynamous; cells of anthers diverging. Stigma simple. Capsule 2-celled, 2-valved; valves bifid at apex; dissepiment contrary, adnate to the valves; placentas central, at length free.—Herbs with opposite leaves, with the habit of *Célsia* and *Alonsòa*. Flowers axillary, racemose. Corollas blue, or violet. Stem and branches quadrangular.

1 A. salicariæfò'lia (Humb. et Bonpl. l. c.) stems erect, tetragonal, rather pilose and clammy; leaves sessile: lower ones lanceolate, acute, serrated towards the apex, finely pubescent on both surfaces: floral ones ovate, shorter. ♃. S. Native near Caraccas, on arid hills. Ker. bot. reg. 415. Flowers axillary, solitary, pedicellate, disposed in terminal racemes. Calyx pilose. Seeds oblong, cuneated, covered by a reticulated membrane. This species, or one nearly allied, has been collected by Schiede and Deppe in Mexico, near the Hacienda de La Laguna; it has the leaves usually 4 in a whorl, and very scabrous above. The hairs of the stem are somewhat adpressed, and of a dirty, fulvescent colour, not purplish. Corolla purplish, hairy.

Salicaria-leaved Angelonia. Fl. Aug. Clt. 1818. Pl. 1½ to 3 feet.

2 A. hi'rta (Cham. et Schlecht. in Linnæa, 8. p. 27.) hairy; stem tetragonal, erect; leaves somewhat auriculate, sessile: cauline ones subcordate, narrowed at the base, oblong, very acute, sharply and obsoletely serrulated: floral ones dilately and auriculately cordate at the base, short, very acutely acuminated, quite entire, shorter than the peduncles. ♃. S. Native of Brazil, Sello. This differs from *A. salicariæfò'lia* in hairiness and shape of leaves; the habit and inflorescence is the same, but the flowers are a little larger.

Hairy Angelonia. Pl. 1½ to 2 feet.

3 A. procu'mbens (Mart. nov. act. bonn. 11. p. 45.) stems weak, procumbent, tetragonal; leaves elliptic, lanceolate, sharply serrated. ♃. S. Native of Brazil, at Villa dos Ilheos. Physídium procúmbens, Schrad. gött. gel. anz. 1821. vol. 72. p. 714. t. 30. Schelvèria argùta, Bot. zeit. 4. jahrj. 1821. p. 299. and 328. Stems articulated, trichotomous, glabrous; angles winged. Leaves glabrous, spiny-serrated; petioles connate, with the projection ciliated. Flowers axillary, solitary or twin, very like those of a species of *Calceolària*, on pedicels which are shorter than the leaves. Corolla violaceous: upper lip of corolla short, 3-lobed; lobes crenulated: lower lip large, inflated, entire. Seeds angular.

Procumbent Angelonia. Pl. procumbent.

4 A. intege'rrima (Spreng. syst. append. p. 235.) leaves scattered, lanceolate, quite entire; peduncles racemose; stem erect. ♃. S. Native of Rio Grande, Sello.

Quite entire-leaved Angelonia. Pl. erect.

Cult. These are very pretty plants when in blossom, and are, therefore, well worth cultivating. A mixture of light turfy loam and peat is a good soil for them; and cuttings strike root readily in the same kind of mould under a hand glass, but as they are liable to rot, air should be frequently given.

Tribe IX.

EUPHRASIE'Æ (this tribe agrees with the genus *Euphràsia* in the characters given below.) D. Don, in edinb. phil. journ. vol. 19. p. 113. july, 1835. Benth. scroph.

Calyx tubular, 5-toothed. Corolla bilabiate. Stamens 4, didynamous. Cells of anthers parallel, usually spurred at the base. Stigma undivided. Capsule crustaceous; dissepiment placentiferous on both sides. Seeds with a membranous testa. Albumen fleshy. Embryo terete, slender, straight, almost the length of the albumen.—Herbs, with opposite leaves, and terminal, subspicate, bracteate flowers.

Subtribe I. Bartsie'æ. Cells of anthers spurred at the base.

XCIV. EUPHRA'SIA (from *ευφραινω*, *euphraino*, to delight; from the supposition of the plants curing blindness.) Tourn. inst. 78. Lin. gen. no. 741. Schreb. no. 998. Juss. gen. 100. edit. Usteri, p. 112. Gærtn. fruct. 1. p. 257. t. 54. Lam. ill. 518. f. 1. H. B. et Kunth, nov. gen. amer. 2. p. 333. Benth. scroph. ind. p. 51.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx campanulate, 4-cleft, somewhat bilabiate. Corolla bilabiate; upper lip galeate, emarginate: lower lip large, spreading; segments emarginate, retuse, denticulated, or entire. Stamens 4, fertile; cells of upper anthers usually with longer spurs than the lower ones. Stigma thickened, oblique, emarginate. Capsule ovate or oblong-ovate, compressed, usually emarginate; valves entire. Seeds few, wrapped in a membranous, striated testa.—Dwarf herbs. Leaves opposite or alternate: the upper or floral ones generally the broadest. Flowers sessile, solitary, subspicate at the tops of the branches, white, yellow, or purple.

§ 1. *Species natives of Europe and Asia. Anthers ciliated at the base; cells of the 2 lower anthers elongated into bristly spurs.*

1 E. officina'lis (Lin. spec. 841.) glabrous or downy, never scabrous; leaves nearly sessile, ovate: lower ones bluntly serrated; floral leaves ovate or roundish, acutely toothed, equal in length or exceeding the calyxes; calycine teeth acute, about equal in length to the tube of the corolla, which is glabrous;

segments of corolla emarginate; capsule equal in length or exceeding the calyx. ⊙. H. Native of Europe, Siberia, Aleutian Islands, on heaths and other dry places, especially on a chalky or sandy soil; plentiful in Britain, in like situations. Curt. lond. 5. t. 42. Fl. dan. 1037. Woodv. med. bot. 2. p. 220. Sabb. hort. rom. 3. t. 9. Blackw. 427. Smith, engl. bot. t. 1416.—Riv. mon. t. 90. f. 1. The plant varies much in size, branched or quite simple. Flowers varying much in colour from white to yellow; limb tinged with blue or streaked with purple. It seems to have been unnoticed by the ancients. The Arabians mention it under the name of Adhil. Mathæus Sylvaticus, a physician of Mantua, who lived about the year 1320, recommended this plant in disorders of the eyes. It is still in use, particularly as an ingredient in British herb tobacco; and Mr. Lightfoot says that the highlanders of Scotland make an infusion of it in milk, and anoint the patient's eyes with a feather dipped in it. It is, however, neglected by the faculty; and even thought by some to be injurious, at least in inflammation of the eyes. It is a weak astringent, but there seems to be no foundation for the old notion of its being useful in disorders of the eyes.

Var. β, elàtior (Benth. scroph. ind. p. 51.) taller, pubescent, simple or branched. ⊙. H. Native of the Himalaya, Kamaon, Cashmere, and at Kidarkonta. E. depauperàta, Benth. in. Wall. cat. no. 3886. E. símplex, D. Don, prod. fl. nep. p 95.

Var. γ, nemoròsa (Bull. herb. ex Led. fl. alt. 2. p. 422.) erect, nearly simple; serratures of leaves setaceous. ⊙. H. Native in dry places. Pers. ench. 2. p. 149. Bess. enum. pl. volh. p. 25.

Var. δ, intermèdia (Led. l. c.) erectish, nearly simple; leaves serrated: lower ones distant; serratures of the upper ones subsetaceous. ⊙. H. Native of the sandy banks of rivers and lakes. E. officinàlis, Lin. spec. 841. Bieb. fl. taur. 2. p. 69.—Gmel. sib. 3. p. 212. no. 25.

Var. ε, imbricàta (Pers. ench. 2. p. 149.) plant minute, branched; leaves of stem adpressed, cuneate, toothed at apex. ⊙. H. Native of France, in sandy places near Dax. Leaves quite entire towards the base.

Var. ζ, alpéstris (Wimmer et Crabowsky, fl. siles. 2. p. 218. Led. l. c.) stem short erect, simple, few-leaved; leaves bluntish, serrated; corolla large, of a purplish-violet colour. ⊙. H. Native of alpine places.

Var. η, alpìna (Duby, bot. gall. 1. p. 354.) leaves setaceously toothed; calyx glabrous, with linear-setaceous segments. ⊙. H. Native of the alps of Salisburgh, Switzerland, and the Pyrenees. E. Salisburgénsis, Funk, in Rœm. arch. 1. p. 43. Hoppe, taschenb. 1794. p. 190. E. alpìna, Lam. ill. t. 518. f. 2.

Var. θ, mínima (Duby, l. c.) stem nearly simple, small; leaves obtuse; calycine segments lanceolate. ⊙. H. Native of the alps of France, in arid pastures; and of the Pyrenees. E. mínima, Jacq. ex Pers. ench. 2. p. 149. A. officinàlis, β, Lam. dict. 2. p. 400. Upper leaves acutely toothed. Corolla yellow, with bluish veins.

Officinal Eyebright. Fl. July, Sept. Britain. Pl. ¼ to ½ foot.

2 E. Tarta'rica (Fisch. ex Spreng. syst. 2. p. 777.) clothed with subglandular villi; leaves sessile, broad-ovate, serrated; calyx clothed with glandular pubescence; segments of corolla emarginate; capsule exceeding the calyx. ⊙. H. Native of Altaia, in dry open places at the rivers Siba and Kerlyx, (Led.) Tcharysch, (Bunge.) Led. fl. ross. alt. ill. t. 435. Very like *E. officinàlis;* but differs in being clothed with glandular villi; the villi in *E. officinàlis* being simple and retrograde.

Tartarian Eyebright. Pl. ½ to 1 foot.

3 E. tricuspida'ta (Lin. spec. 841.) leaves cuneiform-linear, tricuspidate; segments of the lower lip of corolla emarginate. ⊙. H. Native of Italy; Carniola, on the alps.—Plukn. alm. 142. t. 177. f. 1.—Zanich. hist. 110. t. 76. Leaves linear, with one tooth on each side. Corollas similar to those of *E. officinàlis*.

Tricuspidate-leaved Eyebright. Pl. ¼ to ½ foot.

4 E. a'spera (Brot. fl. lus. 1. p. 185.) stem terete, smooth; leaves ovate, bluntly serrated, scabrous, rugosely lined. ⊙. H. Native of Portugal. Plant apparently suffruticose.

Rough Eyebright. Pl. ½ foot.?

§ 2. *Species natives of Australia. Anthers usually bearded.*

5 E. alpi'na (R. Br. prod. p. 436.) leaves cuneated, 3-5-crenated, glabrous; those of the fertile branches distant, and those of the sterile ones decussate; calyxes nearly sessile, pubescent, a little shorter than the capsule; segments of corolla all emarginate. ⊙. H. Native of Van Diemen's Land.

Alpine Eyebright. Pl. ¼ foot.?

6 E. tetragòna (R. Br. l. c.) stem tetragonal; leaves nearly oval, 3-5-toothed, obtuse, glabrous; calyxes glabrous, obtuse, nearly sessile, equalling the capsule in length; lower segments of corolla emarginate. ⊙. H. Native of the south coast of New Holland.

Tetragonal-stemmed Eyebright. Pl. ¼ foot.?

7 E. colli'na (R. Br. l. c.) leaves linear-cuneated, bluntly tridentate, glabrous; spikes many-flowered, the lower pairs distant; calyxes glabrous, about one half shorter than the capsule; segments of corolla all emarginate. ⊙. H. Native of Van Diemen's Land.

Hill Eyebright. Pl. ¼ foot.?

8 E. stria'ta (R. Br. l. c.) stems ascending; leaves and bracteas somewhat palmately 5-lobed, glabrous; spikes obovate; flowers all imbricate; calyxes acutish, glabrous; segments of corolla striated, retuse. ⊙. H. Native of Van Diemen's Land.

Striated Eyebright. Pl. ¼ foot.?

9 E. paludòsa (R. Br. l. c.) leaves linear, acutish, few-toothed, glabrous; those of the branches distant; spikes many-flowered, with the lower pairs distinct; calyxes acutish; segments of corolla nearly entire. ⊙. H. Native of New South Wales, about Port Jackson.

Marsh Eyebright. Pl. ¼ to ½ foot.?

10 E. speciòsa (R. Br. l. c. p. 437.) leaves decussate, ovate, crenately cut, and are, as well as the stem, which is erect, scabrous; calyxes acutish; segments of corolla retuse: lower middle one emarginate. ⊙. H. Native of New South Wales, along with the preceding.

Showy Eyebright. Pl. ¼ foot.?

11 E. sca'bra (R. Br. l. c.) plant scabrous from glandular pubescence; leaves lanceolate, dentately cut; calyxes acute; corolla downy, with entire segments. ⊙. H. Native of Van Diemen's Land, and the south coast of New Holland.

Scabrous Eyebright. Pl. ¼ to ½ foot.?

12 E. argu'ta (R. Br. l. c.) stem erect; plant pubescent; leaves lanceolate, pinnatifidly cut, scabrous; calyxes and bracteas setaceously acuminated; segments of corolla entire. ⊙. H. Native of New South Wales, about Port Jackson.

Sharp-toothed-leaved Eyebright. Pl. ¼ to ½ foot.?

13 E. cunea'ta (Forst. prod. no. 234.) leaves cuneiform-ovate, toothed at apex; segments of the lower lip of corolla subemarginate. ⊙. H. Native of New Zealand.

Wedge-leaved Eyebright. Pl. ¼ foot.?

§ 3. *Species natives of South America. Anthers usually glabrous, mucronate at the base, exserted.*

14 E. santolinæfòlia (H. B. et Kunth, nov. gen. amer. 2.

p. 333. t. 176.) plant clammy, and clothed with glandular villi; stem branched, terete, erect; leaves sessile, linear, obtuse, crenated; filaments downy; segments of corolla obtuse; calyxes obtuse; anthers, style, and capsules glabrous. ♃. G. Native of New Granada, on high plains between Suacha and Santa Fe de Bogota, at the altitude of 1370 hexapods. Leaves 4-5 lines long. Upper lip of corolla concave, emarginate. Crenatures of leaves revolute. Capsule oblong, obtuse, compressed a little.

Santolina-like Eyebright. Pl. ½ to 1 foot.

15 E. stri'cta (H. B. et Kunth, l. c.) hispid; stem nearly simple, somewhat tetragonal, strict; leaves linear-lanceolate, bluntish, crenated; segments of lower lip of corolla rounded: upper lip ovate, obtuse, concave; filaments and anthers glabrous; style and capsule pilose. ♃. G. Native of Quito, on the declivities of Mount Antisana, and in temperate and frigid places near the town of Chillo, at the altitude of 1350-1700 hexapods. Leaves 7-8 lines long. Corolla yellow, downy. Stamens hidden under the upper lip of corolla. Capsule obtuse, compressed. Very nearly allied to the preceding.

Strict Eyebright. Pl. 1½ foot.

16 E. melampyroìdes (H. B. et Kunth, l. c. p. 334.) stem panicled, nearly terete, hispid from reflexed bristles or hairs; leaves bluntly toothed at apex, hispid; calyxes clothed with glandular villi, linear; segments of the lower lip of corolla obtuse, entire: upper lip sub-emarginate; filaments glabrous; anthers, style, and capsules pilose. ♃. G. Native of Quito, in the plains of Cachabamba, and near Pintac, at the foot of Mount Antisana, at the altitude of from 1350 to 1600 hexapods. Leaves 7-8 lines long. Corolla yellow. Capsule oblong, compressed.

Melampyrum-like Eyebright. Pl. ½ to ¾ foot.

17 E. mu'tica (H. B. et Kunth, l. c.) stem panicled, terete, and is, as well as the leaves, hispid; leaves linear-lanceolate, coarsely serrate-crenated; calyxes hispid, linear, sometimes crenated at top; segments of the lower lip of corolla obtuse: upper lip emarginate; corolla, style, and filaments pilose; anthers glabrous, mutic; capsule hairy, oblong, obtuse, compressed. ♃. G. Native of Peru, in dry places between Lacarque and Ayavaca, at the altitude of 1300 hexapods. Leaves an inch long. Corolla flesh coloured.

Mutic-anthered Eyebright. Pl. twining.

Cult. The seeds of these plants may be sown on rockwork, but none of the species as yet have been found to grow in cultivation.

XCV. ODONTITES (from *οδους οδοντος, odous odontos*, a tooth; the plant is said to be good against the toothache. Pliny, liv. 27. cap. 12.) Dill. gen. p. 117. t. 6. Stev. mon. ped. p. 4. Pers. ench. 2. p. 150. Schkuhr, handb. t. 169. Led. fl. alt. 2. p. 423. Euphràsia species, Lin. and other authors.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 4-cleft. Upper lip of corolla galeate: lower lip trifid, with linear, equal segments. Anthers all mucronate, and a little exserted. Style straight. Capsule obtuse, emarginate. Seeds angular.—Branched, downy, annual, erect herbs. Leaves opposite, or the upper ones are alternate. Flowers red or yellow, disposed in unilateral, leafy racemes.

1 O. ru'bra (Pers. ench. 2. p. 150. Led. fl. alt. 2. p. 424.) stem branched; leaves lanceolate, serrated: upper ones alternate; segments of the lower lip of corolla truncate. ⊙. H. Native of Europe and Siberia, in meadows and moist pastures; plentiful in Britain, in like situations. O. vulgàris, Stev. mon. péd. in mem. soc. nat. mosc. 6. p. 4. Euphràsia odontìtes, Lin. spec. 841. Curt. fl. lond. 1. t. 44. Martyn, fl. rust. t. 42. Smith, engl. bot. 1415. Bieb. fl. taur. 2. p. 70. Bártsia odontìtes, Huds. angl. 268.—Hall. helv. no. 304.—Riv. mon. irr. t. 90. f. 2. Cratæogònum Euphrasìne, Ger. 85. emac. 91-3.—Gmel. sib. 3. p. 213. no. 26. Stem hispid, tetragonal. Corolla dusky red, or purple, sometimes varying to white, hairy. Seeds elegantly latticed.

Var. β, vérna (Pers. ench. 2. p. 150.) leaves ovate-lanceolate, toothed; bracteas longer than the flowers. ⊙. H. Native of Piedmont, in pastures. Euphràsia vérna, Bell. append. fl. ped. p. 33. Willd. spec. 3. p. 194. Perhaps a distinct species. Euphràsia sylvestris major purpurea latifolia, Column, ecphr. 1 p. 201. t. 202. f. 1.

Red Eyebright. Fl. July, Sept. Britain. Pl. ½ to 1 foot.

2 O. lu'tea; leaves linear, serrated: superior ones quite entire; segments of the lower lip of corolla emarginate. ⊙. H. Native of the South of Europe, on arid mountains; and of Barbary. Euphràsia lùtea, Lin. spec. 841. Jacq. fl. austr. t. 398. Desf. fl. atl. 2. p. 35. E. Còris, Crantz, austr. p. 298.—Hall. helv. no. 305. Odontìtes flòre lùteo, Riv. mon. t. 91.—Mor. hist. 3. p. 432. sect. 11. t. 24. f. 16.—Column. 1. p. 204. t. 203. This resembles *Odontìtes rùbra;* but the flowers are yellow; the upper lip bearded and emarginate. Stem and leaves rough. Capsule villous, shorter than the calyx. Calyx pubescent.

Yellow-flowered Eyebright. Fl. July, Sept. Clt. 1816. Pl. 1 foot.

3 O. linifòlia; leaves linear, all quite entire; calyx glabrous or pubescent. ⊙. H. Native of France and Italy. Euphràsia linifòlia, Column. ecphr. 2. p. 68. t. 69. Lin. spec. p. 842. Flowers yellow. Capsule hairy, exceeding the calyx.

Flax-leaved Eyebright. Fl. July, Aug. Clt. 1826. Pl. ½ to ¾ foot.

4 O. viscòsa; leaves linear-lanceolate, 3-nerved, almost quite entire; calyxes clammy; lateral lobes of lower lip of corolla emarginate. ⊙. H. Native of Provence and Switzerland, in sterile, gravelly places. Euphràsia viscòsa, Lin. mant. 86. Gouan. ill. 37. Desf. fl. atl. 2. p. 36. Lam. ill. t. 518. f. 3.—Hall. helv. no. 306. Garid. aix. 351. t. 78. Plant pilose, clammy. Flowers yellow. This differs from *E. lùtea*, in the leaves being linear-lanceolate, not strictly linear; and in the calyxes being villous and clammy, not glabrous. Corolla closed, and not shorter than the stamens. Capsule hairy, equal in length to the calyx. It is also to be distinguished from *E. linifòlia*.

Clammy Eyebright. Pl. 1 foot. ?

5 O. tenuifòlia; leaves subsetaceously linear, caducous, all entire; calyxes nearly glabrous; stem branched, twiggy, nearly naked, terete. ⊙. H. Native of Portugal. Euphràsia tenuifòlia, Pers. ench. 2. p. 150. E. linifòlia, Brot. fl. lus. 1. p. 185, but not of Lin. Corollas yellow. Anthers woolly, not exserted beyond the lips of the corolla.

Thin-leaved Eyebright. Pl. ½ to ¾ foot. ?

6 O. Córsica; stem prostrate at the base, branched; leaves linear, quite entire; flowers axillary, subspicate; calyx equal in length to the corolla. ⊙. H. Native of Corsica, on the mountains. Euphràsia Córsica, Low. fl. gall. 2. p. 367. Flowers yellow.

Corsican Eyebright. Pl. prostrate.

7 O. purpu'rea; leaves linear, quite entire, glabrous; racemes secund; stamens about equal in length to the corolla; capsules oblong, villous. ⊙. H. Native of Barbary, in sandy places. Euphràsia purpùrea, Desf. fl. atl. 2. p. 36. Stem dark purple, stiffish, bluntly tetragonal; branches terete, panicled. Calyx 5-toothed. Corollas violaceous, size of those of *E. viscòsa;* segments of the lower lip roundish, usually denticulated. The purple stems and flowers readily distinguish this from *E. viscòsa* and *E. lùtea.*

Purple-flowered Eyebright. Pl. 1 to 1½ foot.

8 O. LONGIFLÒRA; clothed with clammy pubescence; leaves linear, quite entire; tube of corolla filiform, 3 times as long as the calyx. ⊙. H. Native of Spain, on arid gypsose hills. Euphràsia longiflòra, Vahl, symb. 3. p. 78. Cav. icon. 1. p. 45. t. 62. Barrel. icon. 1204. Leaves blunt: rameal ones imbricate. Upper lip of corolla undivided: lobes of the lower one rounded. Stem purple. Branches quadrangular. Flowers axillary, in spikes, yellow. Seeds striated longitudinally. Cells of anthers awned at the base. Perhaps a new genus.

Long-flowered Eyebright. Pl. ½ to 1 foot.

Cult. For culture and propagation see *Euphràsia* above. A light soil answers the plant best.

XCVI. BA'RTSIA (named by Linnæus in memory of his particular friend John Bartsch, M.D., of whom he gives an interesting melancholy account in his Flora Suecica.) Lin. gen. no. 739. Schreb. gen. no. 996. Juss. gen. p. 100. ed. Usteri, p. 113. Nutt. gen. amer. 2. p. 55. Trixàgo, Stev. ped. p. 4.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 4-cleft. Corolla bilabiate: upper lip concave, entire: the lower lip trifid and reflexed. Stamens 4, didynamous. Anthers tomentose, equally lobed, free. Capsule 2-celled, 2-valved; dissepiment contrary to the valves. Seeds angular.—Herbaceous plants. Leaves entire, alternate, and opposite. Flowers alternate, bracteate, in terminal racemes. Corollas bluish purple, or yellow.

SECT. I. EUBA'RTSIA (this section is supposed to contain the true species of the genus.) Corolla shortly bilabiate. Seeds with membranous striated angles.

1 B. ALPI'NA (Lin. spec. 839.) leaves opposite, ovate-subcordate, bluntly serrated; anthers hairy; capsule pilose, exceeding the calyx. ⊙. H. Native of the mountains of Lapland, Switzerland, Savoy, Mount Baldo; and near Orton, in Westmoreland; Labrador, Colmaster. Smith, engl. bot. 361. Pediculàris, fl. dan. t. 43. Schkuhr, handb. 168. Hall. helv. no. 312. Stæchelìna alpìna, Crantz, fl. austr. p. 294. Euphràsia, &c. Lin. fl. lapp. 246.—Plukn. alm. 110. t. 163. f. 5. Clinopòdium alpìnum, Pon. bald. 343. Stem villous, bluntly quadrangular. Leaves sessile, dry, rather hairy: floral ones purple. Flowers solitary from the axils of the upper leaves, forming an interrupted, leafy spike. Corolla reddish, blue, or deep purple, villous.

Alpine Bartsia. Fl. July, Aug. Britain. Pl. ½ foot.

2 B. SPICA'TA (Pers. l. c.) leaves opposite, ovate-cordate, bluntly toothed: superior ones lanceolate, with remote teeth; flowers imbricately spicate; spike branched; stamens equal in length to the galea; anthers hairy; capsule pilose, exceeding the calyx. ⊙. H. Native of the Pyrenees. Ramond. in bull. di. sc. nat. no. 42. p. 141. f. 4. B. Fagònii, Lapeyr. Spike elongated. Bracteas shorter than the calyxes. Flowers yellow. ?

Spicate-flowered Bartsia. Pl. 1 to 1½ foot.

SECT. II. TRIXA'GO. Galea of corolla semi-cylindrical, short. Seeds minute, not winged.

3 B. PURPU'REA (Duby, bot. gall. p. 354.) stem nearly simple, or branched from the base; leaves ovate dentately palmate; spike interrupted at the base, leafy; calyx villous, with lanceolate, obtuse segments; anthers nearly glabrous, about equal in length to the calyx. ⊙. H. Native of the South of France, in pastures, and on the banks of rivers; and other parts of the South of Europe, and North of Africa. Euphràsia latifòlia, Lin. spec. 841. B. latifòlia, Smith. fl. græc. 6. p. 69. t. 568. Trixàgo purpùrea, Stev. mon. ped. p. 4.—Sabb. hort. rom. 3. t. 7.—Magn. monsp. 95. t. 94.—Mor. hist. 3. p. 330. sect. 11. t. 24. f. 8. Column. ecphr. t. 202. f. 2. Leaves opposite. Corolla with a white tube, and a blood-coloured villous limb; upper lip short straight.

Purple-flowered Bartsia. Fl. July, Sept. Clt.? Pl. ½ foot.

4 B. VISCÒSA (Lin. spec. 830.) hairy; leaves lanceolate, acuminated, coarsely serrated: superior ones alternate, serrated; flowers distant, lateral; stamens shorter than the galea; anthers hairy; calycine segments linear-lanceolate, acutish. ⊙. H. Native of France, Italy, and Britain; in the marshes of Cornwall, Devonshire, Lancashire, and Staffordshire; and of Argyleshire, in Scotland. The same plant has been found in Brazil, in the province of Monte Video, by Sello. Rhinánthus viscòsus, Smith, fl. brit. p. 648. Brot. fl. lus. 1. p. 187. Smith, engl. bot. t. 1045. Lightf. fl. scot. p. 321. t. 14.—Plukn. alm. 142. t. 27. f. 5.—Mor. hist. 3. p. 432. no. 15. Alectorólophos, Barrel. icon. t. 665. Stem terete, simple, villous towards the top. Calyx large, divided into 5 lanceolate segments. Corolla yellow. Capsule hairy, much shorter than the calyx. The whole plant clammy. (Fig. 59.)

FIG. 59.

Clammy Bartsia. Fl. July, Aug. Britain. Pl. 1 foot.

5 B. BÍCOLOR (D. C. icon. rar. t. 10. Duby, bot. gall. p. 354.) pubescent; stem simple, or a little branched; leaves opposite, lanceolate-linear, serrated; flowers densely spicate; bracteas ovate, or ovate-roundish; calyx woolly, with ovate-obtuse segments; anthers hairy; capsule villous, shorter than the calyx. ⊙. H. Native of Brittany. D. C. fl. fr. 5. p. 391. Seeds striated, not winged.

Two-coloured-flowered Bartsia. Pl. 1 foot.

6 B. ACUMINA'TA (Pursh, fl. amer. sept. 2. p. 429.) leaves alternate, long, linear: floral ones ovate, long-acuminated, 3-nerved, all undivided; flowers shorter than the bracteas; teeth of calyx acute. ⊙. H. Native on the north-west coast of America, and in the Island of Unalaschka.

Acuminated-leaved Bartsia. Pl.

7 B. TRIXA'GO (Lin. spec. ed. 1. p. 602.) pubescent; stem quite simple; leaves opposite, lanceolate, bluntly serrated; flowers densely spicate; bracteas ovate-roundish; calyx woolly, with small, obtuse teeth; anthers hairy; capsule villous, equalling the calyx; middle segment of the lower lip obtuse, smaller than the lateral ones. ⊙. H. Native of Palestine, Italy, Montpelier, and Caucasus, in humid places by the sea-side among rushes. Smith, fl. græc. t. 585. Rhinánthus Trixàgo, Lin. spec. 840. Alectorólophus Trixàgo, Bieb. cauc. 2. p. 69. Bellárdia Trixàgo, All. ped. no. 220. Bártsia, Lin. spec. ed. 1st. p. 602. Trixàgo A'pula unicaúlis, Column. ecphr. 1. p. 199. f. 197. Mor. hist. 3. p. 427. sect. 11. t. 24. f. 8. Stem quadrangular, rather woolly. Leaves pale, and so deeply toothed as to appear jagged. Spikes of flowers heaped at the top of the stem, large, quadrangular, woolly, and even rather viscid. Calyx inflated, angular. Corolla large, yellow; upper lip shorter, and narrow; palate prominent, 2-lobed. Seeds striated.

Trixago Bartsia. Pl. 1½ foot.

8 B. VERSÍCOLOR (Pers. ench. 2. p. 151.) hairy; stem simple; leaves opposite: lower ones linear-lanceolate, crenated: superior ones linear, deeply serrated; spikes dense, short; bracteas ovate cordate, acuminated, longer than the flowers; segments of the lower lip obtuse: the middle segment the narrowest. ⊙. H. Native of Italy and the North of Africa. Rhinánthus versícolor, Desf. fl. atl. 2. p. 33. Brot. fl. lus. 1. p. 186. Lam. dict. 2. p.

62. Pediculàris versícolor spicàta, Tourn. inst. p. 172.—Barrel. icon. 666. Flowers white, and purple. Calyx woolly, with obtuse teeth. Stamens shorter than the galea, which is hairy outside. This plant differs from *B. máxima* in the stem being simple, in the leaves being narrow-lanceolate, and in the upper ones being alternate, &c.

Party-coloured Bartsia. Pl. 1 to 1½ foot.

9 B. ma'xima (Pers. l. c.) stem branched; lower leaves opposite: superior ones alternate, oblong, bluntly and coarsely toothed; lower lip of corolla longer than the upper one; segments of the lower lip obtuse, equal in size. ⊙. H. Native of Candia. Rhinánthus máximus, Willd. spec. 3. p. 189. Rhinánthus versícolor, Lam. dict. 2. p. 62. Pediculàris Crética máxima amplioribus foliis et floribus, Tourn. cor. p. 9. Plant pubescent. Flowers yellow, ? disposed in spikes at the tops of the branches and stem. Calyx, stamens, and anthers as in preceding.

Largest Bartsia. Pl. 1½ to 2 feet.

Cult. For culture and propagation see *Euphràsia*, p. 611.

XCVII. BU'NGEA (named after Al. a Bunge, one of the editors of "Ledebour's Flora Altaica." 1829-1832.) Meyer. in verz. pflanz. p. 108.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx bracteate, tubular, 4-cleft. Corolla personate: upper lip tridentate: lower one trifid. Anthers all bicalcarate at the base. Stigma somewhat capitate. Capsule sub-indehiscent, ovate, acuminated, 2-valved, 4-celled, many-seeded. Seeds compressed, wrinkled.—A plant with a simple, rather tomentose stem, trifid, linear, pubescent leaves, and axillary, sessile flowers.

1 B. tri'fida (Meyer, l. c.) ⊙. ? H. Native of Asia Minor; and Caucasus, in stony places on Mount Talusch, near Swant, at the altitude of 670 to 800 feet. Bártsia trífida, Spreng. syst. 2. p. 773. Rhinánthus trífidus, Vahl. symb. 1. p. 44. Pediculàris orientalis supina, folio trifido, flore magno flavescente, Tourn. cor. p. 9.—Buxb. cent. 1. p. 5. t. 8. Corolla yellow, rather villous outside. Calyx pubescent, inflated.

Trifid-leaved Bungea. Pl. ½ to ¾ foot.

Cult. For culture and propagation see *Euphràsia*, p. 611.

XCVIII. SIPHONOSTE'GIA (from *σιφων*, *siphon*, a tube; and *στεγος*, *stegos*, a covering.) Benth. scroph. ind. p. 51.

Lin. syst. *Didynàmia*, *Angiospérmia*. Corolla funnel-shaped; tube elongated; limb 4-5 parted. Upper lip of corolla incurved: lower one shorter, with entire segments. Stamens 4, didynamous; cells of anthers parallel, acute at the base, mutic. Stigma capitately thickened. Capsule oblong, straight; valves entire. An erect herb, with twiggy, downy branches. Lower leaves opposite: superior ones alternate, pinnatifid, with acute, cut, lanceolate segments. Flowers scattered, rather distant, nearly sessile, disposed in terminal, interrupted spikes or racemes.

1 S. Chine'nsis (Benth. l. c.)—Native of China, at Macao.

China Siphonostegia. Pl. ?

Cult. For culture and propagation see *Euphràsia*, p. 611.

XCIX. LAMOUROU'XIA (named by Kunth, after J. V. F. Lamouroux, who has written some works on zoophytes and seaweeds.) H. B. et Kunth, nov. gen. amer. 2. p. 336. t. 167.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx campanulate, nearly equal, bilabiate, 4-cleft. Corolla with a short tube, a long, ventricosely compressed throat, and bilabiate limb; upper lip somewhat galeate, entire: lower one narrower and 3-lobed, plicate; lobes nearly equal, oblong, obtuse. Stamens 4, didynamous, the 2 upper ones very short, and generally sterile, wanting in *L. viscòsa*. Anthers of the fertile stamens reniform. pilose; cells usually mucronate at the base. Stigma clavate, undivided. Capsule ovate, compressed, 2-celled, 2-valved; placentas adnate to the dissepiment. Seeds covered by a reticulately cellular membrane.—Erect, branched herbs. Leaves opposite, sessile, serrated, or pinnatifid. Flowers axillary, solitary, opposite, subspicate, scarlet.

§ 1. *Stamens* 4: *2 upper ones short and sterile.*

1 L. virga'ta (H. B. et Kunth, nov. gen. 2. p. 356. t. 167.) branches nearly terete; calyxes and leaves glabrous; leaves linear-lanceolate, obsoletely crenulated; calycine segments lanceolate, quite entire. ♄. ? S. Native near the town of Quito, at the altitude of 1500 hexapods. Herb suffruticose, branched. Leaves about an inch long, and 2 lines broad. Corolla flesh-coloured.

Twiggy Lamourouxia. Shrub 1½ foot.

2 L. serratifòlia (H. B. et Kunth, l. c. t. 168.) branches tetragonal, bifariously pilose; leaves linear-lanceolate, deeply serrated, and are, as well as the calyxes, glabrous; calycine segments oblong-lanceolate, quite entire. ♃. S. Native of New Granada, near Santa Fe de Bogota, and at the Cataract of Tequendama. Leaves nearly sessile, 14-15 lines long, and 2½ lines broad. Corollas like those of the preceding.

Serrate-leaved Lamourouxia. Pl. 1 to 1½ foot.

3 L. rhinanthifòlia (H. B. et Kunth, l. c. p. 337. t. 169.) stem and branches sub-tetragonal, pubescently pilose; leaves oblong, acute, rounded at the base, half stem-clasping, crenately serrated, finely hairy; calyx pilose, with ovate-lanceolate, serrated segments. ♃. S. Native of New Spain, in temperate places near Magdalena, Actopan, and Santa Rosa de La Sierra, at the altitude of from 1040 to 1300 hexapods. Leaves about an inch long. Corolla as in the two preceding. In the Magdalena plant the stem is said to be nearly terete.

Yellow-rattle-leaved Lamourouxia. Pl. 1 to 2 feet.

4 L. sylva'tica (H. B. et Kunth, l. c.) plant twining a little; branches terete, rather pilose; leaves lanceolate-oblong, acute, narrowed at the base, somewhat doubly serrated, and are, as well as the calyxes, hairy; segments of calyx oblong, acute, serrulated. ♃. S. Native of Peru, near Ayavaca, in woods, at the altitude of 1400 hexapods. Leaves nearly sessile, one inch and more long. Corolla rose-coloured, hairy.

Wood Lamourouxia. Pl. twining.

5 L. corda'ta (Cham. et Schlecht, in Linnæa, 5. p. 103.) this is an intermediate plant between *L. viscòsa* and *L. rhinanthòides*, it differs from the first in the broader leaves, and from the second in the inflorescence being clammy; calycine segments quite entire. ♃. S. Native of Mexico. Habit of the plant peculiar. Stem strict, twiggy, densely leafy. Leaves decreasing in size from the top of the stem; largest only 1¼ inch long. Corolla scarlet.

Cordate-leaved Lamourouxia. Pl. 1 to 2 feet. ?

6 L. viscòsa (H. B. et Kunth, l. c. p. 338.) stem sub-tetragonal, and is, as well as the calyxes and leaves, pilosely tomentose, clammy; leaves lanceolate, acuminated, serrated; calycine segments lanceolate, quite entire. ♃. S. Native of Mexico, on the sea-shore near Acapulco. Habit of *Lobèlia*. Leaves hoary, about 2 inches long, and 6-7 lines broad: floral leaves ovate-lanceolate, an inch long, beset with glandular hairs. Corolla flesh-coloured, tomentose outside.

Clammy Lamourouxia. Pl. 1 to 2 feet.

§ 2. *Stamens* 4, *all fertile.*

7 L. xalape'nsis (H. B. et Kunth, l. c.) stem and branches nearly terete, hairy; leaves lanceolate, acuminated, sharply serrated, and are, as well as the calyxes, glabrous; stamens all fertile; calycine segments oblong-linear, quite entire. ♃. S. Native of Mexico, on the eastern declivities of mountains near the town of Xalapa, at the altitude of 680 hexapods. Leaves

nearly sessile, 1½ inch long, and 3 lines broad. Corolla scarlet, hairy outside. Cells of all the anthers mutic. This is, probably, a distinct genus, from the stamens being all fertile, and from the cells of the anthers being mutic at the base.

Xalapa Lamourouxia. Pl. 1 to 2 feet. ?

8 L. multífida (H. B. et Kunth, l. c. p. 339.) stem sub-tetragonal, and is, as well as the leaves, nearly glabrous; leaves pinnatifid; stamens all fertile; calyx clothed with mealy down, with lanceolate, quite entire segments. ♃. S. Native of Mexico, between Guanaxuato and Santa Rosa de La Sierra, at the altitude of 1200 hexapods; and among bushes near Jalapa, &c. Stenochìlus élegans, Willd. herb. no. 11694. Stem rather pilose, reddish. Leaves petiolate, 9-12 lines long. Corolla scarlet, downy outside. Cells of anthers all awned at the base.

Multifid-leaved Lamourouxia. Pl. 1 to 2 feet.

† *A species not sufficiently known.*

9 L. bartsioi'des (Hook. bot. misc. 1. p. 234.) pubescent, branched; leaves linear-oblong, obtuse, crenately pinnatifid, scabrous; bracteas lanceolate, shorter than the corolla; flowers crowded into an oblong spike. ♃. ? S. Native of Peru, in the valley of Canta. Habit of *Bártsia viscòsa*, or *Rhinánthus cristagálli*; but the calyx is cylindrical, and the corolla, as far as can be judged by dried specimens, of *Lamouroúxia*.

Bartsia-like Lamouroúxia. Pl. 1 to 2 feet. ?

Cult. For culture and propagation see *Angelònia*, p. 609.

Subtribe II. Castillegie'æ. Cells of anthers mutic at the base.

C. CASTILLE'JA (named by Linnæus after D. Castillejo, a botanist of Cadiz.) Lin. suppl. 47. no. 1408. Schreb. gen. no. 1059. Lam. ill. 519. Smith, icon. ined. t. 40. Juss. gen. p. 100. ed. Usteri, p. 112. H. B. et Kunth, nov. gen. amer. 2. p. 329.—Bártsia species of authors.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx tubular, compressed, cleft on one side, rarely regular. Corolla tubular, compressed, bilabiate: upper lip linear, canaliculate, entire: lower lip very short, tridentate, or tripartite, ventricose at the base. Stamens 4, didynamous. Stigma capitate. Capsule ovate, compressed, 2-celled, 2-valved. Seeds covered by a loose, reticulated membrane.—Herbs, sub-shrubs, or shrubs. Leaves alternate, entire, or trifid or multifid: floral ones of two forms, bractea-formed and coloured. Flowers axillary, solitary, or terminal and spicate. Corolla white, or greenish.

Sect. I. Eucastille'ja (from εν, *eu*, well; and *Castillèja*. This section is supposed to contain the true species of the genus.) Calyx cleft on one side, and toothed or lobed on the other. Anthers distinct, narrow, with equal lobes. Herbs or subshrubs.

1 C. pa'llida (Kunth, ex Cham. in Linnæa, 2. p. 580. Spreng. syst. 2. p. 232.) tomentose; radical leaves linear, acuminated, entire: superior ones alternate, ovate-lanceolate, 3-nerved, toothed; spike simple; calyx villous. ♃. H. Native of Siberia, in shady places on the banks of rivers; also of Hudson's Bay and Labrador, &c.; Canada and New Hampshire, on the white hills. C. septentrionàlis and C. Sibírica, Lindl. bot. reg. 925. Bártsia pállida, Lin. spec. 839. Michx. fl. bor. amer.—Gmel. sib. 3. p. 201. no. 11. t. 42. Corollas pale purple.

Var. β, *Unalaschénsis* (Cham. et Schlecht, 2. p. 584.) stem simple, thickness of a hen's quill; upper leaves ovate-lanceolate, 3, rarely 5-nerved, more hairy than in the species, and the bracteas less jagged. ♃. H. Native of the Aleutian Islands.

Pale Castilleja. Fl. June, Sept. Clt. 1782. Pl. ½ to 1 foot.

2 C. affi'nis (Hook. et Arn. in Beech. voy. pt. bot. p. 154.) stem herbaceous, nearly simple, pilosely hispid; leaves linear-lanceolate, 3-nerved, pubescent, entire: floral ones linear, entire, rarely dentately lobed at apex; lower flowers pedunculate; floriferous calyx tubular, cleft both in front and behind; lobes bifid: segments linear-lanceolate, acute; corolla exceeding the calyx. ♃. H. Native of California. Nearly allied to *C. pállida*, the *Bártsia pállida*, Michx. It differs from *C. lithospermoìdes* of Kunth, in the floral leaves not being dilated, and from *C. integrifòlia*, Lin. in the calyx being tubular, not ventricose.

Allied Castilleja. Pl. 1 foot.

3 C. Toluce'nsis (H. B. et Kunth, nov. gen. 2. p. 329.) stems branched, procumbent, glabrous; leaves lanceolate, obtuse, hispid, nearly entire: superior ones trifid at apex, 3-nerved; flowers axillary, sessile; calyx about equal in length to the corolla. ♄. G. Native of Mexico, on the mountains near the town of Toluca, at the altitude of 1380 hexapods. Stems tufted. Branches quadrangular, densely leafy. Corolla glabrous. Calyx bifid; lobes rounded.

Toluca Castilleja. Shrub procumbent.

4 C. Morane'nsis (H. B. et Kuuth, l. c.) stem suffruticose, simple, prostrate, pubescently hispid; leaves lanceolate, acute, hispid, entire: superior ones trifid; flowers axillary, sessile; corolla exceeding the calyx a little. ♄. G. Native of Mexico, in temperate places between Pachuca and Moran, at the altitude of 1320 hexapods. Calyx bifid; lobes emarginate.

Moran Castilleja. Clt. 1825. Shrub prostrate.

5 C. nubi'gena (H. B. et Kunth, l. c. p. 330.) stem shrubby, branched, erect, hispid; leaves linear, trifid at apex, densely hairy, the middle segment also somewhat trifid; flowers axillary, on short peduncles; floriferous calyx ventricose, about equal in length to the corolla. Cleft on one side, and lobed on the other. ♄. G. Native on Mount Pichinca, in sandy places near the plains of Verde Cuchu, at the altitude of 1800 hexapods. Branches tetragonal. Floral leaves red.

Nubigenous Castilleja. Shrub ¼ to ½ foot.

6 C. lacinia'ta (Hook. et Arn. in Beech. voy. pt. bot. p. 40.) plant beset with a few stiff hairs; stem erect, herbaceous; leaves linear, trifidly pinnatifid, with elongated, filiform segments; flowers axillary, almost sessile; calyx equal in length to the corolla. ♃. ? G. Native of Chili, about Conception. Very closely allied to *C. nubìgena*, but that appears to be suffruticose, and has an inflated calyx, and the segments of the leaves are much broader and shorter.

Jagged-leaved Castilleja. Pl. 1 foot. ?

7 C. fissifòlia (Lin. suppl. 293.) stem suffruticose, branched, erect, hispid; leaves linear, trifid at the apex, densely hairy: middle segment 3-lobed; flowers spicate, pedicellate; calyx tubular, one half shorter than the corolla. ♄. G. Native of New Granada, in frigid places between Zipaquira and Santa Fe de Bogota, at the altitude of 1360 hexapods. Smith, icon. ined. t. 40. H. B. et Kunth, l. c. p. 330. Leaves 3-nerved, an inch long. Rudiments of branches from the axils of the leaves.

Cleft-leaved Castilleja. Shrub 2 to 3 feet.

8 C. arve'nsis (Cham. et Schlecht, in Linnæa, 5. p. 103.) stem herbaceous, simple, or branched, hispid from pili; leaves spatulate-lanceolate, or oblong-lanceolate, obtuse, narrowed at the base, 3-nerved, entire, hairy; flowers spicate; corolla scarcely exceeding the calyx. ♃. G. Native of Mexico, near Jalapa, among corn, between San Andres and Serra Colorado. Nearly allied to *C. lithospermoìdes*, but is distinguished from it by the form of the leaves. Seeds cuneated, not winged.

Corn-field Castilleja. Pl. 1 foot.

9 C. integrifòlia (Lin. suppl. 293.) stem shrubby, branched, erect, hispid from white hairs; leaves linear, entire, pubescently hispid; flowers spicate, nearly sessile; floriferous calyx

ventricose at the base, shorter than the corolla. ♄. G. Native of New Spain, in temperate places near Tasco, San Augustin de las Cuevas, at the altitude of 1100 hexapods. Smith, icon. ined. t. 39. H. B. et Kunth, nov. gen. 2. p. 33. Leaves 3-nerved, 8 lines long, and 1½ line broad. Calyx bidentate.

Entire-leaved Castilleja. Clt. 1825. Shrub 1 to 1½ foot.

10 C. LITHOSPERMOI'DES (H. B. et Kunth, l. c. p. 331. t. 164.) stem herbaceous, nearly simple, pilosely hispid; leaves lanceolate-linear, narrowed at top, obtuse, entire, beset with pili; flowers subspicate, sessile; corolla hardly exceeding the calyx. ♃. ? G. Native of New Spain, near Real del Monte and Moran; and of the province of Quito, near Chillo, at the altitude of 1350 hexapods; and of the South of Brazil, Sello. C. hyssopifòlia, Willd. herb. no. 11697. Leaves 3-nerved, 1½ to 2 inches long, and 3 lines broad: floral ones red, dilated at apex. Calyx cleft on one side, and 2-lobed on the other. Corolla white.

Lithospermum-like Castilleja. Pl. 1 foot.

11 C. OCCIDENTA'LIS (Torrey, in ann. lyc. 2. p. 230.) stem herbaceous, simple, pilose; leaves linear-lanceolate, attenuated at apex, minutely pubescent, quite entire, acutish; flowers spicate, sessile; corolla hardly exceeding the calyx; bracteas trifid, with erect segments. ♃. H. Native of North America, among the rocky mountains. Leaves sessile, 3-nerved. Spike simple, oblong. Middle segments of the bracteas sometimes trifid. Calyx a little cleft on one side, 4-toothed.

Western Castilleja. Pl. ¼ to ½ foot.

12 C. SCORZONERIFÒLIA (H. B. et Kunth, l. c. p. 331. t. 165.) stem herbaceous, simple, ? pilosely hispid; leaves linear, dilated at the base, half stem-clasping, entire, rather hispid: floral ones bractea-formed, coloured; flowers spicate, sessile; corolla hardly exceeding the calyx. ♃. G. Native of New Spain, on rocks near Pascuaro and Ario, at the altitude of 1100 hexapods. Stem angular, reddish. Leaves 3-nerved, about 3 inches long, and 2-3 lines broad: floral ones purplish. Calyx cleft on both sides; segments emarginately bidentate. Corolla pilose. Very nearly allied to the preceding.

Scorzonera-leaved Castilleja. Pl. 1 foot.

SECT. II. EUCHRÒMA (from *ευ, eu*, well; and *χρωμα, chroma*, colour; in allusion to the common name of the species in North America. "Painted cup," from the brilliant colouring of the bracteas.) Euchròma, Nutt. gen. amer. 2. p. 54. Calyx spathe-formed, bifid, or emarginate, or quadrifid; segments subulate. Anthers linear, with unequal lobes, all cohering in the form of an oblong disk.—Herbaceous plants with simple stems. This section differs from the first in the anthers being connected, and in their cells being unequal.

§ 1. *Calyx spathe-formed, 2-lobed, or quadrifid, inclined to one side.*

13 C. COCCI'NEA; annual, or biennial; leaves, as well as the coloured bracteas, divaricately trifid; calyx bifid, nearly equal with the corolla: segments retuse and emarginate. ♂. H. Native of the States, from New York to Virginia, and of the Arkansas territory. Bártsia coccínea, Lin. spec. 839. Euchròma coccínea, Nutt. gen. amer. 2. p. 55.—Pluck. alm. 283. t. 102. f. 5.—Mor. hist. 3. p. 395. sect. 11. t. 13. f. 28. Corollas yellow. Bracteas scarlet.

Scarlet-bractead Painted Cup. Fl. July, Aug. Clt. 1787. Pl. ½ to 1 foot.

14 C. LATIFÒLIA (Hook. et Arn. in Beech. voy. pt. bot. p. 154.) stem sub-herbaceous, branched, beset with hairy pubescence at bottom, but rather villous at top; leaves ovate-oblong, obtuse, entire, densely pubescent; floral leaves dilated, cuneated, trifid at apex: lobes short, obtuse, the middle one broadest; flowers nearly sessile; floriferous calyx sessile, equally cleft both in front and back: lobes short, bluntly bidentate; tube of corolla equal in length to the calyx. ♃. H. Native of California. Castillèja Toluccénsis, Cham. in Linnæa, 2. p. 579. but not of Kunth. "This and *C. foliolòsa* belong to the same sub-genus or section of *Castillèja*, with *Euchròma coccínea* of Nutt. having the same kind of calyx, while *Castillèja affìnis* has the same kind of calyx as *Euchròma grandiflòra*." Arnott.

Broad-leaved Painted Cup. Pl. 1 foot. ?

15 C. FOLIOLÒSA (Hook. et Arn. in Beech. voy. pt. bot. p. 154.) plant clothed with snowy tomentum; stem shrubby, branched; leaves crowded: lower ones linear, obtuse: upper and floral ones divaricately tripartite, or rarely entire; flowers nearly sessile; floriferous calyx tubular, equally cleft in front and back: lobes emarginate; tube of corolla shorter than the calyx. ♃. H. Native of California. In some points this plant agrees with *Castillèja fissifòlia*, Lin. The axils of the leaves are furnished with a tuft of small leaves, or short abortive branches.

Leafy Painted Cup. Pl. 2 to 3 feet.

16 C. GRANDIFLÒRA; perennial; leaves and uncoloured bracteas shortly trifid; segments divaricate; calyx 4-cleft, partly oblique; corolla longer than the calyx, with the segments of the lower lip acuminated. ♃. H. Native on the plains of the Missouri, from the confluence of the river Platte to the Mountains; also near the Prairie du Chien, Mississippi. Euchròma grandiflòra, Nutt. gen. amer. 2. p. 55. Castillèja sessiliflòra, Pursh, fl. amer. sept. 2. p. 738. ? Bártsia tenuifòlia, Pursh, fl. 2. p. 738. ? Plant downy in every part. Corolla downy, 2-3 inches long, greenish white, a little rosaceous: upper lip almost green.

Great-flowered Painted Cup. Fl. April, June. Clt. 1811. Pl. 1½ foot. ?

17 C. PURPU'REA; leaves cuneated, trifid, or a little jagged; bracteas red; calyx and corollas coloured, quadrifid, unilateral; segments of corolla acute. ♃. H. Native of the Arkansas, on rocks in the hilly prairies of Red river. Euchròma purpùrea, Nutt. in amer. phil. trans. n. s. vol. 5. p. 180. Stem tomentose, the leaves more slightly so. Calyx and corolla of a brilliant reddish purple. Segments of calyx linear, all inclined to one side, and nearly the length of the corolla: apex of the upper lip of the corolla greenish. Nearly related to *E. grandiflòra*, but differs in the proportion of the corolla, and the dilation and brilliant colour of the bracteas.

Purple-flowered Painted Cup. Pl. 1 foot. ?

§ 2. *Calyx quadrifid, equal.*

18 C. AMBI'GUA (Hook. et Arn. in Beech. voy. pt. bot. p. 154.) annual; stems many, branched a little; leaves scattered: lower ones lanceolate, obtuse: superior and floral leaves gradually increasing in size, dilated, and deeply multifid; floriferous calyx tubular, equally 4-cleft to the middle, with subulate segments; tube of corolla exceeding the calyx: upper lip short: lower one 3-lobed: lateral lobes rounded, very concave: middle one straight, mucrone-formed. ♃. ? H. Native of California. Said to be nearly allied to *Bártsia tenuifòlia*, Pursh. The lower lip of the corolla is quite at variance with the character of the genus, yet the upper lip and habit are the same. At each side of the central lobe of the lower lip is a small gland, as in several other species.

Ambiguous Painted Cup. Pl. 1 foot. ?

19 C. PARVIFLÒRA (Bougard, in mem. acad. petersb. 2. p. 157.) stem simple, ascending, clothed with ovate, entire, or cut, acute scales at the base, villous at top; leaves scattered,

sessile, ovate-lanceolate, regularly jagged, with usually 3 segments on each side, opposite, divaricate: lower ones lanceolate, acuminated: upper ones linear, acute: lower ones downy on the nerves: uppermost ones more villous, an inch long; flowers densely racemose at the tops of the branches, sessile, red; bracteas conforming to the leaves, villous; calyx tubular, 4-cleft, with linear lobes; corolla with a tricrenated upper lip, and a tridentate lower one; anthers sagittate, yellow. ♃.? H. Native of the Island of Sitcha. Said to be nearly allied to *C coccínea*, but the flowers are one half smaller.

Small-flowered Painted Cup. Pl. ½ to ¾ foot.

20 C. angustifòlia; dwarf, hairy; leaves divaricately trifid; radical ones simple, with linear, bluntish segments; bracteas trifid; middle segment generally 3-lobed; calyx quadrifid, segments equal. ♃. H. Native in dry prairies, on the borders of little Goddin river, near the source of the Columbia. Euchròma angustifòlia, Nutt. in journ. acad. nat. sc. phil. 7. p. 46. Many stems from the same root, about 3-4 inches high, and hairy; the leaves covered with shorter pubescence, rather hoary; the segments divaricate, bifid, trifid, and simple. Bracteas apparently of a lake colour. Corollas small, hardly longer than the equal calyx.

Narrow-leaved Painted Cup. Pl. ¼ to ½ foot.

21 C. Bradbu`rii; rather pilose; leaves palmately somewhat twice trifid, with linear segments; bracteas divided like the leaves; calyx quadrifid, with equal segments. ♃. H. Native along with the preceding. Euchròma Bradbùrii, Nutt. l. c. p. 47. Stem simple. Leaves pubescent, trifidly divaricate from the middle; the central segment trifid. Bracteas apparently scarlet, the central segment 3-lobed.

Bradbury's Painted Cup. Pl. ½ foot.

Cult. The species are very difficult to cultivate. Peat is the best soil for them. They may be grown in shady peat borders; but are best in pots, being more easily sheltered during winter, by placing them under a frame.

CI. ORTHOCA'RPUS (from *ορθος, orthos*, straight; and *καρπος, karpos*, a fruit; the straightness of the fruit readily distinguishes it from *Melampỳrum*.) Nutt. gen. amer 2. p. 56.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx tubular, semiquadrifid. Corolla bilabiate, closed; upper lip smaller, compressed, with inflexed margins: lower lip concave, obsoletely 3-toothed, unexpanded. Anthers free; cells unequal, divaricate. Capsule straight, elliptic-ovate, 2-celled, 2-valved, many-seeded, opening on both sides; dissepiment transverse. Seeds small, with a winged lunate margin.—Annual. Stem simple. Leaves alternate, entire. Flowers axillary, alternate, sessile, and bracteate; bracteas divaricately trifid. Corollas yellow.

1 O. lu`teus (Nutt. l. c.) ☉. H. Native in humid situations on the plains of the Missouri, near Fort Mandan, very local. Flowers size and form of those of *Melampỳrum* at first sight. Leaves lanceolate, linear, sessile, acute, opaque, and are, as well as the bracteas and calyx, viscidly pubescent. Margins scabrous. Bracteas 3-nerved. Corolla yellow, smooth. Stigma simple, minute.

Yellow-flowered Orthocarpus. Pl. 1 foot.

Cult. For culture and propagation see *Euphràsia*, p. 611.

CII. SCHWA'LBEA (named by Christian George Schwalbe, who has written a Botanical and Medical History of the Quina of the shops). Grov. virg. 92. Schreb. gen. no. 1001. Lam. ill. t. 520. Nutt. gen. amer. 2. p. 54.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx ventricose, tubular, obliquely 4-cleft: upper segment shortest: the lower large and emarginate, or bidentate. Corolla bilabiate: upper lip entire, arched, the lower 3-lobed. Capsule ovate, nearly terete, 2-celled, 2-valved; dissepiment produced by the inflexed margins of the valves, and parallel with the longitudinal receptacle. Seeds numerous, imbricate, linear, and winged.—A perennial, herbaceous plant. Leaves alternate, entire. Flowers axillary, racemose, alternate, on short pedicels. Calyx mostly marked with 10-12 angular stripes, and conspicuously bibracteate at the base. Said by Nuttall to belong to the *Antirrhìneæ*. Capsule without any transverse dissepiment, opening longitudinally always below the adhering summit.

1 S. America`na (Lin. spec. p. 844.) ♃. H. Native from New York to Florida, generally occurring on the borders of spagnose swamps, not far from the sea coast.—Plukn. mant. 73. t. 348. f. 2.? Corollas of a dull yellowish colour. Anthers crescent-shaped.

American Schwalbea. Pl. 2 feet.

Cult. For culture and propagation see *Castillèja* above.

CIII. LAFUE'NTEA (evidently named after some Spanish botanist of the name of La Fuente, of whom we know nothing.) Lag. ex Spreng. syst. 2. p. 680.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla bilabiate: upper lip 2-cleft: lower one 3-cleft. Capsule 2-celled, many-seeded; dissepiment equal.—A strong-scented, suffruticose plant, clothed with glandular, clammy hairs. Leaves decussate, reniform, crenated. Spikes axillary, pedunculate, solitary.

1 L. rotundifòlia (Lag. l. c.) ♄. F. Native of the South of Spain.

Round-leaved Lafuentea. Shrub small.

Cult. For culture and propagation see *Castillèja*, above.

Tribe X.

TEEDIE`Æ (this tribe contains plants agreeing with *Teèdia* in the nearly equal corolla and baccate fruit.) Calyx 5-parted. Limb of corolla nearly equal. Fruit baccate.

CIV. TEE`DIA (meaning not explained by the author.) Rudolf, in Schrad. journ. 2. p. 289. Ker. bot. reg. t. 209. and 214.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, with subulate segments. Corolla salver-shaped; tube cylindrical, a little longer than the calyx, thrust in near the base in front, and consequently gibbous behind; throat pilose; limb nearly regular, 5-cleft, with ovate, obtuse, equal segments. Stamens 4, didynamous; anthers didymous, roundish. Style shorter than the stamens. Stigma subcapitate, convex, obsoletely bifid. Berry globose, black, size of a large pea, girded by the calyx, 2-celled, many-seeded. Seeds inserted in parietal placentas, oval, scrobiculate, ex Burch.—Suffruticose, biennial herbs, natives of the Cape of Good Hope. Stems tetragonal. Leaves opposite, oblong-ovate, about 2 inches long, acuminated; petioles winged, half stem-clasping. Peduncles axillary, usually 3-flowered, forming terminal, leafy panicles. Corollas rose-coloured, with dark purple spots near the throat.

1 T. lu`cida (Rudolf. l. c. Pers. ench. 2. p. 166. Ait. hort. kew. ed. 2. vol. 4. p. 47.) leaves glabrous on both surfaces, like the rest of the plant. ♂. G. Native of the Cape of Good Hope. Ker. bot. reg. 209. Caprària lùcida, Ait. hort. kew. ed. 1st. vol. 2. p. 353. Willd. spec. 3. p. 324. Borckhausènia lùcida, Roth. catalect. bot. 2. p. 56. Bracteas subulate, length of peduncles.

Shining-leaved Teedia. Fl. April, July. Clt. 1774. Pl. 1 to 2 feet.

2 T. pube'scens (Burch. in bot. reg. 214.) leaves downy on both surfaces. ♂. G. Native of the Cape of Good Hope. Very like the preceding species in habit.

Downy Teedia. Fl. May, Oct. Clt. 1816. Pl. 1 to 2 feet.

Cult. Both species are very pretty when in blossom. They thrive best in rich light soil, and are readily increased by cuttings or seeds.

CV. FREYLI'NIA (meaning not explained by the author.) Coll. Freyl. with a figure. Caprària species of Lin. and Thunb.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted. Corolla funnel-shaped. Stamens 4, unequal, perfect, with the rudiment of a fifth. Drupe containing 4 2-seeded nuts. Shrubs with opposite, entire leaves, and terminal panicles of flowers.

1 F. cestroìdes (Coll. l. c.) leaves linear-lanceolate, quite entire, glabrous; panicle terminal, composed of short racemes; segments of corolla revolute. ♄. F. Native of the Cape of Good Hope. Caprària lanceolàta, Lin. suppl. 284. Ait. hort. kew. ed. 1st. vol. 2. p. 354. Link, et Otto, icon. pl. hort. berol. 11. t. 4. Freylìnia oppositifòlia, Spin. seb. not. 13. Búddlea glabérrima, Cat. hort. taur. 13. Leaves 2-3 inches long, acute, striated, stiff. Corolla copper-coloured.

Cestrum-like Freylinia. Fl.? Clt. 1774. Shrub 3 to 6 feet.

2 F. undula'ta; leaves ovate-oblong, quite entire, undulated: upper ones subcordate, verticillate; racemes spike-formed, simple. ♄. G. Native of the Cape of Good Hope. Caprària undulàta, Lin. suppl. 284. Ait. hort. kew. ed. 1st. p. 354. Lher. sert. ang. p. 21. Lam. ill. t. 534. f. 1. Sims, bot. mag. 1556. Corollas purple, 5 times longer than the calyx.

Undulated-leaved Freylinia. Fl. Mar. July. Clt. 1774. Shrub 2 to 3 feet.

3 F. densiflòra (Benth. in Hook. comp. 2. p. 55.) lower leaves verticillate: superior ones scattered, oblong-elliptic, flattish, glabrous; raceme dense, subpanicled; corolla 3-4 times longer than the calyx. ♄. G. Native of North Africa, in the Uitenhage district.

Dense-flowered Freylinia. Shrub.

4 F. longiflòra (Benth. l. c.) leaves opposite or scattered, oblong-elliptic, hardly undulated, glabrous; raceme elongated, simple; corollas 5 times longer than the calyx. ♄. G. Native of North Africa, in Zwarteberg, Ecklon.

Long-flowered Freylinia. Shrub.

5 F.? rí'gida; leaves ovate, entire, glabrous; flowers panicled. ♄. G. Native of the Cape of Good Hope. Caprària rígida, Thunb. prod. p. 103.

Stiff Freylinia. Shrub.

Cult. Some of the species of this genus will survive in the open ground against a wall with a south or west aspect, with a little protection in winter. They will grow freely in any light rich soil, or a mixture of turfy loam and peat; and cuttings strike root readily under a hand-glass.

Tribe XI. HALLERIE'Æ (this tribe only contains the genus *Hallèria.*) Link. Calyx small, 3-4-lobed, unequal, permanent. Corolla large, funnel-shaped; throat ventricose; limb erect, oblique, 4-cleft, unequal: upper segment the largest, obtuse, and emarginate: the side ones shorter, broader, and sharper: the lowest one very short, very slender, and very sharp. Stamens 4, didynamous. Fruit baccate, roundish, terminated by the style, 2-celled, many-seeded. Seeds flat, roundish, winged.—A shrub with opposite, serrated, shining leaves. Pedicels axillary, aggregate.

CVI. HALLE'RIA (so named by Linnæus in honour of the famous Albert Haller, M.D., author of "Stirpes Helveticæ," and other considerable works on botany.) Lin. gen. no. 761. Schreb. gen. no. 1020. Juss. gen. p. 118. ed. Usteri. p. 133.

Lin. syst. *Didynàmia, Angiospérmia.* The character of the genus the same as that of the tribe.

1 H. lu'cida (Lin. spec. 872.) leaves ovate, acuminated, serrated; corollas bilabiate; calyx 3-lobed; stamens exserted. ♄. G. Native of the Cape of Good Hope, in woods. Thunb. nov. act. ups. 6. p. 39. Sims, bot. mag. 1744.—Burm. afr. 244. t. 89. f. 2.—Duh. arb.. ed. nov. fasc. 20. p. 239. t. 69. Branches and leaves green. Leaves size of those of the *Privet.* Corolla reddish, large, drooping. Fruit roundish.

Shining-leaved Halleria. Fl. June, Aug. Clt. 1752. Shrub 4 to 6 feet.

2 H. elli'ptica (Thunb. nov. act. ups. 6. p. 39.) leaves oblong, acute, toothed, cuneiform at the base, and quite entire; corollas equal; calyx 4-lobed; stamens inclosed. ♄. G. Native of the Cape of Good Hope. H. lùcida, β, Lin. spec. 872.—Burm. afr. 243. t. 89. f. 1 Corolla red, drooping. Fruit oblong. "Leaves elliptic. Corollas truncate. Calyx 5-leaved." ex Thunb. l. c.

Elliptic-leaved Halleria. Fl.? Clt. 1816. Shrub 4 to 6 feet.

Cult. These shrubs may be treated like other hardy greenhouse plants, by being housed with myrtles in the winter. A light rich earth is the best for them; and cuttings root readily under a hand glass. They require to be exposed as much as possible to the air, and to have plenty of water given to them during summer.

† *Genera probably belonging to the order, but are not sufficiently known.*

CVII. PI'KRIA (from πικρος, *pikros*, bitter; from the bitterness of the plant.) Lour. coch. p. 393. Pers. ench. 2. p. 165.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 4-leaved, deciduous, longer than the corolla; alternate leaves linear, and shorter. Corolla tubular, ringent, bilabiate; tube constricted in the middle: upper lip spatulate, emarginate: lower lip larger and trifid, with equal, roundish segments. Stamens 4, didynamous; the 2 longer filaments streaked by a papillose tube, and bearing 1-celled anthers, and the two shorter ones bearing 2-celled, connected anthers. Berry ovate, 2-celled, many-seeded. —A very bitter, medicinal plant, with ovate serrated leaves, and crowded flowers.

1 P. Fe'l-te'rræ (Lour. l. c.) ♃.? G. Native of China and Cochinchina. Stem tetragonal.

Earth-gall Pikria. Pl. 1½ foot.

Cult. For culture and propagation see *Castillèja*, p. 616.

CVIII. DIPLANTHE'RA (from διπλοος, *diploos*, double; and ανθηρα, *anthera*, an anther; in reference to the cells of the anthers being distinct and diverging, therefore they appear double.) R. Br. prod. p. 548.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx trifid; upper segment entire: lateral ones bifid. Corolla bilabiate; throat compressed; upper lip obcordate: lower one tripartite, with roundish lobes. Stamens 4, inserted in the bottom of the corolla, exserted, nearly equal, ascending; cells of anthers distinct, diverging, reflexed to the sides of the filaments in æstivation. Ovarium 2-celled, many-seeded; placentas 2, adnate in each cell. Stigma bilamellate. Pericarp unknown.—A middle-sized tree, with a diffuse, irregular tufted top. Branches terete, tomentose. Leaves 4 in a whorl, large, petiolate, entire, biglandular above the base. Thyrse terminal, roundish, depressed. Partial peduncles verticillate; pedicels trichotomous. Flowers showy. Calyx half coloured. Corolla yellow. This genus is probably nearer allied to *Hallèria* than to any other.

1 D. tetraphy'lla (R. Br. l. c. p. 449.) ♄. S. Native of New Holland, within the tropic.

Four-leaved Diplanthera. Tree.

Cult. For culture and propagation see *Hallèria* above.

CIX. GOMA'RA (Lopez de Gomara, a Spanish botanist, mentioned by Tournefort in his Isagoge Flore du Perou.) Ruiz. et Pav. fl. per. syst. 168.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 4-cleft. Corolla irregular; tube curved, coarctate in the middle; nectary cup-shaped, membranous. Stigma capitate. Capsule 2-celled, 2-valved, many-seeded.

1 C. racemòsa (Ruiz. et Pav. l. c.) leaves oblong-lanceolate, denticulated at apex; flowers racemose.—Native of Peru, in woods; flowering in the autumn.

Racemose-flowered Gomara. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Angelònia*, p. 609.

CX. RHYNCHOGLO'SSUM (from ῥυγχος, *rhynchos*, a beak; and γλωσσα, *glossa*, a tongue.) Blum. bijdr. p. 741.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx bilabiate: upper lip trifid: lower one bifid. Corolla ringent: upper lip bifid, reflexed: lower lip larger and semi-trifid: middle segment the largest; throat bicallous. Stamens 4, almost inclosed, 2 of these sterile, and very small; anthers connected. Stigma obtuse. Capsule beaked, 1-celled, 2-valved; dissepiment double, incomplete, contrary to the valves; valves inflexed on both sides, and placentiferous.—A much branched, rather downy herb. Leaves alternate, (one being supra-axillary, and stipule-formed,) oblong, very oblique. Raceme terminal, drooping; pedicels secund. Said by Blum. to be nearly allied to *Gerárdia*.

1 R. obli'quum (Blum. l. c.) ♃. S. Native of Java, on the Seribu mountains.—Rheed. mal. 9. t. 80.

Oblique-leaved Rhynchoglossum. Pl. 2 to 3 feet.

Cult. For culture and propagation see *Angelònia*, p. 609.

Order CLXX. RHINANTHA'CEÆ (this order contains plants agreeing with the genus *Rhinánthus* in the characters given below.) D. C. fl. fr. 3. p. 454. D. Don. in edinb. phil. journ. vol. 33. p. 112. July 1835. Melampyràceæ Richard. Pediculàres part, Juss. gen. p. 99. ed. Usteri. p. 111.

Calyx tubular, 4-5-cleft, permanent. Corolla tubular, hypogynous, deciduous, irregular, imbricate in æstivation; upper lip usually galeate. Stamens 4, didynamous, all fertile; anthers spurred at the base. Ovarium 2-celled. Stigma undivided. Capsule 2-celled, 2-4-valved, many-seeded. Testa of seeds membranous. Albumen copious, fleshy. Embryo inverted, terete; radicle centrifugal, remote from the umbilicus.—Usually humble, herbaceous, rarely suffruticose plants, natives of Europe, Asia, and North America. Leaves usually opposite, and pinnatifid. Flowers terminal, spicate, bracteate. This is intimately allied to the preceding order, but is satisfactorily distinguished by its inverted embryo, with the radicle directed to the opposite extremity of the seed. The tribe *Euphrasièæ* of *Scrophularíneæ* have been included by most botanists in this family, and were they to be retained, the separation between it and the preceding order would be impossible. *Cymbària* differs from the rest of the genera in the very considerable degree of developement of its embryo.

Synopsis of the genera.

Tribe I.

Rhinanthie'æ. Embryo minute at the apex of the albumen.

1 Rhina'nthus. Calyx compressed, membranaceously inflated. Upper lip of corolla galeate. Seeds few, girded by the membranous wing.—Alectorólophus, Stev.

2 E'lephas. Superior lip of corolla linear, beak-like. Seeds few, striated.—Rhinánthus, Stev.

3 Pedicula'ris. Calyx 5-cleft, or unequally 2-3-cleft. Upper lip of corolla galeate, elongated, usually incurved. Seeds girded by a membrane.

4 Melampy'rum. Galea of corolla compressed, with replicate lobes. Seeds large, wingless, one in each cell.

5 Parentuce'llia. Upper lip of corolla galeate, concave: lower one linear at the base, channelled, 3-lobed at top. Calyx 5-toothed, inflated. Seeds wingless.

6 Triphysa'ria. Superior lip of corolla subulate: lower one tripartite, with saccate segments; anthers 1-celled. Calyx 4-cleft. Seeds wingless.

Tribe II.

Cymbarie'æ. Embryo rather foliaceous, almost the length of the albumen.

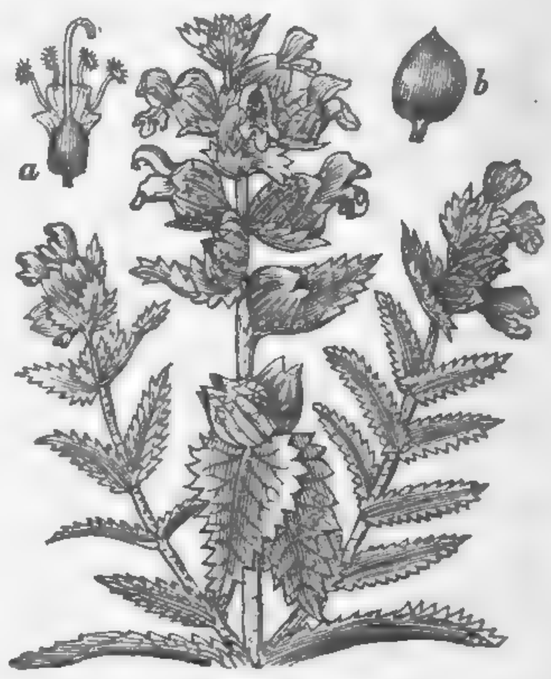
7 Cymba'ria. Corolla tubularly ventricose. Calyx 10-parted.

I. RHINA'NTHUS (from ῥὶν, *rhin*, a snout; and ἀνθος, *anthos*, a flower; so named from its ringent corolla.) Lin. gen. no. 740. Schreb. gen. no. 997. Juss. gen. p. 101. ed. Usteri. p. 113. Gærtn. fruct. 1. p. 255. t. 54. f. 5. Lam. ill. t. 517. f. 1. Schkuhr, handb. t. 169. Alectorólophus, Bieb. fl. taur. 2. p. 68. Stev. mon. ped. p. 4. Ledeb. fl. alt. 3. p. 419.—Pediculàris species, Tourn. inst. 77.—Cristagálli, Riv. mon. irr. t. 92. f. 2, and of many other old authors.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx compressed, membranous, inflated, 4-toothed. Superior lip of corolla galeate, compressed, bidentate at apex: lower one spreading, 3-lobed. Anthers bipartite, mutic, villous. Capsule 2-celled, obtuse, compressed. Seeds compressed, marginate, or girded by a membranous wing.—Marsh annual plants, natives of Europe. Leaves opposite, sessile, lanceolate, deeply toothed, cordate at the base. Flowers opposite, bracteate, disposed in terminal, secund spikes or racemes. Corollas yellow.

1 R. Crísta-ga'lli (Lin. spec. p. 840.) stem slightly branched; leaves lanceolate, serrated; calyx smooth; style inclosed; seeds with a dilated, membranous border. ⊙. H. Native of Europe and America, in barren pastures and meadows; plentiful in Britain. Smith, engl. bot. 657. Curt. lond. 5. t. 43. Fl. dan. 981.? Mart. fl. rust. 148. R. mìnor, Ehrh. herb. 46. beitr. 6. p. 144. Alectorólophos crísta-gálli, Bieb. fl. cauc. 2. p. 68. Mímulus crísta-gálli, Scop. fl. carn. no. 751. Alectorólophus glàber, All. ped. no. 206. Hall. helv. no. 313. Crísta-gálli fémina, Bauh. hist. 3. p. 436. f. 3. Dill. giss. append. 44. Crísta-gálli, Riv. mon. irr. 92. f. 3. Stem branched, quadrangular. Calyx greenish yellow; segments of the upper lip short, bluish. The plant has the name of yellow-rattle from the yellow flowers and rattling of the seeds in the capsule when ripe; and for the same reason it is called rattle-boxes in Ireland. It is known in some counties by the name of Penny-grass, and in Yorkshire by that of Henpenny, from the shape and size of the seed-vessels, like

FIG. 60.



the silver penny. Its other appellation of Cockscomb is derived from the appearance of the upper leaves, or bracteas, which accompany the flowers. Mr. Miller says, that the Dutch formerly carried on a trade with the seeds and seed vessels of a species of this genus to Germany. They call it Semen Savadillos, and it appears very like the seed vessels of this sort. The use they make of it is to kill vermin, especially bugs. They boil a quantity of the seeds and capsules in common water, with which they wash their wainscot, bedsteads, &c. and it is said effectually to destroy the insects.

Cockscomb, or Common Yellow Rattle. Fl. June, July. Britain. Pl. 1 to 1½ foot.

2 R. ma'jor (Ehrh. herb. 56. beitr. 6. p. 144.) stem much branched; leaves linear-lanceolate, serrated; bracteas taper-pointed; calyx smooth; style prominent; seeds slightly bordered. ⊙. H. Native of Europe, in corn fields; in the north of England, in Yorkshire, Northumberland, Durham, &c. R. Crísta-gálli, γ, of authors, β. Lin. spec. 840. R. Alectorólophus, Poll. pall. no. 580. Hoffm. fl. germ. 215. Roth. fl. germ. 1. p. 264. 2. p. 53. Corolla yellow, with a purple upper lip; tube incurved.

Larger Yellow Rattle. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

3 R. hirsu'ta (Lam. fl. fr. 2. p. 353.) stem branched; leaves lanceolate, serrated; style inclosed; ? calyx hairy; seeds with a membranous border. ⊙. H. Native of Middle Europe, as of France, Switzerland, &c. in dry pastures. Mímulus Alectorólophus, Scop. carn. no. 752. Alectorólophus hirsùtus, All. ped. no. 201.—Hall. helv. no. 314. Crísta-gálli mas. Bauh. hist. 3. p. 436. R. crísta-gálli, γ, Lin. spec. 840. Corolla yellow, with a purplish upper lip.? Perhaps a variety of *R. crísta-gálli*.

Hairy-calyxed Yellow Rattle. Pl. 1 foot.

Cult. Sow the seeds in moist soil, and they will grow and flower in cultivation.

II. E'LEPHAS (from *elephas*, an elephant; from the resemblance of the upper lip of the corolla to the proboscis of that animal.) Column. ecphr. 1. p. 186. t. 181. Tourn. cor. 48. itin. 2. p. 299. t. 299. Rhinánthus, Stev. mon. ped. p. 3.—Rhinánthus species of authors.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx bipartite, even to the base: lower lip bipartite: upper lip entire, or bidentate. Upper lip of corolla beak-like, tubular: lower lip trifid. Capsule 2-celled, 2-valved, obtuse, compressed. Seeds few, simple, striated.—Erect, annual, hairy, branched plants. Leaves opposite, serrated. Flowers opposite, disposed in terminal bracteate racemes or spikes. Corollas yellow.

1 C. incu'rva; upper lip of corolla subulate, incurved; calyx 4-cleft, the first under the beak of the corolla, the lateral ones reflexed on both sides, and the fourth straight and obtuse. ⊙. H. Native of the Levant. Rhinánthus orientàlis, Lin. spec. 840. Mill. dict. no. 2. E'lephas orientàlis flore magno, proboscide incurvâ, Tourn. cor. p. 48. itin. 2. p. 96. & 126. with a figure. Tournefort says this is one of the most showy plants that the Levant produces.

Incurved-beaked Elephas. Fl. July, Aug. Clt. 1759. Pl. 1½ foot.

2 C. re'cta; upper lip of corolla subulate, straight; calyx trifid, 2 of the segments reflexed, and the third larger, straight, plicate, and acute. ⊙. H. Native of Italy and Siberia, in shady places; on the coast of the Black Sea, by Tournefort; also of Caucasus. E'lephas orientàlis, Bieb. cauc. 2. p. 69. Rhinánthus élephas, Lin. spec. 840. Lerche, in nov. act. A. N. C. 85. append. 183. E'lephas Campoclarénsium, Col. ecphr. 1. p. 186. t. 188.—E'lephas Itálica, flore magno, proboscide surrectâ, Tourn. cor. 48.—Mor. hist. 3. p. 432. sect. 11. t. 24. f. 14. Habit of the preceding.

Var. β, *parviflòra*; flowers smaller. ⊙. H. Native of the Levant. E'lephas orientàlis flore parvo, proboscide surrectâ, Tourn. cor. p. 48. itin. 3. p. 54.

Straight-beaked Elephas. Fl. July, Aug. Clt. 1759. Pl. 1½ foot.

Cult. For culture and propagation see *Rhinánthus* above.

III. PEDICULA'RIS (from *pediculus*, a louse; from its supposed quality of making sheep that feed on it lousy.) Tourn. cor. t. 77. Lin. gen. 794. Schreb. gen. no. 1067. Rottb. in coll. hafn. 2. p. 255. Gærtn. fruct. 1. p. 246. t. 53. f. 5. Lam. ill. 517. Schkuhr, handb. t. 171. Stev. mon. ped. Led. fl. alt. 1. p. 424.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-cleft or 5-toothed, or unequally 2-3-toothed. Upper lip of corolla galeate, elongated, usually incurved: lower lip trifid, closed, or often spreading. Stamens didynamous. Cells of anthers usually acute, but sometimes obtuse and spurred. Stigma subcapitate. Capsule obliquely mucronate, rarely globose and straight; valves entire. Seeds girded by a membranous testa, rarely naked.—Usually simple herbs. Leaves alternate, opposite, or verticillate, deeply toothed or pinnatifid. Flowers sessile, disposed in dense, terminal, interrupted spikes.

Sect. I. Persona'tæ (so named from the personate corollas.) Stev. mon. ped. p. 17. Leaves opposite. Lower lip of corolla erect, ex Stev. Lips of corolla closed, ex Benth.

1 P. grandiflòra (Fisch, in. mem. nat. cur. mosq. 3. p. 60. no. 3. Stev. mon. p. 17. t. 2.) galea of the corolla, which is closed, falcate; leaves tripinnatifid. ♃. H. Native of Dauria. Plant glabrous. Radical leaves a span long. Flowers rather remote. Bracteas broad, jagged. Calyx of *P. scéptrum*. Corollas purple. Filaments villous at the base. Cells of anthers awned.

Great-flowered Lousewort. Pl. 1½ foot.

2 P. sce'ptrum Carolìnum (Lin. spec. 845.) lips closed; corolla nearly equal; galea obtuse; leaves pinnatifid: lobes ovate, crenulated; stem few-leaved. ♃. H. Native from Bothnia to Dauria, in boggy or spongy parts of woods; in Russia, to lat. 550; in Europe, not further south than the tops of the alps of Salisburgh. Fl. dan. t. 26. Rudb. itin. 1. t. 1. Lin. fl. lapp. no. 243. t. 4. f. 4, 5. Plant glabrous. Spike interrupted. Flowers twin or tern. Lower bracteas leafy: upper ones ovate, serrated. Corollas an inch long, golden-yellow: lower lip tinged with purple or blood-colour. Filaments glabrous. Cells of anthers obtuse. Rudbeck named this plant *Scéptrum Carolìnum*, in honour of Charles II. king of Sweden, from its manner of growth like a sceptre. The plant is common in Norway, Denmark, and Lapland. In the plant figured in Flora Danica, the leaves, bracteas, and flowers are 3-4 in a whorl.

Charles's Sceptre. Fl. Aug. Clt. 1793. Pl. 3 to 4 feet.

3 P. lanceola'ta (Michx. fl. bor. amer. 2. p. 18. Stev. mon. p. 18.) lips of closed corolla nearly equal; galea somewhat beaked; stem leafy; leaves lanceolate, opposite. ♃. H. Native of North America, in the States. Pursh, fl. 2. p. 425. P. Virgínica, Poir. dict. 5. p. 126. P. pállida, Nutt. gen. amer. 2. p. 50. Pursh, l. c. P. serótina, Muhl. cat. Stem usually simple, glabrous at top, but furnished with 2 rows of villi at base. Leaves doubly crenated, cut, downy beneath. Spikes dense, 1½ inch long. Bracteas ovate, crenated. Calyx obliquely 2-lobed: lobes crenulated. Corollas yellow, smaller than those of *P. scéptrum Carolìnum*. Filaments glabrous. Cells of anthers obtuse.

Lanceolate-leaved Lousewort. Pl. 1 to 3 feet.

4 P. CAPITA'TA (Adams, in mem. nat. cur. mosc. 5. p. 100. no. 8. Stev. mon. p. 19. t. 3. f. 2.) lower lip of corolla, which is closed, about half the length of the upper one: galea obtuse; stem nearly naked; leaves bipinnatifid; heads few-flowered. ♃. H. Native of Siberia, at the mouth of the Lena, Adams; Kamtschatka, Steller; Unalaschka, Langsdorf; Russian America, Chamisso. Stem downy, 2-edged at top, and twisted. Leaves downy beneath: radical ones few: cauline one usually solitary. Bracteas foliaceous, villous. Corollas yellow, size of those of *P. scéptrum Carolìnum*. Calyx 5-cleft; segments toothed, oblong. Anthers hardly cordate.

Capitate-flowered Lousewort. Pl. ¼ to ¾ foot.

5 P. STRIA'TA (Pall. itin. 3. p. 266. 321. 435. 737. no. 98. t. R. f. 2. Willd. spec. 3. p. 208. no. 12. Stev. mon. p. 20.) corolla closed; galea acutely bidentate; leaves pinnate, with linear, serrulated segments. ♃. H. Native of Dauria, in high exposed places about Kjachta and elsewhere. P. venòsa, Pall. herb. Corollas size of those of *P. scéptrum*. Galea drawn out into a beak, as in *P. comòsa*. Two of the filaments bearded. Capsule acuminated. Cells of anthers acute.

Striated Lousewort. Pl. 1 to 2 feet.?

6 P. AVA'NA (Wall. cat. no. 1007. Benth. scroph. ind. p. 52.) diffuse, hairy; leaves opposite, pinnatifid; with short, lanceolate, rather cut segments; calyx 5-parted, with linear, quite entire segments; both lips of corolla nearly equal; galea straight, obtuse: lower lip shortly 3-lobed. ♃. H. Native of the Birman Empire, near Ava, towards Mount Taong Dong. Perhaps not a species of this genus.

Ava Lousewort. Pl.?

SECT. II. VERTICILLA'TÆ (so named from the leaves being disposed in whorls or verticils.) Stev. mon. ped. p. 20. Corolla ringent. Leaves verticillate.

§ 1. ROSTRA'TÆ. *Galea beaked.*

7 P. CHAMISSÒNIS (Stev. mon. p. 20. t. 4.) leaves pinnatifid, 4 in a whorl, with lanceolate segments: lower segments pinnatifid: upper ones serrated; galea uncinate. ⊙. H. Native of Siberia, on the Corgon alps frequent, Pallas; Unalaschka, Langsdorf and Chamisso. P. hamàta, Bieb. herb.—A showy glabrous plant. Calyx 5-toothed. Corolla yellow, drying purple. Galea drawn out into an acute, deflexed, or straight, toothless beak. Capsule very oblique, with a long mucrone.

Chamisso's Lousewort. Pl. 1 foot.

8 P. MYRIOPHY'LLA (Pall. itin. 3. pp. 331. 446. 737. no. 99. t. S. f. 1. A.) leaves 4 in a whorl, bipinnatifid, with linear segments; galea of corolla hooked. ♃. H. Native of Siberia, on rocks at the river Jenesee; in alpine marshes of Dauria, at the river Kirkun, among the Altaian mountains. Radical leaves length of stem, bipinnate. Whorls of flowers crowded, spicate. Calyx 5-toothed. Beak of galea hooked, bidentate. Two of the filaments bearded. Anthers sagittate. Capsule oblique, acuminated.

Myriad-leaved Lousewort. Fl. May, July. Clt. 1816. Pl. 1 foot.

9 P. ABROTANIFÒLIA (Bieb. in Stev. mon. p. 22. t. 5. f. 1. Led. fl. ross. alt. ill. t. 275.) leaves 4 in a whorl, bipinnatifid, with linear segments; galea of corolla straight, a little beaked. ⊙. H. Native of Ulterior Siberia. P. verticillàta, β, Willd. spec. 3. p. 214. Plant downy. Stem branched at base. Spike dense, hairy. Calyx hairy, 5-toothed: teeth linear, and are, as well as the bracteas, hairy, ciliated: lower one usually serrated. Corolla sulphur-coloured. Beak of galea short, obtuse. Stamens glabrous. Capsule oblique, hardly mucronate.

Var. β, *glabréscens* (Ledeb. fl. alt. 2. p. 426.) plant earlier and taller than the species; calyxes and bracteas smoothish; spike interrupted at the base. ♂.? H. Native of Altaia, on dry mountains at the river Tschuja.

Southern-wood-leaved Lousewort. Pl. ½ to 1 foot.

10 P. INTERRU'PTA (Stephan, in litt. ex Willd. spec. 3. p. 214. Stev. mon. p. 23. t. 6.) leaves 4 in a whorl, pinnatifid, with lanceolate, deeply serrated segments; galea of corolla dilated, hemispherical, with a very short beak. ♃. H. Native of the Altaian mountains. Ledeb. fl. ross. alt. ill. t. 434. Stem simple. Spike interrupted. Whorles of spikes 6-8-flowered. Lower bracteas denticulated. Calyx smoothish, 5-cleft; segments serrated. Corollas pale yellow, ex Ledeb. Stamens glabrous. Capsule oblique, mucronate. Beak of galea almost toothless.

Interrupted-spiked Lousewort. Pl. ½ to 1 foot.

11 P. GRA'CILIS (Wall. cat. no. 413. Benth. scrop. ind. p. 52.) tall, and paniculately branched; stem bifariously pilose; leaves 4 in a whorl, pinnatifid, with oblong, obtuse, serrulated or cut segments; flowers distant; calyx cleft on one side: teeth short, obtuse, quite entire; beak of galea slender, straight.—Native of Nipaul, in Gosainthan and Kamaon, Wall; Mussooree, Royle. P. stricta, Wall. cat. no. 414. P. Brunoniàna, Wall. cat. no. 422. There are varieties of this with the leaves more or less cut.

Slender Lousewort. Pl. tall.

12 P. PECTINA'TA (Wall. cat. no. 420. Benth. scroph. ind. p. 52.) erect, tall, nearly simple, glabrous; leaves pinnatifid, with lanceolate, acute, serrated, or pinnatifid segments; spike rather loose; teeth of calyx short, entire; beak of galea long, twisted at apex. ♃.? H. Native of Kamaon, Wall.; Choor, Pyr Pundjal, and towards Cashmere, Royle.

Pectinate-leaved Lousewort. Pl. tall.

13 P. PYRAMIDA'TA (Royle, mss. ex Benth. scroph. ind. p. 52.) erect, tall, nearly simple; stem quadrifariously pilose; leaves pinnatifid, with oblong-lanceolate, obtuse, serrately crenated, or somewhat pinnatifid segments; spike interrupted at the base; calyx hairy, with short, acute, quite entire teeth; beak linear, twisted, twice as long as the galea itself.—Native of the Himalaya, towards Cashmere, Royle.

Pyramidal-spiked Lousewort. Pl. tall.

14 P. TENUIRÓSTRIS (Benth. scroph. ind. p. 52.) tall, erect, nearly simple; stem quadrifariously pilose; leaves pinnatifid, with ovate-oblong, obtuse, crenulated segments; spike dense, imbricate; calyxes hairy, with short, quite entire teeth; beak slender, and a little twisted at top, hardly longer than the galea itself.—Native at Pyr Pundjal, Royle.

Slender-beaked Lousewort. Pl. tall.

15 P. PORRE'CTA (Wall. cat. no. 423.) humble, ascending, nearly simple; stem furnished with 2-3 rows of hairs; leaves pinnatifid, with oblong, obtuse, deeply serrated segments; spike rather loose, few-flowered; calyx glabrous, with short, rather crested teeth; beak of galea long, slender, incurved, a little twisted. ♃. H. Native of Kamaon, Wall; at Shalma, and towards Cashmere, Royle.

Stretched Lousewort. Pl. ½ foot.

16 P. BREVIFÒLIA (D. Don, prod. fl. nep. p. 94.) stem erectish, dwarf, simple, clothed with hoary villi at top; leaves ovate, villous, pinnatifid, with short, deeply toothed segments; spike rather dense; calyx hairy, with short crested teeth; beak of galea slender, long, straight. ⊙. H. Native of Nipaul, in Gosainthan, Wall. P. laciniàta, Wall. cat. no. 419. Corolla purple.

Short-leaved Lousewort. Pl. ½ foot.

§ 2. EROSTRA'TÆ. *Galea without a beak.*

17 P. MÓLLIS (Wall. cat. no. 415. Benth. scroph. ind. p. 53.) stem erect, tall, branched, hairy at apex; leaves hairy,

pinnatifid or bipinnatifid, with oblong-lanceolate, deeply serrated segments; spikes interrupted, slender; calycine teeth oblong, crested; galea straight, toothless and beakless.—Native of Nipaul, in Gosainsthan, Wallich. Corolla slender, hardly 4 lines long.

Soft Lousewort. Pl. tall.

18 P. VERTICILLA'TA (Lin. spec. 846.) erect, nearly simple, rather hairy at top; leaves pinnate or pinnatifid, with oblong or ovate, obtuse, toothed segments; spikes dense, or interrupted at the base; calyx hairy, 5-toothed: teeth short, entire; galea straight, toothless and beakless. ♃. H. Native of the western alps of Europe; Kanaour, Royle. Jacq. fl. austr. 3. t. 206. Hall. helv. ed. 2d. no. 318. t. 9. f. 1. Hall. helv. ed. 1st. no. 623. t. 17. f. 1. Flowers pedicellate. Corolla rose-coloured or white; both lips equal in length. Longer filaments bearded; pairs of anthers contiguous. Capsule acuminated, nearly straight.

Var. β, Sibírica; plant more hairy; teeth of calyx serrated: capsule twice as long as the calyx; corolla smaller. ♃. H. Native of Dauria, about Doroninsk, at the river Corgon, and on the Ural mountains; and of Altaia. P. verticillàta, Pall. itin. 3. p. 34. 242. 444.—Gmel. sib. 3. p. 206. no. 18. Hardly distinct from the species.

Whorled-leaved Lousewort. Fl. May, June. Clt. 1790. Pl. ½ to 1 foot.

19 P. SUBROSTRA'TA (Meyer. verz. pflanz. p. 108.) stem simple; cauline leaves 4 in a whorl, pinnatifid; segments short, blunt; flowers densely spicate; calyx smoothish, semiquinquefid; corolla purple, ringent; galea straight, with a short beak. ♃. H. Native of Caucasus, in alpine meadows, at the altitude of 1200 to 1400 hexapods. Leaves of *P. verticillàta*, and corollas of *P. adúnca*.

Subrostrate-flowered Lousewort. Pl. ½ to 1 foot. ?

20 P. STEVE'NII (Bunge, in Ledeb. fl. alt. 2. p. 427.) plant ascending, glabrous, except the angles of the stems; leaves 4 in a whorl, pinnatifid, with ovate, obtuse, doubly serrated, imbricate segments, having white cartilaginous margins; spikes composed of distant whorls; galea straight, obtuse, shorter than the lower lip; calyx hairy, one half shorter than the capsule. ♃. H. Native of Dauria and Altaia, in humid places at the river Tscharysch, and at the fountains of the river Jebagan. P. verticillàta, γ, Stev. mon. p. 24, 25. Two of the filaments are bearded. Pairs of anthers remote.

Steven's Lousewort. Fl. June, July. Pl. ½ to 1 foot.

21 P. SPICA'TA (Pall. itin. 3. p. 444. 738. no. 100. t. S. f. 2. B.) leaves 4 in a whorl, pinnatifid, with obtuse segments; calyx 2-lobed; galea of corolla straight, obtuse. ♃. H. Native of Dauria, in marshes; in shady places at Imgoda. Stem branched. Leaves sometimes 5 in a whorl: the uppermost ones often quite entire. Spike dense, elongated. Calyx hairy: lobes rounded, rarely obsoletely toothed. Corollas purple, like those of *P. verticillàta*. Galea shorter than the lower lip. Capsule oblique, mucronate.

Spicate-flowered Lousewort. Pl. 1 foot.

22 P. AMŒ'NA (Adams, ex Stev. mon. p. 25. t. 7.) leaves 4 in a whorl, pinnatifid, with linear, acutely serrated, or cut segments; calyx 5-cleft, with ovate-linear segments; galea of corolla straight, obtuse, shorter than the lower lip. ♃. H. Native of Kamtschatka and the Curil Islands, Steller; and at the mouth of the river Lena. V. árctica, Bieb. herb. The plant is, with the angles of the stem, hardly downy. Corolla larger than that of *P. verticillàta*, beautiful purple. Stamens all glabrous. Hardly distinct from *P. verticillàta*.

Var. β, álba; flowers white. ♃. H. Native of the Altaian mountains.

Pleasant Lousewort. Pl. ½ to 1 foot.

23 P. CAUCA'SICA (Bieb. fl. cauc. 2. p. 72. Stev. in mem. mosq. 3. p. 267. mon. p. 26. t. 8.) stems simple; leaves 4 in a whorl, pinnatifid, with obtuse, sharply serrated segments; calyx 5-cleft, with serrated segments; galea straight, obtuse, very short. ♃. H. Native of Caucasus, on alps, Casbek and Schagdag; and on the alps in the north of Persia, Hablitz. Spikes terminal, short. Calyx hairy.

Caucasian Lousewort. Pl. ½ foot.

SECT. III. SIPHONA'NTHA (from *σιφων*, *siphon*, a tube; and *ανθος*, *anthos*, a flower; in allusion to the long tube of corolla.) Leaves alternate. Corolla ringent; tube much exserted; galea falcate, beaked; beak proboscis-like, twisted or hooked.

24 P. SIPHONA'NTHA (D. Don, prod. fl. nep. p. 95.) plant humble, tufted, smoothish; leaves elongated, pinnate: leaflets short, oblong, serrated; spikes short; calyx hairy, cleft on one side or bifid, crested; tube of corolla 4 times longer than the calyx; beak of galea proboscis-like, twisted and emarginate. ♃. F. Native of Nipaul, on Gosainthan, where it is called *Cheelomoote Swa* by the natives. Stem and petioles villous. Leaves glabrous. Lateral lobes of calyx 2-lobed or toothed. Corolla purple. Lobes of lower lip of corolla and filaments ciliated.

Tube-flowered Lousewort. Pl. ¼ foot, tufted.

25 P. HOOKERIA'NA (Wall. cat. no. 421. Benth. scroph. ind. p. 53.) plant ascending, a little branched, smoothish; leaves pinnate or pinnatifid, with oblong or ovate, toothed or pinnatifid segments; calyx hairy, cleft on one side or bifid, crested; tube of corolla about 3 times longer than the calyx; beak of galea proboscis-like, twisted, and emarginate. ♃.? F. Native of Kamaon, Wall.; at Simla, and in Cashmere, Royle. Corolla reddish purple or white.

Hooker's Lousewort. Pl. ascending.

26 P. MEGALA'NTHA (D. Don, fl. nep. p. 94.) plant erect, glabrous or hairy at top; leaves pinnatifid, with oblong or ovate, pinnatifid or serrated segments; spikes at length elongated, interrupted; calyx 5-toothed, crested; tube of corolla twice as long as the calyx; beak of galea proboscis-like, twisted, and trifid. ♃. F. Native of Kamaon and Gosainthan, Wall.; at Choor, in Mussoree and Cashmere, Royle. Stems simple. Leaves glabrous. Pedicels and calyxes villous. Corolla large, yellow. Filaments hairy.

Large-flowered Lousewort. Pl. ½ to 1 foot.

27 P. ELEPHANTOI'DES (Benth. scroph. ind. p. 53.) plant erect, pubescent; leaves pinnatifid, with ovate-oblong, pinnatifid or toothed segments; spikes elongated, dense; calyx 5-toothed, crested, cleft on one side; tube of corolla one half longer than the calyx; beak of galea proboscis-like, ascending, incurved and emarginate at top. ♃.? H. Native at Pyr Pundjal, Royle.

Elephas-like Lousewort. Pl. ½ to 1 foot. ?

SECT. IV. FAUCIDE'NTES (from *faux*, the throat, and *dens*, a tooth; in reference to the upper lip or galea being toothed beneath the middle.) Stev. mon. ped. p. 27. Corolla ringent. Superior lip of corolla or galea with a tooth beneath the middle on both sides. Stem branched. Leaves alternate.

28 P. WLASSOVIA'NA (Stev. mon. p. 27. t. 9. f. 1.) superior lip of corolla straight, with a toothlet on both sides beneath the middle; leaves narrower, less divided than those of *P. palústris*. ⊙. H. Native of Dauria, about Doroninsk, Wlassow. Habit of *P. palústris*. Plant glabrous. Flowers on short pedicels: lower ones remote: upper ones spicate. Calyx unequally 5-toothed; larger teeth serrated. Corolla size of that of *P. flámmea;* upper lip dark purple: lower one paler. Filaments ciliated. Capsule roundish, very oblique, with a straight mucrone.

Wlassow's Lousewort. Pl. 1 foot.

29 P. PALU'STRIS (Lin. spec. 845.) upper lip of corolla furnished with a tooth on each side below the middle; galea dilated, gibbous. ⊙. H. Native of Europe, in marshes; plentiful in Britain, North of Russia, Siberia, Altaia, Aleutian Islands. Smith, engl. bot. t. 399.—Riv. mon. t. 92. f. 1.—Petiv. brit. t. 36. f. 3. Branches spreading. Leaves bipinnate or pinnate, with pinnatifid segments. Spikes loose. Corolla purple, varying to white; lower lip fringed. In marshes and wet meadows this is rather common, particularly in the North; it is said to be disagreeable to cattle, and thought by some to be destructive to sheep.

Marsh Lousewort. Fl. June, July. Britain. Pl. 1 foot.

30 P. MACRODÓNTIS (R. Br. in Richards, fl. no. 233.) stem almost simple; leaves pinnatifid; segments linear, obtuse, sinuately toothed or crenated; flowers axillary, sessile; calyx 2-lobed, curled; galea very blunt, toothed at the throat. 4. H. Native of Hudson's Bay. Flowers like those of *P. palústris*.

Large-toothed-calyxed Lousewort. Pl. 1 to 1½ foot.

31 P. ADU'NCA (Bieb. ex Stev. mon. p. 29. t. 5. f. 2.) upper lip of corolla furnished with a tooth on each side beneath the middle; galea falcate, beaked. ⊙. H. Native of Siberia and Kamtschatka. P. palústris, var. Willd. spec. 3. p. 203. Plant glabrous, branched. Leaves an inch long, deeply pinnatifid, with toothed segments. Calyx 2-lobed: lobes ovate, denticulated. Corollas smaller than those of *P. palústris*. Two of the filaments ciliated at top. Capsule very oblique, mucronate.

Hooked Lousewort. Pl. ½ foot.

SECT. V. ROSTRA'TÆ (from *rostra*, a beak; in allusion to the galea of corolla being beaked.) Stev. mon. ped. p. 30. Leaves alternate. Corolla ringent; tube hardly exserted. Galea toothless at the base, falcate; beak straight.

32 P. CARNÒSA (Wall. pl. rar. asiat. 2. p. 44. t. 154.) erect, pubescent; leaves oblong, obtuse, crenated, narrowed at the base: lower ones petiolate; spikes few-flowered, at length elongated, interrupted; calyx cleft on one side, obliquely 2-3-cleft, crested a little; corollas straight; beak of galea slender, straight; lip very broad. ⊙. H. Native of Nipaul, at Narainhetty, Hamilt.; at Choor, and in Mussooree, Royle. Corollas large, rose-coloured.

Fleshy Lousewort. Pl. 1 to 2 feet.

33 P. FURFURA'CEA (Wall. cat. no. 412. Benth. scroph. ind. p. 54.) plant ascending, branched a little; leaves petiolate, ovate: lower ones ample, half pinnatifid: lobes ovate, deeply toothed or pinnatifid; superior leaves small, deeply toothed, or somewhat pinnatifid; calyx cleft on one side, and 2-3-toothed on the other; beak of galea slender, straight, emarginate; lower lip very broad. ⊙.? H. Native of Nipaul, on Gosainsthan.

Scurfy Lousewort. Pl. ½ to 1 foot.?

34 P. ASPLENIFÒLIA (Wall. cat. no. 416. Benth. scroph. ind. p. 54. but not of Floerke) humble; leaves lanceolate, pinnatifid: segments ovate-lanceolate, serrulated; raceme few-flowered; calyx 5-toothed at apex, crested; galea of corolla elongated, falcate, with a straight beak.—Native of Kamaon, Wall. Corolla more open than in *P. rostràta*; the leaves narrower, and less dissected; the capsule more straight, and longer; the rest of the plant is, however, very similar, and is therefore probably only a variety.

Spleenwort-leaved Lousewort. Pl. ½ to 1 foot.

35 P. ROSTRA'TA (Lin. spec. 845.) stems declinate; leaves pinnate: leaflets or segments pinnatifid; raceme few-flowered; calyx cylindrical, 5-cleft: teeth dilated, serrated; galea falcately beaked. 4. H. Native of the West of Europe, on the alps; as of France, Italy, Savoy, Switzerland, Austria, &c. Jacq. austr. 3. t. 205.—Hall. helv. no. 322. t. 8. f. 1. P. aspleniifòlia, Floerke, spicul. fl. salisb. med. ex Willd. spec. 3. p. 208. Plant sometimes glabrous, and sometimes hairy. Corollas purple. Beak of galea truncate at apex. Two of the filaments are bearded. Capsule ovate, oblique, ending in a hooked mucrone.

Beaked Lousewort. Fl. July, Aug. Clt. 1819. Pl. ¼ to ¾ foot.

36 P. TUBIFLÒRA (Fischer, in mem. nat. cur. mosc. 3. p. 58. Stev. mon. p. 30.) glabrous; leaves pinnatifid, with roundish, crenated segments: floral ones with broad, ciliated petioles; calyx downy, 2-lobed: lobes deeply toothed, sometimes there is a small third lobe; tube of corolla very long; galea subulately and circinately incurved. 4. H. Native on rocks, at lake Baical, among moss. P. longiflòra, Rudolph. mem. acad. petrop. 4. (1811.) p. 345. t. 3. Filaments inserted at the top of the tube, not at the base, as in other species. Raceme short, compact. Corollas yellow; tube narrow, 3 inches long. Stamens all bearded.

Tube-flowered Lousewort. Pl. ¼ foot.

37 P. TEUCRIIFÒLIA (Bieb. ex Stev. mon. p. 31. t. 10. f. 1.) stems many, simple; leaves lanceolate, doubly crenated, tomentose on both surfaces; calyx more deeply cleft above, obliquely bifid; galea of corolla subulate, falcate. 4. H. Native of the Curil Islands, Bieb. et Pallas. Very like the preceding; but differs in the form of the corolla. Root tufted. Flowers not half the size.

Germander-leaved Lousewort. Pl. ¾ foot.

38 P. RESUPINA'TA (Lin. spec. 846. Stev. mon. p. 31.) stem branched; leaves nearly sessile, lanceolate, doubly crenated, smoothish; calyx more or less downy, oblique, bifid; galea circinately hooked. 4. H. Native throughout Siberia, in shady humid places. Pall. itin. 3. p. 316. 319. Amm. ruth. 42.—Gmel. sib. 3. p. 204. no. 16. t. 44. Stem angular, and often pubescent. Leaves generally glabrous, rarely tomentose beneath. Flowers sessile in the upper axils, rather remote, at length aggregate into a dense head or short spike. Corolla purple, flesh-coloured, or white. Beak of galea acuminated, bifid. Longer filaments bearded. Capsule obliquely mucronate.

Resupinate Lousewort. Fl. May, July. Clt. 1816. Pl. 1 foot.

39 P. GRŒNLA'NDICA (Retz. scand. ed. 1st. p. 117. Willd. spec. 3. p. 212. Stev. mon. p. 32.) stem simple; leaves deeply pinnatifid, with lanceolate, acuminated, serrated segments; calyx glabrous, 5-toothed; corolla closed; beak of galea subulate, arched upwards. 4. H. Native of Greenland. Fl. dan. t. 1166. P. incarnàta, e. Grœnlandia, Retz. obs. 4. p. 27. t. 1. Filaments all glabrous. Corolla red.

Greenland Lousewort. Pl.

40 P. PROBOSCI'DEA (Stev. mon. p. 33.) leaves deeply pinnatifid; segments doubly serrated; spike dense, elongated; calyx campanulate, bilabiate, 5-toothed, glabrous; galea of corolla ovate, acuminated, rostrately beaked, with a villous margin. 4. H. Native of Dauria, at Angura, Gmelin; Altaian mountains, in fertile meadows, Pallas. P. uncinàta, labio corollæ inferiore villoso, Steph. in Willd. spec. 3. p. 213.—Gmel. sib. 3. p. 209. no. 20. t. 45. Pall. itin. 2. p. 523. This is very like *P. uncinàta*, in the spikes and form of the leaves; but the flowers are very distinct. Leaves shorter and broader; pinnæ more numerous, and nearly imbricated. Bracteas all lanceolate, and quite entire, with villous edges. Corolla yellow. Beak of galea straight, acuminated, truncate at apex. Galea exceeding the lower lip.

Proboscis-like Lousewort. Pl. 2 to 3 feet.

41 P. UNCINA'TA (Steph. in Willd. spec. 3. p. 213. Stev. mon. p. 34. t. 12.) glabrous; stem simple; leaves deeply pinnatifid, with lanceolate, serrated segments; spike elongated, loose; calyx glabrous, campanulate, 5-toothed; beak of galea

acuminated, emarginate, twice as long as the lower lip. ♃. H. Native of Siberia, from the Jenesee even to Dahuria, in cold shady places. P. incarnàta, Lin. spec. 847. exclusive of the syn. of Allioni and colour of the flowers. P. altíssima, Pall. itin. 3. p. 297. 317. 319. Leaves on short petioles; serratures ciliately serrulated. Corolla yellow; galea sometimes falcate and sometimes hooked. Two of the filaments are bearded. Capsule ovate, obliquely acuminated, mucronate.

Hooked Lousewort. Fl. July, Aug. Clt. 1815. Pl. 2 to 3 feet.

42 P. BRACHY'STACHYS (Bunge, in Ledeb. fl. alt. ross. ill. t. 427. fl. alt. 2. p. 429.) stem downy, simple; leaves deeply pinnatifid, glabrous, with lanceolate-linear, acutely serrated segments; spike short, few-flowered; calyx 5-toothed, rather hairy; galea beaked, arcuately inflexed, ciliated, equal in length to the lower lip, and inclosed in it. ♃. H. Native of Altaia, on the top of alp Aigulac, between the rivers Katunga and Tschuja. Lower bracteas deeply serrated: upper ones subtrifid. Calycine segments acute, serrated. Corolla cream-coloured. Two of the filaments are bearded. Galea and habit of *P. proboscídea* and *P. uncinàta*.

Short-spiked Lousewort. Pl. 1 to 2 feet. ?

43 P. LAPPÓNICA (Lin. spec. 847.) stem simple; leaves nearly pinnate, with serrated segments; spike short, loose; calyx ovate, with short teeth, cleft on the under side; galea of corolla hooked. ☉. H. Native of Lapland, Greenland, Kamtschatka, and of Siberia, even to the mouth of the river Lena, in stony places; also of the Caucasian alps. Oed. fl. dan. t. 2. Pall. itin. 3. p. 34. 444.—Lin. fl. lapp. 242. t. 4. f. 1. Stem downy at top. Calyx 2-3-toothed, rarely 5-toothed. Beak of galea truncate at apex. Filaments glabrous. Capsule ovate, oblique, mucronate. Corolla yellow.

Lapland Lousewort. Pl. ½ foot. ?

44 P. COMPA'CTA (Steph. in Willd. spec. 3. p. 219. Stev. mon. p. 36. t. 11. f. 1.) stem simple; leaves bipinnatifid, with serrulated segments: upper pinnæ imbricate and confluent; spike dense, capitate; calyx inflated, membranous, 5-toothed; galea of corolla furnished with a rectangular deflexed hook. ♃. H. Native of Siberia, in meadows; Soongaria, Altaia, &c. P. physòdes, Herb. Gorenki. Stem downy at top. Calyx glabrous, cleft almost to the middle on the under side. Corolla yellow. Beak of galea truncate at the apex, or emarginate, about equal in length to the lower lip. Two of the filaments bearded.

Compact Lousewort. Fl. July, Aug. Clt. 1815. Pl. 1 to 1½ foot.

45 P. INCARNA'TA (Jacq. austr. 2. t. 140. Stev. mon. p. 38.) stem simple; leaves deeply pinnatifid, with unequally toothed, linear-lanceolate segments; spike loose; calyx ovate, 5-cleft, clothed with hoary pubescence; galea of corolla falcately beaked. ♃. H. Native of the alps of Europe: as of Switzerland, Dauphiny, Savoy, Austria, Carinthia, &c. All. ped. no. 28. t. 3. & t. 4. f. 2. P. rostrato-spicàta, Crantz. austr. p. 317.—Hall. helv. no. 319. Corolla pale red. Beak of galea obtuse or emarginate. Filaments glabrous. (fig. 61.)

FIG. 61.

Flesh-coloured-flowered Lousewort. Fl. June, July. Clt. 1796. Pl. 1 foot.

46 P. TUBERÒSA (Lin. spec. p. 847.) stem simple; leaves bipinnatifid: segments toothed; spike loose; calyx campanulate, 5-cleft, smoothish; galea of corolla falcately beaked. ♃. H. Native of the alps of Europe; as of France, Switzerland, and Italy. Vill. dauph. 2. p. 430. Willd. spec. 3. p. 217. exclusive of var. β.—Hall. helv. no. 323. t. 10. P. alpìna lùtea, Segu. pl. ver. 3. p. 126. Angles of stem downy. Superior bracteas palmately jagged. Teeth of calyx usually quite entire. Corolla yellow; beak of galea emarginate. P. adscéndens, Sternb. et Hoppe. in act. soc. bot. bav. 2. p. 122. bot. zeit. 1820. p. 62. is more hairy, and the teeth of calyx ciliated; but it is hardly a species; it appertains to P. tuberòsa, γ, Bertol. amœn. ital. p. 381.

Tuberous-rooted Lousewort. Fl. July, Aug. Clt. 1799. Pl. ½ to 1 foot. ?

47 P. ATRORU'BENS (Schleicher, cat. pl. helv. 1817. p. 21. D. C. syn. fl. fr. 212) glabrous; stem simple; leaves bipinnatifid; spike compact, calyx 5-cleft; galea of corolla arched, with a short beak, which is somewhat bidentate at apex. ♃. H. Native of Switzerland, on Mount St. Bernard. P. pennìna, Gaudin. Habit of *P. recutìta*, with which it is mixed in herbaria. Bracteas ciliated. Calyxes hairy, usually entire. Corolla dark purple. Two of the filaments bearded, and the other two furnished with a few hairs under their top. Capsule ovate, oblique, mucronate.

Dark-purple-flowered Lousewort. Fl. June, Aug. Clt. 1819. Pl. 1 foot.

48 P. GYROFLE'XA (Vill. dauph. 2. p. 426. t. 9. Stev. mon. p. 40.) stem hairy, simple; leaves pinnate; leaflets bipinnatifid; spike elongated, loose; calyx downy, 5-cleft, with serrated segments; galea of corolla arched, with a short conical beak. ♃. H. Native of the alps of Dauphiny; Mount Cenis; and the Apennines, Switzerland, &c.—Hall. helv. no. 324. t. 11. P. tuberòsa, All. ped. no. 131. ? Flowers purple. Beak of galea emarginate. Filaments all more or less bearded.

Circular Lousewort. Fl. July, Aug. Clt. 1819. Pl. ½ to 1 foot.

SECT. VI. BICUSPIDA'TÆ (so called in consequence of the bidentate top of the galea of the corolla.) Leaves alternate. Upper lip of corolla toothless at the base; galea short, bidentate at apex, without a beak.

49 P. ÆQUINOXIA'LIS (H. B. et Kunth. nov. gen. amer. 2. p. 332. Stev. mon. p. 41. t. 3. f. 1.) stem simple; leaves lanceolate, crenately pinnatifid, with very blunt, emarginate, toothed segments; calyx obliquely 2-lobed; galea of corolla convex, bidentate. ♃. G. Native of Mexico, on the mountains, in shady places. Habit of *P. Canadénsis;* but the leaves are more numerous, and the segments dense and obtuse.

Equinoxial Lousewort. Pl. 1 foot.

50 P. CANADE'NSIS (Lin mant. 86.) stems simple; leaves pinnatifid, with obtuse, crenated segments; calyx hairy, obliquely 2-lobed: galea of corolla obtuse, bidentate. ♃. H. Native of North America. Pursh, fl. 2. p. 425. Nutt. gen. amer. 2. p. 50. Sweet, fl. gard. t. 67. P. mariàna, & Plukn. phyt. t. 437. f. 3. Very like *P. euphrasioìdes*, but differs in the compact hairy spike. Lobes of calyx obtuse, entire. Corollas like those of *P. comòsa*, wholly cream-coloured, or the galea is purple. Two of the stamens bearded at top. Capsule obliquely acuminated.

Var. β, gladiàta; spike elongated. ♃. H. Native of North America. P. gladiàta, Michx. fl. bor. amer. 2. p. 18. Pursh. l. c. Nutt. l. c.

Canadian Lousewort. Fl. July, Aug. Clt. 1780. Pl. ½ to 1 foot.

51 P. EUPHRASIOI'DES (Steph. in Willd. spec. 3. p. 204.) stem branched; leaves linear-lanceolate, pinnatifidly toothed: upper ones becoming entire; racemes terminal, loose; calyx cleft on the lower side, and shortly tridentate on the other; galea of corolla convex, bidentate. ⊙. H. Native on the eastern part of the Ural mountains; at the Lena; beyond the Baical; in Kamtschatka, and Aleutian Islands; Labrador, &c. P. paniculàta, Pall. itin. 3. p. 34, 265, 287, 316. P. corymbòsa, Pall. in herb. Bieb. P. heterophýlla, Patrin, in herb. D. C. P. ramòsa, Wormskiold, in herb. D. C. P. Labradórica, Houtt. pfl. syst. 8. p. 39. t. 57. C.—Gmel. sib. 3. p. 203. no. 15. t. 43. Stem downy at top. Lower leaves similar to those of *P. palústris*, but becoming gradually entire as they ascend. Corollas size of those of *P. palústris*, yellow, fulvous, spotted with purple, or altogether purple. Two of the filaments bearded. Capsule lanceolate, obliquely acuminated. The Labrador, Kamtschatka, and Greenland plants have pure yellow flowers.

Eyebright-like Lousewort. Fl.? Clt. 1816. Pl. ½ to 1 foot.

52 P. NASU'TA (Bieb. ex Stev. mon. p. 43. t. 15. f. 1.) stem or scape naked, or furnished with 1 leaf; leaves bipinnatifid: segments linear, serrated; calyx downy, 5-cleft; galea of corolla arched, with a very short, bidentate beak. ♃. H. Native of Kamtschatka and the neighbouring islands. Plant glabrous, with the habit of the preceding. Spike terminal, ovate, dense; lower bracteas like the leaves: upper one ovate, hairy. Corollas purple, size of those of *P. palústris*. Filaments all glabrous.

Beaked-flowered Lousewort. Pl. ¾ foot.

53 P. SUDE'TICA (Willd. spec. 3. p. 209. Stev. mon. p. 44. t. 15. f. 2.) stems simple; leaves pinnatifid, with lanceolate, serrated segments; calyx 5-cleft: segment entire, or finely serrulated; galea of corolla convex, obtuse, bidentate. ♃. H. Native of Savoy; Siberia, on the sea-shore, about the mouth of the river Lena; Kamtschatka, &c. Richards, in Frankl. journ. ed. 2d. append. 25. P. hirsùta, Hænke, sud. p. 86.? P. incarnàta, Krok. siles. no. 984. P. comòsa, Mattuschk. siles. no. 600. Stem downy under the spike. Filaments all glabrous. Corollas purple. The Siberian plant has the calyx more densely woolly than that from Savoy; and the colour of the flowers is purple; this is *P. serótina*, Adams. There is also a variety from the Lena, (*P. Stevènii*, Adams,) which has the corolla yellow, with a purple helmet.

Savoy Lousewort. Pl. ½ to ¾ foot.

54 P. SYLVA'TICA (Lin. spec. 845.) stem branched at the base; leaves pinnate; leaflets ovate, deeply toothed; spikes few-flowered; calyx glabrous, 5-toothed, inflated in the fructiferous state; galea of corolla very blunt, bidentate. ⊙. H. Native of Europe and Siberia, in wet marshes and heaths, also in woods. Smith, engl. bot. t. 400. Fl. dan. t. 225.—Petiv. brit. t. 36. f. 4. P. mìnor, Riv. mon. t. 92. f. 2. Aletorólophus III. Clus. 2. p. 211. f. 1.—Gmel. sib. 3. p. 203. no. 13. Habit of *P. palústris*, but differs in the want of the teeth on the sides of the galea of the corolla. Two of the filaments bearded at top. Capsule inclosed, oblique, mucronate. Corollas purple. Four of the calycine teeth are said to be crested. The expressed juice of the herb, or a decoction, has been used with advantage as an injection in sinous ulcers. The plant is said to be injurious to sheep which feed upon it.

Wood Lousewort. Fl. June. Britain. Pl. ½ to 2 feet.

55 P. FLA'VA (Pall. itin. 3. append. no. 97. t. R. f. 1. Stev. mon. p. 45. Ledeb. fl. ross. alt. ill. t. 439.) stem simple, pubescent; leaves fleshy, deeply pinnatifid, with distant, oblong, coarsely and doubly toothed segments; calyx woolly, 5-toothed: teeth serrated, shorter than the foliaceous bracteas; galea of corolla obtuse, bidentate; filaments all glabrous. ♃. H. Native of Dahuria, in gravelly places at the river Onon-Borsa; and of Altaia, in grassy places. P. sulphùrea, Pall. itin. 3. p. 230, 321. Corolla like that of *P. comòsa*, yellow, striped with red. Galea very convex. What is P. flàva, Sibth. et Smith, fl. græc.?

Yellow-flowered Lousewort. Pl. 1 foot.

56 P. COMÒSA (Lin. spec. 847. Stev. mon. p. 46. t. 14.) root fascicled; stem simple, downy; leaves pinnate: leaflets pinnatifid and toothed; calyx 5-toothed, exceeding the long, entire bracteas; galea of corolla obtuse, bidentate. ♃. H. Native throughout the Russian empire, in fields; in Europe, as of the Pyrenees, alps of France, and Italy, even to Calabria. Bieb. fl. cauc. no. 1195. Pall. itin. 1. p. 148. 2. p. 448. All. ped. no. 229. t. 4. f. 1. Steph. icon. mosc. t. 5. All. spec. 50. t. 11. f. 1. P. tuberòsa, Pall. itin. 2. p. 38. Falck, itin. 2. p. 211. P. bulbòsa, Pall. itin. 2. p. 87. P. foliòsa, Pall. itin. 3. p. 510. P. cónica laciniòsa, pyramidàta, imbricàta, and frondòsa, Pall. in herb. Bieb. P. tuberòsa, β, Vill. dauph. 2. p. 427.—Alectorólophos, alp. I. Clus. var. 210, with a figure. The plant varies much in the leaves and colour of the flowers, and in downiness. Segments of the calyx usually entire. Corolla cream-coloured. Two of the filaments are more or less bearded. Capsule shorter than the calyx, ovate, obliquely mucronate. Spike short, dense.

Var. β; corolla white, or flesh-coloured. ♃. H. P. tanacetifòlia, Adams, mem. nat. scrut. mosc. 5. p. 102. no. 9. P. incarnàta, Pall. itin. 2. p. 404.

Var. γ; corolla purple. ♃. H. P. fasciculàta, Bell. in Willd. spec. 3. p. 218. D. C. fl. fr. 3. no. 2440. P. asparagoìdes, Lapeyr. ex D. C. l. c.

Tufted-spiked Lousewort. Fl. July, Aug. Clt. 1775. Pl. ½ to 2 feet.

57 P. ALTA'ICA (Steph. mon. p. 48. t. 14. A. Ledeb. fl. alt. ross. ill. t. 442. fl. alt. 2. p. 436.) stem simple; radical leaves pinnate, with ovate, bluntish, coarsely crenate-serrated leaflets; cauline leaves deeply pinnatifid, with serrulated lobes: uppermost ones linear, crenated; spike loose, elongated; calyx foliaceous, cylindrical, obsoletely and bluntly 5-toothed, canescent, spotted, about equal in length to the pinnatifid or serrated bracteas; two of the filaments are bearded. ♃. H. Native of Altaia, in grassy places at the river Tschuja, and in the Kirghisean Steppe. Stem spotted with purple. Corolla yellow; galea furnished with very short teeth.

Altaian Lousewort. Fl. July. Pl. 1 to 2 feet.

58 P. RU'BENS (Steph. in Willd. spec. 3. p. 219. Ledeb. fl. ross. alt. ill. t. 435. fl. alt. 2. p. 435.) stem simple, smoothish, pilose; leaves lanceolate, bipinnate: segments acute, glabrous; spike leafy; calyx foliaceous, cylindrical, unequally 5-toothed: teeth and bracteas foliaceous, deeply serrated; teeth of galea drawn out into thickish beaks. ♃. H. Native of Siberia and Altaia, in marshes at the river Tscharysch and Ursul. P. incarnàta, Pall. itin. 2 & 3, in many places. P. comòsa, var. γ, Steph. mon. p. 48.—Gmel. sib. 3. p. 210. no. 21.—Amm. ruth. p. 32. no. 41. Bracteas pinnatifid, exceeding the calyx. Corolla purple. Two of the filaments bearded. Capsule twice as long as the calyx.

Reddish-flowered Lousewort. Pl. ½ to 1 foot.

59 P. ACHILLEÆFÒLIA (Steph. in Willd. spec. 3. p. 219. Ledeb. fl. ross. alt. ill. t. 446.) plant canescent from down; stem simple; leaves pinnate: leaflets distant, deeply pinnatifid; segments deeply toothed; spike dense, elongated; calyx foliaceous, cylindrical, acutely 5-toothed, about equal in length to the foliaceous, deeply toothed bracteas; two of the filaments are bearded. ♃. H. Native of Altaia, on dry rocks at the rivers Tscharysch, Kurtschum, and Tschuja; and of Caucasus. P. comòsa, var. β, Stev. mon. p. 47. et 48. t. 14. B.? Plant at

first canescent, but at length becoming glabrous. Spikes naked. Corolla pale yellow, or white; galea furnished with short teeth. Capsule ovate-lanceolate, acuminated.

Milfoil-leaved Lousewort. Pl. 1 to 1½ foot.

60 P. LASIÓSTACHYS (Bunge, in Ledeb. fl. alt. ross. ill. t. 440. fl. alt. 2. p. 434.) stem downy; leaves pinnate: leaflets dense, linear, pinnatifid; spike short, dense, leafy; calyx membranous, funnel-shaped, acutely 5-toothed, densely woolly, shorter than the bracteas, which are foliaceous, quite entire at the base, pinnate in the middle, and serrulated at top; filaments all glabrous. ♃. H. Native of Altaia, in marshes on the tops of the alps at the river Tschuja, near the mouth of the river Tschegan. Root fascicled. Branches and calyxes clothed with yellowish wool. Corolla ringent, pale yellow, hardly twice the length of the calyx. Style less exserted than in *P. flàva*. Habit of *P. Langsdórfii*, but that has no teeth at the top of the galea.

Woolly-spiked Lousewort. Fl. July. Pl. ¼ to ½ foot.

61 P. A'RCTICA (R. Br. in Frankl. journ. append. p. 742.) stem simple, woolly; leaves pinnatifid: lobes subovate, dentately cut, glabrous in the adult state; petioles of cauline leaves dilated; calyx woolly, 5-cleft; galea obtuse, truncate, bidentate; longer filaments hairy. ♃. H. Native of Melville Island. Corolla purple, glabrous. Said to be nearly allied to *P. Sudética*.

Arctic Lousewort. Pl. ¼ foot.

SECT. VII. EDE'NTULÆ (so named from the galea of corolla being toothless.) Leaves alternate. Corolla ringent; galea toothless, without a beak.

62 P. LANGSDÓRFII (Fisch. in Stev. mon. p. 49. t. 9. f. 2.) stem simple; leaves bipinnatifid: segments more or less cut: rachis of cauline leaves dilated; calyx 5-cleft, 4 times shorter than the corolla; galea obtuse, truncate. ♃. H. Native of Arctic Siberia, about the mouth of the river Lena; Kamtschatka, and other Russian American Islands. Stem hairy, or woolly at top. Spike dense, leafy. Corolla purple. Filaments all more or less ciliated. Capsule a little longer than the calyx, oblique, mucronate.

Var. β; calyx woolly. ♃. H. P. alopecuroìdes, Adams. P. lanàta, Pall. in Bieb. herb. Willd. herb. no. 11310. Cham. et Schlecht. in Linnæa, 2. p. 583. Perhaps a species.

Langsdorf's Lousewort. Pl. ½ foot.

63 P. HIRSU'TA (Lin. spec. p. 848. Stev. mon. p. 51.) stem simple; leaves pinnatifid, with lanceolate, bluntly toothed segments; rachis of cauline leaves dilated into foliaceous petioles; calyx hairy, 5-cleft; corolla twice as long as the calyx; galea very blunt. ♃. H. Native of Lapland; and of Siberia, at the mouth of the river Lena. Pall. itin. 3. p. 34. Wahl. fl. lapp. no. 31. P. árctica, Adams, mss.—Lin. fl. lapp. 245. t. 4. f. 3. Petioles of cauline leaves stem-clasping. Segments of calyx often toothed. Filaments all glabrous. Capsule longer than that of *P. flámmea*.

Hairy Lousewort. Pl. 1 foot.?

64 P. FLA'MMEA (Lin. spec. 846. Stev. mon. p. 51.) stem simple; leaves pinnate: leaflets roundish, imbricated backwards, doubly toothed; calyx 5-cleft, glabrous; galea of corolla very blunt, rounded; segments of the lower lip linear. ♃. H. Native of Lapland and Greenland. Willd. spec. 3. p. 215, exclusive of most of the synonymes. Wahl. fl. lapp. no. 310, exclusive of var. β. Lin. fl. lapp. 244. t. 4. f. 2. Filaments all glabrous. Corolla pale red.

Flame-coloured-flowered Lousewort. Fl. May, June. Clt.? Pl. ½ to 1 foot.

65 P. VERSÍCOLOR (Wahl. fl. helv. p. 118.) dwarf; leaves pinnate: segments or leaflets imbricated backwards, serrated; spike oblong; calyx 5-cleft, hairy, crested a little; galea straight, obtuse, angular in front. ♃. H. Native of Siberia, towards the mouth of the river Lena, Altaia, Kamtschatka, Aleutian Islands: Lapland, Switzerland, Denmark, Carpathian mountains, &c.; on the Himalaya at Sholma, and towards Cashmere, Royle. Royle, ill. himal. t. 72. f. 1. P. flámmea, of German and Swiss authors. — Fl. dan. t. 30. P. filicifòlia, Adams, mss.—Hall. helv. no. 315. t. 8. f. 3. Root fasciculately tuberous. Petioles of lower cauline leaves slender: of the upper ones dilated at the base, and supporting the flowers. Apex of galea reflexed. Two of the filaments bearded. Corolla party-coloured, ? red and yellow, or pure yellow.

Party-coloured-flowered Lousewort. Fl. June, Aug. Clt. 1819. Pl. ½ to 1 foot.

66 P. ZEYLA'NICA (Benth. scroph. ind. p. 54.) erect, simple; leaves oblong, obtuse, cartilaginous, doubly crenated, clothed with scurfy down beneath; raceme elongated, loose; calyx cleft on one side, and 5-toothed on the other, crested; galea straight, obtuse, rather angular in front.—Native of Ceylon, Macrae.

Ceylon Lousewort. Pl. ?

67 P. ELA'TA (Willd. spec. 3. p. 210. Stev. mon. p. 53. t. 11. f. 2.) glabrous; stem simple; leaves pinnatifid, with lanceolate, serrulated segments; spike loose, elongated; calyx ovate, glabrous, with 5 short teeth; galea of corolla obtuse, obsoletely toothed, glabrous. ♃. H. Native of Siberia, at the Oby; about Kranojarsk; and about Smejof, Patrin. P. punícea, Pall.—Gmel. sib. 3. p. 211. no. 22, exclusive of the synonymes. Root fascicled. Corolla purple. Two longer filaments bearded. Capsule mucronate, rather oblique.

Tall Lousewort. Pl. 1½ to 2 feet.

68 P. ORIZA'BÆ (Schlecht. et Cham. in Linnæa, 5. p. 103.) stem erect, simple; leaves pectinately pinnatifid, with lobately pinnatifid segments, glabrous; calyx 5-toothed: teeth lobulate; galea short, rostrately truncate.—Native of Mexico, on Mount Orizaba. Radical leaves 3-4 inches. Corolla purple: lower lip trifid. Allied to *P. elàta*.

Orizaba Lousewort. Pl. ½ to 1½ foot.

69 P. RÒSEA (Jacq. icon. rar. 1. t. 115. Wulf. in Jacq. misc. 2. p. 57.) stem simple; leaves pinnate: leaflets linear, pinnatifid; calyx hairy, tubular, unequally 5-toothed, or 5-cleft; galea of corolla obtuse. ♃. H. Native of the Alps, as of Carinthia, Italy, and France; also of Siberia. P. hirsùta, All. ped. 227. t. 341. spec. 52. t. 12. f. 1. Stems naked, or few-leaved. Flowers few, purple. Two of the filaments bearded. Capsule longer than the calyx, obliquely mucronate.

Rose-coloured-flowered Lousewort. Pl. ½ foot.

70 P. RECUTÌTA (Lin. spec. p. 846.) stem simple; leaves pinnatifid, with deeply toothed segments; spike compact, leafy; calyx glabrous, about equally 5-toothed; galea of corolla very blunt. ♃. H. Native of the alps of Middle Europe, as of Switzerland, Italy, Austria, &c.; and on the confines of Russia. Jacq. austr. 3. t. 258. P. obsolèta, Crantz. austr. p. 316. —Hall. helv. no. 316. t. 8. f. 2. Habit singular, from the leaves being collected under the spike. Calyx usually glabrous, but sometimes hairy. Corolla purple. Two of the filaments bearded. Capsule mucronate, very oblique.

Surrounded-spiked Lousewort. Fl. July, Aug. Clt. 1787. Pl. 1 to 1½ foot.

71 P. WILHELMSIA'NA (Stev. mon. p. 55. t. 16. Bieb. fl. taur. 3. p. 412.) stem simple; leaves pinnate: segments or leaflets ovate, pinnatifid; spike dense; calyx ovate, woolly, 5-cleft, with linear, elongated segments; galea of corolla very short. ♃. H. Native of Caucasus, on Mount Beschtau, and about Nartzana. Habit of *P. foliòsa*. Root yellow, divided into oblong tubers. Stem downy, with few leaves, or even naked

to the spike. Radical leaves similar to those of *Spiræ'a filipéndula*. Bracteas large, foliaceous. Corolla cream-coloured. Filaments all bearded. Capsule length of calyx.

Wilhelms's Lousewort. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

72 P. foliòsa (Lin. syst. 552. mant. 86. Stev. mon. p. 56.) stem simple; leaves pinnate: leaflets pinnatifid, with lanceolate, unequally toothed segments; spike dense; calyx obliquely 5-toothed; galea of corolla very blunt. 4. H. Native of Europe, as of Switzerland, Hungary, Dauphiny, Italy, even to the Crimea. Jacq. austr. 2. t. 139. P. comòsa, Scop. carn. no. 765.—Hall. helv. no. 317. t. 9. f. 3. P. sumàna, Poll. pl. ver. 16. Stem short, and almost naked, or tall and leafy. Calyx glabrous, or hairy. Corolla cream-coloured; galea downy, or glabrous.

Leafy Lousewort. Fl. July. Clt. 1786. Pl. $\frac{1}{2}$ to 3 feet.

73 P. condensa'ta (Bieb. fl. taur. 2. p. 73. no. 1193.) stem simple; leaves pinnate: leaflets pinnatifid, with lanceolate, unequally toothed segments; calyx woolly, tubular, with a straight, 5-toothed mouth; galea of corolla very blunt. 4. H. Native of Caucasus, in humid, alpine meadows; Iberia, above Tschala; and of Hyrcania. This is a very showy species; the leaves and flowers as they ascend give the stem a pyramidal appearance. Corolla exactly of *P. foliòsa*. Filaments all bearded, more or less.

Dense Lousewort. Pl. 1 foot.?

74 P. trístis (Lin. spec. 846. Stev. mon. p. 57. t. 10. f. 2.) stem simple; leaves pinnatifid, with short, obtuse, sharply and doubly denticulated segments; spike dense; calyx 5-cleft; galea of corolla furnished with a short mucrone, villous on the edges. ⊙. H. Native of the Altaian mountains, in Dauria, and beyond the Lena, &c.; also of Kamtschatka. Pall. itin. 2. p. 566. 3. p. 444. P. macrocárpos, Pall. herb.—Gmel. sib. 3. p. 212. no. 23. Plant trailing. Corolla yellow. Filaments glabrous. Capsule hardly exceeding the calyx.

Sad-flowered Lousewort. Pl. $\frac{1}{2}$ to 1 foot.

75 P. acau'lis (Wulf. in Jacq. coll. 1. p. 207. t. 14.) stemless; leaves pinnate: leaflets ovate, obtuse, toothed; scapes or peduncles 1-flowered, shorter than the leaves; calyx 5-cleft, with toothed segments; galea obtuse, with a villous margin. 4. H. Native of the alps of Carniola and Carinthia.—Scop. carn. no. 761. t. 31. Flowers showy, very unlike those of other species. Corolla whitish. Filaments all villous at the base, or only 2 of them.

Stemless Lousewort. Pl. dwarf.

Cult. All the species of *Pediculàris* are extremely shy of cultivation. Peat soil and a moist situation suit the generality of the species. All foreign species require the protection of a frame, or other covering in winter, and for this purpose they had better be grown in pots. Tragus affirms, and others take it from him, that these plants in pastures breed lice on animals that feed on them. The truth, however, seems to be, that they indicate a very bad pasture, and the want of proper food may occasion the cattle to be in bad condition, and to breed vermin.

IV. MELAMPY'RUM (Μελαμπυρον, of Theophrastus; from μελας, *melas*, black; and πυρος, *pyros*, wheat.) Tourn. inst. t. 78. Lin. gen. no. 742. Schreb. gen. no. 999. Juss. gen. p. 101. ed. Usteri. p. 113. Gærtn. fruct. 1. p. 244. t. 53. Lam. ill. t. 518. Schukhr, handb. t. 170. Nutt. gen. amer. 2. p. 58. Led. fl. alt. 2. p. 438.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx tubular, bilabiate, 4-cleft. Corolla tubular, bilabiate: upper lip galeate, compressed, with the margin folded back: lower lip grooved, trifid, nearly equal. Stamens 4, didynamous, inclosed; anthers oblong; cells acuminated. Capsule 2-celled, obliquely acuminated, opening on one side; cells 2-seeded, ex Nutt., 1-seeded, ex Lin. Seeds cartilaginous, cylindrically oblong, or ovoid.—Annual plants. Leaves opposite, lanceolate-linear, entire. Flowers opposite, usually secund, forming terminal racemes; bracteas more or less pinnatifid.

1 M. crista'tum (Lin. spec. 842.) spike quadrangular; bracteas cordate, plicate, denticulated, imbricate, coloured; calycine segments linear, acute. ⊙. H. Native of the North and middle of Europe, and Siberia, in meadows and woods; plentiful in some parts of Britain. Smith, engl. bot. t. 41. Fl. dan. 1104.—Riv. mon. t. 81. f. 1.—Plukn. phyt. t. 99. f. 2.—Mor. hist. sect. 11. t. 23. f. 32.—Leaves linear-lanceolate, quite entire. Flowers reddish, yellow, and white. Beard of throat constantly yellow. According to Relham the galea is purplish, or white, with a yellow edge. Corolla gaping.

Crested Cow-wheat. Fl. July, Aug. England. Pl. 1 to $1\frac{1}{2}$ foot.

2 M. arve'nse (Lin. spec. 842.) spikes conical, loose; bracteas ovate, setaceously-toothed, coloured; teeth of calyx scabrous, lanceolate-linear, acuminated; corollas closed. ⊙. H. Native of the South of Europe, in fields of wheat; in England but rare, particularly in Norfolk. Smith, engl. t. 53. Fl. dan. 911.—Riv. mon. t. 80.—Sabb. hort. rom. 3. t. 8.—Mor. hist. sect. 11. t. 23. f. 1. Tríticum vaccínium, Dod. pempt. 541. f. 2. Lob. icon. 1. t. 37. Plant slightly downy. Leaves linear lanceolate. Bracteas purple, entire at top. Corolla yellow, and dusky purple. The seeds when ground with corn give a bitterness and greyish cast to the bread, but do not render it unwholesome.

Var. β, *argyrocòmium* (Fisch.) Native of the alpine regions of Caucasus. Bracteas white.

Corn-field Cow-wheat. Fl. June, July. England. Pl. 1 to $1\frac{1}{2}$ foot.

3 M. barba'tum (Waldst. et Kit. ex Willd. spec. 3. p. 198.) spikes conical, loose; bracteas setaceously toothed; teeth of calyx bearded; corolla gaping. ⊙. H. Native of the south of Hungary, in fields. This species differs from *M. arvénse*, to which it is nearly allied, in the bracteas being green, in the teeth of the calyx being furnished with long diaphanous hairs, in the corolla being gaping, the upper lip more villous on the edges, and the corolla totally yellow.

Bearded-calyxed Cow-wheat. Pl. 1 to $1\frac{1}{2}$ foot.

4 M. nemoro'sum (Lin. spec. 843.) flowers secund, lateral; bracteas cordate-lanceolate, toothed: upper bracteas coloured, sterile; calyxes woolly, lanceolate, or ovate acuminated. ⊙. H. Native of Europe, in woods; as of Upland and Scania, Denmark, Switzerland, Carniola, Austria, Silesia, and Dauphiny. Fl. dan. t. 305. M. sylvàticum, Riv. mon. t. 81. f. 2.—Barrel. icon. t. 769. f. 2. Stem 4 cornered. Leaves ovate-lanceolate, acuminated, or somewhat sagittate, eared and toothed at the base, rough, hairy beneath, with hispid edges. Bracteas bluish violet, jagged, or toothed at the base. Corolla greenish yellow; throat deeper yellow; the tube purplish. Calyx coloured, woolly. Anthers bearded at the base. This is the most showy of the species.

Grove Cow-wheat. Fl. July, Aug. Clt.? Pl. 1 to $1\frac{1}{2}$ foot.

5 M. prate'nse (Lin. spec. 843.) flowers axillary, secund; corollas gaping; leaves long-lanceolate: floral ones hastate, or pinnatifidly cut; calycine segments linear, acuminated. ⊙. H. Native of the North of Europe, in dry fields and woods; plentiful in many parts of Britain, in like situations. Smith, engl. bot. t. 113.—Hall. helv. no. 308.—Besl. eyst. t. 150. f. 2.—Mor. hist. sect. 11. t. 23. f. 3.—Besl. eyst. astiv. 12. t. 2. f. 2. Cratæogònum album, Gerard. herb. 84. emac. 91. Corolla full yellow; throat orange coloured.

Field Cow-wheat. Fl. July, Aug. Britain. Pl. 1 to 1½ foot.

6 M. SYLVA'TICUM (Lin. spec. 843.) flowers axillary, secund; corollas gaping; leaves long-lanceolate, quite entire; calycine segments linear lanceolate, acute. ⊙. H. Native of the north of Europe, in woods; and on the mountains in the south of Europe; in England. Fl. dan. t. 145. Smith, engl. bot. t. 804.—Hall. helv. 307. This species is said to differ from *M. praténse*, in the corollas being one half shorter, with a gaping limb, and in the full yellow colour, not with a white tube as in that species.

Wood Cow-wheat. Fl. July, Aug. Britain. Pl. 1 to 1½ foot.

7 M. LINEA'RE (Lam. dict. 4. p. 23.) flowers axillary; corolla gaping; lower leaves linear, quite entire: floral ones lanceolate, toothed behind. ⊙. H. Native from Canada to Carolina, in woods, particularly on the mountains. M. Americànum, Michx. fl. amer. bor. 2. p. 16. Habit of *Euphràsia linifòlia*. Branches subtetragonal. Corollas pale yellow, with a tinge of purple; superior lip obtuse, with a villous margin.

Linear-leaved Cow-wheat. Pl. 1 foot.

8 M. LATIFÒLIUM (Muhl. cat. ex Nutt. gen. amer. 2. p. 58.) we know nothing of this plant but the name. ⊙. H. Native on the Delaware.

Broad-leaved Cow-wheat. Pl. 1 foot.?

Cult. The plants being all annual, the seeds of them may be sown in the open ground. They are, however, very shy of cultivation.

V. PARENTUCE'LLIA (named in honour of Th. Parentucelli, of Sarzana in Liguria, founder of the botanic garden at Rome.) Viv. fl. libyc. p. 31. t. 21. f. 2.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx tubular, inflated, membranous, 5-toothed; teeth linear-lanceolate, unequal, beset with glandular hairs. Corolla with a slender tube, and a bilabiate limb; upper lip ovate, concave, galeate; lower linear, pilose towards the throat, channelled, 3-lobed at top. Stamens 4, nearly equal from the base of the upper lip; anthers globose, didymous, conniving. Stigma thick, truncate. Capsule somewhat 2-celled, 2-valved; dissepiment incomplete from the inflexed valves. Seeds inserted in parietal placentas, hanging by short funicles.—A hairy, annual, erect herb. Leaves opposite, sessile, 5-7-nerved; radical ones ovate, acute, deeply serrated: superior and floral ones ovate-lanceolate, dentately cut: upper ones tricuspidate. Flowers purple. This genus appears to be nearly allied to *Rhinánthus*.

1 P. FLORIBU'NDA (Viv. fl. libyc. p. 32.) ⊙. H. Native of Libya, on hills by the sea-side. Hairs on the calyxes and corollas, and other floral parts glandular. Flowers solitary, axillary, spicate, or racemose; pedicels very short.

Bundle-flowered Parentucellia. Pl. ½ to 1 foot.

Cult. For culture and propagation see *Melampỳrum*, p. 626.

VI. TRIPHYSA'RIA (from τρεις τρια, *treis tria*, three; and φυσα, *physa*, a bladder; the 3 segments of the lower lip of the corolla are saccate.) Fish. et Meyer, cat. sem. hort. petrop. 1836. p. 52.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx tubular, 4-cleft. Corolla personate; tube filiform; superior lip undivided, subulate; lower one tripartite; segments saccate. Stamens 4, didynamous, all fertile; anthers linear, mutic, 1-celled. Stigma oblong, 2-lobed. Capsule oblong, 2-celled, many-seeded. Seeds small, blackish, oblong, wingless; testa scrobiculate, closely adhering to the nut.—An annual herb, with the habit of *Oncorýnchus*.

1 T. VERSI'COLOR (Fisch. et Meyer, l. c.) ⊙. H. Native of New California, about Port Bodega. Leaves elongated, dilated at the base, half stem-clasping, pinnately lobed at apex, cut, scattered; lowers ones usually opposite; floral ones scarcely longer than the calyx. Flowers axillary, solitary, sessile. Corolla white, at length rose-coloured; tube filiform, twice as long as the calyx; upper lip straight, subulate, with inflexed margins; lower one large, trifid; segments obovate, each apiculated by a small, erect segment, and furnished with a longitudinal chink in the throat.

Party-coloured-flowered Triphysaria. Pl.?

Cult. For culture and propagation see *Melampỳrum*, p. 626.

Tribe II.

CYMBARIE'Æ (this tribe only contains the genus *Cymbària.*) D. Don, in edinb. phil. journ. vol. 37. July, 1835. p. 112. Embryo rather foliaceous, almost the length of the albumen.

VII. CYMBA'RIA (from κυμβη, *cymbe*, a boat; in reference to the boat-shaped fruit.) Lin. gen. 751. Schreb. gen. no. 1008. Amm. ruth. 1. t. 1. f. 2. Juss. gen. p. 119. ed. Usteri, p. 134. Gærtn. fruct. 1. p. 252. t. 53.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 10-parted, unequal, with linear segments. Corolla with a ventricose tube, and a bilabiate limb: upper lip arched, 2-parted: lower one 3-lobed, obtuse; palate prominent. Stamens 4, didynamous; anthers 2-cleft, prominent. Stigma obtuse. Capsule cordate, 2-valved; placenta central, tetragonal, with the angles membranously winged, therefore the capsule is falsely 4-celled, but 1-celled, ex Lin. Seeds angular, smooth, compressed.—A plant with the habit of *Antirrhìnum*. Stem a little branched; branches opposite, sterile. Leaves opposite. Flowers few, axillary, usually solitary, nearly sessile, large, yellow.

1 C. DAU'RICA (Lin. spec. 861. mant. 417.) leaves lanceolate; calyx 10-toothed; upper lip of corolla 2-parted, reflexed. ♃. H. Native of Dauria, on the mountains, in exposed, stony places.—Amm. ruth. 47. t. 1. f. 2.—Gmel. sib. 3. p. 198. no. 8. Plant hoary. Seeds compressed, with an irregular, membranous edge.

Daurian Cymbaria. Fl. June, July. Clt. 1796. Pl. 1 foot.

2 C.? BORYSTHE'NICA (Pall. ex Spreng. syst. 2. p. 815.) leaves linear; calyx 5-cleft; upper lip of corolla entire, erect. ♃. H. Native of the province of Cherson, between Borysthene and Hypanim.

Borysthene Cymbaria. Pl. 1 foot.?

Cult. For culture and propagation see *Pediculàris*, p. 626.

ORDER CLXXI. OROBA'NCHEÆ (this order contains plants agreeing with *Orobánche* in the characters given below.) Juss. ann. mus. 12. p. 445.—Rich.—Ledeb. fl. alt. 2. p. 450. D. Don, in edinb. phil. journ. vol. 37. p. 113. July, 1835.—Pediculáres, sect. III. Juss. gen. p. 101. ed. Usteri, 113.

Calyx divided, permanent. Corolla tubular, hypogynous, irregular, permanent, imbricate in æstivation. Stamens 4, didynamous, all fertile; anthers usually spurred at the base. Ovarium 1-celled; stigma 2-lobed, or undivided. Capsule 1-celled, 2-valved, many-seeded. Seeds inserted into narrow, parietal placentas, which rise from the margins of the valves; testa very thin, membranous, reticulated by nearly square areolæ. Albumen copious, cartilaginous. Embryo inverted in the top of the albumen, excentric, minute, nearly globose, usually undivided.

Radicle superior, remote from the umbilicus.—Usually parasitical, leafless, rather fleshy, rufescent, scaly herbs. Flowers terminal, solitary, spicate, or racemose.

This is a very natural family, well distinguished from the preceding by their permanent corolla, unilocular ovarium, centrifugal embryo, and peculiar economy, in being for the most part parasitical herbs, destitute of proper leaves, and of the green colour common to other plants. The seeds are attached to the narrow, depressed placentæ, formed by the united edges of the valves. The embryo is placed in the ventral side of the seed, and at the opposite extremity from the hilum, resembling a minute, nearly globular homogeneous mass, and is, therefore, probably devoid of true cotyledons. In all these respects the genera *Obolària* and *Tózzia* seem to agree, but differ in having proper leaves, and in being terrestrial.

Synopsis of the genera.

Tribe I.

Orobanchie'æ. Parasitical, leafless herbs.

1 Oroba'nche. Calyx bractless, somewhat 1-2-parted.

2 Phelipæ'a. Calyx tubular, bibracteate, 4-5-toothed, or 4-5-cleft.

3 Anòplon. Calyx bractless, 5-cleft, sub-bilabiate.

4 Boschnia'kia. All as in *Orobánche*, but the calyx is truncate, and unequally 5-toothed; the capsule opens laterally, the stigma sub-bilabiate, and terminated by a stigmatose margin.

5 Canópholis. Calyx ventricose, 5-parted, bibracteate. Corolla incurved: upper lip entire: lower one bifid.

6 Epiphe'gus. Calyx short, 5-toothed, bractless.

7 Lathræ'a. Calyx bibracteate, campanulate, 4-cleft.

8 Hyoba'nche. Calyx tubular, 7-cleft, unequal, bibracteate.

9 Ale'ctra. Calyx bilabiate, bractless? upper lip 2-cleft; lower one trifid.

10 Ægine'tia. Calyx spathaceous. Capsule many-celled.

11 Ambla'tum. Calyx campanulate, 4-cleft. Both lips of corolla entire.

Tribe II.

Obolarie'æ. Terrestrial, leafy plants.

12 Obola'ria. Calyx 5-cleft, bibracteate. Corolla campanulate.

13 Tózzia. Caylx 5-toothed, bractless.? Corolla ringent, tubular. Capsule 1-seeded by abortion.?

Tribe I.

OROBANCHIE'Æ (this tribe contains plants agreeing with the genus *Orobánche*.) Parasitical, leafless, fleshy, scaly plants.

1 OROBA'NCHE (of Pliny, Οροβανχη of Theophrastus and Dioscorides; from *ορoβος*, *orobos*, a vetch; and *αγχω*, *ancho*, to strangle; because it is supposed to strangle and kill the plants on which it grows.) Tourn. inst. p. 176. t. 81. Lin. gen. no. 779. Schreb. gen. no. 1045. Juss. gen. p. 101. ed. Usteri, p. 113. Gærtn. fruct. 3. p. 42. t. 185. f. 4. Lam. ill. t. 551. Wallr. orob. sect. 1. Ospròleon. Led. fl. alt. 2. p. 450.—Aphýllon, Michel, gen. t. 25.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx bractless, 1-2-parted; sepals distinct, or combined on one side at the base. Corolla tubular, ringent: upper lip 2-lobed: lower one trifid. Stamens 4, didynamous. Stigma capitate, emarginately 2-lobed. Ovarium glandular at the base. Capsule 1-celled, 2-valved; valves dehiscing laterally, but joined at the base and apex. Placentas parietal, 2 in each valve.—Parasitical, fleshy, usually simple, rarely branched, scaly, erect herbs. Flowers sessile, erect, solitary, in the axils of the floral scales. There is a fleshy gland that girds the ovarium. Filaments usually hairy, flat at the base. Anthers glabrous; cells mucronate at the base.

Sect. I. Sepals free, or combined in front at the lower part, open behind.

§ 1. *Upper lip of corolla emarginate, or retuse, never bifid.*

* *Corolla dilated, sub-campanulate, never narrow, or cylindrical.*

1 O. Caryophylla'cea (Smith, in Lin. trans. 4. p. 169. Led. fl. alt. 2. p. 452.) hairy, or pubescent; floral scales lanceolate, equal in length to the flowers; sepals bifid: lobes linear-lanceolate, equal; corolla sub-campanulate, straightish: lower lip a little shorter than the upper: lobes equal, obtuse, denticulately curled; filaments hairy at the base, glandular, as well as the style at the apex; stigma emarginate. ♃. H. Native of Siberia; Italy; and about Lauterine in the Palatinate; also on the Himalaya at Pungee. Wallr. orob. p. 36. Bieb. taur. 2. p. 81. O. màjor, Poll. pal. no. 600. Vill. dauph. 2. p. 407. Falck, topog. beytr. 2. p. 212. Pall. ind. taur. Hablitz, taur. p. 154. Desf. fl. atl. 2. p. 58. Orobánche màjor caryophyllum redolens, Bauh. pinn. p. 87. Tourn. inst. 176. t. 81. Riv. mon. irr. 1. t. 89.—Gmel. sib. 3. p. 214. no. 28, exclusive of all the synonymes. Plant yellowish, or rufescent, as well as the corollas, which are tipped with purple. Upper lip of corolla large, emarginate. Stigma brown, or purplish. The plant has a strong smell of cloves when fresh, hence the specific name. The bulb is said to be scaly.

Clove-scented Broom-Rape. Pl. 1 to 1½ foot.

2 O. crue'nta (Bertol. amœn. ital. p. 89.) pubescent; scales lanceolate, acuminated; spikes loose at bottom and dense at top; floral scales shorter than the flowers; upper lip of corolla emarginate; segments of the lower lip fimbriately curled; inner sides of filaments very hairy, as well as the top of ovarium and style; stigma yellow. ♃. H. Native of Italy. O. caryophyllàta, Viv. ann. bot. 1. p. 175. Plant, as well as flowers, reddish.

Blood-red Broom-Rape. Pl. 1 to 1½ foot.

3 O. ma'jor (Lin. spec. 882, exclusive of the syn. but not of D. C.) hairy; bulb middle sized, scaly; scales lanceolate, not adpressed; sepals bifid; corolla inflated, a little curved: upper lip blunt, entire; lobes of lower lip equal, acute, denticulated; filaments glabrous at bottom, and hairy at top; style hairy, pubescent at top, yellow; stigma 2-lobed. ♃. H. Native of Europe, growing on furze or broom; plentiful in some parts of Britain. Sutton, in Lin. trans. 4. p. 175. Curt. lond. 4. t. 44. Smith, engl. bot. 421. O. barbàta, Brot. fl. lus. 1. p. 183. O. Ulìcis Europæ'i, Vauch.—Petiv. brit. t. 69. f. 10. Plant dusky yellow, or tinged with purple. Corollas of a brownish rust-colour, tinged with purple, yellowish, or purple.

Larger, or Common Broom-Rape. Fl. June, July. Britain. Pl. ½ to 1½ foot.

4 O. ri'gens (Lois. fl. gall. p. 384.) scape glabrous; scales lanceolate, stiff, downy, imbricated; flowers loosely spicate; style and stamens glabrous; lobes of lower lip of corolla acutish; stigma bifid; lobes distant. ♃. H. Native of Corsica; and of Germany. Lois. D. C. fl. fr. 5. p. 392.

Stiff-scaled Broom-Rape. Pl. ½ foot.?

5 O. epíthymum (D. C. fl. fr. 3. p. 490.) scape nearly

equal; scales lanceolate; flowers spreading, scattered, glandularly viscid, remote; calycine segments lanceolate, rarely bifid; superior lip of corolla rounded, crenulated: lower one 3-lobed: lobes bluntly crenated; stigma 2-lobed, reddish. ♃. H. Native of France, on arid mountains, on the roots of *Thymus serpyllum*. O. Thymi-serpýlli, Vauch. mon. t. 6. Plant reddish.

Var. β, *epithymoides* (Duby. bot. gall. 1. p. 349.) scape rather inflated; corolla veiny; upper lip 2-lobed; lobes superincumbent. ♃. H. Native of Provence, near Brignollis, growing on the roots of *Thymus vulgaris*. O. Thymi-vulgaris, Vauch. mon. p. 53.

Thyme Broom-Rape. Pl. 1 foot.

6 O. Gallii (Dub. bot. gall. 1. p. 349.) scape moderately thickened at the base, scaly; scales lanceolate, blackish; calycine segments lanceolate, or irregularly bifid; corolla inflated; upper lip arched, sub-emarginate: lower lip 3-lobed: lobes roundish; filaments inflexed; anthers blackish; stigma 2-lobed, dark red. ♃. H. Native of France, in gravelly places, on the roots of *Galium Mollugo*. O. Gallii Mollúginis, Vauch. l. c. t. 7. Scapes reddish. Flowers purplish.

Galium Broom-Rape. Pl. 1 foot.

7 O. Hederæ (Vauch. mon. p. 56. t. 8.) scape thickened into a sparingly scaly bulb; scales lanceolate, fewer; bracteas attenuated at the apex, reflexed; upper lip of corolla entire: lower lip 3-lobed: lobes rounded; calycine segments nearly entire; lower stamens approximate: superior ones divaricate; stigma emarginate, yellowish. ♃. H. Native of Vascony, parasitical on ivy.

Ivy Broom-Rape. Pl. 1 foot.

8 O. gracilis (Smith, in Lin. trans. 4. p. 172.) pubescent; scape simple; floral scales shorter than the flowers; corolla inflated: lower lip very short, with the segments obcordate, unequal, fringed and curled; stamens and style beset with spreading hairs. ♃. H. Native near Genoa, in hilly pastures at St. Orsese. Corolla size of that of *O. major;* but the upper lip is of a dark or purplish colour, and less fringed and curled. Ovarium smooth. Stamens rather exserted. It differs from *O. minor* in the larger inflated corolla, short lower lip, longer stamens, and hairy style.

Slender Broom-Rape. Pl. 1 to 1½ foot.

9 O. cytisi (Duby, bot. gall. 349.) scape thickened beyond the base; scales ovate-oblong, remote, clothed with scurfy hairs; calycine segments divided into linear segments; corolla ventricose, glandular outside; upper lip short, nearly entire: lower one 3-lobed; stigma deeply divided. ♃. H. Native of Provence, near Mees, in stony places; Eastern Pyrenees, Tolosa, and Vascony. O. fœtida, Duby, bot. gall. p. 349. D. C. fl. fr. 5. p. 392. O. variegata, Wallr. diask. p. 40. O. cýtisi scopárii, Vauch. mon. p. 37. This is the largest of the species. Flowers fulvous.

Cytisus Broom-Rape. Pl. 1½ to 2 feet.

* * *Corolla cylindrical, not campanulate, more or less incurved.*

10 O. ammophila (C. A. Meyer. in Led. fl. ross. alt. ill. t. 889. fl. alt. 2. p. 454.) clothed with white wool; floral scales ovate-lanceolate, equalling the flowers in length; sepals bifid: lobes lanceolate, nearly equal, shorter than the tube of the corolla, which is incurved and cylindrical; lips of corolla nearly equal; lobes of lower lip obtuse, denticulated, nearly equal; filaments and style hairy; stigma sub-bipartite, with very spreading segments. ♃. H. Native of Altaia, in sandy places, at the rivers Irtysch and Bekun, and at the mines of Loktewsk. Sepals free. This is said to differ from *O. cærulea*, in the sepals being less deeply cleft; in the shorter tube of corolla, and in being deeper blue; and in the filaments and style being always hairy.

Sand-loving Broom-Rape. Pl. ½ to 1 foot.

11 O. crinita (Viv. fl. cors. p. 11.) scape furnished with linear, elongated scales at the base; floral scales linear, acuminated, hairy outside, exceeding the flowers; corolla 4-cleft, incurved, subcylindrical; lobes rounded, crenately ciliated; filaments and capsule quite glabrous; stigma 2-lobed, recurved. ♃. H. Native of Corsica, near Bonifacio. Flowers fulvous.? Spike elongated, compact, comose by bracteas at top.

Long-haired Broom-Rape. Pl. ½ to 1 foot.

12 O. sparsiflora (Wallr. sched. crit. 1. p. 310.) pubescent; flowers remote, spicate; floral scales equal in length to the flowers; corolla hairy; upper lip subemarginate; lobes of the lower lip obovate: middle one the largest: stamens ciliated. ♃. H. Native of Middle Germany.

Scattered-flowered Broom-Rape. Pl. ½ to 1 foot.

13 O. cærulescens (Steph. in. Willd. spec. 3. p. 349.) plant pubescent; scape simple; lower scales adpressed: upper ones spreading, and clothed with white villi: floral ones ovate, long-acuminated, length of flowers; spike dense, elongated; calyx bifid, with bipartite, subulate, unequal segments, nearly the length of the tube of the corolla; genitals glabrous; upper lip of corolla emarginate. ♃. H. Native of Siberia, towards the Caspian sea; and of Caucasus, about the river Terek. Bieb. cauc. 2. p. 82. Spike 3 inches long. Corollas bluish. Floral scales and calyxes white from hairs.

Bluish-flowered Broom-Rape. Pl. ½ to 1 foot.

14 O. Medicaginis (Duby, bot. gall. p. 349.) scape hardly inflated at the base; lower scales numerous, lanceolate, blackish: floral ones short, and fewer; calycine segments 2-lobed; corolla elongated, with a constricted throat; lower lip 3-lobed; galea subemarginate; stigma bifid, reflexed, yellowish-red. ♃. H. Native of France, growing from the roots of *Medicago sativa*. O. Medicáginis sativæ, Vaucher, mon. t. 2. Plant yellowish.

Lucern Broom-Rape. Pl. ½ to 1 foot.

15 M. minor (Sutt. in Lin. trans. 4. p. 179. t. 17. f. 1, 2, 3.) hairy; scape thickened at the base, moderately scaly; floral scales lanceolate, pilose; calycine segments sometimes simple and sometimes bifid; corolla arcuately cylindrical; upper lip rounded and crenulated: lower one trifid, with equal, rounded, crenulated lobes; stamens inserted beyond the base of the corolla, beset with glandular hairs below; stigma retuse, ex Sutton; 2-lobed, purplish, with transverse chinks, ex Duby; anthers blackish; style smooth at top. ♃. H. Native of Europe, in fields and pastures, growing from the roots of *Trifolium praténse;* plentiful in some parts of Britain, as in Norfolk, Smith, engl. bot. 422. O. major, Loefl. hisp. no. 35. O. major, β, Haller, helv. ed. 1. p. 610. ed. 2d. no. 209. O. barbata, Lam. dict. 4. p. 621. O. flore minore, Ray. syn. 288. O. ramosa, β, Huds. engl. ed. 2. p. 266. O. trifolii-praténsis, Vauch. mon. t. 5. Plant flesh-coloured. Flowers whitish-yellow, with purple veins, varying to full yellow, finally becoming of a rust-colour or purplish.

Smaller Broom-Rape. Fl. July, Aug. Britain. Pl. ½ to 1 foot.

16 O. elatior (Sutt. in Lin. trans. 4. p. 178. t. 17. f. 4.) clothed with clammy hairs; scape nearly equal; scales lanceolate; flowers remote; calycine segments bifid, with linear lobes; corolla tubular, cylindrical, recurved, veiny; limb plicate or fringed; upper lip emarginate: lower one 3-lobed; stamens beset with hairs below; stigma bifid, obcordate, brownish-yellow; style smooth above. ♃. H. Native of Europe, in woods and fields, growing from the roots of *Centaurea scabiosa;* in England, in clover-fields, thickets, and bushy, hilly places, on a gravelly soil. Smith, engl. bot. 568. Fl. dan. 1334. O.

Centaurèæ-scabiòsæ, Vauch. mon. p. 61. with a figure. *O. màjor*, Sibth. p. 191. Flowers of a pale russet-colour, with darker veins.

Taller Broom-Rape. Fl. July, Aug. Britain. Pl. 1 to 1½ foot.

17 *O.* nudiflòra (Wallr. sched. crit. 1. p. 310.) pubescent; scales narrow, few; spike few-flowered, loose; floral scales exceeding the flowers, which are tubular; lobes of corolla quite entire; middle segment of the lower lip obovate; stamens downy at the base; style glabrous; stigma 2-lobed.? ♃. H. Native of Germany and Denmark. *O. mìnor*, Vahl, fl. dan. t. 1213.

Naked-flowered Broom-Rape. Pl. ½ to 1 foot.

18 *O.* a'lba (Steph. in Willd. spec. 3. p. 350. Rchb. icon. t. 679. and t. 680.) scape simple, beset with glandular hairs at top; scales remote, adpressed, lanceolate; spike elongated, loose; floral scales ovate, acute, clothed with glandular hairs, a little longer than the calyx; calyx bifid, with entire segments; corolla cylindrical: upper lip obcordate, denticulated, as well as the segments of the lower lip; base of filaments and top of style beset with glandular hairs; stigma large, 2-lobed. ♃. H. Native of Siberia, towards the Caspian Sea; and of Caucasus, on the Talusch mountains, at the altitude of from 500 to 800 hexapods. The corollas are generally white; but there are also varieties with dirty purplish, or brownish corollas.

White-flowered Broom-Rape. Pl. ½ foot.

§ 2. *Superior lip of corolla bifid.*

19 *O.* speciòsa (D. C. fl. fr. 3. p. 490.) scape beset with glandular hairs; spike dense; corolla tubular; upper lip 2-lobed: lobes all rounded and crenulated; middle segment of the lower lip larger than the lateral ones; calycine segments undivided; stamens and style glabrous. ♃. H. Native of France, at Telon.

Showy Broom-Rape. Pl. 1 foot.

20 *O.* ru'bra (Smith, engl. bot. t. 1786. fl. 3. p. 148.) clothed with glandular, viscid pubescence; scape simple, densely scaly; calycine segments 2, lanceolate, undivided; floral scales shorter than the flowers; corolla tubular, somewhat tumid; upper lip bifid; lobes all crenated and fringed with short, glandular hairs on the margin; base of stamens, and top of style fringed and glandular. ♃. H. Native of the North of Ireland and Scotland, on basaltic rocks; plentiful at Cave-hill, near Belfast; also on the Giant's Causeway; at Staffa, and near Kirkaldy. Hook. fl. lond. t. 105. Root creeping along the rock. The whole plant is of a rusty-purplish colour. Spike not dense. Flowers with a powerful scent of honeysuckle.

Red-flowered Broom-Rape. Pl. 1 foot.

21 *O.* acau'lis (Roxb. fl. ind. 3. p. 29.) scapeless; flowers crowded into irregular heads, which are sessile on the roots; calyx 1-leaved, opening on the side, or divided into 2 unequal portions; segments of corolla jagged; anthers simple, each inner pair augmented with a large, recurved, oval gland; stigma peltate. ♃. G. Native of the East Indies, parasitical on the roots of the China sugar-cane in the botanic garden at Calcutta. Bracteas triangular, embracing the base of 1 or more pedicels. Corolla purple outside, yellow inside.

Stemless Broom-Rape. Pl. dwarf.

22 *O.* condensa'ta (Mor. elench. sard. fasc. 2d. ex Linnæa, 5. p. 94.) scapes villous; scales lanceolate, acuminated; calyx bipartite, with semibifid segments; upper lip of corolla somewhat 2-lobed; spike elongated, cylindrical, compact; style glabrous; stamens rather pilose at the base. ♃. H. Native of Sardinia, on the roots of *Genísta Córsica*. Said to be nearly allied to *O. speciòsa*, D. C.

Condensed-spiked Broom-Rape. Pl. ½ to 1 foot.?

23 *O.* sórdida (C. A. Meyer, in Led. fl. ross. alt. ill. t. 386. fl. alt. 2. p. 455.) pubescent; floral scales oblong-lanceolate, about half as long as the flowers; calycine segments free, bifid: lobes lanceolate, nearly equal; corolla cylindrical, incurved; lips of equal length: lobes of the lower one oblong, acutish, quite entire, flat, middle lobe the longest; filaments and style rather hairy; stigma 2-lobed. ♃. H. Native of Altaia, in the Soongarian desert, on the Arkaul mountains, not far from lake Noorsaisan, in rocky places. Hairs white. Corolla dirty yellow, or pale brown, glandular outside; lobes of the upper lip truncate or rounded. Style glandular, and sometimes the stamens.

Dirty-flowered Broom-Rape. Fl. May. Pl. 1 foot.

24 *O.* fœ'tida (Poir. itin. 2. p. 195. Desf. fl. atl. 2. p. 59. t. 144. Tenor. fl. nap. 2. p. 63. Viv. fl. libyc. p. 34.) scape simple, hairy, fistular; scales lanceolate: floral scales linear-lanceolate, longer than the corollas; calyx 2-leaved: segments bifid, lanceolate, subulate, unequal; corolla cylindrical; upper lip 2-lobed: lower one 3-lobed: lobes roundish, denticulated; stigma thick, 2-lobed. ♃. H. Native of Barbary, everywhere in fields and cultivated ground; and of Tripoli, on hills. Link. et Hoffm. fl. port. 2. p. 316. t. 62. Bracteas hairy. Corolla dark purple, size of those of *O. màjor*. Stamens inclosed.

Stinking Broom-Rape. Pl. 1 to 2 feet.?

25 *O.* amœ'na (C. A. Meyer, in Led. fl. ross. alt. ill. t. 385. fl. alt. 2. p. 457.) smoothish; floral scales ovate-lanceolate, 3 times shorter than the flowers; calycine segments free, bifid, with linear-lanceolate, nearly equal lobes; corolla cylindrical, incurved; lips of equal length: lobes of the lower lip bluntish, denticulated: middle lobe rather the longest; filaments hairy at the base, but rather glandular at top, as well as the style; stigma 2-lobed. ♃. H. Native along with the preceding, on the Arkaul mountains. The whole plant is clothed with glandular scurf, nearly glabrous, and of a yellowish-brown colour. Corollas of a deep violet-blue colour, with a few glands outside. Lobes of the upper lip nearly orbicular, denticulated. Nearly allied to *O. sórdida* and *O. arenària*, Bieb.

Pleasant Broom-Rape. Pl. ½ foot.

26 *O.* ra'pum (Thuil. par. ed. 2d. p. 317. Duby, bot. gall. 1. p. 348.) scape thickened into an imbricately scaly bulb; scales ovate-oblong, clothed with clammy hairs; calycine segments free, bifid, with nearly equal, linear lobes; corolla inflated; upper lip 2-lobed: lower one 3-lobed; stigma 2-lobed, yellow. ♃. H. Native of France, in sterile and argillaceous soil, from the roots of *Genísta tinctòria*, Wallr. diask. p. 32. *O. màjor*, Lam. ill. t. 551. but not of Lin. *O. genístæ tinctòriæ*, Vauch. mon. t. 1.—Mor. hist. sect. 12. t. 16. f. 2. Plant reddish-yellow.

Var. β, gràcilis; plant much more slender; scales dilated at the base; flowers few, short. ♃. H. Native of France, from the roots of *Genísta sagittàlis*. *O. vulgàris*, Lam. dict. 4. p. 621.? D. C. fl. fr. 3. p. 489. *O. genístæ sagittàlis*, Vauch. mon. Perhaps a species.

Rape Broom-Rape. Pl. 1 foot.

27 *O.* pruinòsa (Laper. abr. suppl. p. 87.) scape fistular, pilose, pruinosely grey, dilated into a middle sized bulb; scales lanceolate: floral ones narrow, shorter than the corolla; calycine segments deeply and narrowly bifid; lips of corolla plicate at the top: superior one bifid: lower one 3-lobed: lobes denticulated; stigma deeply divided, pale purple. ♃. H. Native of the Eastern Pyrenees, on the roots of *Fàba satìva*. *O. fàbæ satìvæ*, Vauch. mon. p. 37. t. 5. Flowers white.

Frosted Broom-Rape. Pl. ½ to 1 foot.

28 *O.* arena'ria (Bieb. fl. cauc. 2. p. 83.) smoothish; scales lanceolate; spike few-flowered; floral scales smaller than the corolla, and are, as well as the calyxes, smooth; caly-

cine segments bifid; lobes of corolla acutish; stamens glabrous. ♃. H. Native of Podolia, Bessarabia, Tauria, and Caucasus. O. crética procèrior non ramosa, caule tenui, flore parvo subcæruleo, Tourn. cor. p. 10. Scapes simple. Corolla blue: upper lip bifid.

Sand Broom-Rape. Pl. 1 foot.?

29 O. sangui'nea (Presl. del prag. p. 176.) pubescent; scape simple, scaly; floral scales about equal in length to the flowers; spike dense; lobes of corolla equal, obtuse, denticulated; stamens quite glabrous. ♃. H. Native of Sicily.

Bloody Broom-Rape. Pl. 1 to 1½ foot.?

30 O. ru'bi (Duby, bot. gall. p. 350.) scape thickened into a scaly bulb, beset with white hairs; scales numerous, blackish; calycine segments bifid; upper lip of corolla bifid: lower one 3-lobed: lobes roundish, erose; stamens adnate above the base; stigma 2-lobed, yellowish. ♃. H. Native of Provence, in cornfields near Luc, parasitical on the roots of *Rùbus fruticòsus*. O. rùbi fruticòsi, Vauch. mon. t. 9. Scapes reddish. Flowers pale yellow.

Bramble Broom-Rape. Pl. 1 foot.?

31 O. Ery'ngii (Duby, bot. gall. p. 350.) scape incurved at the base, scaly; scales numerous, lanceolate, half adherent; calycine segments deeply bifid: lobes linear; upper lip of corolla arched, hardly bifid: lower lip 3-lobed, subplicate; stigma 2-lobed, reddish. ♃. H. Native of the southern provinces of France, parasitical on the roots of *Eryngium campéstre*. O. Eryngii campéstris, Vaucher. mon. p. 58. t. 10. Scapes red, hairy. Flowers reddish white.

Eryngo Broom-Rape. Pl. 1 foot.?

32 O. cóncolor (Duby, bot. gall. p. 350.) scape dilated at the base, scaly, slender; scales numerous, lanceolate, blackish-yellow; flowers numerous; calycine segments hairy, generally bifid; corolla yellow; upper lip somewhat 2-lobed: lower lip 3-lobed, elongated; stamens and ovarium 2-lobed; stigma yellow. ♃. H. Native of Provence, parasitical on the roots of *Scabiòsa columbària*, *Chærophyllum sylvéstre*, and *Méntha arvénsis*. O. scabiosæ Columbàriæ, Vauch. mon. p. 59. t. 11. Plant wholly yellow.

Self-coloured Broom-Rape. Pl. 1 foot.?

33 O. pedunculà'ta (Roxb. fl. ind. 3. p. 29.) smooth; scape simple, furnished with a few tapering, fleshy scales; floral scales triangular; calyx spath-formed, 1-leaved, opening by a single slit on the inner side; corolla with an inflated tube, as long as the calyx; limb 5-parted, nearly equal: segments reniform, finely toothed on the edges; filaments smooth; stigma broad, cordate, peltate. ♃. S. Native of Bengal, parasitical upon the roots of *Andropògon muricàtus*. Peduncles length of stem, 1-flowered. Flowers very large. Corolla with a yellow tube, and a deep violet limb. Calyx filled with a clear clammy liquor. Stamens inclosed. Anthers connected, entangled by a long, horizontal, fleshy appendage, into which the filaments are inserted. Capsule ovate. Perhaps a species of *Æginètia*.

Peduncled Broom-Rape. Pl. ¼ to ½ foot.

Sect. II. Sepals combined in the back part towards the base; not in front, as in the sect. 1.; the front part being free.

34 O. bi'color (C. A. Meyer, in Led. fl. ross. alt. ill. t. 390. fl. alt. 2. p. 458.) plant scurfy; floral scales ovate, acute, about twice as long as the flowers; calycine segments bifid or undivided: lobes lanceolate, nearly equal; corolla cylindrical, incurved; upper lip the longest, 2-lobed: lobes of the lower lip small, nearly orbicular, denticulated, nearly equal; filaments puberulous at the base, but glabrous at top, as well as the style; stigma emarginate. ♃. H. Native of Altaia, in the Soongarian desert, in argillaceous and sandy soil, on the banks of the river Tschuganka, towards the foot of Mount Tschingistan; and of Spain.? O. cérnua, Pall. ind. taur. Lin. spec. 882.? Loefl. itin. 2. p. 229.? Corollas white or pale violet: limb small, deep violet. Stigma yellow.

Two-coloured-flowered Broom-Rape. Pl. ½ to ¾ foot.

35 O. me'dia (Desf. fl. atl. p. 59.) scape simple, hairy, striated, firm; scales adpressed, ovate or ovate-lanceolate; flowers densely spicate; floral scales ovate, concave, length of calyx; calyx 2-leaved: leaflets bifid: lobes narrow, acute; corolla curved, twice as long as the calyx; upper lip 2-lobed: lower one 3-lobed: lobes rounded, nearly equal; stamens inclosed. ♃. H. Native of Barbary, near Cafsa, in sandy places. Corollas size of those of *Phelipæ'a ramòsa*, pale yellow.

Intermediate Broom-Rape. Pl. 1 to 1½ foot.?

† *Species hardly known.*

36 O. purpu'rea (Lin. suppl. 288. syst. 573.) stem simple and branched, villous; flowers racemose; pedicels opposite; corolla quadrifid, campanulate; anthers spurred. ♃. G. Native of the Cape of Good Hope. Plant purplish-red, with large flowers, becoming black on drying.

Purple Broom-Rape. Pl.

37 O. Cape'nsis (Thunb. prod. 97.) stem simple, villous; corolla curved, clavate. ♃. G. Native of the Cape of Good Hope.

Cape Broom-Rape. Pl.

38 O. interru'pta (Pers. ench. 2. p. 181.) stem branched, flexuous; spike of flowers interrupted. ♃. G. Native of the Cape of Good Hope. O. ramòsa, Thunb. prod. 97. but not of Lin.

Interrupted-spiked Broom-Rape. Pl. 1 foot.?

39 O. longiflòra (Pers. ench. 2. p. 181.) stem hairy, branched a little; tube of corolla flaccid, very long. ♃. G. Native of the Cape of Good Hope.

Long-flowered Broom-Rape. Pl.

40 O. Ægypti'aca (Pers. l. c.) many-stemmed; flowers on long peduncles; calyx 5-cleft; anthers bearded at top. ♃. G. Native of Egypt. Filaments glabrous. Perhaps a species of *Phelipæ'a*.

Egyptian Broom-Rape. Pl.

Cult. Singular parasitical plants, none of which are properly cultivatable.

II. PHELIPÆ'A

(so named by Tournefort, after the illustrious family Phelipeaux; great patrons of the natural sciences, and of Tournefort.) Tourn. inst. p. 47. Desf. fl. atl. 2. p. 60. t. 145. Led. fl. alt. 2. p. 459. Orobánche, Lin. and other authors. Gærtn. fruct. 3. p. 43. t. 185. f. 4. Lam. ill. t. 971.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx bibracteate, tubular, 4-5-cleft or 4-5-toothed. Corolla bilabiate; upper lip bifid: lower one trifid. Stigma capitate, 2-lobed. Capsule 1-celled, 2-valved; valves dehiscing at top, but cohering at the base; placentas parietal, 2 in each valve.—Plants with the habit of *Orobánche*; but are readily distinguished by the tubular, bibracteate calyx, and in the capsule dehiscing at top instead of at the side.

Sect. I. Triony'chion (from τρεις τρια, *treis tria*, three; and ονυχιον, *onychion*, a little claw; in reference to there being 3 bracteas to each flower; that is, 2 bracteas to the calyx, and one floral scale.) Ledeb. fl. alt. 2. p. 460. Orobánche, sect. Trionýchion, Wallr. diask. p. 58. Vauch. mon. p. 65. Kópsia, Du-

mont. Calyx 4-5-cleft: lobes elongated, unequal, acuminated. Anthers with glabrous superfices, and villous dehiscing cells. Capsule crowned by the base of the deciduous style.

1 P. lanuginòsa (C. A. Meyer, in Led. fl. ross. alt. ill. t. 377. fl. alt. 2. p. 460.) clothed with white wool; floral scales ovate-lanceolate, longer than the calyxes; lobes of calyx lanceolate, nearly equal; throat of corolla inflated a little; superior lip rather the longest: lobes of lower lip nearly equal, elliptic, obtuse, a little denticulated; filaments and anthers glabrous; style glandular; stigma 2-lobed. ♃. H. Native of Altaia, in grassy places at the rivers Talitza and Katunga, and near Barnaoul; and of Caucasus. Orobánche cæ'sia, Rchb. icon. t. 698. Scape yellowish. Corolla bluish. This is said to be intermediate between *P. comòsa* and *P. cærùlea*, but differs from both in being clothed with white wool, &c.

Woolly Phelipæa. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ foot.

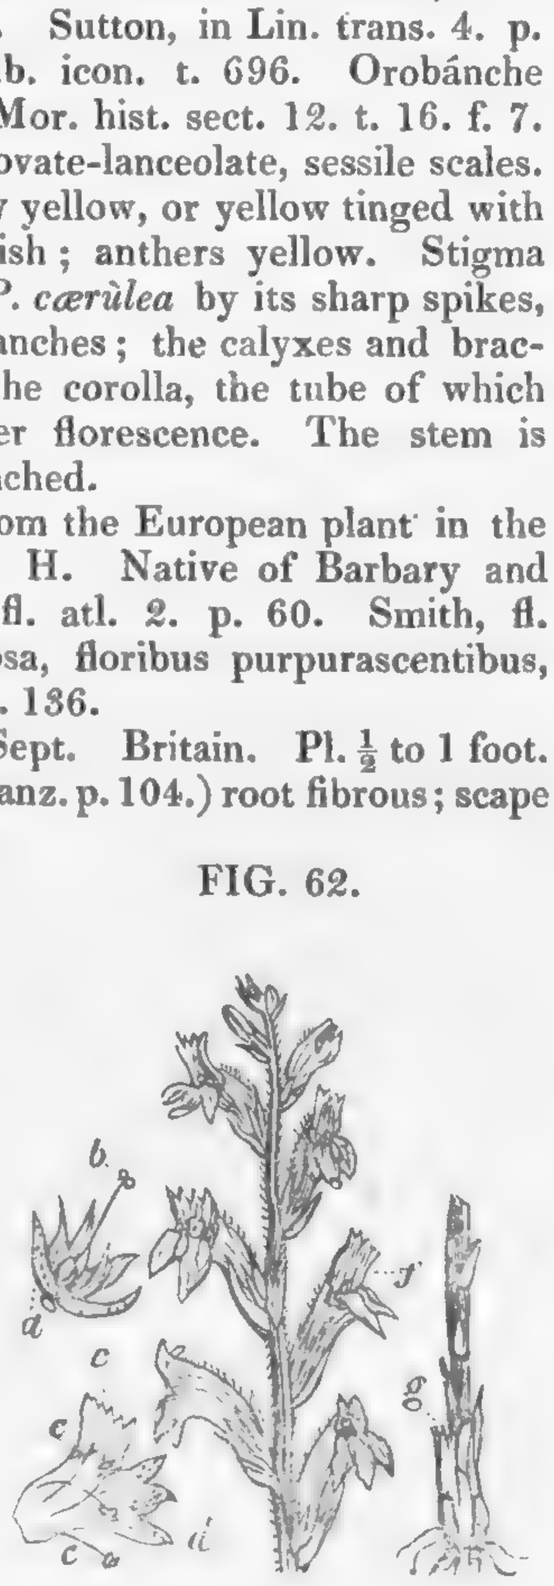
2 P. ramòsa (Meyer, verz. pflanz. p. 104.) root a solid bulb; scape naked, or furnished with a very few scales, hairy, swelling at the root, branched; spikes acute, terminal; bracteas hardly as long as the calyxes; calyx suburceolate, 4-5-cleft, unequal, acuminated; corolla tubularly funnel-shaped, swollen at the base, and yellow: upper part and lips blue, hairy outside: upper lip roundish, bifid: lower lip trifid; segments rounded, obtuse: the middle segment largest, with 2 yellow prominences at the mouth; stamens inclosed, downy at the base; stigma emarginate, white. ♃. H. Native of Europe; as of the South of France, Germany, and Britain; also of Caucasus, Barbary, and the Grecian Islands; in many parts of Britain, from the roots of hemp, in moist, rich fields, particularly in Norfolk and Suffolk, on *Galeópsis Tetràhit*. Orobánche ramòsa, Lin. spec. 882. Smith, engl. bot. 184. Sutton, in Lin. trans. 4. p. 185. Lam. ill. 551. f. 2. Rchb. icon. t. 696. Orobánche cánnabis, Vaucher. mon. t. 16.—Mor. hist. sect. 12. t. 16. f. 7. Root furnished with one or two ovate-lanceolate, sessile scales. Stem and branches brown, or dirty yellow, or yellow tinged with purple. Filaments and style bluish; anthers yellow. Stigma blunt. It is distinguished from *P. cærùlea* by its sharp spikes, the few scales on the stem and branches; the calyxes and bracteas being shorter by half than the corolla, the tube of which becomes globular at bottom after florescence. The stem is sometimes, though seldom, unbranched.

Var. β, violàcea; this differs from the European plant in the corollas being wholly blue. ♃. H. Native of Barbary and the Levant. O. ramòsa, Desf. fl. atl. 2. p. 60. Smith, fl. græc. t. 608. Orobánche ramòsa, floribus purpurascentibus, Bauh. pin. p. 88. Tourn. inst. p. 136.

Branched Phelipæa. Fl. Aug. Sept. Britain. Pl. $\frac{1}{2}$ to 1 foot.

3 P. cæru'lea (Meyer, verz. pflanz. p. 104.) root fibrous; scape simple, hairy; scales ovate-lanceolate, hairy; spikes loose, bluntish; bracteas linear-lanceolate, scarcely equal in length to the calyx; calyx 4-cleft, with the rudiment of a fifth, lanceolate, acuminated, exceeding the capsule; corolla hairy; tube cylindrical below, incurved in the middle: segments of the lower lip equal; filaments naked; stigma 2-lobed, yellowish. ♃. H. Native of Europe, on the borders of fields; as of Switzerland, Austria, Germany, South of France; also of Caucasus; in Britain, but rare, in grassy pastures near the sea; on the borders of fields in Hampshire; near Northreps, Norfolk. Orobánche cærùlea, Vill. dauph. 2. p. 406. Sutton, in Lin. trans. 4. p. 182. Smith, engl. bot. t. 423. Rchb. icon. t. 692. Orobánche purpùrea, Jacq. austr. t. 276. O. læ'vis, Lin. spec. 882. Orobánche purpuráscens, Gmel. syst. p. 954. t. 14. Orobánche ramòsa, β, With. arr. ed. 3d. p. 558. Orobánche Artimíseæ vulgàris, Vauch. mon. t. 14. P. cérnua, Pall. ind. taur.—Buxb. cent. 3. p. 2. t. 1. f. 2.—Gmel. sib. 3. p. 215. t. 46. f. 1. Scape simple, of a yellowish olive colour. Flowers bluish-violet. Stigma capitate.

FIG. 62.



Blue-flowered Phelipæa. Fl. July. Britain. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

4 P. I'ndica; plant branched, hairy; scape with a scale at each ramification only; calyx subunilateral, 5-cleft; spikes dense, clavate; corolla tubular: upper lip 2-lobed: lower lip 3-lobed; anthers woolly, 2-lobed: cells spurred; filaments smooth; stigma 2-lobed. ♃. S. Native of Hindostan, Oude, Nipaul, at the roots of Tobacco. Orobánche I'ndica, Roxb. fl. ind. 3. p. 27. This species is said to be nearly allied to *P. cérnua* and *P. ramòsa;* but differs from both, in the flowers being twice the size, but also blue. Root fibrous.

Indian Phelipæa. Pl. $\frac{1}{2}$ to 1 foot.

5 P. comòsa; scape nearly simple: scales hairy; calyx 4-lobed: lobes linear; corolla funnel-shaped, tubular, wide, 5-cleft: lobes roundish: lower one smaller: anthers at length pilose; stigma 2-lobed, rufescent. ♃. H. Native of the southern provinces of France, parasitical on the roots of many kinds of plants. Orobánche comòsa, Wallr. sched. crit. 1. p. 314. Orobánche vagabúnda, Vauch. mon. t. 15. Scape bluish, Corollas blue.

Comose Phelipæa. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

6 P. longiflòra; pubescent; floral scales ovate, obtuse; calyx 4-5-parted; spikes loose; corolla 3 times as long as the calyx: lower lip elongated; stamens downy. ♃. H. Native of Siberia, at the Volga. Orobánche longiflòra, Trev. in repert. soc. nat. berol. 1813. 2. p. 150. t. 2. f. 10, 11. Said by Bieb. to be a variety of *P. cærùlea.*

Long-flowered Phelipæa. Pl. 1 to $1\frac{1}{2}$ foot. ?

7 P. Ludovicia'na; clothed with powdery pubescence; scape low and simple; flowers and ovate scales subimbricated; calyx unequally and deeply 5-cleft; corolla recurved, 5-cleft; stamens inclosed, smooth. ♃. H. Native of North America, in sandy alluvial soil, around Fort Mandan abundant, but not apparently parasitical. Flowers very numerous and crowded, much longer than the bracteas. Segments of calyx long, linear, and acute. Upper lip of corolla bifid: lower one trifid and plaited, purple. Anthers whitish: lobes acute at the base.

Louisiana Phelipæa. Pl. 3 to 4 inches.

8 P. Califórnica; clothed with viscid down; scape simple; flowers corymbose; scales broad-lanceolate, acute, short, numerous at the base; corolla straight, tubular: upper lip flat, 2-lobed at apex: lower one trifid: segments distant, linear, acute; anthers sagittate, with a villous chink; stigma orbicular, peltate. ♃. H. Native of California, at Port St. Francisco. Orobánche Califórnica, Cham. et Schlecht. in Linnæa, 3. p. 134. Flowers pedicellate. Calyx bibracteate, campanulate, deeply 5-toothed; segments linear-narrow, dilated at the base.

Californian Phelipæa. Pl. $\frac{1}{4}$ foot.

9 P. compa'cta; scape simple, imbricated with scales, floriferous from the base; spike ovate, many-flowered; bracteas ovate; upper lip of corolla bifid: segments ovate, acute. ♃. H. Native on the shores of the Great Syrtus. Orobánche compácta, Viv. fl. libyc. p. 34. t. 15. f. 2. Scape thickened at the base. Floral scales one half the length of the flowers. Calyx 4-leaved; segments ovate, obtuse, sometimes truncate, 3

times shorter than the corolla. Corolla incurved, gradually dilated to the mouth; lobes of upper lip ovate, acute; segments of the lower lip roundish, undulated, nearly equal. Stamens length of tube; filaments smooth; anthers hairy from interwoven pili. Stigma capitately truncate.

Compact-flowered Phelipæa. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

10 P. Cape'nsis; glabrous, a little branched; flowers spicate; bracteas, floral scales, and calyxes obtuse; corolla tubular, incurved; upper lip bifid; calyx 4-5-parted. ♃. G. Native of the Cape of Good Hope. Orobánche squammàta, Thunb. prod. 97.

Cape Phelipæa. Pl. 1 foot.

Sect. II. Hæmodòron (from *αἱμα*, *haima*, blood; and *δωρον*, *doron*, a gift; in allusion to the flowers in most species being red.) Ledeb. fl. alt. 2. p. 461. Cistánthe, Hoffm. et Link, fl. port. vol. 2. Calyx semiquinquefid; lobes equal, obtuse. Anthers woolly all over. Capsule terminated by the permanent style, at length separating lengthwise. Scapes very simple.

11 P. sa'lsa (Meyer, in fl. ross. alt. ill. t. 376. Led. fl. alt. 2. p. 461.) plant rather woolly; floral scales ovate-lanceolate, longer than the calyx; bracteas nearly linear; lobes of calyx nearly orbicular, equal; corolla straightish, tubular, campanulate: lobes nearly equal, semiorbicular, spreading; style glabrous; stigma emarginate. ♃. H. Native of the Kirghisean Steppe, in saltish, argillaceous soil, beyond the Kurtschum, towards the east. Amblàtum Tatáricum, Fisch. in litt. Scape tuberously thickened at the base. Calyx glabrous. Corolla having the scent of violets, glabrous outside; tube white; limb beautiful violet; plicæ of the throat yellow, hairy. Filaments densely woolly at the base, and the whole surfaces of the anthers clothed with white wool.

Salt Phelipæa. Pl. $\frac{1}{2}$ to 1 foot.

12 P. fi'ssa (Meyer, verz. pflanz. p. 104.) plant woolly; floral scales lanceolate, obtuse, longer than the calyxes; upper or posterior segments of calyx linear: lower or anterior one spathformed, and 4-toothed: teeth obtuse; corolla violaceous, straightish, campanulately tubular, with nearly equal, semiorbicular, spreading lobes; filaments bearded at the base; anthers mucronulate, drawn out at top into a connective; style glabrous; stigma undivided. ♃. H. Native of Caucasus, near Baku. Allied to *P. sálsa*.

Cleft-calyxed Phelipæa. Pl. $\frac{1}{2}$ to 1 foot.

13 P. fla'va (Meyer, verz. pflanz. p. 104.) quite glabrous; scales linear-lanceolate: floral ones much longer than the corollas; calyx tubular, with rounded lobes; corolla yellow, incurved, tubularly campanulate, with spreading, nearly equal, ovate lobes; filaments pubescent at the base: anthers mucronulate, drawn out into a connective at top; style very glabrous; stigma subretuse. ♃. H. Native of Caucasus, along with *Convólvulus erinàceus*. Nearly allied to *P. lùtea*. Anthers sometimes resupinate.

Yellow-flowered Phelipæa. Pl. $\frac{1}{2}$ to 1 foot.

14 P. viola'cea (Desf. fl. atl. 2. p. 60. t. 145.) scape fleshy; scales lanceolate, bluntish, scattered, numerous; spike conical; bracteas coloured; calyx semiquinquefid: segments elliptic, obtuse; limb of corolla irregular, 5-cleft: lobes rounded; anthers villous; stigma thick, 2-lobed. ♃. H. Native of Barbary, in a sandy desert near Tozzer; and of Tripoli, on the sea shore. Orobánche Phelipæ'a, Willd. spec. 3. p. 352. Scapes simple, or branched at the base. Corollas size of those of *Antirrhìnum màjus*, violaceous; plicæ in the throat yellow, ex Desf., of two colours; that is, the tube is white, and the limb violet, ex Viv. fl. libyc.

Violaceous-flowered Phelipæa. Pl. $\frac{1}{2}$ to 1 foot.

15 P. lu'tea (Desf. atl. 2. p. 61. t. 146.) scape fleshy, furrowed; corolla arched, narrowed at the base. ♃. H. Native of Barbary, in humid, sandy places on the shores of the river Elhammah, near Mascar; and of Portugal. Orobánche tinctòria, Forsk. desc. p. 112. Vahl, symb. 2. p. 70. Phelipæ'a Lusitánica flore luteo, Tourn. cor. 47. Lathræ'a Phelipæ'a, Lin. spec. 844. Very nearly allied to the preceding; but differs in the corolla being yellow, in the tube being narrower at the base, and in the limb being widened below.

Yellow-flowered Phelipæa. Pl. $\frac{1}{2}$ to 1 foot.

16 P.? subacau'lis (Benth. scroph. ind. p. 55.) stem very short, thick, scaly; peduncles 3-4 on each stem, shorter than the scales, 1-flowered; calyx 6-7 lines long, tubular, inflated a little at the base, irregularly 4-5-toothed at apex; corolla $2\frac{1}{2}$ inches long: tube slender at the base, but widened at length into an ample dilated throat: limb short, and broadly somewhat bilabiate, 5-lobed; stamens 4, glabrous; anthers glabrous; cells spurred; stigma capitate;? capsule not seen. ♃. S. Native of the Indian Peninsula. In the Madras herbarium along with *Æginètia abbreviàta*.

Almost-stemless Phelipæa. Pl.?

Cult. Plants not cultivatable.

III. ANO'PLON (from α priv. and *ὁπλον*, *hoplon*, a shield; in reference to the scapes being without scales.) Wallr. diask. p. 78. Meyer, verz. pflanz. p. 103. Phelipæ'a species, Desf. Spreng. Orobánche species of authors.

Lin. syst. *Didynàmia*, *Angiospérmia*. Flowers hermaphrodite, bractless. Calyx campanulate, 5-cleft, sub-bilabiate; upper lip of corolla bifid: lower one trifid. Stigma capitate, quite entire, or sub-emarginate. Capsule 1-celled, 2-valved; valves dehiscing at top, combined at the base; placentas parietal, 2 to each valve.—Plants with the habit of *Orobánche*.

1 A. Tournefórtii; scape simple, villous, 1-flowered, naked, but involved in scale-like sheaths at the base, which rise from the root; lobes of corolla spreading, circinate. ♃. H. Native of Armenia. Phelipæ'a Tournefórtii, Desf. ann. mus. 10. p. 298. t. 21. Phelipæ'a orientàlis flore coccineo, Tourn. cor. p. 47. Calycine segments ovate-lanceolate, unequal. Corolla large, scarlet, with 2 large, bearded, black plicæ in the throat. Style recurved. Stigma capitate, entire.

Tournefort's Anoplon. Pl. $\frac{1}{2}$ foot.

2 A. Bieberstèinii (Meyer, verz. pflanz. p. 104.) scape simple, 1-flowered, remotely scaly; lobes of corolla equal, orbicular, spreading. ♃. H. Native of Tauria and Caucasus, in alpine regions, at the elevation of 800 to 1200 hexapods; also of Siberia, towards the Caspian sea. Phelipæ'a foliàta, Spreng. syst. 2. p. 818. Orobánche coccínea, Bieb. casp. p. 58. pl. rar. ross. 2. t. 56. Phelipæ'a coccínea, Pers. ench. 2. p. 181. Lathræ'a Phelipæ'a, Guild. itin. 1. p. 422. Calyx unequally 5-parted. Corolla inflated, 5-cleft, sub-bilabiate, scarlet.

Bieberstein's Anoplon. Pl. $\frac{1}{2}$ foot.

3 A. fasciula'tum; stem short and simple; peduncles many, naked, nearly terminal, and about the length of the stem; scales few, ovate, and concave, pubescent; lobes of corolla very short, rounded, and naked on the margins. ♃. H. Native in sandy alluvial soils around Fort Mandan. Orobánche fasciculàta, Nutt. gen. amer. 2. p. 59. Phelipæ'a fasciculàta, Spreng. syst. 2. p. 818. Stem clothed with powdery pubescence, terminating in 6 or more naked, filiform peduncles. Calyx campanulate, semiquinquefid; segments sublanceolate, acute. Corolla curved, tubular, pale purple: segments short: lower lip producing a grooved palate. Stamens smooth. Lobes of anthers parallel.

Fascicled Anoplon. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

4 A. biflòrum; stem very short, usually obsolete, mostly 2-flowered; peduncles scape-formed, naked; scales smooth, concave; lobes of corolla oblong-oval, with a pubescent, coloured margin. ♃. H. Native in shady woods throughout the Atlantic States, Nutt.; Carolina to Virginia, Pursh. Orobánche uniflòra, Lin. spec. 882. Pursh. fl. amer. sept. 2. 431. Orobánche biflòra, Nutt. gen. amer. 2. p. 59. Phelipæ'a biflòra, Spreng. syst. 2. p. 818. Calyx and corolla as in the preceding; but the lobes of the corolla are deeper, the whole yellowish white, the segments bordered with an azure blue line; plicæ in the throat yellow, as in the preceding. Stamens smooth. Anthers pubescent on the margins of the cells. Stigma bilamellate. Plant of a tan-colour.

Two-flowered Anoplon. Pl. $\frac{1}{4}$ foot.

Cult. Plants not cultivatable.

IV. BOSCHNIA'KIA (in memory of —— Boschniak, a Russian botanist.) Meyer, mss. ex Bongard, in mem. acad. imp. st. petersb. 2. p. 157. Orobánche species, Cham. et Schlecht.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx unequally 5-toothed, bractless. Corolla bilabiate; tube short; upper lip arched, stretched out, bifid: lower lip short, somewhat 3-lobed. Stamens exserted; cells of anthers mutic at the base. Style tubular at top, sub-bilabiate, terminated by a stigmatose margin. Capsule 1-celled, dehiscing laterally, with a solitary, parietal placentæ to each valve.—A plant with the habit *Orobánche*, from which genus it is principally distinguished by the capsule dehiscing laterally, by the style being tubular at top, and somewhat bilabiate, terminated by a stigmatose margin, and by the placentas in both valves being solitary and very distant.

1 B. gla'bra (Meyer, mss. ex Bongard, l. c.) ♃. H. Native of Siberia, at the Lena; Kamtschatka; Chamisso's Island; Island of Sitka, &c. Orobánche Róssica, Cham. et Schlecht, in Linnæa, 3. p. 132.—Gmel. sib. 3. p. 216. t. 46. f. 2. Tuber naked, usually with many scapes rising from it. Spikes dense. Floral scales, calyxes, and corollas ciliated. Plant reddish. Anthers glabrous. The scales of the scape are shorter, and less pergamaceous than those of *Canópholis Americànus*.

Glabrous Boschniakia. Pl. $\frac{1}{2}$ to 1 foot.

Cult. Plant uncultivatable.

V. CANO'PHOLIS (from *κανων, kanon*, a rule; and *φολις, pholis*, a scale; the scales are imbricated in 4 rows.) Wallr. diask. p. 78. Orobánche species, Lin.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx ventricose, 5-parted, unequal, bibracteate. Corolla incurved, bilabiate: upper lip entire: lower lip 2-parted, erect. Stamens exserted. Stigma capitate. Capsule 1-celled.—A parasitical plant, with the habit of *Orobánche*. Scapes simple. Corollas nearly white.

1 C. America'nus (Wallr. l. c.) ♃. H. Native from Carolina to Pennsylvania, often growing in vast clusters at the roots of trees, in moist shady forests. Orobánche Americàna, Lin. syst. 573. mant. p. 88. Pursh. fl. amer. sept. 2. p. 431. Plant of a brownish yellow colour, glabrous. Scapes simple. Scales oval-lanceolate, imbricate. Spike dense, imbricate, glabrous; bracteas equal in length to the tube of the corolla.

American Canopholis. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

Cult. An uncultivatable plant.

VI. EPIPHE'GUS (from *επι, epi*, upon; and *φηγος, phegos*, beech; the plant is parasitical on the roots of beech.) Nutt. gen. amer. 2. p. 60. under Epifàgus. Orobánche species of Lin.

Lin. syst. *Didynàmia, Angiospérmia.* Flowers polygamous. Calyx short, 5-toothed. Corolla of the infertile flower ringent, compressed, 4-cleft: lower lip flat; fertile flower minute, 4-toothed, deciduous. Capsule truncate, oblique, imperfectly 2-valved, opening only on one side.—A rather fleshy, herbaceous plant, parasitical only on the roots of beech. Stem virgately branched; branches simple, every where distantly floriferous. Scales small, and remote, commencing from the extremity of the root; upper parts of the branches producing perfect flowers, but abortive fruit; lower imperfectly formed flowers fructiferous. Capsule coriaceous and small, the character of *Melampy'rum*, but truncated, and at length extending by moisture in the form of a cup.

1 E. America'nus (Nutt. l. c.) ♃. H. Native of every part of North America, equally indigenous. Orobánche Virginiàna, Lin. spec. 882.—Mor. hist. 3. p. 502. sect. 12. t. 16. f. 9. ? Root tuberous, fleshy, scaly. Upper lip of corolla emarginate: lower one 3-toothed, white, with dark, but bright purple stripes; plicæ in the throat wanting. Stamens partly exserted, smooth. Anthers pubescent.

American Beech Drops. Pl. 1 to $1\frac{1}{2}$ foot.

Cult. Plant not cultivatable.

VII. LATHRÆ'A (from *λαθραιος, lathraios*, clandestine, which is from *λαθρα, lathra*, clam.) Lin. gen. no. 743. Schreb. gen. no. 1000. Gærtn. fruct. 1. p. 242. t. 52. Lam. ill. t. 551. f. 1. Juss. gen. 102. ed. Usteri, p. 114. Clandestìna, Tourn. inst. 952. Squammària, Scop.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, 4-cleft. Corolla tubular, bilabiate: upper lip concave, galeate: lower one trifid, reflexed. Stamens 4, didynamous, hidden by the upper lip. Anthers connected. Ovarium glandular at the base. Stigma 2-lobed. Capsule covered by the calyx, acuminated, 1-celled, elastically 2-valved; placentas parietal, 2 to each valve. Seeds few, globose.—Succulent, leafless, scaly herbs, parasitical on the roots of trees. Flowers solitary, or spicate, and unilateral.

1 L. clandesti'na (Lin. spec. 843.) stem branched almost under the earth; flowers erect, solitary. ♃. H. Native of Europe, in shady places, parasitical on the roots of trees, as of France, Pyrenees, and Italy. D. C. fl. fr. 3. p. 491. Lam. ill. 551. f. 1. Clandestìna rectiflòra, Lam. Clandestìna flore subcæruleo, Tourn. inst. 952. Orobánche montàna, Rudb. elys. 2. p. 233. f. 14. Dentària aphýllos, Ray, hist. 1230.—Mor. hist. 3. p. 503. sect. 12. t. 16. f. 15. The stem bears a corymb under ground, so that solitary flowers only appear above ground on each branch. Flowers large, blue. This is probably a very distinct genus from the following.

Clandestine Toothwort. Pl. parasitical.

2 L. squamma'ria (Lin. spec. 844.) stem quite simple; flowers spicate, unilateral, disposed in 2 rows; corollas pendulous. ♃. H. Native of most parts of Europe, in woods, parasitical on the roots of trees, as elms, hazels, beech, generally almost covered by the fallen leaves; plentiful in some parts of Britain; it has also been discovered on the Himalaya by Royle. Gærtn. fruct. 1. p. 242. t. 52. Smith, engl. bot. t. 50. Fl. dan. 136. Clandestìna penduliflòra, Lam.—Blackw. t. 430. Squammària Orobánche, Scop. carn. no. 760.—Riv. mon. irr. t. 89. f. 2. Amblàtum, Dod. pempt. 553. f. 1. Root articulated, branched, and surrounded by white scales. Stem naked, except perhaps furnished with one or two oval scales. Bracteas or floral scales

roundish-oval, large, reddish on one side of each pedicel. Calyx hairy, whitish; segments equal, bluntish. Corolla pale purple, or flesh-coloured: lower lip white: upper one short, and rather truncate. The English name Toothwort is derived from the resemblance of the scaly roots to the human fore-teeth, and hence it was fancied formerly to be good for the tooth-ache.

Scaly-rooted Toothwort. Fl. April. Britain. Pl. ½ to 1 foot.

Cult. Uncultivatable plants.

VIII. HYOBA'NCHE (from ὑς ὑος, *hys hyos*, a pig; and αγχω, *ancho*, to strangle; the plant is said to be hurtful to pigs.) Lin. gen. ed. Schreb. no. 1046. Juss. gen. p. 101. ed. Usteri, p. 112.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 7-parted; segments linear. Corolla tubular: lower lip wanting: superior one arched, emarginate. Stamens 4, didynamous, inserted at the bottom of the corolla; anthers ovate, nutant. Stigma emarginate. Capsule 2-celled, ? many-seeded.—A parasitical herb, with the habit of *Orobánche*. Scapes simple, thick, scaly. Spike fleshy, dense, thick; floral scales imbricate, villous.

1 H. sangui'nea (Lin. syst. 574. mant. 253.) ♃. G. Native of the Cape of Good Hope, parasitical on the roots of shrubs.—Petiv. gaz. t. 37. f. 4. Spike villous. The whole plant is blood red. Flowers purple. Plant of a blood red colour.

Bloody Hyobanche. Pl. ½ foot.

Cult. An uncultivatable plant.

IX. ALE'CTRA (derivation unknown to us.) Thunb. nov. gen. p. 81. Schreb. gen. no. 1066. Pers. ench. 2. p. 182.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx bilabiate: upper lip 2-cleft: lower one 3-cleft. Corolla tubular, widened upwards; limb 5-parted; segments broad ovate, obtuse. Stamens 4, didynamous, inclosed; filaments bearded; anthers twin. Stigma a little thicker than the style, striated on both sides. Capsule ovate, obtuse, twin, 2-celled, 2-valved. Seeds solitary in the cells, ovate.—Plant with the habit of *Orobánche*, and grows black on drying.

1 A. Cape'nsis (Thunb. nov. gen. p. 82.) ⊙. G. Native of the Cape of Good Hope, in grassy places near rivers. Stem or scape simple. Scales ovate, obtuse, villous, erect, becoming gradually larger as they ascend the stem. Spike terminal, leafy, or scaly, flowering by degrees. Corollas yellow, streaked with purple.

Cape Alectra. Fl. Nov. Dec. Pl. ½ to 1 foot.

Cult. An uncultivatable plant.

X. ÆGINE'TIA (named in memory of Paul Æginette, a physician, who flourished in the seventh century.) Roxb. fl. ind. 3. p. 30. cor. 1. p. 63. t. 91. Wall. pl. rar. asiat. 3. p. 13. t. 319. Orobánche species, Lin.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx spath-formed, one-leaved. Corolla campanulate, 5-parted, nearly equal; tube erect at bottom, but pitcher-formed above, and bent. Stamens 4, didynamous; anthers twin, united by pairs. Stigma capitate. Capsule 1-celled, ovate large, containing various convolute, parietal placentas, and numerous very small seeds.—Small, rush-like, naked, annual plants, with smooth, naked, intricately interwoven, fleshy roots. Scapes with a few scales, except at the base, which is involved in a small sheath.

1 Æ. I'ndica (Roxb. cor. 1. p. 63. t. 91.) scape elongated, nearly simple, naked, 1-flowered; limb of corolla shortly 4-cleft. ♃. S. Native of Nipaul, Silhet, Circars, Taong Dong, Tavoy, Wall. Deyra Dhoun, Kidarkonta, Kheree Pass, Royle. Orobánche Æginètia, Lin. spec. p. 883.—Rheed. mal. 11. p. 97. t. 47. Corolla curved, purple. Calyx yellowish.

Indian Æginetia. Pl.

2 Æ. abbrevia'ta (Hamilt. mss. ex Benth. scroph. ind. p. 55.) stem very short, branched, scaly; corolla large; limb bilabiate: lower lip amply 3-lobed. ♃. G. Native of the Indian Peninsula, Silhet, Rangoon, Prome. Wall. cat. no. 3965.

Short-stemmed Æginetia. Pl.

Cult. Uncultivatable plants.

XI. AMBLA'TUM (meaning unknown to us.) Tourn. cor. 48. Lathræ'a species, Lin. Orobánche species.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, 4-cleft. Corolla tubular, bilabiate, both lips entire: upper one galeate. Stamens 4, didynamous; anthers connected. Stigma truncate. Ovarium glandular at the base. Capsule 1-celled, 2-valved; placentas parietal, 2 in each valve.—An herb with the habit of *Lathræ'a*, or *Orobánche*.

1 A. Tournefórtii; ♃. H. Native of the Levant. Lathræ'a Amblàtum, Lin. spec. 844. Amblàtum orientale flore purpurascente, Tour. cor. p. 48.

Tourneforts' Amblatum. Pl. ½ to 1 foot. ?

Cult. An uncultivatable plant.

Tribe II.

OBOLARIE'Æ (this tribe contains plants agreeing with *Obolària* in being terrestrial, not parasitical.) D. Don, in edinb. phil. journ. vol. 37. p. 113. July, 1835.

XII. OBOLA'RIA (from *obolus*, a small coin; in allusion to the bracteas being round, like a piece of money.) Lin. gen. no. 778. Schreb. gen. no. 1044. Juss. gen. 101. ed. Usteri. p. 113. Nutt. gen. amer. 1. p. 103.

Lin. syst. *Didynàmia, Angiospérmia*, or *Tetrándria, Monogynia.* Calyx none, or in the form of two bracteas. Corolla campanulate, 4-cleft; segments entire (the margins sometimes crenulately torn). Stamens 4, equal, or nearly so, proceeding from the clefts of the corolla. Stigma emarginate. Capsule ovate, 1-celled, 2-valved, many-seeded. Seeds minute.—A very small vernal plant, with a simple stem, and opposite leaves. Flowers terminal, sessile, and marcescent, collected by pairs, or by threes, towards the summit of the stem. Stigma minutely bifid.

1 O. virgi'nica (Lin. spec. 881. Nutt. gen. 1. p. 103.) ♃. ? H. Native of Pennsylvania, in the neighbourhood of Philadelphia rare; and near West Chester; abundant in the shady forests of Lake Erie.—Mor. hist. 3. p. 504. sect. 12. t. 16. f. 33.—Pluk. alm. 209. f. 6. Plant about 3-4 inches high, with a small, branching root. Leaves thick, green, almost fleshy, frequently purplish on the under side. Flowers bluish-white, or pale red, supported by foliaceous bracteas.

Virginian Obolaria. Pl. 3-4 inches.

Cult. For culture and propagation see *Pediculàris*, p. 626.

XIII. TO'ZZIA (so named by Micheli, in honour of Bruno Tozzi, Abbot of Vallambrosa, F.R.S., Micheli's companion in his botanical excursions, in one of which he found this plant.) Micheli, gen. p. 20. t. 16. Lin. gen. no. 745. Schreb. gen. no. 1002. Juss. gen. 97. ed. Usteri, p. 109. Lam. ill. t. 522.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx campanulate, sub-bilabiate, 4-toothed, 5-toothed. ? Corolla tubular; limb bilabiate, nearly equal: upper lip 2-lobed: lower one 3-lobed. Stamens 4, didynamous; cells of anthers awned at the base. Stigma capitate. Ovarium 2-celled; cells 2-seeded; ovula fixed their whole length, free at bottom. Capsule spherical, 2-valved, 1-seeded by abortion.—An erect herb, having the stem scaly at the base, as in *Orobánche*. Leaves opposite. Flowers solitary, axillary, pedicellate.

1 T. alpi'na (Lin. spec. 844.) stem weak; flowers axillary, disposed into an interrupted, leafy spike. ♃. H. Native of the Alps of Jura, and the Pyrenees, Switzerland, Austria, Italy, in rough, moist places. D. C. fl. fr. 3. p. 487. Lam. ill. t. 522. Jacq. austr. 2. t. 165.—Mentz. pug. t. 9. f. 3, 4.—Mor. hist. 3. sect. 12. t. 16.—Col. ecphr. 2. p. 49. t. 50. Root formed of many scales (fig. 63. b.) Stem tetragonal, branched. The whole habit succulent and tender. Leaves roundish, bluntly notched, pale. Corollas yellow; the 3 lower segments spotted of a deeper yellow (fig. 63.)

FIG. 63.

Alpine Tozzia. Pl.

Cult. For culture and propagation see *Pediculàris*, p. 626.

Order CLXXII. CHELO'NEÆ (this order contains plants agreeing with *Chelòne* in the characters given below.) D. Don, in edinb. phil. journ. vol. 19. no. 37. July, 1835. Genera of Scrophularíneæ of authors.

Calyx 5-parted, permanent. Corolla tubular, hypogynous, irregular, deciduous; limb 5-lobed. Stamens 4, didynamous, fertile, with the rudiment of a fifth; anthers 2-celled, mutic; cells confluent at apex. Stigma undivided. Capsule 2-celled, many-seeded. Seeds erect, angular, or compressed, with membranous edges. Albumen fleshy. Embryo erect, foliaceous.—Herbs or under shrubs natives of North America. Leaves opposite. Inflorescence panicled, or spicate. This order approaches *Bignoniàceæ* and *Pedalíneæ*, but is readily distinguished from both in its many-parted calyx, undivided stigma, and erect, albuminose seeds. All the plants contained in this order are extremely showy.—This group is well entitled to be retained apart from *Scrophularíneæ*, on account of the greater degree of developement of the embryo, its compressed, winged seeds, and of the presence of a rudimentary stamen, all of which characters bring it near to *Pedalíneæ* and *Bignoniàceæ*, from which it is distinguished by its albuminous seeds.

Synopsis of the genera.

1 Pentste'mon. Seed angular.

2 Chelòne. Seed surrounded by a membranous margin.

I. PENTSTE'MON (from πεντε, *pente*, five; and στημων, *stemon*, a stamen; in reference to the 4 fertile stamens, and the one sterile.) Micheli, gen. 14. and in act. nat. cur. 8. append. 214. Schreb. gen. no. 1758. p. 808. Ait. hort. kew. 3. p. 511. Nutt. gen. amer. 2. p. 51. Chelòne, Spreng.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx 5-parted, with a distant, solitary bractea. Corolla ventricose, bilabiate. Stamens didynamous, with the rudiment of the fifth, which is usually filiform and bearded on the upper side; anthers separate, usually glabrous. Capsule ovate, 2-celled, 2-valved, many-seeded. Seeds angular.—Herbs or under shrubs, natives of North America. Leaves opposite, smooth, acuminated, entire, or serrated. Flowers paniculately racemose, purple, blue, rose-coloured, white, or pale yellow, rarely scarlet. The corolla is usually bilabiate, oblong, and tubular: the upper lip shorter, 2-lobed, and coarctate; the orifice generally pubescent; in several species the corolla appears campanulate, and with the border almost equally 5-lobed; in these the sterile filament is less conspicuous. The anthers in some species are woolly or hairy.

Sect. I. Ve'ræ (this section contains the true species of the genus.) Anthers glabrous.

§ 1. Campanula'tæ. Corolla sub-campanulate: limb almost equally 5-lobed.

1 P. crista'tum (Fras. cat. 1813. Nutt. gen. amer. 2. p. 52.) pubescent; radical leaves lanceolate, denticulated: cauline ones sessile, linear-oblong, sub-lanceolate; peduncles axillary and terminal, 1-3-flowered, very short; calyx rather hairy: segments linear lanceolate, acuminated; sterile filament subexserted, very conspicuously and crestedly bearded, as well as the orifice of the lower lip. ♃. H. Native of America, on arid, naked, argillaceous hills, from the confluence of the Teeton river and the Missouri to the mountains. P. erianthèra, Pursh, fl. amer. sept. 2. p. 737. Chelòne cristàta, Spreng. syst. 2. p. 813. Corolla large and violaceous, ventricose; border 5-lobed, spreading.

Crested Pentstemon. Fl. Aug. Sept. Clt. 1811. Pl. ½ to 1 foot.

2 P. cæru'leum (Nutt. gen. amer. 2. p. 52.) plant smooth, and glaucous; radical leaves sub-linear: cauline ones sub-lanceolate-linear, all entire and sessile, minutely pubescent on the margin; segments of the calyx lanceolate, acute; peduncles many-flowered; sterile filament short and bearded above. ♃. H. Native on the plains of the Missouri, near Fort Mandan, and the Indian towns. P. angustifòlium, Fraser, cat. 1813. Pursh, fl. amer. sept. 2. p. 738. Chelòne cærùlea, Spreng. Corollas sub-campanulate, azure blue.

Blue-flowered Pentstemon. Fl. July, Sept. Clt. 1811. Pl. 1½ foot.

3 P. a'lbidum (Nutt. gen. amer. 2. p. 53.) dwarf; leaves ovate-lanceolate, sub-serrulated, smooth, and sessile; flowers partly fascicled, axillary, and terminal; sterile filament slender, and interruptedly bearded; corolla internally smooth and partly tubular, with an almost equally 5-cleft, spreading limb; calyx downy, with linear-lanceolate segments. ♃. H. Native on the plains of the Missouri, common from the confluence of the river Platte to the mountains. P. teretiflòra, Fraser, cat. 1813. Stems rather angular. Leaves approximate. Flowers usually white.

Whitish-flowered Pentstemon. Fl. June, Sept. Clt. 1823. Pl. ½ to ¾ foot.

4 P. grandiflòrum (Fras. cat. 1813. Nutt. gen. amer. 2. p. 52.) smooth and glaucous; leaves entire: radical ones suboval: cauline stem-clasping, roundish-oval, with an abrupt point; flowers large, mostly solitary and axillary; corolla campanulate, with a 5-lobed, spreading limb; sterile filament partly pubescent at the summit. ♃. H. Native of America, on the plains of the Missouri; common from the confluence of the river Platte to the mountains; also near the prairie du chien Mississippi. P. Bradbùrii, Pursh, 2. p. 738. Chelòne Bradbùrii, Spreng. A beautiful species. Flowers variously tinged, as large as those of *Digitàlis purpùrea*, which they not unaptly resemble.

Great-flowered Pentstemon. Fl. July, Sept. Clt. 1811. Pl. 2 to 3 feet.

5 P. speciòsum (Dougl. in bot. reg. t. 1270.) glaucous, gla-

brous; leaves quite entire: radical ones spatulate: cauline ones lanceolate, sub-undulated, sessile; flowers verticillately panicled; lobes of corolla nearly equal; sterile filament quite glabrous. ♃. H. Native of North-West America, on the banks of the Spokan river. Douglas, D. Don, in Sweet, fl. gard. n. s. t. 259. Calycine segments equal, sub-imbricate. Flowers very showy, in axillary, many-flowered cymes, the whole forming a pyramidal panicle. Corolla sky blue, varying to red, about an inch long.

Showy Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 2 to 3 feet.

6 P. ACUMINA'TUM (Dougl. in bot. reg. t. 1285.) ascending, glabrous, and very glaucous; radical leaves ovate-oblong, on long petioles, quite entire, rather coriaceous: cauline leaves and bracteas cordate, acuminated, sessile, stem-clasping; fascicles of flowers on short peduncles; calycine segments acuminated, quite glabrous; corolla with a funnel-shaped tube, and an inflated throat; segments of the limb broad, retuse. ♃. H. Native of North-West America, in barren, sandy plains on the Columbia river. Corollas purple, bordered with lively blue, rivalling those of *P. speciòsum*. Radical leaves tufted. Sterile filament shorter than the tube of the corolla, pilose, and hooked at top.

Acuminated-leaved Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 1 to 1½ foot.

7 P. PU'MILUM (Nutt. in journ. acad. nat. sc. phil. vol. 7. p. 46.) puberulous, rather tufted; leaves lanceolate-linear, acute, entire; stems very short, few-flowered; flowers rather large, glabrous; calycine segments lanceolate, acuminated; sterile filament bearded at top. ♃. H. Native near the sources of the Columbia river, on the borders of the little Goddin river. Root large. Stem not more than 3-4 inches high. Flowers large.

Dwarf Pentstemon. Pl. ¼ to ½ foot.

8 P. COBÆ'A (Nutt. journ. acad. nat. sc. phil. 7. p. 182.) clothed with glandular pubescence; leaves sharply serrulated, shining: radical ones lanceolate, petiolate: cauline ones ovate: ultimate ones half stem-clasping; throat of corolla inflated, naked; calycine segments ovate; sterile filament bearded. ♃. H. Native of North America, in the sterile and denudated portions of the prairies of Red River, in calcareous soil; and of the interior of Texas. D. Don, in Sweet, fl. gard. n. s. t. 348. Hook. bot. mag. t. 3465. Peduncles 3-5-flowered, the whole forming a terminal panicle. Leaves broadish, and thick. Calyx clothed with viscid down. Corolla large, pale purple, marked more or less with red streaks.

Cobæa-flowered Pentstemon. Fl. May, Sept. Clt. 1835. Pl. 2 to 3 feet.

9 P. DIGITA'LIS (Nutt. in amer. phil. trans. n. s. vol. 5. p. 181.) quite glabrous; cauline leaves lanceolate, acuminated, repandly denticulated; calyx clammy, with acuminated reflexed segments; corolla large, subcampanulate; sterile filament bearded at top. ♃. H. Native of the Arkansas, in wet woods and prairies common. Sweet, fl. gard. t. 120. Said to be allied to *P. campanulàtum*. Leaves broad. Panicle naked. Ultimate branches and calyxes clothed with viscid down. Corolla pure white, and downy; the tube exserted; orifice inflated, subcampanulate, and terete; the upper lip a little shorter than the lower, and coarctate: the lower one 3-lobed and dilated.

Foxglove-flowered Pentstemon. Fl. June, Sept. Clt. 1824. Pl. 1½ to 2 feet.

§ 2. *Flowers appearing as if they were verticillate. Corolla bilabiate.*

10 P. TUBIFLÒRUM (Nutt. in amer. phil. trans. n. s. vol. 5. p. 181.) leaves ovate, connate, denticulated, glabrous; stem tall, nearly naked; calyx and corolla clothed with clammy down; calycine segments ovate; corolla tube-formed: limb villous inside; sterile filament bearded. ♃. H. Native of the Arkansas, in wettish prairies from Fort Smith to Red river. Radical leaves elliptic-oblong, entire, and smooth: cauline ones sinuated towards the base of the stem: lower ones oblong-ovate. The cauline leaves are so small and remote as to give the stem the appearance of being naked. Corollas pure white; the whole orifice and tube villous. This is a very beautiful species, with the flowers rather small and crowded, as if it were in verticillate clusters.

Tube-flowered Pentstemon. Pl. 2 to 3 feet.

11 P. OVA'TUM (Dougl. in. bot. mag. 2903.) flowers, stems, and peduncles, clothed with glandular hairs; leaves ovate-cordate, stem-clasping, glabrous, coarsely toothed: lower ones on long petioles; peduncles axillary, subcorymbose: upper ones short, and appearing as if they were verticillate; corolla tubular; sterile filament bearded at top, and unidentate at the base. ♃. H. Native of North-west America, among limestone rocks on the high mountains about the grand rapids of the Columbia. D. Don, in Sweet, fl. gard. n. s. t. 211. Stem tetragonal upwards. Radical leaves on long petioles. Calyx glandular. Corollas of a brilliant purple blue, glandular externally.

Ovate-leaved Pentstemon. Fl. June, Sept. Clt. 1826. Pl. 4 feet.

12 P. PRÓCERUM (Dougl. mss. Graham, in edinb. phil. journ. july, 1829. Hook. bot. mag. 2954.) stem erect, nearly simple; leaves lanceolate, quite entire: lower ones petiolate: superior ones sessile, subconnate; flowers verticillately spicate; whorles distant; segments membranaceously jagged; sterile filament toothless, bearded on the upper side at the top. ♃. H. Native of North-west America, and the Rocky Mountains. Douglas, Drummond, and Dr. Richardson. Plant glabrous. Flowers in crowded, opposite racemes, from the upper and smaller leaves, and standing so close to the stem that they seem verticillate. Corolla small, of a rich veined purple, glabrous.

Tall Pentstemon. Fl. July, Sept. Clt. 1827. Pl. 1 to 2 feet.

13 P. CONFE'RTUM (Dougl. in. bot. reg. 1260.) leaves quite entire, glabrous: radical ones spatulate, acuminated, on long petioles: superior one sessile, ovate, acuminated; peduncles axillary, short, bearing each a cyme of crowded flowers, which appear verticillate; upper floral leaves reduced to jagged or serrated bracteas; calycine segments acute, mucronate, jagged or serrated; corolla a little longer than the calyx; sterile filament bearded. ♃. H. Native of North-west America, in open places of mountainous pine forests, in dry sandy soils between the Salmon river and the Kettle falls on the Columbia river; also in the valleys of the Rocky Mountains. Stem ascending. Cauline leaves and bracteas under the peduncles, somewhat stem-clasping. Corolla tubular, subventricose, pale cream-coloured, glabrous.

Crowded-flowered Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 1 to 2 feet.

14 P. MICRA'NTHUM (Nutt. in journ. acad. nat. sc. phil. vol. 7. p. 45.) smooth; leaves linear-lanceolate, acute, half stem-clasping, quite entire; flowers small, glomerate; interruptedly and spicately panicled; corolla rather tubular, bearded inside; sterile filament minute, hardly bearded; calycine segments lanceolate, acute. ♃. H. Native of North America, among the Rocky Mountains, in the valleys near the sources of the Columbia. Stems slender. Flowers purple, very small, collected into about 3-4 clusters. Corolla tubular, a little curved, with an almost regular, 5-lobed border.

Small-flowered Pentstemon. Pl. 1 to 1½ foot.

15 P. PRUINÒSUM (Dougl. in bot. reg. t. 1280.) leaves grey: radical ones petiolate, entire, or toothed: cauline leaves tooth-

ed, sessile; superior bracteas entire; flowers verticillate; calyxes and bracteas villous; corolla glabrous, twice as long as the calyx; segments of the limb roundish, entire. ♃. H. Native of North-west America, near the Priest's Rapid, on the Columbia river. Plant pruinose. Radical leaves tufted, downy. Peduncles many-flowered, short. Corollas blue, rivalling in brilliancy those of *P. speciòsum.*

Pruinose Pentstemon. Fl. June, Sept. Clt. 1827. Pl. ½ to 1½ foot.

§ 3. *Corolla bilabiate. Upper lip of corolla compressed; the lower plaited.*

16 P. GLAU'CUM (Graham, in edinb. phil. journ. 1829. p. 348. Lindl. bot. reg. 1286.) stem smoothish; leaves all glabrous: radical ones lanceolate, petiolate, quite entire, or denticulated: cauline leaves and bracteas ovate-lanceolate, sessile, stem-clasping; panicle thyrsoid; corollas inflated, and are, as well as the calyxes, clothed with glandular down outside; sterile filament stretched out, bearded. ♃. H. Native of Arctic America. P. gràcile, Hook. bot. mag. 2945, description, but not the figure. Corollas bluish-purple, with a pale or whitish throat.

Glaucous Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 1 foot.

17 P. ATTENUA'TUM (Dougl. in bot. reg. 1295.) stem erect, pilose at top; radical leaves elliptic, acute, petiolate: superior ones ovate-oblong, stem-clasping, sessile, all quite glabrous and quite entire; panicle strict, and are, as well as the calyxes and corollas, downy; capsule glabrous; sterile filament bearded. ♃. H. Native of North-West America, on the mountains of Lewis and Clark's river. Leaves dark green: radical ones sometimes cuneated and cuspidate. Corollas cream-coloured.

Attenuated-leaved Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 1½ to 2 feet.

18 P. DEU'STUM (Dougl. in. bot. reg. 1318.) stem almost simple, ascending, glabrous; leaves deeply toothed: radical ones ovate-oblong: those near them spatulate; cauline leaves oblong, acute, sessile: upper ones almost quite entire; calyxes glabrous; limb of corolla flat, with retuse segments: upper ones the smallest. ♃. H. Native of North-west America, on scorched rocky plains in the interior. Peduncles axillary, many-flowered, the whole forming a panicle. Radical leaves on long petioles: upper cauline leaves half stem-clasping, all coarsely and unequally toothed. Corollas cream-coloured. Calyxes and corollas glabrous.

Burned Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 1 foot.

19 P. DIFFU'SUM (Dougl. in bot. reg. t. 1132.) stem branched; leaves ovate-oblong, glabrous, unequally serrated; peduncles axillary, many-flowered, the whole forming a terminal panicle; calyx turbinate, with jagged segments; sterile filament length of tube, bearded. ♃. H. Native of North-west America, in the district around the mouth of the Columbia river. Root creeping. Stems decumbent, radicant, branched, purple. Leaves evergreen. Inflorescence downy. Corolla purple, an inch long; upper lip retuse.

Diffuse Pentstemon. Fl. June, Oct. Clt. 1827. Pl. 1½ to 2 feet.

20 P. STATICIFÒLIUM (Lindl. bot. reg. 1779.) stems ascending, pubescent; radical leaves oblong-lanceolate, narrowed to the base, entire, glabrous; cauline leaves sessile, cordate-ovate, toothed, pubescent; cymes nearly sessile, tomentose; corolla ventricose, pubescent. ♃. H. Native of California. Radical leaves 7 inches long. Corolla violet, an inch long. The cymes being sessile, the flowers appear somewhat verticillate.

Statice-leaved Pentstemon. Fl. June, Oct. Clt. 1834. Pl. 2 feet.

21 P. CORDIFÒLIUM (Benth. in scroph. ind. p. 7.) stem pruinose; leaves on short petioles, broad, ovate, obtuse, quite entire, cordate at the base, bullate, nerved beneath; panicle loose; corollas tubular, deeply bilabiate; upper lip emarginate: lower one trifid; sterile filament bearded. ♃. H. Native of California, Douglas.

Heart-leaved Pentstemon. Pl. ?

22 P. TRIPHY'LLUM (Dougl. in bot. reg. 1245.) humble; leaves 3-4 in a whorl, glabrous, bluntly cut: lower ones oblong: floral ones entire, linear-lanceolate, usually alternate; peduncles 2-3-flowered, and are, as well as the calyxes, clothed with cobwebbed down; segments of corolla oblong, obtuse: those of the lower lip equal; sterile filament bearded. ♃. H. Native of North-west America, on the blue mountains, in the district watered by the river Columbia; and of Northern California. Stem branched. Flowers sparingly panicled. Calycine segments ovate, acute. Corolla ventricose at the base, pale red.

Three-leaved Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 1 to 1½ foot.

23 P. GRA'CILE (Nutt. gen. amer. 2. p. 52.) stem smooth and slender; leaves smooth, linear, acute, half stem-clasping, sharply serrulated; panicle simple, few-flowered; sterile filament bearded longitudinally; corolla smooth inside; segments of the calyx linear-oblong. ♃. H. Native of North America, from the Arikarees to Fort Mandan, in depressed soils. Hook. bot. mag. 2945. figure, but not the description. Corolla small, tubular, blue, ex bot. mag.; pale purple, ex Nutt. Radical leaves lanceolate-ovate, entire: cauline ones pungently serrulated.

Slender Pentstemon. Fl. June, Sept. Clt. 1824. Pl. 1 foot.

24 P. PUBE'SCENS (Ait. hort. kew. 2. p. 360. Sims, bot. mag. 1424.) stem pubescent; leaves repandly serrulated, lanceolate-oblong, sessile, stem-clasping; flowers in panicles; the sterile filament bearded from the summit below the middle. ♃. H. Native of North America, in the Southern States, as in Carolina and Georgia. Chelòne Pentstèmon, Lin. spec. 850. Asarìna erécta, Mill. dict. no. 2. fig. t. 252.—Mor. hist. 3. p. 417. sect. 11. t. 21. f. 2. Corollas pale purple.

Downy Pentstemon. Fl. June, Sept. Clt. 1758. Pl. 2 feet.

25 P. HIRSU'TUM (Willd. spec. 3. p. 227.) stem and leaves hairy; leaves acuminated, repandly serrulated; sterile filament long, very villous at top; orifice of the lower lip of corolla pubescent. ♃. H. Native of Virginia. P. pubéscens, β, angustifòlia, Martyn and Mill. no. 2. Chelòne hirsùta, Lin. spec. 849. Mill. dict. no. 3.—Mor. hist. 3. p. 417. sect. 11. t. 21. f. 3.—Gron. virg. 71-93. 2, 3. Flowers pale purple. Perhaps only a variety of *P. pubéscens.*

Hairy Pentstemon. Fl. Aug. Sept. Clt. 1758. Pl. 1 foot.

26 P. LÆVIGA'TUM (Ait. hort. kew. 2. p. 361. Sims, bot. mag. 1425.) glabrous; lower leaves quite entire, petiolate: the rest repandly serrulated, sessile, or half stem-clasping, lanceolate; sterile filament bearded at top; orifice of the lower lip of corolla pubescent. ♃. H. Native of North America. Chelòne Penstèmon, J. F. Mill. icon. 4. Arduin, spec. 1. p. 14. t. 5.—Mor. hist. 2. p. 479. sect. 5. t. 8. f. 6. Flowers panicled. Corollas purple.

Smooth Pentstemon. Fl. June, Sept. Clt. 1776. Pl. 1 to 2 feet.

§ 4. MEXICA'NÆ. Sometimes herbs, but usually undershrubs. Leaves lanceolate, sharply serrated. Stamens exserted. Superior filaments flat at the base, probably in all. Corollas tubular: lower lip usually bearded. Peduncles few-flowered, disposed in a terminal panicle.

27 P. PULCHE'LLUM (Lindl. bot. reg. 1138.) stems herbaceous, pubescent; leaves sessile, ovate-lanceolate, serrulated, gla-

brous; peduncles 1-2-flowered, longer than the bracteas, the whole forming a secund raceme; calyx downy, with lanceolate segments; corolla ventricose, rather pilose, glandless; palate villous; sterile filament bearded; stamens length of tube of corolla. ♃. F. Native of Mexico, between Toluca and Tianquillo, at the altitude of 1500 hexapods; and of Cuba, near the Havana. P. élegans, G. Don, in Loud. hort. brit. p. 243. Chelòne élegans, H. B. et Kunth, nov. gen. 2. p. 364. Superior leaves half stem-clasping. Corollas lilac, downy; palate spotted. This species differs from *P. campanulàtum*, in the corolla being paler, and destitute of glands.

Pretty Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 1½ foot.

28 P. RÒSEUM (G. Don, in Loud. hort. brit. p. 243.) herbaceous; leaves sessile, glabrous, ovate-lanceolate, sharply serrulated, acuminated; superior leaves broader; peduncles generally 3-flowered; superior filaments flat at the base; corollas rather hairy; lower lip of corolla bearded; sterile filament bearded at top. ♃. F. Native of Mexico. P. angustifòlium, Lindl. bot. reg. 1122. but not of Kunth. Chelòne ròsea, Cerv. mss. Sweet, fl. gard. 230. Inflorescence rather glandular. Panicle thick, many-flowered. Corolla tubular, somewhat ventricose, of a bright rose-colour, glandular, like the top of the plant.

Rosy-flowered Pentstemon. Fl. June, Sept. Clt. 1825. Pl. 1½ foot.

29 P. KU'NTHII (G. Don, in Loud. hort. brit. p. 243.) stem and leaves quite glabrous; leaves linear, sharply serrulated, spreadingly recurved; peduncles 1-2-flowered, hairy, disposed in a simple hairy panicle; calycine segments linear-lanceolate, hairy; corolla downy; lower lip densely bearded at the base; sterile filament bearded at apex. ♃. F. Native of Mexico, near Moran and Omitla, at the altitude of 1320 hexapods. Chelòne angustifòlia, H. B. et Kunth, nov. gen. amer. 2. p. 365. Leaves sessile, somewhat stem-clasping. Corolla purple. Stamens hardly exserted.

Kunth's Pentstemon. Fl. July, Sept. Clt. 1825. Pl. 2 to 4 feet.

30 P. CAMPANULA'TUM (Willd. spec. 3. p. 228.) stem and leaves glabrous, linear-lanceolate, sharply serrated; peduncles secund, disposed in a terminal panicle; calycine segments lanceolate; corollas bearded; sterile filament bearded at top. ♃. H. Native of Mexico, near Santa Rosa de La Sierra, and Los Joares, at the altitude of 1300 hexapods. Jacq. schœnbr. 3. t. 362. Sims, bot. mag. 1878. Chelòne campanulàta, Cav. icon. 1. p. 18. t. 29. Chelòne campanuloìdes, Andr. bot. rep. t. 40. Stem downy at top. Leaves glabrous. Calyx downy. Throat of corolla bearded. Corollas pale purple.

Campanulate-flowered Pentstemon. Fl. March, Oct. Clt. 1794. Pl. 1½ to 2 feet.

31 P. ATROPURPU'REUM (G. Don, in Loud. hort. brit. p. 243.) shrubby; stem rather flexuous, shining, beset with glandular pili at top; leaves sessile, sharply serrulated, glabrous: lower ones lanceolate, attenuated at both ends: superior ones ovate, acuminated, stem-clasping; peduncles axillary, usually 3-flowered; calyxes and corollas clothed with glandular pubescence; corolla bearded; sterile filaments bearded at top. ♃. H. Native of Mexico. Chelòne atropurpùrea, Sweet. fl. gard. t. 235. Flowers dark purple, the whole forming a panicle.

Dark-purple-flowered Pentstemon. Fl. July, Sept. Clt. 1825. Pl. 2 to 3 feet.

32 P. GENTIANOI'DES; stem downy at top; leaves lanceolate, quite entire, glabrous; panicle composed of 1-2-3-flowered peduncles; calycine segments ovate; corollas beardless; sterile filament glabrous. ♃. H. Native of Mexico, on Mount Toluco, at the altitude of 1750 hexapods. Chelòne gentianoìdes, H. B. et Kunth, nov. gen. amer. 2. p. 363. t. 172. Stem and branches downy. Leaves 4 inches long, and 6-8 lines broad. Corolla violaceous, downy outside; tube short; throat large; limb bilabiate; superior lip 2-lobed: lower one trifid, beardless. Anthers glabrous. Stamens inclosed.

Gentian-like Pentstemon. Fl. July, Sept. Clt. 1825. Pl. 3 to 4 feet.

SECT. II. ERIANTHE'RA (from *εριον, erion*, wool; and *ανθηρα, anthera*, an anther; the anthers are ciliated or downy, not glabrous, as in the last section.

33 P. HETEROPHY'LLUM (Lindl. bot. reg. 1899.) leaves glaucescent, quite entire: lower ones linear-lanceolate: superior ones linear; raceme twiggy; sepals ovate, acuminated; corolla ventricose, beardless; sterile stamen glabrous; anthers sagittate, fringed at top. ♃. H. Native of California, Douglas. Leaves hardly ever serrulated. Peduncles 1-2-flowered, bibracteate above the middle. Corolla bilabiate; sterile filament sub-emarginate.

Variable-leaved Pentstemon. Fl. June, Sept. Clt. 1834. Pl. 1½ to 2 feet.

34 P. GLA'BRUM (Pursh, fl. amer. sept. 2. p. 738.) very smooth; leaves sessile, ovate-lanceolate, entire, having the margins partly undulated; peduncles many-flowered, secund; segments of calyx roundish-oval, acuminated; corolla subcampanulate; sterile filament slightly bearded under the retuse apex; anthers pubescent. ♃. H. Native of North America, in arid soils near the confluence of the Shian river, and towards the sources of the Columbia river. Curt. bot. mag. 1672. P. erianthèra, Nutt. gen. amer. 2. p. 52. but not of Pursh. Flowers numerous, purple.

Glabrous Pentstemon. Fl. July, Sept. Clt. 1811. Pl. 1½ foot.

35 P. GLANDULÒSUM (Dougl. in bot. reg. 1262.) plant clothed with glandular pubescence; radical leaves ovate, coarsely toothed: cauline ones stem-clasping, acute, almost quite entire; peduncles many-flowered; calyx loose, with ovate segments; corolla ventricose; anthers ciliated; sterile filament glabrous. ♃. H. Native of North America, on the banks of the Kooskooskee river, 6300 feet above the level of the sea. Radical leaves on long petioles: cauline ones cordate-ovate. Peduncles forming a racemose panicle. Corolla large, pale rose-coloured, striped with purple inside. Anthers white. Capsule glabrous, equal in length to the calyx.

Glandular Pentstemon. Fl. June, July. Clt. 1827. Pl. 2 to 2½ feet.

36 P. VENU'STUM (Dougl. in bot. reg. 1309.) stem suffruticose, erect, glabrous; leaves sessile, ovate-lanceolate, acuminated, denticulated, glabrous; peduncles many-flowered, the whole forming a panicle; calyx glabrous; corolla ventricose, ciliated; anthers pilose; sterile filament bearded at top. ♄. H. Native of North-west America, in dry channels of rivers, among the mountains. Very nearly allied to *P. diffùsum*; but differs in the stem being more erect; in the leaves being sessile, longer, straighter; in the corolla being of a more obscure colour; in the calyx being glabrous; and in the anthers being pilose.

Graceful Pentstemon. Fl. June, Sept. Clt. 1827. Pl. 2 feet.

37 P. RICHARDSÒNII (Dougl. in bot. reg. 1121.) herbaceous; leaves sessile, pinnatifid; peduncles few-flowered; calyx clothed with glandular pubescence: with ovate-acute segments; corolla ventricose; anthers ciliated; sterile filament bearded with a few hairs at apex. ♃. H. Native of North-west America, on dry rocks in the vicinity of the Columbia. Hook. bot. mag.

3391. Plant a little branched, minutely downy. Calycine segments oblong-lanceolate. Corolla purple, nearly glabrous outside. Valves of anthers ciliated towards the apex.

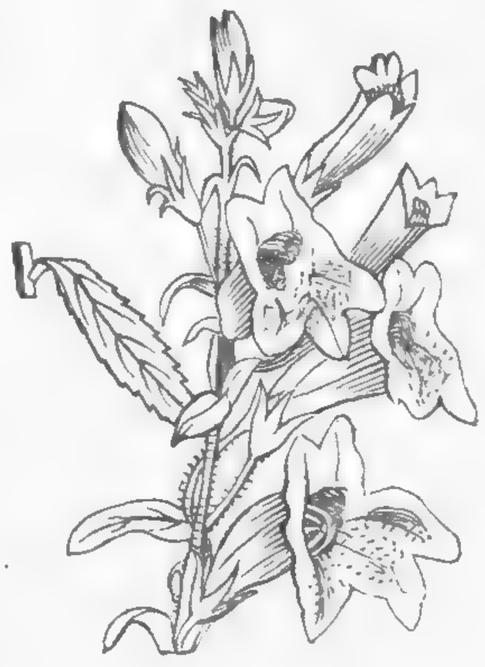
Richardson's Pentstemon. Fl. June, Sept. Clt. 1825. Pl. $1\frac{1}{2}$ foot.

38 P. DISSE'CTUM (Ell. car. 2. p. 129.) leaves opposite, sessile, compoundly dissected: the segments linear, and generally blunt; flowers in panicles. ♃. H. Native of Georgia, Louisville. Stem slightly pubescent. Corolla purple; segments of the upper lip larger than those of the lower, and more blunt. Stamens inclosed; anthers downy, or hairy. ?

Dissected-leaved Pentstemon. Pl. 2 feet.

39 P. SCOULE'RI (Dougl. in bot. reg. 1277.) suffruticose; leaves obovate-lanceolate, serrulated: upper ones quite entire; peduncles 1-flowered, racemose; calyx downy, with acuminated segments; corolla ventricose; anthers woolly. ♃. H. Native of North-west America, on the Kettle falls of the Columbia. Branchlets pilose. Corolla purple, nearly 2 inches long; palae open. Mr. Douglas considered this a species of *Chelòne* from the woolly anthers; but it has the angular seeds of *Pentstèmon*. (fig. 64.)

FIG. 64.



Scouler's Pentstemon. Fl. May, July. Clt. 1827. Shrub 2 to 3 feet.

SECT. III. GENTIANOI'DES (from *gentiana*, gentian; and *idea*, *like;* habit of species.) Sterile filament glabrous. Anthers glabrous. Leaves narrow, entire, glaucous: radical ones crowded. Flowers panicled.

40 P. HUMBÓLDTII; stems simple, downy; leaves linear, quite entire, glabrous; peduncles 2-flowered, disposed in a panicle; calycine segments roundish-ovate, acute; corollas beardless; sterile filament glabrous. ♃. H. Native of Mexico, in mountain places between Puerto de Varientos and Santa Rosa, at the altitude of 1350 hexapods. Chelòne imbérbis, H. B. et Kunth, nov. gen. amer. 2. p. 363. Leaves bluntish, 2-3 inches long, and $1\frac{1}{2}$ to 2 lines broad. Calyx downy. Corollas similar to those of *P. barbàtum*, but smaller and beardless. Stamens exserted.

Humboldt's Pentstemon. Pl. 1 to $1\frac{1}{2}$ foot.

41 P. BARBA'TUM (Nutt. gen. amer. 2. p. 51.) glaucous, glabrous; stems branched; leaves connate, sessile, linear-lanceolate, quite entire, very long, channelled: radical ones crowded, spatulate; peduncles axillary, opposite, 2-flowered: the whole forming a panicle; limb of calyx scarious; corolla bearded on the lower lip with yellow hairs. ♃. H. Native of Mexico. Chelòne barbàta, Cav. 3. p. 22. t. 242. Ker. bot. reg. t. 116. Chelòne ruelloìdes, Andr. bot. reg. t. 34. Corollas showy, scarlet outside, and white inside, drooping. Sterile filament glabrous.

Bearded-flowered Pentstemon. Fl. June, Sept. Clt. 1794. Pl. 4 to 5 feet.

42 P. CENTRANTHIFÒLIUM (Benth. scroph. ind. p. 7.) glabrous, glaucous; leaves ovate-lanceolate, quite entire, cordately stem-clasping at the base; peduncles axillary, many-flowered, disposed in an elongated, terminal panicle; corolla tubular, pendulous, glabrous; throat naked; limb almost equally 5-parted; sterile filament beardless. ♃. H. Native of California. Corolla scarlet. Chelòne centranthifòlia, Benth. in hort. trans. ser. 2d. vol. 1. p. 481. Lindl. bot. reg. t. 1737.

Centranthus-leaved Pentstemon. Fl. July, Nov. Clt. 1832. Pl. 3 to 7 feet.

Cult. The species of *Pentstèmon* are amongst the most showy border flowers we possess in our gardens. They grow best in light rich soil, and are readily increased by divisions and cuttings. They are rather tender, being usually killed by severe frosts or damp in winter, if allowed to remain in the open air; it is therefore safest to keep a few plants of each species in pots, so that they may be readily sheltered by placing them under a frame in winter.

II. CHELO'NE (from χελωνη, *chelone*, a tortoise; the back of the upper lip of the corolla is compared to a tortoise.) Dill. gen. p. 11. Lin. gen. no. 748. Schreb. gen. no. 1005. Juss. gen. 137. ed. Usteri, p. 153. Gærtn. fruct. 1. p. 256. t. 54.—Anónymos, Gron. virg. 71, 72. Act. par. 1706. t. 3. p. 87. Pentstèmon species of authors.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx 5-parted, tribracteate. Corolla ringent, ventricose: upper lip emarginate: lower one trifid, sterile. Stamens didynamous, with a sterile filament, which is shorter than the rest; anthers woolly. Capsule 2-celled, 2-valved. Seeds surrounded by a membranous margin. —Herbaceous plants, with opposite leaves; flowers imbricately spiked, terminal. Lower lip of corolla internally bearded. Capsule oval.

1 C. GLA'BRA (Lin. spec. 849.) leaves lanceolate-oblong, acuminated, serrated, nearly sessile, glabrous. ♃. H. Native of the United States.—Trew, ehrh. t. 83. C. glàbra, var. álba, Pursh, fl. amer. sept. 2. p. 427. Corollas white.

Var. β, *lanceolàta* (Nutt. gen. amer. 2. p. 51.) leaves lanceolate, conspicuously acuminated, serrated, sessile, downy beneath; bracteas scarcely dilated; segments of calyx oblong. ♃. H. Probably a distinct species according to Nuttal.

Glabrous Chelone. Fl. Aug. Oct. Clt. 1730. Pl. 2 to 3 feet.

2 C. OBLI'QUA (Lin. syst. 553.) leaves petiolate, oblique, lanceolate. ♃. H. Native of North America, in the Southern States. Ker. bot. reg. 175. A. glàbra, β, Lin. spec. 849. C. glàbra, β, purpùrea, Michx. fl. bor. amer. 2. p. 24. C. purpùrea, Mill. dict. no. 2. fig. t. 93. Digitàlis mariàna, Ray, suppl. 397. Plenk. mant. t. 348. f. 4. Corollas purple.

Oblique Chelone. Fl. Aug. Oct. Clt. 1752. Pl. 2 to 4 feet.

3 C. LYÒNI (Pursh, fl. amer. sept. 2. p. 737.) glabrous, branched; leaves petiolate, cordate-ovate, serrated; spikes terminal, with the flowers clustered. ♃. H. Native of North Carolina, near Wilmington; and of Georgia. C. màjor, Sims, bot. mag. 1864. Flowers purple. (fig. 65.)

FIG. 65.

Lyon's Chelone. Fl. July, Sept. Clt. 1812. Pl. 3 to 4 feet.

4 C. LATIFÒLIA (Muhl, cat. ex Ell. car. 2. p. 127.) glabrous; leaves wide-ovate, or oval, serrated, abruptly acuminated, tapering at the base, petiolate; sterile filament bearded near the summit. ♃. H. Native of Carolina. Chelòne Pentstèmon, Walt. car. p. 172. Corollas pale purple.

Broad-leaved Chelone. Pl. 1 to 2 feet.

5 C. NEMORÒSA (Dougl. in bot. reg. 1211.) branched, glabrous; leaves ovate, acuminated, serrated: superior ones stem-clasping, cordate; peduncles 3-flowered, downy; calycine segments and bracteas subulate, and are, as well as the corolla, rather downy. ♃. H. Native of North-west America, in mountain woods, near springs and rivulets. Corolla ventricose, of a rosy purple colour; anthers woolly. Habit of a species of *Pentstèmon*.

Grove Chelone. Fl. July, Sept. Clt. 1827. Pl. 1 foot.

Cult. The species of *Chelòne* are extremely handsome border flowers; they grow in any common garden soil, but prefer peat, and are readily increased by dividing at the root.

ORDER CLXXIII. SIBTHORPIA'CEÆ (this order contains plants agreeing with *Sibthórpia* in the characters given below.) D. Don, in edinb. phil. journ. vol. 19. no. 37. July, 1835.—Scrophularíneæ genera of authors.

Calyx 4-8-parted, permanent. Corolla rotate, 4-8-cleft, regular, deciduous, imbricate in æstivation. Stamens 4-8, equal, alternating with the lobes of the corolla; anthers 2-celled; cells parallel. Style one; stigma capitate, undivided. Capsule 2-celled, 2-valved, many-seeded; placenta large, spongy, globose. Seeds erect; testa membranous; albumen copious, dense, fleshy. Embryo terete, erect, inclosed. Radicle long, cylindrical, obtuse, contrary to the umbilicus, centripetal.—Herbs, with alternate undivided leaves, and axillary, solitary, pedunculate flowers. This small family is intermediate between *Scrophularíneæ* and *Primulàceæ;* and is distinguished from the first by the regular symmetrical flowers, and globose placenta; and from the last, in the stamens being alternate with the lobes of the corolla, not opposite them, and in the 2-celled capsule.

Synopsis of the genera.

1 SIBTHÓRPIA. Corolla rotate, 5-cleft. Stamens 4-5.

2 DISA'NDRA. Corolla rotate, 6-8-cleft. Stamens 7.

3 CAPRA'RIA. Corolla campanulate, 5-parted. Stamens 4, subdidynamous.

4 XUARE'ZIA. Corolla campanulate, 5-parted. Stamens 5, equal.

5 LEUCÓSPORA. Corolla tubular, hardly campanulate, 4-cleft: upper lobe emarginate. Stamens 4, subdidynamous. Capsule at length 1-celled.

6 SCOPA'RIA. Corolla rotate, 4-cleft. Stamens 4, equal.

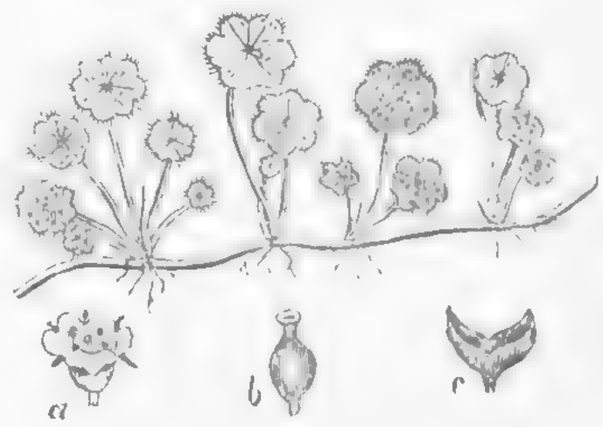
7 ROMANZÒVIA. Corolla salver-shaped, 5-cleft. Stamens 5, equal.

I. SIBTHO'RPIA (so named after Humphry Sibthorp, M.D., formerly professor of botany at Oxford, successor to Dillenius. His son, Professor John Sibthorp, who travelled in Greece, collected all the treasures now in the course of publication in that splendid work entitled "Flora Græca," and author of "Flora Oxoniensis.") Lin. gen. 775. Schreb. gen. no. 1038. Gærtn. fruct. 55. Juss. gen. 99. ed. Usteri, p. 111. Lam. ill. t. 535. f. 3. H. B. et Kunth, nov. gen. amer. 2. p. 390.

LIN. SYST. *Tetra-Pentándria, Monogýnia.* Calyx 5-parted. Corolla sub-rotate, 5-lobed. Stamens 4-5, nearly equal. Stigma capitate. Capsule sub-orbicular, compressed, dehiscing at top.—Small, creeping, rooting, tufted herbs, with small, alternate, reniform leaves, and axillary, solitary, pedicellate, inconspicuous flowers.

1 S. EUROPÆ'A (Lin. spec. p. 880.) plant hairy, creeping; leaves on long petioles, reniform, 7-9-lobed; flowers tetrandrous, somewhat didynamous. ♃. H. Native of the South of Europe, as of Portugal, Spain, West of France, &c., in shady places about springs; in England, as in Devonshire and Cornwall plentiful; and about Longledale in Westmoreland. Smith, engl. bot. 649. S. prostràta, Salisb. icon. 11. t. 6.—Plukn. phyt. t. 7. f. 6.—Petiv. brit. t. 6. f. 11. Calyx hispid. Corolla pale yellow, with a purplish tinge on the 3 upper segments. Seeds plano-convex, or sub-angular, brown. (fig. 66.)

FIG. 66.



European Sibthorpia. Fl. June, Sept. Britain. Pl. creeping.

2 S. PICHINCHE'NSIS (H. B. et Kunth, nov. gen. amer. 2. p. 390. t. 176.) plant hispid, creeping; leaves on long petioles, reniform, 7-9-lobed: lobes obtuse; flowers pentandrous. ♃. F. Native on the burning mount of Pichinca, in rugged places between the plains of Verdecuchu and Chorro de Cantuna, at the altitude of 1800 hexapods. Flowers purple. Seeds very minute. Habit of *S. Europæ'a.*

Pichincha Sibthorpia. Pl. creeping.

3 S. RETU'SA (H. B. et Kunth, l. c. p. 391. t. 177.) plant hispid, creeping; leaves on long petioles, reniform, many-lobed: lobes retuse; flowers pentandrous. ♃. F. Native of New Spain, near Tiangillo, at the altitude of 1500 hexapods. Leaves twice or three times the size of those of *S. Europæ'a.* Flowers double the size of those of *S. Pichinchénsis,* purplish violet.

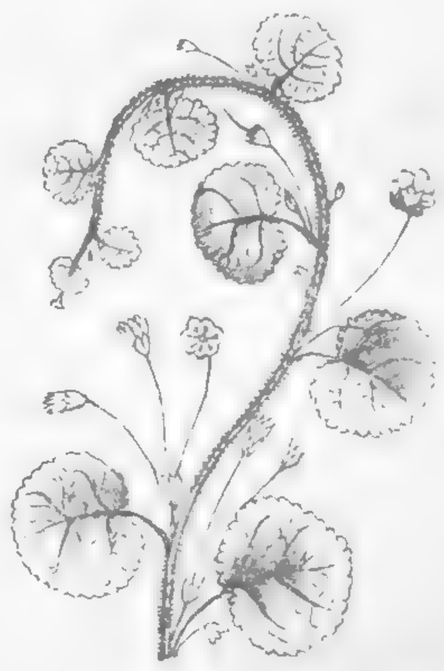
Retuse-lobed Sibthorpia. Pl. creeping.

Cult. Sibthórpia is a genus of singular plants, but of no beauty; they are, therefore, only grown in botanic gardens, or those of the curious. They succeed best in peat soil and moist situations, and are readily increased by division. *S. Pichinchénsis* and *S. retùsa* require protection from frost in winter.

II. DISA'NDRA (from δις, *dis,* twice; and ανηρ ανδρος, *aner andros,* a male; in reference to the stamens being sometimes 4 and sometimes 8, therefore often double the common number 4.) Lin. syst. 352. Schreb. gen. no. 627. Juss. gen. 99. ed. Usteri. p. 111. Lam. ill. t. 275. f. 2. Sibthórpia species, Lin.

LIN. SYST. *Pénta-Octándria, Monogýnia.* Calyx 5-8-parted. Corolla rotate, 5-8-lobed. Stamens 5-8. Stigma simple. Capsule ovate. Seeds ovate.—Herbs with the habit of *Sibthórpia.* The number of floral parts are variable, but usually 7.

FIG. 67.



1 D. PROSTRA'TA (Lin. syst. 352.) prostrate, pubescent; leaves reniform, crenated; pedicels twin. ♃. G. Native of Madeira. Curt. bot. mag. 218. Sibthórpia peregrìna, Lin. spec. p. 880. amœn. 3. p. 20.—

Plukn. phyt. 257. f. 5. Leaves on long petioles, resembling those of Ground-ivy. Pedicels usually twin, but sometimes solitary and by threes. Corollas yellow. (fig. 67.)

Prostrate Disandra. Fl. May, Aug. Clt. 1771. Pl. pros.

2 D. Africa'na (Lin. syst. ed. Reich. p. 137.) prostrate, pubescent; leaves orbicular, crenated; pedicels solitary. ♃. G. Native of the North of Africa. Sibthórpia Africàna, Lin. spec. 880. amœn. 3. p. 22.—Shaw. afr. f. 149.

African Disandra. Pl. prostrate.

Cult. A light rich soil is the best for the species of *Disàndra*, and they are readily increased by division.

III. CAPRA'RIA (from *caper*, a goat; goat-weed.) Lin. gen. no. 768. Schreb. gen. no. 1030. Gærtn. fruct. 1. p. 250. t. 53. Juss. gen. p. 118. ed. Usteri. p. 133. Lam. ill. t. 534. f. 2. H. B. et Kunth, nov. gen. 2. p. 354.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, equal. Corolla campanulate, with a short tube, and a 5-cleft, nearly equal limb. Stamens 4, nearly equal, inclosed. Stigma capitate, 2-lobed, ex Bonpl. Capsule ovate, compressed; valves bifid.—Annual herbs, with alternate leaves, and axillary pedicellate flowers.

1 C. biflòra (Lin. spec. 875.) branches pilose; leaves oblong, serrated, narrowed and quite entire at the base, ciliated, smoothish; pedicels twin, elongated, capillary, pilose. ⊙.? S. Native of the warmer parts of America, common. Jacq. amer. 182. t. 115. pict. 90. t. 174. Swartz. obs. 239. Lam. ill. 534. f. 2. C. Curassávica, Herm. par. t. 110.—Comm. hort. 1. p. 79. t. 40.—Plukn. alm. 237. t. 98. f. 4. Feuill. per. 1. p. 764. t. 48. Corollas white. Pedicels solitary, or twin, rarely by threes.

Two-flowered Goatweed. Fl. July, Aug. Clt. 1752. Pl. 2 to 4 feet.

2 C. hirsu'ta (H. B. et Kunth, nov. gen. amer. 2. p. 355.) branches hairy; leaves oblong, serrated, cuneated at the base, and quite entire, hairy; pedicels twin, short, hairy. ⊙.? S. Native of Mexico, between La Venta del Exido and Acapulco, at the altitude of 200 hexapods, and elsewhere. Corolla white; lower segments marked by a pilose red spot. Very like the preceding, but the flowers are smaller, pedicels shorter, &c.

Hairy Goatweed. Pl. 1 to 2 feet.

3 C. semi-serra'ta (Vahl, eclog. 2. p. 47.) branches hairy; leaves lanceolate, serrated from the top to the middle; peduncles 1-4-flowered, solitary.? ⊙.? S. Native of the Island of St. Martha. Leaves 2-3 inches long, quite entire at the base. Calycine segments subulate. Corolla with a villous throat, and linear, oblong segments. Stigma capitate. Capsule oblong. Placenta linear, free.

Half-serrated-leaved Goatweed. Pl. 1 to 2 feet.

4 C. saxifragifòlia (Cham. et Schlecht, in Linnæa, 5. p. 105.) plant branched, hairy; leaves spatulately obovate, cuneated, doubly and deeply serrated, rather pilose; peduncles almost solitary, short, hairy. ⊙.? S. Native of Mexico, near Vera Cruz. Said to be allied to *C. hirsùta*.

Saxifrage-leaved Capraria. Pl. 1 to 2 feet.?

† *A species hardly known.*

5 C.? hu'milis (Ait. hort. kew. 2. p. 354.) pubescent; leaves opposite, or 3 in a whorl, ovate serrated, petiolate; peduncles axillary, shorter than the petioles. ⊙. S. Native of the East Indies.

Dwarf Capraria. Fl. July, Aug. Clt. 1781. Pl. ½ to 1 foot.

Cult. The seeds of the species of *Caprària* require to be reared on a hot bed in spring, and when the plants are of sufficient size, they require to be planted in separate pots, and placed in the greenhouse or stove; and some of them may be set out in the open ground in a warm, sheltered situation.

IV. XUARE'ZIA (named after Caspar Xuarez, a Spanish botanist, who has written a work on the plants of Italy.) Ruiz. et Pav. prod. p. 24. t. 4. fl. per. 2. p. 123. f. a. Pers. ench. 1. p. 176. H. B. et Kunth, nov. gen. 2. p 355.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-parted. Corolla sub-campanulate, with a very short tube, and a 5-parted, equal limb. Stamens 5, equal. Stigma bilamellate. Capsule oblong, obtuse, rather compressed; valves bifid; placenta central, at length free.—A shrub with alternate, entire leaves; and axillary, twin, white, pedicellate flowers.

1 X. biflòra (Ruiz. et Pav. l. c.) ♄. G. Native of Peru and the neighbouring parts of South America. Caprària Peruviàna, Feuill. per. 2. p. 764. t. 48. Shrub much branched, glabrous. Leaves lanceolate, remotely serrated, narrowed into the petioles, and quite entire at the base. Corolla small, whitish yellow, campanulately rotate. Called Tea in Peru.

Two-flowered Xuarezia. Shrub 4 to 6 feet.

Cult. A light rich soil will suit this plant, and cuttings are readily rooted.

V. LEUCO'SPORA (from λευκος, *leucos*, white; and σπορα, *spora*, a seed; seeds white.) Nutt. journ. acad. nat. sc. phil. 7. p. 87. Caprària multífida, Michx.

Lin. syst. *Tetrándria, Monogýnia.* Calyx 5-parted. Corolla tubular, hardly campanulate, obtuse, 4-cleft: upper segment emarginate. Stamens 4, nearly equal. Capsule 1-celled, at length 4-valved, many-seeded.—An annual, erect, viscid herb. Leaves 3 in a whorl, trifid. Flowers solitary, axillary. Said by Nuttall to be nearly allied to *Gratìola*.

1 L. multi'fida (Nutt. l. c.) ⊙. H. Native of North America, on the banks of the large western streams; Ohio, Mississippi, Missouri, and Arkansas. Caprària multifida, Michx. fl. bor. amer. 2. p. 22. t. 23. Leaves lyrate, partly twice trifid; the segments linear, oblong, and blunt. Capsule ovate; placenta central, narrow, and almost columnar. Seeds white, diaphanous. Flowers pale red, and very fugaceous.

Multifid-leaved Leucospora. Pl. ½ foot.

Cult. For culture and propagation see *Caprària*, p. 642.

VI. SCOPA'RIA (from *scopa*, a broom; to which use it is adapted.) Lin. gen. no. 143. Schreb. gen. 187. Gærtn. fruct. 1. p. 251. t. 53. Juss. gen. p. 118. ed. Usteri. p. 132. R. Br. prod. p. 443. H. B. et Kunth, nov. gen. amer. 2. p. 354. Cham. et Schlecht, in Linnæa, 2. p. 603.

Lin. syst. *Tetrándria, Monogýnia.* Calyx 4-5-parted, equal; segments usually 3-nerved. Corolla rotate, 4-cleft, regular; throat girded by a crown of hairs. Stamens 4, equal. Stigma obtuse. Capsule 2-valved, with a septicidal dehiscence; valves semi-bifid; placenta central, large, bipartible, at length free.—Glabrous herbs or under shrubs. Leaves dotted, opposite, or 3 in a whorl. Peduncles axillary, 1-flowered. Calyx bractless. Corollas small, white.

§ 1. *Calyx 4-cleft.*

1 S. du'lcis (Lin. spec. 168.) leaves ovate-lanceolate, deeply serrated, tapering into the petioles. ⊙. S. Native of every part within the tropics, common, particularly near the sea.—Plukn. phyt. t. 215. f. 1.—Herm. par. 241. f. 241.—Sloan. jam. 1. p. 195. t. 108. f. 2.—Tupeicavi, Pis. bras. 246. Corollas small, white; the segments have bearded threads on their

edges. The French call the plant *Balai doux*, or *Sweet Besom;* the Spaniards *Escobilla menuda*, or *Little Besom*. An infusion of it is used for disorders of the breast. According to Browne it may be considered as an excellent vulnerary. Leaves and branches usually 3 in a whorl.

Var. β, procúmbens; leaves in fours; flowers nearly sessile. ⊙. S. Native of New Spain. S. procúmbens, Lin. spec. 168. Stems procumbent. Leaves narrower.

Var. γ, arbòrea; leaves lanceolate, alternate, quite entire; corymbs compound, trichotomous. ♄. G. Native of the Cape of Good Hope. S. arbòrea, Lin. syst. 157. Thunb. prod. 29. Willd. spec. 1. p. 653. This is surely a species *Freylínia*.

Sweet Scoparia. Fl. June, Sept. Clt. 1730. Pl. 1 to 3 feet.

§ 2. *Calyx 5-cleft.*

2 S. fla'va (Cham. et Schlecht, in Linnæa, 2. p. 603.) leaves lanceolate, tapering into the petioles, toothed; peduncles glabrous; calycine segments acute, with pellucid edges. ♃. F. Native of Brazil, in the province of Cisplatin, Sello. Microcarpæ'a Montevidénsis, Spreng. syst. 1. p. 42. Corollas pale yellow. Leaves and branches 4 in a whorl.

Yellow-flowered Scoparia. Pl. ½ to 1½ foot.

3 S. erica'cea (Cham. et Schlecht, l. c. p. 604.) shrubby; leaves linear, quite entire; peduncles pubescent; calycine segments acute, with pellucid margins. ♄. G. Native of the South of Brazil, Sello. Shrub much branched, glabrous. Leaves opposite, on tetragonal branches; 3 in a whorl, on hexagonal branches; and 4 in a whorl, on polygonal branches.

Heath-like Scoparia. Shrub 1 to 2 feet.

4 S. plebe'ia (Cham. et Schlecht, l. c. p. 605.) leaves nearly linear, a little toothed; peduncles glabrous; calycine segments acute, a little ciliated. ⊙. S. Native of the South of Brazil, Sello. Branches hexagonal. Leaves 3 in a whorl.

Plebeian Scoparia. Pl. 1 to 1½ foot.

5 S. elli'ptica (Cham. et Schlecht, in Linnæa, 8. p. 21.) angles of branches winged a little; peduncles, calyxes, nerves, and margins of leaves pilose; leaves elliptic, coarsely serrated in front; calycine segments acute, with pellucid edges, and finely ciliated towards the apex. ⊙. S. Native of Brazil, Sello. Primary stems and branches tetragonal; branchlets pentagonal, or hexagonal. Leaves nearly sessile, opposite, or 3 in a whorl. Corolla exceeding the calyx a little, longer than those of *S. dùlcis*.

Elliptic-leaved Scoparia. Pl. 1 to 1½ foot. ?

6 S. multi'fida (Cham. et Schlecht, l. c. 8. p. 22.) leaves linear, pinnatifid; peduncles glabrous; calycine segments unequal, acutish, with pellucid edges; corolla twice the length of the calyx. ♄. S. Native of Brazil, Sello. Leaves opposite, or 3-4 in a whorl.

Multifid-leaved Scoparia. Shrub ½ to 1 foot.

Cult. For culture and propagation of annual species see *Caprària*, p. 642. and of the shrubby species see *Xuarèzia*, p. 642.

VII. ROMANZO'FFIA (named in honour of Count Romanzoff, at whose expence the voyage of Kotzebue round the world was undertaken.) Cham. hor. phys. berol. p. 71. t. 14. Linnæa, 1. p. 547. 2. p. 607.

Lin. syst. *Pentándria, Monogýnia.* Calyx 5-cleft, permanent. Corolla salver-shaped, deciduous. Stamens 5, inserted in the bottom of the tube of the corolla. Stigma capitate, simple. Capsule ovate, obtuse, 2-valved, many-seeded; dissepiment contrary to the valves. Seeds obovate, angular.—Fleshy, pilose herbs, with alternate leaves. Root præmorse, fibrous. Stems many, usually simple. Radical leaves roundish-reniform, cordate, many-lobed, or crenated; cauline leaves few, similar to the radical ones. Flowers white, bractless, marked with veins, racemose; raceme secund, revolute at top.

1 R. Unalasche'nsis (Cham. l. c.) radical leaves on long petioles, reniformly-cordate, many-lobed, or crenated, pilose; petioles channelled, pilose; stem usually simple, tufted, few-leaved; flowers racemose. ♃. H. Native of the Island of Unalascha, in valleys, growing in the fissures of rocks. Saxífraga nùtans, D. Don, in Lin. trans. 13. no. 2. Saxífraga secúnda, Willd. herb. no. 8408. Calycine segments lanceolate, bluntish. Lobes of corolla equal, roundish. Filaments capillary; anthers 2-celled, incumbent. Placentas 4, linear, 2 in each cell, adnate longitudinally to the dissepiment along the axis. Seeds numerous, minute, angular, scrobiculate. Albumen cartilaginous. Embryo in the axis of the seed, cylindrical, erect.

Unalascha Romanzoffia. Pl. ¼ to ½ foot.

2 R. Sitche'nsis (Bongard, mem. acad. imp. st. petersb. 2. p. 156.) radical leaves on long petioles, roundish-reniform, coarsely-toothed, glabrous, rarely furnished with a few hairs; petioles glabrous, or pilose dilated; stems tufted, simple, or dichotomous, furnished with 1-2 leaves, similar to the radical ones; flowers racemose. ♃. H. Native of the Island of Sitcha. Plant a span high. Petioles dilated at the base, 2-4 inches long. Calycine segments lanceolate. Corollas largish, 5-cleft, rarely 4-cleft. Stamens 4-5, alternating with the lobes of the corolla. Stigma 2-lobed.

Sitcha Romanzoffia. Pl. ½ to ¾ foot.

Cult. Should any of these plants ever be introduced to our gardens, we would recommend their being grown in pots in a mixture of peat soil and sand.

Order CLXXIV. GESNERIA'CEÆ (this order agrees with *Gesnéria* in the characters given below.) Gesnèreæ, Richard. et Juss. in ann. mus. 5. p. 427. H. B. et Kunth, nov. gen. amer. 2. p. 392. Mart. nov. gen. 3. p. 68. Cyrtandràceæ, Jack. in Lin. trans. 14. p. 23. Didymocárpeæ, D. Don, prod. fl. nep. p. 122.

Calyx 5-cleft. Corolla oblique; tube drawn out behind and in front above, or tubular at the base; limb 5-cleft, sub-bilabiate. Stamens 4, didynamous, with usually the rudiment of a fifth, alternating with the divisions of the corolla: the upper one or more of them abortive. Anthers distinct, cohering by pairs, or altogether. Ovarium 1-celled; placentas 2, parietal, bilamellate. Fruit capsular or baccate, silique-formed, or round. Seeds numerous, hanging by long funicles, or erect. Albumen copious or wanting. Embryo straight, slender.—Herbs or shrubs, usually tuberescent at the base. Leaves opposite or verticillate, rarely alternate, thickish, entire. Inflorescence cymose, rarely racemose. Down or hairs simple. Cymes axillary or racemose, from the flowers being axillary and solitary. Corollas beautiful, of various colouring, scarlet, violet, blue, lilac, rose-coloured, green, cream-coloured, and white; of one colour or spotted, or marked with other colours. Roots usually tuberous. Stems erect, decumbent or parasitical, and climbing on trees. Leaves entire or quite entire, thickish, green above, but often purple or reddish beneath. Leaves emollient.

Synopsis of the genera.

Tribe I.

Gesnerie'æ. Calyx usually adhering to the ovarium at the

base; the ovarium is therefore half inferior. Seeds albuminous.

Subtribe I.

Gloxinie'æ. Calyx adnate to the ovarium. Corolla half inferior, perigynous.

1 Trevera'nia. Ring round the ovarium entire. Corolla oblique; limb spreading.

2 Gesne'ria. Glands around the ovarium free. Corolla straightish, tubular, furnished with 5 gibbosities at the base.

3 Gloxi'nia. Glands as in *Gesnèria*. Corolla very oblique, campanulately ringent, with only one gibbosity at the base.

Subtribe II.

Conradie'æ. Calyx adnate to the ovarium. Corolla superior. Leaves alternate or scattered.

4 Rytidoca'rpum. Epigynous ring thick and sinuated. Leaves stipulate.

5 Conra'dia. Ring or glands scarcely present.

Subtribe III.

Beslerie'æ. Calyx free. Corolla inferior.

6 Sarmie'nta. Fruit baccate. Ring hypogynous. Stamens 4, 2 hind ones perfect: front ones abortive.

7 Besle'ria. Fruit baccate. Ring hypogynous. Stamens 4, all perfect, with a chaff-formed rudiment of a fifth.

8 Hypocy'rta. Fruit baccate. Glands hypogynous. Anthers connected. Corolla tubular, ventricose in front.

9 Colu'mnea. Fruit baccate. Glands hypogynous. Anthers connected. Corolla tubular, ringent: hind lip arched.

10 Mitra'ria. Fruit baccate. Glands hypogynous. Anthers free. Bracteas mitre-formed.

11 Drymònia. Fruit capsular. Rudiment of a fifth stamen wanting. Corolla very oblique, campanulately ringent; throat ample.

12 Klu'gia. Fruit capsular. Rudiment of a fifth stamen wanting. Stigma capitately truncate. Corolla tubular, ringent.

13 Tapi'na. Fruit capsular. Rudiment of a fifth stamen present. Corolla very oblique, campanulately ringent, with a constricted throat.

14 Nemata'nthus. All as in *Tupìna;* except that the corolla is campanulate, and its limb nearly equal and spreading.

15 Allople'ctus. Fruit capsular. Rudiment of a fifth stamen present. Corolla straightish, club-shaped or funnel-shaped. Stigma capitately funnel-shaped.

16 Epi'scia. All as in *Alloplèctus;* except that the corolla is tubularly funnel-shaped, and the stigma 2-lobed.

Tribe II.

Cystandra'ceæ. Ovarium wholly superior. Seeds exalbuminous.

Subtribe I.

Trichospòreæ. Capsule silique-formed, terete. Seeds pendulous, expanded at both ends, or only at the apex or base into a setaceous or membranous wing.

17 Tromsdórffia. Calyx tubular, somewhat 5-cleft. Stamens 4, 2 of which are sometimes sterile, inclosed. Stigma sub-bilamellate. Seeds furnished with a membranous wing at the base.

18 Æschyna'nthus. Calyx ventricose, tubular, 5-cleft. Stamens 4, fertile, exserted, with the rudiment of a fifth, inclosed. Stigma somewhat funnel-shaped. Seeds drawn out into a bristle-formed tail at both ends.

19 Lysionòtis. Calyx deeply 5-cleft, or 5-parted. Stigma capitate. Anthers, capsule, and seeds as in *Æschynánthus.*

20 Agalmy'la. Calyx 5-parted. Stamens 5, 2 or 4 of which are fertile, and exserted. Stigma bilamellate. Capsule and seeds as in *Æschynánthus.*

Subtribe II.

Didymoca'rpeæ. Capsule silique-formed. Seeds pendulous, minute, naked.

21 Streptoca'rpus. Calyx 5-cleft. Corolla tubularly funnel-shaped; limb 5-lobed, nearly equal, oblique. Stamens 4, 2 front ones fertile; and the other 2 tubercle-formed and sterile. Valves of capsule twisted. Stigma 2-lobed. Seeds minute, naked.

22 Didymoca'rpus. Calyx campanulate, bluntly 5-toothed, or 5-lobed. Corolla tubular; limb spreading. Stamens 4, rarely 5, inclosed, 2 or 4 of which are antheriferous. Cells of anthers divaricate. Stigma obtuse, or simple. Seeds subulate, or roundish.

23 Chira'ta. Calyx 5-cleft, inflated, 5-angled. Corolla funnel-shaped; limb bilabiate. Stamens 5, inclosed, 2 lower ones fertile; anthers reniform, 1-celled. Stigma funnel-shaped, 2-lobed. Seeds subulate, acute at both ends.

Subtribe III.

Cyrta'ndreæ. Fruit baccate. Seeds pendulous, naked.

24 Cyrta'ndra. Calyx tubular, 5-cleft. Stamens 5, 3 of them sterile. Cells of anthers parallel. Stigma capitate, sometimes emarginate. Berry a little longer than the calyx.

25 Whi'tia. Calyx small, 5-parted. Stamens as in *Cyrtándra*, but exserted; cells of anthers unequal in insertion. Stigma somewhat funnel-shaped. Berry much longer than the calyx.

26 Rhynchote'cum. Calyx 5-cleft. Stamens 4, fertile, inclosed; anthers 1-celled. Stigma obtuse. Berry globose, inclosed.

27 Loxo'nia. Calyx tubular, 5-cleft. Stamens 4, fertile, inclosed; anthers sagittate. Stigma bilamellate. Berry oblong, nclosed.

28 Centro'nia. Calyx spathaceous, cleft. Stamens 4, fertile, inclosed; anthers 1-celled, spurred at the base. Stigma capitate. Berry longer than the calyx.

29 Uta'nia. Calyx 5-cleft. Stamens 5, fertile, exserted; anthers incumbent, bifid at base. Stigma capitate. Berry ovate, longer than the calyx.

30 Fie'ldia. Calyx 5-parted, inclosed in a spath-formed bractea, which is cleft on one side. Corolla tubularly ventricose; limb equal, 5-lobed, sub-bilabiate. Stamens 5, 4 fertile exserted, and sterile one inclosed. Stigma bilamellate. Berry spongy, longer than the calyx. ?

Subtribe IV.

Loxotie'æ. Capsule 2-valved, or circumcised. Seeds erect, naked.

§ 1. *Capsule 2-valved.*

31 Loxòtis. Calyx tubular, 5-cleft. Corolla tubular; limb short, bilabiate. Stamens 2, fertile; sterile ones none, or very minute. Capsule 2-valved.

32 Glossa'nthus. Calyx tubular, 5-cleft. Corolla tubular; limb bilabiate: upper lip very short: lower one large, convex. ? Stamens 4, fertile. Capsule 2-valved.

33 Platyste'mma. Calyx ovate, 5-cleft. Corolla rotately bilabiate, 5-cleft, without any tube. Stamens 4, very short, equal; anther 1-celled. Stigma capitate, entire. Ovarium roundish-ovate, 2-celled.

34 Ouri'sia. Calyx 5-parted. Corolla funnel-shaped; limb 5-cleft, equal. Stamens 4, fertile. Stigma capitate, emarginate. Placentas globose, adnate to the dissepiment.

§ 2. *Fruit capsular, circumcised.*

35 Stauranthe'ra. Calyx subrotately campanulate, 5-plicate, somewhat 10-cleft. Corolla with a very short tube, ample, oblique, somewhat 5-cleft at top. Stamens fertile, 4; anthers heart-shaped, cohering in a cruciate manner. Capsule circumcised.

36 Aiki'nia. Calyx tubular, 5-cleft. Corolla bilabiate, spreading. Stamens 4, 2 lower ones sterile. Capsule girded by the calyx, 1-celled, circumcised.

† *A genus doubtful whether belonging to Gesneriàceæ or Bignoniàceæ.*

37 Amphicòme. Calyx tubular, 5-toothed. Corolla tubular, ventricose near the base: limb 5-lobed, ciliated. Stamens 4, didynamous, with the rudiment of a fifth. Stigma bilamellate. Capsule silique-formed. Seeds winged at both ends, and bearded.

Tribe I.

GESNERIE'Æ (this tribe contains plants agreeing with *Gesnèria* in the characters given below.) Calyx usually adhering to the ovarium at the base; the ovarium is, therefore, half inferior. Seeds albuminous.

Subtribe I.

GLOXINIE'Æ (this subtribe contains plants agreeing with the genus *Gloxínia* in the characters given below.) Calyx adnate to the ovarium. Corolla half inferior, perigynous.

I. TREVERA'NIA (named in honour of Lud. Christ. Treveranus, M.D., professor of botany in the university of Bonn, on the Rhine.) Willd. enum. 2. p. 638. Mart. nov. gen. bras. 3. p. 56.—Cyrílla, Lher.—Achimènes species, P. Browne.—Achimènes, Pers.—Colúmnea species, Lam.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx adnate to the ovarium; limb 5-parted, nearly equal. Corolla funnel-shaped; tube rather oblique, gibbous behind at the base; limb nearly equal, spreading, 5-lobed. Stamens didynamous, with the rudiment of a fifth; anthers connected. Ovarium girded by a ring. Capsule dry, 1-celled, or half 2-celled; placentas 2, parietal. Seeds many, scobiform.—Branched, pubescent, perennial herbs, furnished with scaly ament-formed stolons under ground, and sometimes from the axils of the leaves. Leaves opposite, or 3 in a whorl, serrated. Flowers axillary, solitary, or few and aggregate.

1 T. pulche'lla (Willd. enum. 2. p. 638.) plant tomentosely hairy; leaves 3 in a whorl, ovate, acuminated at both ends, serrated, with minute leaves in the axils; peduncles solitary, axillary. ♃. S. Native of Jamaica, among the mountains in steep places. Cyrílla pulchélla, Lher. stirp. 1. p. 147. t. 71. Curt. bot. mag. 374. Buchnèra coccínea, Scop. insubr. 2. p. 10. t. 5. Colúmnea erécta, Lam. dict. 2. p. 66. Achimènes mìnor, P. Browne, jam. 271. t. 38. Achimènes coccínea, Pers. ench. 2. p. 165. Gesnèria pulchélla, Swartz. prod. p. 90. Corollas scarlet. Genitals inclosed. Capsule somewhat 2-celled.

Neat Treverania. Fl. Aug. Sept. Clt. 1778. Pl. 1 to 1½ foot.

2 T. grandiflòra (Schiede, in Linnæa, 8. p. 247.) beset with spreading hairs; leaves opposite, equal, ovate, acute, oblique at the base, coarsely serrated. ♃. S. Native of Mexico, on shady places near the Hacienda de La Laguna. Leaves green above, and reddish beneath, very like those of elm; the largest ones 1½ to 2 inches long. Corollas large, of a violet purple colour. Genitals inclosed. Lobes of corolla roundish, quite entire.

Great-flowered Treverania. Pl. 1 foot.

3 T. heterophy'lla (Mart. nov. gen. bras. 3. p. 56.) plant sparingly pilose; leaves opposite, the one smaller than the other, cordate ovate, acuminated, coarsely serrated. ♃. S. Native of Mexico, Karwinski. Largest leaves 1-3 inches long. Flowers solitary, or twin. Corolla scarlet; lobes roundish, ciliated. Genitals inclosed.

Variable-leaved Treverania. Pl. ½ to 1 foot.

Cult. The species of this genus are exceedingly beautiful when in flower, like most of the other genera of the present order. A mixture of sand, loam, and peat is the best soil for them. As soon as the plants are done flowering they should not have any water given to them until the roots begin again to vegetate, when they should be taken out of the pots and divided. Five or six strong roots are sufficient for a sixty size pot. After this has been done, they require moisture and warmth to make them grow strong, and flower in perfection.

II. GESNE'RIA (a name given by Plumier in honour of Conrad Gesner, of Zurich, the famous botanist and natural historian.) Lin. gen. no. 749. Gærtn. fruct. 2. p. 472. t. 177. Juss. gen. 165. ed. Usteri. p. 184. H. B. et Kunth, nov. gen. 3. p. 392. Mart. nov. gen. bras. 3. p. 27.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx adnate to the ovarium; limb nearly equally 5-lobed, free. Corolla semisuperior, tubular, with 5 gibbosities at the base; limb sub-bilabiate; upper lip drawn out, emarginately 2-lobed: lower lip 3-lobed. Stamens didynamous, with the rudiment of a fifth

behind; anthers at first cohering into a round head. Glands 5, or fewer around the ovarium. Capsule dry in the calyx, 1-celled, incompletely 2-valved; placentas 2, parietal, many-seeded. Seeds scobiform.—Perennial plants, furnished with solid fleshy tubers of various forms; but in most of the species these tubers are nearly globose or placentiform, which send forth the stems every year. The plants are beset with compound, articulated hairs, and often with glandular, clammy pili. Stems simple, or branched, woody, or annual, terete, rarely angular. Leaves opposite, or verticillate, on short petioles, entire, toothed, or serrated, thickish, clothed with soft villi, which is often silky, but paler and more densely villous beneath. Buds naked. Leaves complicate. Flowers disposed in opposite cymes, constituting a terminal thyrse; the peduncles furnished with floral leaves, or bracteas at the base: rarely disposed in racemes or spikes. Corollas scarlet, or purple, rarely green, of one colour, or spotted with others, usually pubescent. This beautiful genus is diffused throughout the tropical parts of America, particularly in the fissures of moist rocks, and in shady, moist places.

* *Peduncles radical.*

1 G. tuberòsa (Mart. nov. gen. bras. 3. p. 29. t. 212.) stem rhizomatoid, horizontal, marked by the cicatrices of the fallen leaves; leaves opposite, broad-ovate, toothed, cordate at the base, clothed with soft pubescence, but hairy on the nerve and veins beneath; peduncles from the base of the rhizomatose roots; limb of corolla erectish, nearly equal; hypogynous glands twin behind. ♃. S. Native of Brazil, in the mine provinces near Villa Rica, in the fissures of rocks. Tuber nearly globose, 1 to 1½ inch in diameter. Peduncles radical, erect, numerous. Corollas tubular, erect, scarlet.

Tuberous-rooted Gesneria. Pl. ½ foot.

** *Cymes terminal, umbellate.*

2 G. rupi'cola (Mart. nov. gen. bras. 3. p. 30. t. 213.) the whole plant villously pubescent; stem a span high, leafless at top; leaves opposite, on short petioles, broad ovate, or obovate, purplish beneath, crenated; cymes terminal; limb of corolla erectish, nearly equal; hypogynous glands 5. ♃. S. Native of Brazil, in the mine provinces, in high, exposed places. Tuber size of a filbert or walnut. Superior part of stem scape-formed. Floral leaves 2, sessile, under the cyme. Corollas tubular, scarlet.

Rock Gesneria. Pl. ½ to ¾ foot.

3 G. cane'scens (Mart. l. c. p. 36.) clothed with hoary villi; stem erect; leaves opposite, and 4 in a whorl, broad-ovate, acutish at both ends, a little toothed; cymes terminal, few-flowered; corolla clavately cylindrical: limb short, nearly equal; hypogynous glands 2, behind. ♃. S. Native of Brazil, in shady rocky places in the province of St. Paul, and on Serra do Mar. Stem purplish. Leaves 1 to 1½ inch long. Cyme of 3-6-8 flowers. Floral leaves under the cyme sometimes 4. Corolla scarlet, an inch long. Hypogynous glands linear-oblong, truncate.

Canescent Gesneria. Pl. ¾ to 1 foot.

4 G. Dougla'sii (Lindl. in bot. reg. t. 1110. Mart. nov. gen. bras. 3. p. 33.) clothed with fine pubescence; stem erect; leaves falsely verticillate, 4-5-6, rarely opposite, ovate, acute, crenately toothed; cyme terminal, simple, or compound; limb of corolla nearly equal; hypogynous glands twin behind. ♃. H. Native of Brazil, in woods near Rio Janeiro, and in the tract of mountains of Serra do Mar, in various places. G. maculàta, Mart. nov. gen. bras. t. 215. G. verticillàta, Hook. bot. mag. t. 2776. Tuber nearly globose, 1½ to 2 inches in diameter. Stems solitary, or numerous from the same tuber. Corollas 1½ inches long, drooping, rose-coloured, irregularly marked with longitudinal, blood-coloured, or brownish blood-coloured stripes and spots.

Douglas's Gesneria. Fl. Aug. Sept. Clt. 1826. Pl. 2 to 3 feet.

*** *Peduncles axillary, 2, or many-flowered, cymose.*

5 G. latifòlia (Mart. in Otto, et Link, verh. bot. gart. 5. p. 218. t. 1. nov. gen. bras. p. 34.) plant tomentosely villous; stem erect; leaves opposite, broad, or orbicularly-ovate, obtuse, or elliptic, coarsely toothed; cymes axillary, crowded upwards into a terminal thyrse; corolla cylindrical, with an equal tube; limb short, erect, nearly equal; hypogynous glands 2, behind. ♃. S. Native of Brazil, in the provinces of St. Paul, and Minas Geraes, in shady, rocky places. Tuber large, a span in diameter, placenta-formed. Stems simple, numerous from the same root. Leaves 4-7 inches long. Cymes 5-12-flowered. Corolla an inch long, beautiful scarlet, villous outside; tube broadly bigibbous from the base downwards.

Broad-leaved Gesneria. Pl. 1½ to 2 feet.

6 G. aggrega'ta (Ker. bot. reg. t. 329.) clothed with subviscid villi; stem erect, branched; leaves opposite, rarely 3 in a whorl, oblong-ovate, acutish at both ends, villous, especially on the veins beneath, crenated; peduncles axillary, 2-4-6-flowered, verticillate, 2 to 8, length of corolla, which is coarsely bigibbous behind, clavately cylindrical: limb nearly equal, erect; hypogynous glands 4-5. ♃. S. Native of Brazil, in woods about Rio Janeiro, and elsewhere. G. pendulìna, Lindl. bot. reg. t. 1032. This species agrees in some points with the *G. latifòlia*, particularly in the form of the corolla. Corolla before florescence often tricoloured; that is, scarlet at the base, yellow in the middle, and greenish at top; tube broadly bigibbous from the base downwards. The 2 hind hypogynous glands are often combined in one.

Aggregate-flowered Gesneria. Fl. July, Aug. Clt. 1816. Pl. 2 feet.

7 G. Deppea'na (Cham. et Schlecht, in Linnæa, 5. p. 110.) tomentum on the superior surfaces of the leaves soft, not strigosely scabrous; that on the lower surfaces yellowish white, not fuscescent; the crenæ, tomentum of stems, and peduncles spreading, not reflexed; anthers exserted; segments of calyx narrower, more acute, triangular, and the leaves more elongated than in *G. elongàta*, H. B. et Kunth. ♃. S. Native of Mexico, in the woods of Jalapa; and at the Hacienda de La Laguna. G. vetulìna, Willd. herb. no. 11253. Nearly allied to *G. aggregàta*, Ker. but differs in the broad, ovate, acuminated, acute calyxes, and the smaller corollas, which are also scarlet.

Deppe's Gesneria. Pl.

8 G. bulbòsa (Ker. bot. reg. t. 343.) villous; stem erect; leaves opposite, broad-ovate, cordate, acutish, serrately crenated; cymes many-flowered, spreading from the axils of the leaves, and disposed upwards into a terminal thyrse; superior lip of corolla very long; hypogynous glands 2, behind. ♃. S. Native of Brazil, in shady rocky places at Villa Rica; also on the mountains of Serra dos Orgaos, at the altitude of 2500 to 3000 feet. Leaves very like those of *G. latifòlia*; but is distinguished by the figure of the corolla. It is very variable in the size of the corolla; and the cymes are sometimes all crowded into a terminal thyrse, and sometimes others are axillary. Corollas scarlet.

Bulbous-rooted Gesneria. Fl. May, July. Clt. 1816. Pl. 2 feet.

9 G. Sellòwii (Mart. l. c.) stem pilose, branched; leaves

opposite, on short petioles, cordate-ovate, acute, serrated, hairy above, and hoary from tomentum beneath; cymes many-flowered, lateral, disposed into a long thyrse; corollas clavately cylindrical; limb short, nearly equal; hypogynous glands 4. ♃. S. Native of Brazil, in the province of Rio Grande do Sul, on Mount Butucaray, Sello. Leaves 5 inches long, and nearly 3 broad. Cymes opposite.

Sello's Gesneria. Pl. 2 to 3 feet.

10 G. móllis (H. B. et Kunth, nov. gen. amer. 2. p. 395. t. 191.) branches pilose; leaves opposite, obliquely ovate-oblong, acuminated, rounded at the base, sub-cordate, serrately crenated, densely and pilosely pubescent above, silvery and pilose beneath; peduncles axillary, 3-flowered; corolla tubular, inflated at top, pubescent; limb 5-cleft, nearly equal, spreading; hypogynous glands unknown. ♃. S. Native of New Granada. Leaves on short petioles, 3 inches long, and 1½ inch broad. Corolla scarlet; limb spotted.

Soft Gesneria. Pl. ?

11 G. macrosta'chya (Lindl. bot. reg. t. 1202.) clothed with hoary down; stem simple; leaves opposite, on short petioles, cordate ovate, crenated, wrinkled; cymes from the axils of the bracteas or upper leaves, many-flowered, the whole forming a long, leafless, terminal, compound raceme; corolla tubular, tomentose: limb nearly equal, short; hypogynous glands twin behind. ♃. S. Native of Rio Janeiro. Root tuberous, like the rest. Corolla scarlet; limb spotted.

Long-spiked Gesneria. Fl. Aug. Clt. 1825. Pl. 2 feet.

12 G. longiflòra (H. B. et Kunth, l. c. p. 396.) branches clothed with woolly hairs; leaves opposite, obliquely ovate, acute, narrowed into the short petioles at the base, crenated, finely pilose above, and pubescent beneath; peduncles axillary, 2-flowered; corolla tubular, woolly: limb nearly equal, 5-cleft, spreading; hypogynous glands unknown. ♃. S. Native of New Granada. Leaves 4-5 inches long, and 2½ broad. Corolla purplish, ventricose at top; limb spotted.

Long-flowered Gesneria. Pl. ?

13 G. elonga'ta (H. B. et Kunth, l. c. p. 396. t. 192.) branches tetragonal, clothed with woolly hairs; leaves opposite, oblong acuminated, acute at the base, somewhat crenated, scabrous from strigæ above, and clothed with fuscescent, woolly tomentum beneath; peduncles axillary, 4-flowered, elongated; corolla tubular, ventricose at top, hairy; limb 5-cleft, nearly equal; hypogynous glands unknown. ♃. S. Native of Quito. Leaves 4 inches long; veins purplish beneath. Corolla scarlet: throat contracted; limb spreading, spotted.

Elongated-peduncled Gesneria. Shrub. ?

14 G. corymbòsa (Swartz, prod. p. 89. fl. ind. occ. 2. p. 1022.) shrubby, subdivided; leaves opposite, ovate, acute, serrated, scarious, rough, clothed with hoary tomentum beneath, on short petioles; peduncles terminal and axillary, many-flowered, corymbose; corolla cylindrical, incurved: 2 upper segments of the limb concave: the 3 lower ones longer, with crenated edges. ♄. S. Native of the South of Jamaica, in rocky chalky places on the banks of rivers. Leaves 2 inches long. Corollas scarlet.

Corymbose-flowered Gesneria. Fl. June, Aug. Clt. 1822. Pl. 2 feet.

15 G. lasia'ntha (Zucc. abhandl. acad. wiss. 1829, 1830. p. 305. t. 13.) stem shrubby, branched, hairy; leaves petiolate, decussate, ovate-lanceolate, acuminated, serrulated, clothed with silky hairs; peduncles 4-flowered; tube of corolla equal at the base, with 5 gibbosities; hypogynous glands 5, minute. ♄. S. Native of Mexico. Corolla downy. Nearly allied to *G. Deppeàna*, Schlecht. et Cham. in Linnæa, 5. p. 110.

Woolly-flowered Gesneria. Shrub 2 to 3 feet.

* * * * *Flowers verticillate, spicate, or racemose.*

16 G. sce'ptrum (Mart. nov. gen. bras. 3. p. 32. t. 214.) villous; leaves on short petioles, opposite, or 3 in a whorl, from subcordate at the base to oblong, bluntly serrated; whorls of flowers almost leafless at top, disposed in an elongated thyrse; pedicels about the length of the corolla; upper lip of corolla drawn out; hypogynous glands 4 or 5. ♃. S. Native of Brazil, in the province of St. Paul, at Mogy das Cruce, along the banks of the Sapucahy river. Tuber large, depressed, globose. Leaves 2-3 inches long, villous. Stems simple.

Var. α, rùbra (Mart. l. c.) leaves with more parallel margins, lanceolate-oblong, acute, 3-5 inches long; peduncles loose and longer; corollas red, or scarlet.

Var. γ, flávida (Mart. l. c.) leaves broader, broad ovate-oblong, 4-6 inches long; peduncles loose and longer; corolla pale yellow.

Var. γ, ígnea (Mart. l. c.) leaves smaller, 1½ to 2 inches long, obtuse, rarely crenated, more densely pubescent beneath and canescent; peduncles shorter, strict; corollas pale fire coloured, reddish towards the edge of the limb.

Sceptre Gesneria. Pl. 3 to 4 feet.

17 G. chelonioi'des (H. B. et Kunth, nov. gen. 2. p. 392.) stem nearly simple, hairy; leaves opposite, on short petioles, oblong, acutish, obtuse at the base, coarsely crenated, hairy on both surfaces, canescent beneath; flowers spicate, opposite, solitary or twin; corolla tubular, hairy, gibbous above at the base: throat wide; hypogynous glands 5. ♃. S. Native of New Granada, in shady places in the valleys of Gualguase and Smitha, between Popayan and Almaguer, at the altitude of 580 to 700 hexapods. Leaves 3 inches long. Flowers pedicellate. Limb of corolla bilabiate: lobes all rounded. Corolla pale red. Ovarium only adhering to the calyx at the base.

Chelone-like Gesneria. Pl. 3 to 4 feet.

18 G. ela'tior (H. B. et Kunth, nov. gen. 2. p. 393.) stem simple? pilose; leaves 3 in a whorl, nearly sessile, lanceolate, obtuse at both ends, crenated, pilose, but more densely so beneath; spikes terminal, verticillate; whorles 3-flowered, remote; corolla clavately cylindrical, villous; hypogynous glands 5. ♃. H. Native of New Andalusia, in shady places on Mount Tumiriquiri, at the altitude of 600 hexapods. Leaves on short petioles, canescent beneath, 2½ inches long, and 7 lines broad. Flowers pedicellate, drooping. Corolla tubular, inflated at top, red.

Taller Gesneria. Pl. 3 to 4 feet.

19 G. sylva'tica (H. B. et Kunth, l. c.) stem simple, pilose; leaves 3 or 4 in a whorl, lanceolate-oblong, acuminated, quite entire, strigosely pilose on both surfaces, but especially beneath; spike terminal, verticillate; whorles 2-4-flowered: lower ones distant; corolla tubularly ventricose; limb 5-lobed, reflexed; hypogynous glands unknown. ♃. S. Native of the province of Bracomoros, between Jaen and the river Amazon, at the altitude of 230 hexapods. Leaves canescent beneath, 1½ inch long, and ½ an inch broad. Flowers pedicellate. Corolla 8 lines long, scarlet, pilose outside.

Wood Gesneria. Pl. 2 to 3 feet.

20 G. spica'ta (H. B. et Kunth, l. c. t. 188.) stem suffruticose, simple, pilose; leaves 3 in a whorl, on short petioles, lanceolate-oblong, acuminated, crenated, densely pilose above, and clothed with woolly tomentum beneath; spike terminal, verticillate; whorles 10-flowered, approximate; corolla tubular, incurved, hairy: limb 5-cleft: the 2 upper segments rather the largest; hypogynous glands 5. ♄. S. Native of New Granada, in boggy places near Ibague, at the foot of Mount Quindiu; also near the Hacienda de La Laguna, in Mexico, at the

altitude of 1730 hexapods. Leaves 5 inches long, and 1½ inch broad. Flowers pedicellate. Corolla scarlet. The Mexican plant usually has 4 leaves in a whorl, very scabrous above. The hairs of the stem are sometimes adpressed, of a fulvescent colour, not purplish. Corollas purplish.

Spicate-flowered Gesneria. Clt. 1831. Pl. 3 to 4 feet.

21 G. allagophy'lla (Mart. l. c.) stem erect, pilose, usually trigonal; leaves villous, nearly sessile, 3 in a whorl, or opposite, or scattered, linear-oblong or spatulate, obtuse, crenated; flowers sessile, in whorls, disposed in a long terminal spike; tube of corolla cylindrical, pilose; limb equal, spreading, glabrous; hypogynous glands 2, behind. ♃. S. Native of Brazil, in the mine provinces, in various places. Lindl. bot. reg. t. 1767. Tuber large, often a span in diameter, placentiform. Superior leaves more approximate than the others. Floral leaves ovate, acutish, serrated. Lower whorles of flowers 2-3 inches distant, but more approximate upwards; sometimes the peduncles are scattered, and therefore constituting a long spike. Corolla scarlet, pilose.

Changeable-leaved Gesneria. Fl. May, July. Clt. 1835. Pl. 2½ to 3 feet.

* * * * * *Peduncles axillary, 1-flowred, solitary, or aggregate.*

22 G. prasina'ta (Ker. bot. reg. t. 428. Mart. l. c. p. 37.) villous; stem erect; leaves opposite or 3 in a whorl, ovate or ovate-oblong, serrated; peduncles axillary, shorter than the corolla, which is campanulate, villous outside, with a nearly equal limb; hypogynous glands 5. ♃. S. Native of Brazil, in fields at Villa Rica, and elsewhere, in the mine provinces. Codonóphora grandiflòra, Lindl. in bot. reg. under no. 1112. Corollas scarlet? larger than those of *G. allagophýlla*, campanulate.

Green Gesneria. Fl. May, July. Clt. 1818. Pl. 1½ to 2 feet.

23 G. ru'tila (Lindl. bot. reg. 1158. Mart. l. c. p. 34.) villous; stem erect; leaves opposite, oblong-lanceolate, acutish at both ends, coarsely crenated; peduncles axillary, shorter than the corolla; superior lip of corolla drawn out; hypogynous glands 2, behind. ♃. S. Native of Brazil, in shady woods, in a moist soil, and in the fissures of rocks near Rio Janeiro, and in the tract of the mountains called Serra dos Orgaos, in various places. This species differs from *G. scéptrum* in the smaller stature, slenderer, usually purplish, stem, opposite, narrower, more or less attenuated leaves, shorter, interfoliaceous peduncles, which are not disposed into a terminal thyrse; and in the corolla, which is always scarlet, of a deeper colour towards the margins, more constricted towards the base, and more ventricose towards the mouth, and in the hypogynous glands being only 2.

Var. β, *atrosanguínea* (Bot. reg. 1279.) Corolla deep scarlet.

Brilliant Gesneria. Fl. Aug. Sept. Clt. 1825. Pl. 1 to 2 feet.

24 G. ulmifòlia (H. B. et Kunth, nov. gen. 2. p. 394.) shrubby? branches subtetragonal, and pilose; leaves opposite, ovate, acute, obliquely cordate at the base, crenated, blistered and scabrous above, reticulated and clothed with hairy pubescence beneath; peduncles axillary, 1-flowered, by threes or fours; corolla tubular, inflated at top, pilose outside; limb quinquefid; 2 superior lobes the largest; ovarium girded by a yellow ring. ♄. S. Native of Quito, between Chillo and Sangolgui, at the altitude of 1350 hexapods. Leaves petiolate, 32-33 lines long. Flowers erect. Corolla scarlet, 4 times longer than the calyx. This belongs to a different genus, if the ovarium is really surrounded by a ring instead of glands.

Elm-leaved Gesneria. Shrub.?

25 G. hirsu'ta (H. B. et Kunth, l. c. p. 394. t. 189) shrubby; branches very hairy; leaves opposite, oblong-ovate, acuminated, rounded at the base, tomentosely pilose above, and clothed with woolly tomentum beneath: peduncles axillary, 1-flowered, twin; corolla tubular, incurved, hairy outside; hypogynous glands hairy. ♄. S. Native of the province of Cumana, near the monastery of Caripe, at the altitude of 460 hexapods. Leaves on short petioles, about 3 inches long, having the veins and margins purplish beneath. Flowers drooping. Corolla 3 times longer than the calyx, ventricose at top, purple: limb of 5 roundish spreading, spotted lobes.

Hairy Gesneria. Fl. June, Aug. Clt. 1826. Shrub.

26 G. Honde'nsis (H. B. et Kunth, l. c. p. 395. t. 190.) stem nearly terete, clothed with silky white wool; leaves opposite, somewhat obliquely ovate-oblong, acuminated, acute at the base, crenulated, very scabrous above, and clothed with white wool beneath; peduncles axillary, 1-flowered, by twos and threes; corolla tubular, ventricose at top, hairy outside; limb nearly equal; hypogynous glands 5, truncate, sub-bidentate. ♃. S. Native of New Granada, in rocky places near the town of Honda, at the altitude of 150 hexapods. Leaves petiolate, 4½ inches long. Corolla yellowish green, beset with scarlet hairs: limb spotted with purple.

Honda Gesneria. Pl. 1 to 3 feet.

27 G. Suttòni (Booth, in bot. reg. 1637.) stem terete, tomentose; leaves ovate-cordate, crenated, tomentose; peduncles axillary, solitary, 1-flowered; upper lip of corolla oblong, undulated: lower one small, revolute. ♃. S. Native of Rio Janeiro, near the bay of Bomviaga. Root tuberous. Leaves opposite, green above, and hoary beneath. Corolla large, scarlet, downy, swelling at the base.

Sutton's Gesneria. Fl. July, Aug. Clt. 1833. Pl. 2 feet.

28 G. tubiflòra (Cav. icon. 6. p. 61. t. 584.) stem tetragonal, tomentose; leaves ovate, acuminated, crenulated, tomentose; peduncles 1-flowered, axillary, by twos or threes; corolla tomentose, tubularly ventricose, straight; throat contracted: limb small, equal, of 5 diverging crenatures or teeth. ♃. S. Native of Panama. Leaves hoary beneath. Peduncles unequal, longer than the petioles. Calyx tomentose, adherent, with lanceolate segments. Corolla an inch long, scarlet. Hypogynous glands 5, obtuse. Capsule ovate. Perhaps a distinct genus.

Tube-flowered Gesneria. Pl. 1½ to 2 feet.

29 G. verticilla'ta (Cav. icon. 6. p. 62. t. 585. f. 1.) stem tetragonal, villous; leaves ovate, crenulated, villous, nearly sessile, hispid above, and clothed with hoary tomentum beneath; peduncles 1-flowered, numerous, axillary, villous, and appearing as if they were verticillate; corolla villous, tubularly urceolate: throat contracted: limb equal, of 5 short, rounded, spreading crenatures or teeth. ♃. S. Native of New Granada, between Guaranda and Chimborazo. Leaves opposite, hardly an inch long. Corolla scarlet, 3 lines long.

Whorled-flowered Gesneria. Pl. 1 foot.

N.B. What is Gesnèria acaúlis, Lin.?

Cult. All the species of this genus are very showy while in flower; they are, therefore, great favourites with collectors. A light rich soil, or a mixture of loam, peat, and sand, answers them best. Most of the species are readily propagated by cuttings, and by the tubers of the root. The roots while in a dormant state should have no water given to them.

III. GLOXI'NIA (so named by L'Heritier, in memory of Benj. Petr. Gloxin, of Colmar, author of "Observationes Botanicæ." Argent. 1785. 4to.) Lher. stirp. 149. Ait. hort. kew. 2. p. 331. Mart. nov. gen. bras. 3. p. 262. Martýnia

spec. Lin.—Paliàva, Velloz. in Vand. script. t. 7. f. 17. Sinníngia, Nees.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx adnate to the ovarium, to the middle: limb 5-parted, free. Corolla semisuperior, oblique, funnel-shaped, or campanulately subringent, gibbous behind at the base; tube ventricose: limb spreading: upper lip 2-lobed: lower one 3-lobed. Stamens 4, didynamous, with the rudiment of a fifth behind. Glands 5, perigynous. Capsule 1-celled, 2-valved; placentas 2, parietal, 2-lobed. Seeds numerous, oblong. Root a thick unequal tuber.—Plants sometimes stemless, therefore the flowers and leaves rise immediately from the root; sometimes with simple, terete, soft stems. Leaves opposite, petiolate, thick, for the most part crenated or serrated. Gemmation naked. Flowers large, axillary, solitary, or many, aggregate, drooping, violaceous, greenish-yellow, or white, of one colour, or obscurely spotted, and striped with other colours. Native of tropical America, on the east coast, in wet shady places of woods, and on humid rocks, and sometimes at the roots of trees.

Sect. I. Eugloxi'nia. (This section is supposed to contain the true species of the genus.) Calyx terete. Corollas violaceous, bluish or white.

1 G. gra'cilis (Mart. nov. gen. bras. 3. p. 64. t. 226.) caulescent; stems elongated, rather pilose, as well as the leaves; leaves oblong, attenuated at both ends, acute, serrated; flowers axillary, solitary or twin; calyx terete, with long, acuminated segments; corolla downy. ♃. S. Native of the province of Rio Janeiro, in humid places, upon stones at Mount Corcovado, and near Tejuco. Tuber size of a small apple, nearly globose. Leaves distant, 3-4 inches long, pale, and rather reddish beneath. Corolla an inch and a half long, blue or pale violet, very like those of *G. caulèscens* and *G. speciòsa.*

Slender Gloxinia. Pl. 2 to 4 feet.

2 G. caule'scens (Lindl. bot. reg. 1127.) caulescent; leaves oval, crenated, obtuse, tomentose, with revolute edges; peduncles solitary, axillary, elongated; corolla downy: segments nearly equal: middle one cordate-ovate, all undulated; calyx oblique, with acuminated segments, exactly like that of *G. speciòsa.* ♃. S. Native of Pernambuco. Corolla large, a little arched, drooping, bluish purple.

Caulescent Gloxinia. Fl. July, Aug. Clt. 1826. Pl. ½ to 1 foot.

3 G. macrophy'lla (Nees et Mart. in nov. act. bonn. 11. p. 66.) nearly stemless; leaves ovate, clothed with soft pubescence, sessile, shorter than the flowers, crenated, obtuse; flowers crowded, nutant; calyx large, 5-cleft, with triangular acuminated segments. ♃. S. Native of Brazil, on the road to Felisbert. Leaves 8 inches long, and 5½ inches broad. Corolla blue, like those of *G. speciòsa*, but smaller. This species is similar to *G. speciòsa*, but differs in the flowers being in nearly sessile glomerules; and in the leaves being much larger, and in the flowers being smaller.

Long-leaved Gloxinia. Pl. ½ to ¾ foot.

4 G. speciòsa (Ker. bot. reg. 213.) stemless, hispid or hairy; leaves oval, crenated; peduncles from the axils of the leaves, villous, longer than them; calyx 5-cleft, with ovate, acuminated segments. ♃. H. Native of Brazil. Sims, bot. mag. 1937. Lodd. bot. cab. 28. Stem very short. Leaves 7 inches long, when full grown. Corolla large, bluish purple; with rounded segments.

Var. β, álba; flowers white.

Showy Gloxinia. Fl. June, Nov. Clt. 1815. Pl. ¼ to ½ foot.

5 G. macula'ta (Lher. stirp. t. 149.) caulescent; stems simple, spotted; radical leaves cordate, obtuse, doubly toothed, shining above, and reddish beneath; cauline leaves petiolate, roundish-ovate, simply toothed; peduncles axillary, 1-flowered, solitary; calyx glabrous, with oblong obtuse segments; corolla downy. ♃. S. Native of America, about Carthagena. Sims, bot. mag. 1191. Martýnia perénnis, Lin. spec. 862. Mill. dict. no. 2. Med. bot. beot. 1783. p. 238.—Martýnia foliis serratis, Lin. hort. cliff. p. 322. t. 18.—Ehret. pict. t. 9. f. 2. Root scaly, like that of *Dentària.* Corolla purplish-blue.

Spotted-stemmed Gloxinia. Fl. July, Oct. Clt. 1739. Pl. 1 foot.

6 G. hirsu'ta (Lindl. bot. reg. t. 1004. Hook. bot. mag. 2690.) stemless, very hairy; leaves ovate-roundish, wrinkled, hispid, rather cordate at the base; scapes or peduncles aggregate, 1-flowered; calyx tubular below, with lanceolate segments; corolla funnel-shaped: tube narrow: limb spreading, with obtuse or retuse unequal lobes. ♃. S. Native of Brazil. Leaves lying flat on the ground. Corolla pale blue, downy, striped with darker veins; the interior of the tube yellow, with darker spots.

Hairy Gloxinia. Fl. June, Aug. Clt. 1824. Pl. ¼ foot.

Sect. II. Sinni'ngia (W. Sinning, gardener to the University of Bonne, on the Rhine.) Mart. nov. gen. bras. 3. p. 64. Sinníngia, Nees, in ann. scienc. nat. 6. p. 297. t. 12. The whole of the calyx, or only the bottom of it, angular or winged. Flowers white, yellowish green, or pale yellow.

7 G. Schóttii (Mikan. del. bras. p. 4.) leaves glabrous, cordate, ovate, serrated, ciliated; calyx turbinate, twice as long as the ovarium. ♃. S. Native of Rio Janeiro. Sinníngia Hellèri, Nees, l. c. Lindl. bot. reg. 997. Corolla pale yellow or greenish yellow.

Schott's Gloxinia. Fl. June, July. Clt. 1820. Pl. 1 foot.

8 G. gutta'ta (Mart. l. c.) leaves oblong-lanceolate, attenuated at the base, pubescent, lucid, serrated; corollas spotted; calyx cylindrically campanulate, 3 times as long as the ovarium. ♃. S. Native of Brazil. Sinníngia guttàta, Lindl. bot. reg. t. 1112. Corolla downy, pale, almost white, spotted inside with livid purple.

Spotted-flowered Gloxinia. Fl. July. Clt. 1826. Shrub 1½ foot.

9 G. veluti'na (Mart. l. c.) leaves oblong, subcordate, velvety; calyx cylindrically campanulate, 3 times as long as the ovarium. ♃. S. Native of Brazil. Sinníngia velutìna, Lindl. bot. reg. under no. 1112. Corolla pale yellow.

Velvety Gloxinia. Fl. July. Clt. 1826. Pl. 1½ foot.

10 G. villòsa (Mart. l. c.) stem and leaves villous; calyxes 5-parted, length of ovarium; flowers aggregate. ♃. S. Native of Brazil. Sinníngia villòsa, Lindl. bot. reg. 1134. Larger than other species of this section. Corolla pale yellowish green.

Villous Gloxinia. Fl. July. Clt. 1826. Pl. 1½ foot.

11 G. du'bia; calyx tubular, 5-angled, foliaceously winged, with a 5-cleft mouth; corolla with an inflated sub-bilabiate limb; rudiment of fifth filament inserted above the base of the corolla; hypogynous glands 5, alternating with the filaments; fruit capsular, rather fleshy. ♄. S. Native of Mexico. Gesneriàceæ, Genus nova, Nees, in Linnæa, 1. p. 305.

Doubtful Gloxinia. Shrub.

Cult. Gloxínia is a genus of splendid plants, and great favourites with gardeners. A light rich soil, or a mixture of sand, loam, and peat, suits them well. *G. maculàta* is increased by dividing at the root; and it should be kept free from suck-

ers, and only a single stem in a pot, or it will not grow strong enough to flower. The rest of the species flower freely, and strike readily from cuttings. The leaves of *G. speciòsa*, and probably of most others, if taken off close to the stem, and planted, will strike root, and make each a plant.

Subtribe II.

Conradie'æ (this section agrees with *Conràdia* in the character given below.) Calyx adnate to the ovarium. Corolla superior. Leaves alternate or scattered, not opposite, as in the last section.

IV. RYTIDOPHY'LLUM (from *ῥυτις ῥυτιδος, rytis rytidos*, a wrinkle; and *φυλλον, phyllon*, a leaf; leaves blistered.) Mart. nov. gen. bras. 3. p. 38.—Gesnèria species, Lin. and Swartz.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx wholly adnate to the ovarium; limb 5-toothed or 5-cleft. Corolla superior, campanulate, constricted in the middle; limb 5-lobed. Stamens 4, didynamous, with the rudiment of a fifth behind; anthers free or anisogeneous, and cohering. Disk epigynous, thick, annular, sinuous. Capsule dry, combined with the somewhat 5-ribbed calyx; top flat, 2-valved; placentas 2, parietal, many-seeded.—Small trees and shrubs, with fibrous roots. Branches alternate and scattered, hairy. Leaves stipulate, on short petioles, scattered, very hairy beneath; the parenchyma in the upper surface elevated into small blisters, each bearing a hair at apex. Flowers cymose, on peduncles which rise from the axils of the superior leaves, green, of one colour, or spotted with blood-colour, or wholly blood-coloured.

1 R. tomentòsum (Mart. l. c. p. 39.) branches hairy; stipulas roundish, revolute, crenated, tomentose; leaves oblong, acuminated, narrowed at both ends, serrated, reticulated, and clothed with hoary pubescence beneath, and papillosely rough above; corymbs axillary, on long peduncles; calyx villous, with a 5-parted equal limb. ♄. S. Native of tropical America, on the banks of rivers and rivulets. Gesnèria tomentòsa, Lin. spec. 851. Mill. dict. no. 1. Jacq. amer. 179. t. 175. f. 64. pict. 89. t. 261. f. 2. Sims. bot. mag. 1023. Codonóphora lanceolàta, Lindl.—Sloane, hist. 1. p. 162. t. 104. f. 2. Corollas spotted with yellow and dark purple. What is Gesnèria tomentòsa, H. B. et Kunth, nov. gen. 2. p. 396, which is described as a herbaceous plant, with a fusiform root, a simple procumbent stem, and opposite leaves.

Tomentose Rytidophyllum. Clt. 1759. Shrub 2 to 4 feet.

2 R. gra'nde (Mart. l. c.) branches hairy; leaves broad-lanceolate, very long, denticulated, hairy, scabrous above, petiolate; peduncles long, terminal and axillary, dichotomous; pedicels usually 3-flowered; segments of calyx acute, equal. ♄. S. Native of Jamaica, on the mountains. Gesnèria grándis, Swartz. prod. 89. fl. ind. occ. 2. p. 1018. Leaves scabrous and white beneath. Flowers large, greenish-yellow. Corolla irregular, dilated at the base; limb ventricose towards the top; upper lip large, arched, bifid.

Great Rytidophyllum. Shrub 6 to 15 feet.

3 R. Berteroa'num (Mart. l. c.) branches densely hairy; stipulas subulate; leaves lanceolate, acuminated at both ends, doubly toothed, scabrous from hairs beneath, and papillosely rough above; calyx villous, with setaceously elongated segments. ♄. S. Native of the island of St. Domingo, on rocks. Gesnèria scàbra, Spreng. syst. 2. p. 838. but not of Swartz.

Bertero's Rytidophyllum. Shrub.

Cult. This is a beautiful genus, like the rest of the present order. A light rich earth, vegetable mould, or a mixture of loam, sand, and peat, is good soil for the species; and cuttings strike root readily in heat.

V. CONRA'DIA (named after Conrad Gesner, see *Gesnèria.*) Mart. nov. gen. bras. 3. p. 38. Gesnèria species, Plum. and Swartz.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx wholly adnate to the ovarium; limb 5-cleft or 5-toothed, free. Corolla superior, tubular or campanulate; limb somewhat equally 5-cleft. Stamens 4, didynamous, with the rudiment of a fifth behind; anthers usually cohering into a round head. Glands or disk wanting. Capsule dry, clothed with a 5 or 10-ribbed calyx, flat on the top, 2-valved; placentas 2, parietal, many-seeded. Seeds scobiform.—Shrubs, rarely herbs, with fibrous roots. Branches alternate or scattered. Leaves petiolate, alternate, or scattered, towards the tops of the branches, rough from stiffish white hairs, particularly on the nerves and veins, rarely glabrous, usually toothed. Flowers disposed in few-flowered cymes, on peduncles which rise from the axils of the upper leaves, red or green, spotted with blood-colour, white or pale.

Sect. I. Synanthe'ra (from *συν, syn*, together; and *ανθηρα, anthera*, an anther.) Stamens inclosed. Anthers all connected into a round head.

1 C. hu'milis (Mart. l. c.) leaves lanceolate, serrated, sessile; peduncles dichotomous, 3-7-flowered, very long; calyx campanulate, 5-toothed; corolla campanulate, irregular. ♄. S. Native of Tropical America, and the West Indies. G. hùmilis, Lin. spec. 850. G. hùmilis flore flavescente, Plum. gen. 27. icon. 133. f. 2. Corolla yellowish green, with dark spots within.

Humble Conradia. Shrub 2 feet.

2 C. craniola'ria (Mart. l. c.) leaves cuneate-obovate, acute, sub-runcinate, toothed, glabrous above, and hairy beneath; calyx downy, with linear lanceolate, reflexed segments; corolla campanulate; limb nearly regular. ♄. S. Native of Hispaniola, among broken rocks on the mountains. Gesnèra craniolària, Swartz, prod. 89. fl. ind. occ. 2. p. 1015. Craniolària fruticòsa, Lin. spec. 861.—Plum. gen. 27. icon. t. 137. Leaves 4-6 inches long. Corolla green outside, hairy, and dark purple. Margins of the segments of the lower lip of corolla laciniately jagged.

Craniolaria-like Conradia. Shrub 3 to 4 feet.

3 C. sca'bra (Mart. l. c.) leaves ovate-lanceolate, serrated, scabrous; calyx scabrous, with ovate, acute, blood-coloured segments; corolla incurved, cylindrical: limb nearly equal. ♄. S. Native of Jamaica, on calcareous rocks. Gesnèria scàbra, Swartz, prod. 89. fl. ind. occ. 2. p. 1020. Leaves petiolate, scabrous above, wrinkled, hispid, and hoary beneath. Corolla small, blood red.

Scabrous Conradia. Shrub 2 to 4 feet.

Sect. II. Dittanthe'ra (from *διττος, dittos*, twin; and *ανθηρα, anthera*, an anther.) Stamens exserted; anthers connected by pairs.

4 C. ventricòsa (Mart. l. c.) leaves elliptic, acuminated, crenated, glabrous; peduncles usually 4-flowered; calycine segments subulate, elongated; corolla cylindrical, incurved: segments of the lower lip crenately ciliated. ♄. S. Native of Jamaica, Martinique. Gesnèria ventricòsa, Swartz, prod. p. 90. fl. ind. occ. 2. p. 1028. Pentaràphia longiflòra, Lindl. Leaves

6-8 inches long. Flowers large, scarlet. Capsule turbinately-obovate.

Ventricose-flowered Conradia. Fl. June, July. Clt. 1823. Shrub 6 to 8 feet.

5 C. exse'rta (Mart. l. c.) leaves oblong-lanceolate, crenated, glabrous; peduncles 3-flowered; calycine segments long, acute, reflexed; corolla with the tube dilated at the base, and contracted in the middle, gibbose behind, and ventricose in front. ♄. S. Native of Jamaica, on the top of the mountains. Gesnèria exsérta, Swartz, prod. p. 89. fl. ind. occ. p. 1024. Leaves petiolate, pale beneath. Corolla large, yellow, an inch long.

Exserted-stamened Conradia. Shrub 8 to 10 feet.

6 C. calyci'na (Mart. l. c.) leaves ovate-lanceolate, acuminated, serrately crenated, glabrous; peduncles 3-flowered; calyx inflated, campanulate, 5-toothed: teeth ovate, acute, erect; corolla like that of *C. exsérta;* genitals exserted; capsule cylindrical. ♄. S. Native of Jamaica, in mountain woods. Gesnèria calycìna, Swartz, prod. p. 90. fl. ind. occ. 2. p. 1026. Sinníngia calycìna, Hort. ex Loud. hort. brit. p. 241. Leaves petiolate, 4-6 inches long.

Large-calyxed Conradia. Fl. July, Aug. Clt. 1824. Shrub 6 feet.

Sect. III. Chorisanthe'ra (from χωριζω, *chorizo*, to separate; and ανθηρα, *anthera*, an anther; anthers separate, not combined.) Stamens a little exserted; anthers distinct. Fruit like those of the other species.

7 C. pu'mila (Mart. l. c.) stemless; leaves cuneate-obovate, crenated, nearly sessile, rather hairy; peduncles usually 2-flowered, shorter than the leaves; calycine segments ovate-lanceolate, acute: lower ones large, reflexed; corolla with a funnel-shaped tube, dilated and sub-campanulate above: limb nearly regular, with crenately ciliated segments: upper 2 erect. ♃. S. Native of Jamaica. Leaves rather scabrous. Corolla whitish, covered with blood-coloured hairs.

Dwarf Conradia. Pl. ¼ foot.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

Subtribe III.

BESLERIE'Æ (the genera contained in this subtribe agree with *Beslèria.*) Calyx free. Corolla inferior.

VI. SARMIE'NTA (named after Mart. Sarmiento, a Spanish botanist.) Ruiz. et Pav. fl. per. 1. p. 8. t. 7. f. b. Mart. nov. gen. bras. 3. p. 66. t. 219. f. 2. Urceolària, Feuill. per. 3. p. 69. t. 43.

Lin. syst. *Diándria, Monogýnia.* Calyx inferior: limb 5-parted, nearly equal. Corolla urceolate: limb 5-lobed, nearly equal. Two hind stamens perfect, with the rudiments of three sterile ones, the hind one of these subulate and smaller. Ring hypogynous. Capsule 1-celled, circumcised, ex Ruiz. et Pav.; placentas 2, parietal, many-seeded.—A branched, loose, scandent, parasitical herb, with strong, wiry roots. Leaves opposite, thickish, hairy, dotted. Flowers on long peduncles, scarlet, bibracteate.

1 S. re'pens (Ruiz. et Pav. l. c.) ♃. ◡. S. Native of Peru, in woods. Urceolària scándens, Feuill. per. 3. p. 69. t. 43.

Creeping Sarmienta. Pl. climbing.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

VII. BESLE'RIA (so named by Plumier after Basil Besler, an apothecary of Nuremberg, editor, with the assistance of Jungermann, of a large work, entitled "Hortus Eystettensis, 1613." The garden belonged to Conrada Gemmingen, a bishop, and the plates were engraved at his expense.) Plum. gen. 5. in part. Lin. gen. no. 755. in part. Schreb. gen. no. 1012. Jacq. amer. 187. in part. Juss. gen. p. 121. in part. H. B. et Kunth, nov. gen. amer. 2. p. 397. in part. Gærtn. fruct. 1. p. 24. t. 52. Mart. nov. gen. bras. 3. p. 43.—Eríphia, Browne, jam. 270.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx coloured, 5-cleft, free; segments quite entire. Corolla campanulately-ringent: upper lip 2-lobed: lower one 3-lobed. Stamens 4, didynamous, rising above the base of the tube, with a chaff-formed rudiment of a fifth behind. Hypogynous ring, without any gland. Berry globose, 1-celled. Seeds very minute, numerous, attached to two parietal, 2-lobed placentas.—Erect, branched shrubs. Stems sub-tetragonal. Leaves opposite, petiolate, thickish; nerves and veins very prominent beneath. Peduncles axillary, few-flowered. Down and hairs on the plants simple. All inhabitants of Tropical America, in shady, moist places.

1 B. umbròsa (Mart. l. c. p. 44. t. 218.) leaves oblong, acuminated, attenuated at the base, or cordate, quite entire, ciliated in the young state, and with the nerve and veins strigillosely pubescent beneath; peduncles axillary, solitary, usually 3-flowered, exceeding the petioles. ♄. S. Native of Brazil, in shady woods, at fountains near Mandiocca, and elsewhere in the tract of the mountains called Serra dos Orgaos, at the altitude of 500 feet. Leaves 3-5 lines long. Corollas white, glabrous.

Shaded Besleria. Shrub 3 to 5 feet.

2 B. lu'tea (Lin. spec. 863. Swartz, obs. 231.) leaves broad-oblong, acuminated, contracted behind, coarsely-toothed in front, glabrous; peduncles axillary, 1-flowered, about equal in length to the petioles. ♄. S. Native of Jamaica, in humid places; Guiana and Para.—Plum. gen. 29. p. 36. t. 49. f. 1. Eríphia, &c. Browne, jam. p. 271. Corolla yellow.

Yellow-flowered Besleria. Fl. July, Aug. Clt. 1739. Shrub 3 to 5 feet.

3 B. lu'teo-vìrens (Nees, et Mart. nov. act. bonn. 11. p. 49. Mart. nov. gen. bras. 3. p. 45.) leaves oblong-lanceolate, acuminated, cuneated at the base, serrated, especially in front, rather pilose; cymes axillary, many-flowered, contracted, equal in length to the petioles. ♄. S. Native of Brazil, in boggy parts of woods near St. Petro de Alcantara, in the district of Ilheos. Corolla greenish-yellow.

Greenish-yellow-flowered Besleria. Shrub.

4 B. e'legans (H. B. et Kunth, nov. gen. amer. 2. p. 397.) leaves somewhat obliquely elliptic-oblong, acuminated, quite entire, glabrous; peduncles axillary, generally twin, and usually 3-flowered, shorter than the petioles. ♄. S. Native of New Granada, on the Andes of Quindiu, between Quebrada de Tucheacto and the river San Rafall, at the altitude of 1350 hexapods. Branches terete, twisted, hairy while young. Leaves 7 inches long, and 3 broad. Calyx glabrous. Corolla scarlet, glabrous.

Elegant Besleria. Shrub.

5 B. solanoi'des (H. B. et Kunth, l. c.) leaves lanceolate-oblong, acuminated, narrowed at the base, remotely and obsoletely denticulated, glabrous; peduncles axillary, usually by threes, 1-flowered, about equal in length to the petioles. ♄. S. Native of the valley of San Lorenzo, on the banks of the river Pansitara, between the city of Popayan and Almaguer, at the altitude of 1050 hexapods. Stems wrinkled, glabrous. Leaves opposite. ? Peduncles solitary, twin, or by threes. Corolla orange-coloured, glabrous. Said to be nearly allied to the preceding.

Solanum-like Besleria. Shrub 3 to 6 feet.

6 B. INCARNA'TA (Aubl. guian. 2. p. 635. t. 256.) leaves oblong, crenated, tomentose on both surfaces; peduncles axillary, solitary, 1-flowered; genitals exserted. ♃. S. Native of Guiana. Plant erect, herbaceous, tomentose. Stem tetragonal. Corollas purplish; tube long, ventricose: lobes of limb reflexed, roundish, unequal, fringed.

Flesh-coloured-flowered Besleria. Fl. ? Clt. 1820. Pl. 2 feet.

7 B. ? VIOLA'CEA (Aubl. guian. 2. p. 637. t. 254.) leaves ovate, acute, quite entire; peduncles racemosely panicled, terminal; stem scandent. ♄. S. Native of Guiana, in woods. Leaves glabrous, stiff. Flowers purple, size of those of *Lilac*. Calyx ventricose, 5-toothed, purple. Corolla with a curved tube and spreading limb. Berry purple, edible.

Var. β, *cærùlea* (Aubl. guian. 2. p. 631.) berries blue.

Violet-berried Besleria. Shrub climbing.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

VIII. HYPOCY'RTA (from ὑπο, *hypo*, under; and κυρτος, *cyrtos*, gibbous; the under part of the tube of the corolla exhibits a conspicuous gibbosity.) Mart. nov. gen. bras. 3. p. 48.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx free, deeply 5-parted. Corolla inferior, tubular, gibbous behind at the base, but, with the tube, ventricose in front: limb 5-lobed, or 5-toothed, nearly equal. Stamens 4, didynamous, with the rudiment of a fifth behind, which rises from the base of the tube; anthers cohering by pairs. Hypogynous ring bearing a gland behind. Berry globose, juicy, coloured, 1-celled. Seeds many, fixed to 2 2-lobed, parietal placentas (f. 68. f.)—Glabrous, or hairy shrubs, inordinately branched, extending and radicant, rarely erect. Leaves opposite, thickish, paler beneath, and shining, and often reddish. Flowers axillary, solitary, or aggregate, of a beautiful colour, such as scarlet, white, cream-coloured, and rose-coloured.—Some of the species grow upon old trees, or in humid places throughout tropical Brazil.

Sect. I. Codona'nthe (from κωδων, *kodon*, a bell; and ανθος, *anthos*, a flower; in reference to the campanulate tube of corolla.) Mart. nov. gen. bras. 3. p. 49. Tube of corolla sub-campanulate, a little more ventricose on the lower side; limb broadish.

1 H. GRA'CILIS (Mart. nov. gen. bras. 3. p. 50. t. 220.) glabrous; branches inordinate, ascending, rooting every where, loose, epidermis shining; leaves on short petioles, ovate, with sub-undulately-toothed edges; peduncles axillary, solitary, or twin; corollas sub-campanulately tubular: lobes rounded, spreading. ♄. S. Native of Brazil, in various places among stones, in humid places from Rio Janeiro to Para. Corollas glabrous, white outside, yellow inside, and spotted with red at the base. Branches obsoletely tetragonal.

Slender Hypocyrta. Shrub creeping.

2 H. AGGREGA'TA (Mart. l. c. p. 51. t. 221.) stem erect, nearly simple, hairy; leaves oblong, acuminated at both ends, quite entire, pilose in the young state; petioles and nerves hairy beneath; peduncles axillary, aggregate; calyxes vermillion coloured; corollas urceolate: lobes roundish, spreading. ♄. S. Native of Brazil, in the province of Rio Negro, in woods along the river Japura, near Manacuru and elsewhere. Stem terete, or obsoletely tetragonal. Corolla fine scarlet, finely pubescent outside.

Aggregate-flowered Hypocyrta. Shrub 4 to 6 feet.

Sect. II. Oncoga'stra (from ογκος, *oncos*, a hook; and γαστηρ, *gaster*, a belly; in allusion to the tube being gibbously ventricose downwards on the lower side.) Mart. nov. gen. bras. 3. p. 49. Tube of corolla very much gibbously ventricose downwards; limb short, toothed, erect.

3 H. HIRSU'TA (Mart. l. c. p. 52. t. 222.) stem erectish, or ascending, villously hairy at top; leaves on short petioles, obovate, bluntish, hairy; flowers axillary, solitary; corollas greatly swollen in front: limb contracted, erect, 5-toothed. ♄. S. Native of Brazil, in the mine provinces, in shady, stony places on the edges of woods, near Villa Rica and elsewhere. Stem flexuous, or obsoletely tetragonal. Corolla an inch long, scarlet, pubescent. (fig. 68.)

FIG. 68.

Hairy Hypocyrta. Shrub 1 to 1½ foot.

4 H. STRIGILLÒSA (Mart. l. c. p. 52.) stem erectish, villous at top; leaves on short petioles, oblong, acutish, mucronulate; flowers axillary, solitary; corollas coarsely ventricose in front; limb contracted, erect, 5-toothed. ♄. S. Native of Brazil, in the mine provinces, on the rocks of Mount Lenheiro, near St. Joâo d' El Rey and elsewhere; also on the mountains of Sincora, in the province of Bahia. Flowers similar to those of the preceding, except the calyx, which has the segments broader and acute, and the strigæ on the nerves of the leaves are more conspicuous than in the other parts, and the corolla is less pubescent. Perhaps belonging to the first section *Codonánthe*.

Strigillose Hypocyrta. Shrub 1 to 1½ foot.

5 H. CILIÒSA (Mart. l. c. p. 53.) hairy; stem decumbent, radicant; leaves broad-lanceolate, acuminated at both ends, a little serrated; flowers axillary, aggregate; calyxes subulate, purplish; corollas campanulately tubular: lobes roundish, spreading: lower one with bent in ciliæ. ♄. S. Native of Brazil, in the diocess of Japura, in woods at Manacuru. Stems rooting on trees, terete, purplish. Corolla more than an inch long, cream-coloured, pubescent; tube calcarately gibbous at the base behind, and widened upwards.

Ciliated-flowered Hypocyrta. Shrub creeping.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

IX. COLU'MNEA (a name given by Plumier, in honour of Fabius Columna, as he is commonly called, or Fabio Colonna, of the noble family of Colonna, in Italy; author of "Minus cognitarum stirpium Ecphrasis," Rome, 1616; and "Phytobasanos," 1 vol. 4to. Naples, 1592.) Plum. 33. Lin. gen. no. 792. Schreb. gen. no. 1060. Juss. gen. 121. ed. Usteri. p. 135. Mart. nov. gen. bras. 3. p. 56. t. 224. f. 2.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx inferior, 5-parted. Corolla tubular, straightish, gibbous behind at the base, ringent: upper lip erect, arched: lower one trifid, spreading. Stamens 4, didynamous; anthers connected with the rudiment of a fifth behind. Glands 1-5 around the ovarium. Berry 1-celled; placentas 2, parietal, 2-lobed. Seeds oblong. —Stems flexile, erect, or scandent. Leaves decussately opposite, thickish, hairy, or pubescent, somewhat serrated. Peduncles axillary, solitary, or crowded. Corollas scarlet.

1 C. SCA'NDENS (Lin. spec. 891.) leaves ovate, acute, serrated, rather villous; segments of calyx denticulated, and are, as well as the corollas, pubescent; upper lip of corolla undivided. ♄. S. Native of Guiana, and the West Indies, in humid, shady woods, climbing upon trees. Jacq. amer. pict. t. 179. hort.

vind. 3. p. 27. t. 48. Ker. bot. reg. 805.—Plum. gen. 28. t. 89. f. 1. Stem quadrangular. Leaves petiolate. Flowers solitary. Corollas scarlet, melliferous, hairy. The plant is called by the French in the West Indies *Liane de Sirop*.

Var. β; flowers yellow; fruit white. ♄. ◡. S. Colúmnea scándens flore lutescente, fructu albo, Plum. gen. 28.

Climbing Columnea. Fl. Aug. Sept. Clt. 1759. Shrub climbing.

2 C. HIRSU'TA (Swartz, prod. 94. fl. ind. occ. 2. p. 1080.) leaves ovate, acuminated, serrated, hairy above; calycine segments denticulated, and are, as well as the corollas, hairy. ♄. ◡. S. Native of Jamaica, at the roots of trees on the mountains in dense woods. Ait. hort. kew. 2. p. 366.—Archimènes, &c. Browne, jam. 270. t. 30. f. 3.—Sloan. hist. 1. p. 157. t. 100. f. 1. Leaves petiolate. Corollas villous, purplish, or pale red. Flowers usually twin.

Hairy Columnea. Fl. Aug. Nov. Clt. 1780. Shrub climbing.

3 C. RU'TILANS (Swartz, prod. p. 94. fl. ind. occid. 2. p. 1083.) leaves ovate-lanceolate, denticulated, rather scabrous, hairy, and coloured beneath; calycine segments jagged, and are, as well as the corollas, villous. ♄. ◡. S. Native of the interior of Jamaica, on the trunks of trees, in dense woods. Corollas reddish yellow.

Red-leaved Columnea. Fl. Aug. Sept. Clt. 1823. Shrub climbing.

4 C. HÍSPIDA (Swartz, prod. p. 94. fl. ind. occid. 2. p. 1083.) leaves ovate, obtuse, denticulated, hairy; calycine segments lanceolate, entire, pilose; stem pilosely scabrous. ♄. S. Native of the West of Jamaica, on shady rocks. Calyx blood-red. Corolla scarlet. ? Fruit white.

Hispid Columnea. Shrub 1 to 3 feet.

5 C. OVA'TA (Cav. icon. 4. p. 62. t. 391.) stems creeping and scandent; leaves ovate, crenated, rather hispid above, and somewhat tomentose beneath. ♄. ◡. S. Native of San Carlos de Chiloe. Peduncles terminal, solitary. Calycine segments tridentate. Corolla scarlet, beset with white hairs. Capsule 2-celled, ex Cav.

Ovate-leaved Columnea. Shrub creeping.

6 C. SCHIEDEA'NA (Schlecht, in Linnæa, 8. p. 249.) stems simple; leaves oblong-lanceolate, quite entire, clothed with silky villi; calycine segments ovate-lanceolate, entire, and are, as well as the corollas, spotted and villous. ♃. S. Native of Mexico, on old trees near Misantla, and near the Hacienda de La Laguna. Stems nodose, smoothish at bottom, but clothed with purplish villi at top. Leaves on short petioles, largest ones 5 inches long, and 1½ broad. Corolla 2 inches long, clothed with glandular villi, variegated with yellow and brown. Berry globose, white. Seeds oblong, acutish at both ends.

Schiede's Columnea. Shrub.

N.B. What is C. stellàta, Loir. coch. p. 384. ?

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

X. MITRA'RIA (from μιτρα, *mitra*, a mitre; in reference to the mitre-formed bractea which covers the calyx.) Cav. icon. 6. p. 57. t. 579. Mart. nov. gen. bras. 3. p. 66.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx inferior; limb 5-parted, equal, calyculated by a 2-lobed, mitre-formed bractea. Corolla tubularly-ventricose; upper lip of limb 2-lobed; lower one 3-lobed. Stamens 4, didynamous, exserted, with the rudiment of a fifth behind; anthers free. Berry 1-celled, many-seeded.—Habit of *Colúmnea*. Stems scandent. Leaves ovate, acute, serrated. Flowers axillary. Corollas scarlet.

1 M. COCCÍNEA (Cav. l. c.) ♄. ◡. S. Native of San Carlos de Chiloe.

Scarlet-flowered Mitraria. Shrub scandent.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XI. DRYMO'NIA (from δρυμος, *drymos*, an oak wood; in allusion to the plant growing on trees in woods.) Mart. nov. gen. bras. 3. p. 57.—Gesnèria species, Jacq. et Kunth.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx free, oblique, 5-leaved; leaflets imbricate, 2 interior. Corolla oblique, campanulately sub-ringent, gibbous at the base behind; throat spreading; upper lip 2-lobed; lower one 3-lobed. Stamens 4, didynamous, without any rudiment of a fifth; anthers free. Hypogynous disk, bearing an ovate gland behind. Capsule baccate, ovate, coriaceous, 1-celled, 2-valved; placentas 2, parietal, bilamellate. Seeds numerous, fusiform.—Shrubs climbing, and fixed by strong roots to trees, or lying upon the earth. Stems flexile, nearly terete, with a shining epidermis, inordinately branched. Leaves opposite, petiolate, serrated, pubescent from simple hairs, like all the herbaceous parts of the plant, thickish. Peduncles axillary, solitary, shortish, bractless. Corollas large, painted.

1 D. CALCARA'TA (Mart. l. c. p. 58. t. 224.) leaves ovate, rounded at the base, cordate, acute at the apex, and are, as well as the obliquely cordate-ovate, toothed segments of the calyx, downy; segments of corolla denticulated; anthers spurred at the base. ♄. S. Native of Brazil, in the province of Rio Negro, along the river Japura, on trees. Corolla large, white, striped with yellow, and spotted with purple. Calyx large.

Spurred-anthered Drymonia. Shrub climbing.

2 D. SPECTA'BILIS (Mart. l. c. p. 59.) leaves elliptic-oblong, acute, obsoletely toothed, clothed with adpressed pili; calycine segments ovate-oblong, obsoletely denticulated, clothed with adpressed hairs; segments of corolla crenulated, fringed, ex Bonpl. ♄. S. Native of New Granada, in woods on the banks of the river Smitha, between Villa La Sequia and the town of Popayan, at the altitude of 600 hexapods. Leaves 2-3 inches long. Corolla large, white, campanulate, downy outside; limb reddish.

Showy Drymonia. Shrub climbing.

3 D. JACQUI'NI; leaves oblong, acuminated at both ends, hairy, toothed; calycine segments serrated; limb of corolla sharply serrulated. ♄. S. Native of the West Indies. Beslèria serrulàta, Jacq. hort. schœnbr. 3. p. 21. t. 290. Leaves hairy, greenish above, and brownish purple beneath. Calyx large green. Corolla cream-coloured.

Jacquin's Drymonia. Fl. ? Clt. 1806. Shrub climbing.

4 D. ? GRANDIFLÒRA; leaves ovate-oblong, acuminated, crenated, densely pilose above, villous beneath, as well as on the branchlets; peduncles axillary, elongated, many-flowered; calycine segments ovate-oblong, acute, quite entire, densely pilose; corollas campanulate, villous; throat open. ♄. S. Native of New Granada, in humid woods between Paramo de San Fortunato and Fusagasuga, at the altitude of 1000 hexapods. Beslèria grandiflòra, H. B. et Kunth, nov. gen. amer. 2. p. 401. Leaves purplish beneath. Calyx purplish. Corolla campanulate, sub-gibbous at the base, villous outside, white, and glabrous inside: limb bilabiate, spotted with red. Anthers cohering cruciately with the rudiment of a fifth stamen.

Great-flowered Drymonia. Shrub.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XII. KLU'GIA (named after Fr. Klug, M.D.) Schlecht, in Linnæa, 8. p. 248.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx free, pentagonally 5-winged, 5-toothed. Corolla tubular: limb bilabiate: upper lip large, roundish entire: lower one small, 3-lobed. Stamens 4, nearly equal, without any rudiment of a fifth. Anthers approximating by pairs. Hypogynous disk narrow, glandular. Capsule membranous, free, 2-valved; placentas 2,

bilamellate. Seeds numerous, cylindrical.—An herb with alternate leaves, and somewhat grumose from minute down. Leaves unequal-sized. Flowers disposed in a terminal raceme. Habit of a species of *Cùphea*.

1 K. azu'rea (Schlecht, l. c.) ♃. S. Native of Mexico, at Cueste grande de Chiconquiaco. Root creeping. Stems simple, or branched, roughish from minute, spreading, stiff hairs. Leaves oblong-ovate, acuminated, vertical, entire, or repand, or obsoletely and sinuately-toothed, bluntish at the base, green above, and beset with short, thick, rufous hairs, paler beneath, and clothed with somewhat grumose, minute down; largest ones 4-5 inches long. Racemes usually solitary, downy. Corolla blue, 1½ inch long. Capsule elliptic, attenuated at both ends, 1-celled.

Azure-flowered Klugia. Pl. ½ to 1 foot.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XIII. TAPI'NA (from *ταπεινος*, *tapeinos*, humble; dwarf plants.) Mart. nov. gen. bras. 3. p. 59.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx free, 5-parted, unequal. Corolla funnel-shaped, sub-ringent, gibbous in front at the base; tube coarsely ventricose behind; throat contracted; limb erect; upper lip 2-lobed; lower one 3-lobed. Stamens 4, didynamous, with the rudiment of a fifth behind; anthers cohering. Hypogynous ring swelling into a gland behind. Capsule ovate, coriaceous, 1-celled, 2-valved; placentas 2, parietal, bilamellate. Seeds numerous, oblong.—Stems simple, or branched, rising from an underground tuber, and, like all the herb, soft and fleshy. Leaves petiolate, opposite. Peduncles axillary, 1-flowered, solitary, rarely twin.

1 T. barba'ta (Mart. l. c. p. 60. t. 225. f. 1.) stem branched; leaves oblong, or oblong-lanceolate, attenuated at both ends, acute, toothed; segments of calyx cordately sub-deltoid; corolla hairy outside. ♃. S. Native of Brazil, in the mine provinces, in dense woods near Almada; and in like marshy places on the road to Felisbert. Gesnèria barbàta, Nees, et Mart. in nov. act. bonn. 11. p. 48. Stems decumbent, throwing out roots at the base. Corolla white, suffused with red inside, above an inch long, much inflated below. (f. 69. a.)

FIG. 69.

Bearded-flowered Tapina. Pl. decumbent.

2 T. pusi'lla (Mart. l. c. p. 61. t. 225. f. 2.) stem simple, an inch high; leaves orbicularly-ovate, obtuse, crenated; calycine segments triangular; corolla downy outside. ♄. S. Native of the province of Rio Janeiro, in shady woods on Serra d' Estrella, Beyrich. Tuber size of a pea. Corolla 4-lines long, white, ventricose in the throat below.

Least Tapina. Pl. 1 inch.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XIV. NEMATA'NTHUS (from *νημα*, *nema*, a thread; and *ανθος*, *anthos*, a flower; in allusion to the flowers being hairy.) Schrad. in gött. gel. anz. 1821. 1. p. 719. Maximil. reise bras. 2. p. 108. and 343. Mart. nov. gen. bras. 3. p. 46.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx free, deeply 5-parted, oblique. Corolla inferior, campanulately funnel-shaped, oblique, gibbous at the base behind; throat spreading; limb equally 5-lobed. Stamens 4, didynamous, with a small rudiment of a fifth, or without; anthers cohering. Hypogynous ring swollen into an oblong gland behind. Capsule pyramidal, coriaceous, 1-celled, 2-valved; placentas 2, parietal, bilamellate. Seeds numerous, oblong.—Shrubs with simple, or irregularly branched stems, furnished with shining, cinereous epidermis, tumid at the nodi, climbing upon trees, and adhering to them by their roots. Leaves opposite, petiolate, thickish. Gemmation naked, with complicate leaves. Peduncles axillary, 1-flowered, bractless, very long and filiform, pendulous. Corollas large, showy, scarlet.

1 N. chlorone'ma (Mart. l. c. p. 47. t. 219.) leaves oblong-lanceolate, acuminated at both ends; calyxes and peduncles 2-4 inches long, green, clothed with white hairs. ♄. S. Native of the province of Rio Janeiro, in shady parts of woods on Mount Corcovado; and on Serra dos Orgaos. Leaves reddish beneath, or pale, glabrous, or ciliated. Calyx 1 to 1½ inch long, with glandularly denticulated margins. Corollas large, 2 inches long, scarlet, beset with white hairs outside. Filaments white.

Green-threaded Nematanthus. Shrub climbing.

2 N. Jone'ma (Schrad. l. c.) leaves broad-lanceolate, acuminated at both ends; calyx of a violaceous colour, clothed with hoary villi; peduncles 6 to 12 inches long, clothed with violaceous and white villi. ♄. ◡. S. Native of Brazil, in woods between Ilheos and St. Petro de Alcantara. Habit of the preceding. Calyx obscurely violaceous; segments shorter and narrower, hoary from white hairs. Corolla scarlet, a little smaller, beset with scattered, minute hairs.

Violet-threaded Nematanthus. Shrub climbing.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XV. ALLOPLE'CTUS (from *αλλος*, *allos*, diverse; and *πλεκω*, *pleco*, to plait; the calyx appears as if it was plaited in diverse directions.) Mart. nov. gen. bras. 3. p. 53.—Crántzia, Scop.—Orobánche species, Vellos. in Vand. script. t. 7. f. 18.—Gesnèria species, Lin., Aubl., Swartz, and Kunth.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx free, coloured, 5-cleft; segments imbricate, more or less combined, 2 interior. Corolla inferior, tubular or club-shaped, straightish; limb short, 5-lobed or 5-toothed. Stamens 4, didynamous, with a small rudiment of a fifth from the base of the tube. Hypogynous ring swollen into a gland behind. Capsule baccate, ovate, coriaceous, 1-celled, 2-valved. Seeds numerous, oblong.—Shrubs climbing on trees, and adhering to them by the roots, or by the clasping of the branches. Stems somewhat tetragonal above, and somewhat thickened at the nodi, rather flexile, and filled with medulla. Branches opposite. Leaves opposite, one in each pair smaller than the other, petiolate, fleshy, with scattered or decumbent, or erect down, the under surface generally reddish. Gemmation naked, with the young leaves complicate, villous, or hairy. Flowers axillary or many, aggregate, nearly sessile or racemose, furnished with coloured bracteas, or solitary, on long peduncles. Calyxes and bracteas scarlet or blood red. Corolla yellow. The species inhabit the humid parts of woods in tropical America, in which they are great ornaments to the trees, from the vivid colour of the calyxes and bracteas.

1 A. sparsiflòrus (Mart. nov. gen. bras. 3. p. 55. t. 223. f. 1.) leaves oblong, or oblong-lanceolate, attenuated at the base, acuminated, beset with fine strigæ; flowers nearly sessile, axillary, aggregate, or scattered; bracteas smaller than the orbicularly triangular segments of the calyx, which are, as well as the bracteas, of a deep blood colour, and almost quite entire; limb of corolla villous, 5-toothed. ♄. S. Native of Brazil, in the province of Rio Janeiro, climbing upon rocks and trees, in shady humid places near Corrego Seco, and elsewhere on Serra dos Orgaos; as well as on Serra de St. Geraldo, in the mine

provinces. Leaves 3-7 inches long, reddish beneath. Corolla yellow.

Scattered-flowered Alloplectus. Shrub climbing.

2 A. circina'tus (Mart. l. c. p. 56. t. 223. f. 2.) leaves oblong or broad-oblong, attenuated at the base, acuminated, finely strigillose; racemes axillary; peduncles nodulose; bracteas larger than the oblong, calycine segments, and are, as well as them, deep purple, and almost quite entire; limb of corolla villous, shortly 5-lobed, revolute. ♄. ◡. S. Native almost throughout Brazil, in moist parts of woods, climbing upon trees. Beslèria hirtélla, Schott. in œstr. med. jahrb. 42. p. 8.? Corollas yellow.

Circinate Alloplectus. Fl. July, Aug. Clt. 1824. Shrub climbing.

3 A. hi'spidus (Mart. l. c. p. 57.) leaves oblong-elliptic, acute, serrately crenated, hispid; peduncles axillary, solitary, 1-flowered; calycine segments ovate-lanceolate, sharply serrated, hispid; bracteas unknown. ♄. S. Native of New Granada, in humid places on the Andes of Popayan, and in the valley of the river Mayo, between Mamendoy and the town of Pasto, at the altitude of 1040 hexapods. Beslèria híspida, H. B. et Kunth, nov. gen. amer. 2. p. 399. Branches warted, hispid, while young. Leaves 2 inches long, and 1 broad. Corolla yellow, hispid from pili; limb oblique, 5-cleft, reflexed. Said to be nearly allied to *Beslèria cristàta*.

Hispid Alloplectus. Shrub climbing.

4 A. Ku'nthii; leaves ovate-oblong, subacuminated, denticulated, pilose above, and pilosely pubescent beneath, and purplish; peduncles axillary, few together, 1-flowered; calycine segments ovate, acuminated, denticulated, pilose, purplish; bracteas unknown. ♄. ◡. S. Native of New Granada, in shady places on the Andes, about Quindiu, and near the Villa La Erre; and in the plains of Sacandonoy, between the town of Almaguer and Pasto, at the altitude of 1000 to 1200 hexapods. Beslèria bícolor, H. B. et Kunth, nov. gen. amer. 2. p. 398. Branches hispid, subtetragonal. Corolla hairy, yellow, purple on the back, and somewhat gibbous at the base; limb somewhat 5-cleft, and sub-bilabiate.

Kunth's Alloplectus. Shrub climbing.

5 A.? calcara'tus; leaves oblong, subacuminated, crenately serrated at apex, pilose; peduncles axillary, 2-4-flowered; calyx hairy, with oblong, acuminated, denticulated, coloured segments; limb of corolla 5-lobed; bracteas unknown. ♄. S. Native of the Andes of Quindiu, near La Pamilla, at the altitude of 1130 hexapods. Beslèria calcaràta, H. B. et Kunth, nov. gen. amer. 2. p. 399. Branches fuscous, pilose, hispid while young. Corolla orange-yellow, glabrous, tubularly calceolate, spurred above at the base, and saccately inflated under the lower lip; spur short, straight, obtuse; throat constricted; lobes of limb rounded: 2 superior ones larger.

Spurred-flowered Alloplectus. Shrub 2 to 3 feet.

6 A. sangui'neus (Mart. l. c.) leaves obovate-oblong, acuminated, toothed, furnished with a few adpressed hairs, marked with purple spots beneath; flowers axillary, sessile; calycine segments deeply serrated, very hairy, coloured. ♄. S. Native of St. Domingo, and the Antilles; of New Granada, on Mount Quindiu, near El Passo del Machin, at the altitude of 1030 hexapods. Beslèria sanguínea, Pers. syn. 2. p. 165. Dalbergària phœnícea, Tussac. ant. 1. p. 141. t. 30. Calyxes more jagged than serrated. Corolla tubular, villous, gibbous, sub-bilabiate, ex Pers.; rudiment of a fifth stamen wanting.

Bloody-calyxed Alloplectus. Shrub climbing.?

7 A. crista'tus (Mart. l. c.) leaves ovate, serrated; peduncles axillary, solitary, 1-flowered; bracteas cordate, toothed, sessile, scarlet, as well as the calycine segments, which are serrated; corolla hairy outside; lobes rounded, entire. ♄. ◡. S. Native of Guiana and Martinico, in humid woods. Beslèria cristàta, Lin. syst. p. 468. Aubl. guian. 2. p. 637. Swartz, obs. 232. Jacq. amer. p. 188. t. 119. Mill. dict. no. 3.—Plum. gen. 29, with a figure. Corolla yellowish.

Crested-calyxed Alloplectus. Fl. June, Aug. Clt. 1739. Shrub climbing.

8 A. cocci'neus (Mart. l. c.) leaves ovate, glabrous, stiff, a little toothed; peduncles axillary, bearing 3-6 flowers in an umbel at top; bracteas 2, at the division of the common peduncle, orbicularly cordate, toothed, scarlet, like the calycine segments, which are serrated. ♄. ◡. S. Native of Guiana, in marshy parts of woods. Beslèria coccínea, Aubl. guian. 2. p. 632. t. 255. Corolla and fruit yellow.

Scarlet-calyxed Alloplectus. Fl.? Clt. 1819. Shrub climbing.

9 A. Schóttii; leaves ovate-lanceolate, quite entire, pubescent; flowers axillary, crowded, nearly sessile; calyxes red, denticulated, roundish; limb of corolla, which is clavate, erectish. ♄. ◡. S. Native of Brazil. Beslèria bícolor, Schott. in œstr. med. jahrb. 4. 2. p. 8. Beslèria díchrous, Spreng. syst. 2. p. 840.

Schott's Alloplectus. Shrub climbing.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XVI. EPI'SCIA (from επι, *epi*, upon; and σκια, *scia*, a shadow; so named because the species delight in shady places.) Mart. nov. gen. bras. 3. p. 39. Beslèria species of authors.

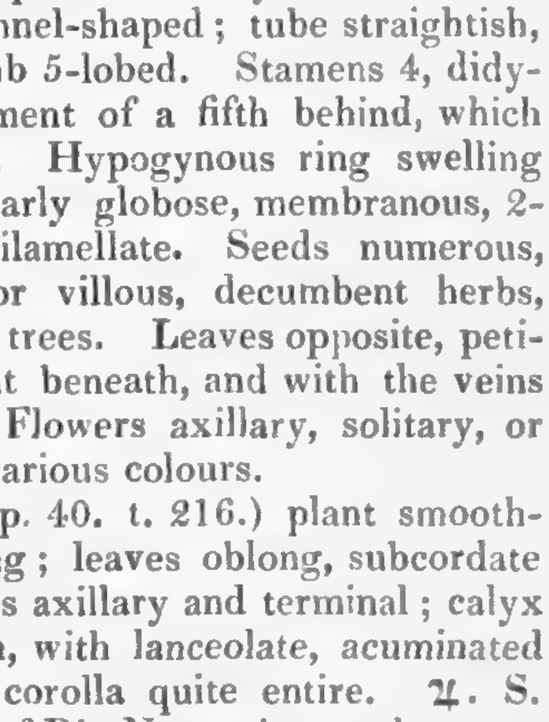
Lin. syst. *Didynàmia, Angiospérmia.* Calyx free, 5-cleft or 5-parted. Corolla inferior, funnel-shaped; tube straightish, gibbous behind at the base; limb 5-lobed. Stamens 4, didynamous, furnished with the rudiment of a fifth behind, which rises from the base of the tube. Hypogynous ring swelling into a gland behind. Capsule nearly globose, membranous, 2-valved; placentas 2, parietal, bilamellate. Seeds numerous, oblong.—Soft, juicy, glabrous, or villous, decumbent herbs, rooting upon the earth or decayed trees. Leaves opposite, petiolate; the middle nerve prominent beneath, and with the veins thick, anastomosing, and juicy. Flowers axillary, solitary, or in little cymes, and bracteate, of various colours.

1 E. decu'mbens (Mart. l. c. p. 40. t. 216.) plant smoothish; stems decumbent and creeping; leaves oblong, subcordate at the base, acute, crenated; cymes axillary and terminal; calyx about half as long as the corolla, with lanceolate, acuminated subserrated segments; lobes of corolla quite entire. ♃. S. Native of Brazil, in the province of Rio Negro, in marshy parts of dense woods, along the river Japura, &c., creeping on the trunks of decayed trees. Leaves 3-5 inches long, reddish beneath. Corolla white, $1\frac{1}{2}$ inch long.

Decumbent Episcia. Pl. 1 to 3 feet.

2 E. re'ptans (Mart. l. c. p. 41. t. 217.) plant pilosely hairy; stem sarmentose, radicant; leaves ovate, obtuse, crenated; peduncles solitary, axillary, 1-flowered; calycine segments linear-subspatulate, obtuse; lobes of corolla toothed. ♃. S. Native of Brazil, in thickets along the river Japura and elsewhere. Leaves whitish beneath. Corolla scarlet, hairy outside. (fig. 70.)

FIG. 70.



Creeping Episcia. Pl. creeping.

3 E. melittifòlia (Mart. l. c. p. 42.) pilose; stem erect; leaves ovate, acutish at both

ends, coarsely crenated; cymes axillary and terminal; calyx nearly equal in length to the tube of the corolla; calycine segments lanceolate, acuminated, subserrated; lobes of corolla quite entire. ♃. S. Native of Guiana and the Antilles. Beslèria melittifòlia, Lin. spec. p. 862. Aubl. guian. 2. p. 636. Smith, exot. bot. 1. t. 54. Beslèria melissæ Tragi folio, Plum. gen. p. 29. t. 5. icon. t. 48. Corolla purple. Capsule globose, size of a large pea, and, without doubt, 2-valved, but probably baccate from the umbilical funicles being long and fleshy. Seeds as in *E. réptans*.

Balm-leaved Episcia. Fl. July, Aug. Clt. 1789. Shrub 1 to 3 feet.

4 E.? pulche'lla (Mart. l. c.) stem erect; leaves oblong-ovate, wrinkled, crenated, running into the petioles, which are connate; cymes axillary; calyx pentagonal, coloured; lobes of corolla entire: lower ones the largest. ♃. S. Native of Trinidad. Beslèria pulchélla, Donn, hort. cant. p. 140. Sims, bot. mag. 1146. Beslèria umbellàta, Herb. Banks. Bracteas 2, opposite, under the corymbs. Calyx scarlet; segments serrated. Corolla yellow, striped with red. This differs from the other species of *Episcia*, in the calyx being tubular and 5-toothed, and of a reddish colour. The rudiment of the fifth stamen wanting. It is said to be nearly allied to *Beslèria lùtea*, and *B. coccínea*, Lin. but is probably a species of *Allopléctus*.

Neat Episcia. Fl. July, Aug. Clt. 1806. Pl. 2 to 3 feet.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

Tribe II.

Cyrtandra'ceæ (this tribe agrees with the genus *Cyrtándra* in the characters given below.) Calyx inferior. Fruit capsular and baccate, superior. Seeds exalbuminous.

Subtribe I.

Trichospòreæ (the plants contained in this tribe agree with the genus *Æschynánthus*, in the seeds being furnished with hairs at ends.) Blum. bijdr. 779. Fruit capsular, siliquose. Seeds pendulous, expanded at both ends, or only at the base or apex, into a setaceous or membranous wing.

XVII. TROMSDO'RFFIA (named in honour of J. B. Tromsdorff, who has written various works on the use of many plants, as well as analyzing their chemical parts.) Blum. bijdr. p. 762.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx tubular, 4-5-cleft; segments equal. Corolla funnel-shaped, widened upwards, with an unequal, somewhat bilabiate limb. Stamens 4, 2 of which only bear anthers; anthers 2-celled, cohering; cells equal in their insertion. Stigma broad, somewhat bilamellate. Capsule silique-formed, elongated, falsely 4-celled, 2-valved; lobes of the dissepiment, which is contrary, bearing the seeds on the margins, which are revolute. Seeds minute, pendulous, expanded at the base into a membranous wing.—Erect or radicant shrubs, with opposite or alternate, serrated leaves, and elongated, axillary peduncles. This genus is nearly allied to *Didymocárpus*, from which it differs in the seeds being furnished with a membranous wing at the base.

1 T. speciòsa (Blum. bijdr. p. 763.) stem erect; leaves opposite, nearly equal, elliptic-oblong, acuminated, unequally toothed, clothed with rough hairs above, downy beneath; peduncles crowded, bifid, or sometimes dichotomous; flowers diandrous. ♄. S. Native of Java, on the west side of the island, on the banks of rivers. Flowers showy, having the tube of a deep violet colour at bottom, and the throat sulphur-coloured. Filaments 4, villous at top.

Showy Tromsdorffia. Fl. Year. Shrub erect.

2 T.? elonga'ta (Blum. bijdr. p. 765.) stem climbing, radicant; leaves alternate, or the opposite one is very small, elliptic, attenuated at both ends, doubly serrated, downy; peduncles solitary, very long, bearing a many-flowered umbel at top; stamens didynamous. ♄. ◡. S. Native of the Moluccas. The fruit has not been seen, but the structure of the ovarium and ovula agree with those of the first species.

Elongated Tromsdorffia. Shrub climbing.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XVIII. ÆSCHYNA'NTHUS (from *αισχυνω*, *aischuno*, to be ashamed; and *ανθος*, *anthos*, a flower.) Jack. in Lin. trans. 14. p. 42. t. 2. f. 3. Wall. pl. rar. asiat. 1. p. 55. t. 71.—Trichósporum, D. Don. prod. fl. nep. p. 124. Blum. bijdr. p. 763. Incavíllea species of Roxb.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx ventricosely tubular, 5-cleft. Corolla tubular, incurved, with a dilated, campanulate throat, and an oblique, sub-bilabiate limb. Stamens 4, didynamous, exserted, usually with the rudiment of a fifth; anthers at first conniving by pairs; cells parallel. Stigma excavated, somewhat funnel-shaped. Capsule long, silique-formed, 2-valved, falsely 4-celled. Seeds small, generally scabrous from papillæ ending in a bristle-like tail at both ends.—Twining, radicant, parasitical shrubs; with opposite, simple, entire leaves, and axillary and terminal, few-flowered, umbellate peduncles.

1 Æ. radi'cans (Jack. in Lin. trans. 14. p. 43.) stem radicant; leaves ovate or oval, acute, sometimes almost cordate at the base, villous in the young state, veinless; peduncles axillary, sometimes terminal, 2-flowered, villous, bibracteate; calyxes villous. ♄. ◡. S. Native of Java and Sumatra, in woods, rooting on old trees. Trichósporum radìcans, Nees, ex Blum. bijdr. p. 764. Leaves 1-2 inches long. Flowers drooping. Corolla of a crimson colour, and villous outside, and sulphur coloured inside. The rudiment of the sterile stamen very small.

Radicant Æschynanthus. Shrub climbing.

2 Æ. volu'bilis (Jack. l. c. p. 42.) stem twining; leaves oval, acute at both ends, glabrous, with indistinct nerves; peduncles axillary, 2-flowered, bibracteate; pedicels longer than the peduncle; calyxes glabrous. ♄. ◠. S. Native of the neighbourhood of Bencoolen. The axils of the leaves are sometimes furnished with a flower-bearing branchlet, which has the appearance of a many-flowered peduncle. Corolla crimson-coloured.

Twining Æschynanthus. Shrub twining.

3 Æ. pu'lcher; stem radicant; leaves lanceolate, rounded at the base; peduncles 2-flowered, bibracteate, disposed in axillary and terminal fascicles. ♄. ◡. S. Native of Java, along with *Æ. radìcans*. Trichósporum púlchrum, Blum. bijdr. 764. Corollas scarlet.

Fair Æschynanthus. Fl. Year. Shrub creeping.

4 Æ. grandiflòrus; stem radicant; leaves long-lanceolate, nerveless; umbels terminal, many-flowered; lobes of corolla rounded, nearly equal. ♄. ◡. S. Native of the East of Bengal, in forests of Silhet, and on the Garrow hills, creeping upon trees. Incarvíllea parasítica, Roxb. cor. 2. p. 291. fl. ind. 3. p. 112. Trichósporum grandiflòrum, D. Don, in edinb. phil. journ. and prod. fl. nep. p. 125. Flowers large, drooping, colour of a beautiful mixture of orange and crimson, size of those of *Digitàlis*. Segments of calyx ovate. Style exserted.

Great-flowered Æschynanthus. Shrub creeping.

5 Æ. parviflòrus; stem radicant; leaves elliptic, acuminated, nerved; umbels terminal, few-flowered; superior lobes of corolla shorter, and acutish. ♄. ◡. S. Native of Lower Nipaul, creeping on the trunks of trees. Trichósporum parvi-

flòrum, D. Don, prod. fl. nep. p. 125. This species differs from the preceding, in the flowers being not one-third the size; in the segments of the calyx being linear; in the 2 superior lobes of corolla being shorter, and acutish; and, lastly, in the leaves being twice as broad, shorter, and nerved; as well as in the style being inclosed.

Small-flowered Æschynanthus. Shrub creeping.

6 *Æ.* oblongifòlius; downy; stem thick, tetragonal; leaves unequally ovate-oblong, acuminated, downy, serrulated; cymes axillary. ♄. S. Native of Chittagong, in mountain valleys common. Incarvíllea oblongifòlia, Roxb. fl. ind. 3. p. 112. Peduncles solitary, dichotomous, with a flower in each fork; and each division bearing 3-6 flowers, all very villous. Corollas large, like those of *Martýnia diándra*, colour a mixture of whitish-red, tinged with yellow; one pair of the filaments slender and abortive; the fertile pair thick and villous, bearing large 2-lobed anthers. The capsule is shorter and thicker than in the preceding species. The seeds are flat, and winged by a membranous margin all round. Perhaps a new genus.

Oblong-leaved Æschynanthus. Shrub.

7 *Æ.* ramosi'ssima (Wall. pl. rar. asiat. 1. p. 55. t. 71.) stem much branched, radicant; leaves oblong, acuminated; umbels terminal, many-flowered; corolla subclavate, clothed with glandular down. ♄. ◡. S. Native of Nipaul, in woods, creeping upon trees and on rocks. Capsule 4-angled, and 4-furrowed, compressed, 10 inches long, 1-celled, 4-valved. Seeds sometimes terminated by 2 bristles at apex, and ending in one at the base. Calyx tubular, 5-toothed. Corolla curved: lower lip 4-cleft: upper one bifid. Stigma clavate, plano convex at top. Corolla orange-coloured, reddish above. Very nearly allied to *Æ. grandiflòrus* (fig. 71.)

FIG. 71.

Much-branched Æschynanthus. Shrub creeping.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XIX. LYSIONO'TUS (from λυω, *luo*, to release; and νωτος, *notos*, the back; in reference to the capsule opening with elasticity from the dorsal suture.) D. Don, in edinb. phil. journ. 7. p. 86. prod. fl. nep. p. 124. Blum. bijdr. 764. Incarvíllea species, Wall.—Chirìta, Hamilt. mss.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx deeply 5-cleft or 5-parted, equal. Corolla tubular, incurved, with a dilated campanulate throat, and oblique, bilabiate, 5-lobed limb. Stamens 4, inclosed: 2 upper ones sterile, and shorter: and the 2 lower ones antheriferous; anthers linear, combined; cells parallel. Stigma capitate, sometimes funnel-shaped, with an excavated disk. Capsule long, silique-formed, 2-valved, falsely 4-celled, opening with elasticity from the dorsal suture. Seeds small, oblong-terete, muricated, ending in a hair at both ends, as in *Æschynánthus*.—Terrestrial or parasitical, glabrous, perennial herbs, with creeping roots and stems. Leaves opposite or verticillate, simple. Peduncles axillary and terminal, 1-flowered, solitary, or in fascicles, furnished with two opposite, involucral leaves at the base, and bibracteate in the middle.

1 L. serra'ta (D. Don, l. c.) root creeping; stems erect, glabrous, rather fleshy; leaves 3 in a whorl, oblong-lanceolate, acuminated, coriaceous, serrated, reticulately veined; corymbs pedunculate, 5-10-flowered, below the top of the stem. ♃. S. Native of Nipaul, upon trunks of trees and on rocks. L. ternifòlia, Wall. pl. asiat. rar. 2. p. 2. t. 118. Chirìta ternifòlia, Hamilt. mss. Plant glabrous. Peduncles verticillate or opposite, like the leaves. Corymbs twice or thrice trichotomous, furnished with 2 opposite bracteas under each division. Seeds terminated by a long simple hair at each end. Corollas large, pale blue.

Serrated-leaved Lysionotus. Pl. 1 foot.

2 L. angustifòlius (Blum. bijdr. p. 765.) stem radicant; lower leaves opposite: superior ones subverticillate, linear-lanceolate, bluntish, veinless; axillary flowers solitary: terminal ones aggregate. ♃. S. Native of Java, near Buitenzorg, creeping upon trees. Bignònia angustifòlia, Blum. hort. buit. p. 82. bat. verh. 9. p. 194. Trichósporum angustifòlium, Blum. in bot. zeit. no. 9. 1825.

Narrow-leaved Lysionotus. Fl. Year. Pl. creeping.

3 L. a'lbidus (Blum. bijdr. p. 765.) stem radicant; leaves oblong-lanceolate, rather crenulated, glabrous, veinless; peduncles disposed in axillary and terminal fascicles; bracteas minute, subulate. ♃. S. Native of Java, in the western provinces, in woods, where it is called *Mengando-Manjal*. Bignònia álbida, Blum. cat. hort. buit. p. 81. bat. verh. 9. p. 195. Thichósporum álbidum, Blum. bot. zeit. no. 9. 1825. Flowers whitish.

Whitish-flowered Lysionotus. Pl. creeping.

4 L. longiflòrus (Blum. bijdr. p. 766.) stem radicant; leaves opposite, oblong-lanceolate, or ovate-oblong, long-acuminated, quite entire, almost veinless, glabrous; flowers disposed in terminal fascicles. ♃. S. Native of Java, in the provinces of Tjanjor, Buitenzorg; and Bamtam, in woods on the mountains.

Var. β; leaves narrower. ♃. S. Native of Java, among the elevated woods of Mount Gede, upon old trees.

Long-flowered Lysionotus. Fl. Year. Pl. creeping.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XX. AGALMY'LA (from αγαλμα, *agalma*, an ornament; and ὕλη, *hule*, a wood; the species are great ornaments to the woods in which they grow wild.) Blum. bijdr. p. 766.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-parted, equal. Corolla tubular, incurved, with a dilated throat, and an oblique, 5-lobed, sub-bilabiate limb. Stamens 5, exserted, of which 2 or 4 are fertile; anthers linear, connected, with parallel cells. Stigma bilamellate. Capsule very long, silique-formed, 2-valved, falsely 4-celled. Seeds minute, ending in a hair at both ends.—Climbing or radicant herbs, with simple leaves, and axillary fascicles of flowers. This genus is nearly allied to *Lysionòtus*, from which it differs in the bilamellate stigma, and in habit.

1 A. stami'nea (Blum. bijdr. 767.) stem radicant, and is, as well as the petioles, hairy; leaves alternate, oblong, acuminated, denticulated, nearly equal at the base, downy beneath and on the edges; flowers diandrous, disposed in axillary fascicles. ♃. S. Native of Java, in mountain woods. Justícia parasítica, Lam. ill. 1. p. 42. Cyrtándra stamínea, Vahl, enum. 1. p. 105.

Long-*stamened* Agalmyla. Pl. creeping.

2 A. asperifòlia (Blum. bijdr. p. 767.) stem rather scandent; leaves opposite, elliptic-oblong, acuminated, denticulated, nearly equal at the base, rather hispid; flowers didynamous, disposed in axillary fascicles. ♃. S. Native of Java, in humid parts of woods in the province of Tjanjor.

Rough-leaved Agalmyla. Fl. Aug. Pl. climbing.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

Subtribe II.

DIDYMOCA'RPEÆ (the plants contained in this subtribe agree with the genus *Didymocárpus*, in the siliquose capsules and naked seeds.) All as in *Trichospòreæ*, except the seeds, which are not furnished with any hair at either end.

XXI. STREPTOCA'RPUS (from στρεπτος, *streptos*, twisted; and καρπος, *carpos*, a fruit; the capsule is spirally twisted.) (fig. 72. f.) Lindl. bot. reg. 1173. Didymocárpus species, Hook.

FIG. 72.

Lin. syst. *Diándria, Monogýnia.* Calyx 5-parted (fig. 72. a.) Corolla tubularly funnel-shaped; throat ventricose; limb oblique, 5-lobed, nearly equal. Stamens 4, the 2 anterior ones fertile, and the 2 sterile ones tubercle-formed (f. 72. d.); anthers glabrous, connate (f. 72. c.): cells divaricate. Style compressed; stigma bilabiately dilated: lips reniform. Capsule siliquose, spirally twisted; placentas bilamellate, conniving in the middle; margins revolute, seminiferous. Seeds numerous, minute, glabrous.—A tufted, stemless herb. Leaves wrinkled, flat on the ground. Peduncles radical, 1-flowered, bibracteate above the middle. Corollas pale blue.

1 S. Re'xii (Lindl. l. c.) 4. S. Native of South Africa, in the lands of Mr. G. Rex, at the Knysna, where it was discovered by Mr. Bowie. Didymocárpus Réxii, Hook. exot. fl. t. 227. Leaves ovate, crenated, 6-9 inches long, and 3-4 broad. Peduncles on the axils of the leaves. Corolla 2 inches long, pubescent. (Fig. 72.)

Rex's Streptocarpus. Fl. Year. Clt. 1824.? Pl. ½ foot.

Cult. A light rich earth or vegetable mould is a good soil for this plant; which is readily increased by division.

XXII. DIDYMOCA'RPUS (from διδυμος, *didymos*, twin; and καρπος, *karpos*, a fruit; in reference to the twin capsules.) Wall. ex Jack. in Lin. trans. 14. p. 32. D. Don, prod. fl. nep. p. 122.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-cleft. Corolla funnel-shaped, with a ventricose throat; limb 5-lobed; upper lip the shortest. Stamens 4, rarely 5, 2 of which are antheriferous, inclosed: sterile ones very short; anthers adnate: cells transverse. Stigma lateral, flattish, obtuse. Capsule silique-formed, falsely 4-celled, 2-valved; valves opening elastically from the dorsal suture. Lobes of dissepiment with revolute, seminiferous edges. Seeds naked, pendulous, ovate. Perennial, stemless, or caulescent herbs. Roots tufted, fibrous. Leaves usually cordate, crenated, wrinkled, hairy. Stems or scapes erect, simple. Flowers rose-coloured or purple, involucrated, disposed in dichotomous umbels.

§ 1. Scapi'geræ. *Stemless, scapigerous plants, with radical leaves.*

1 D. macrophy'lla (Wall. in litt. ex D. Don, prod. fl. nep. p. 122.) leaves cordate-oval, dentately serrated or crenated, villous above and nearly naked beneath; scapes glabrous, much shorter than the leaves; involucra and involucels roundish, quite entire, connate at the base; calycine segments roundish. 4. G. Native of Nipaul and Kamaon; from Jurreepanee upwards, towards Mussooree, and near Simla. Royle, ill. himal. t. 70. f. 2. Leaves large, usually solitary, 3-7 inches long, and 2½ or 5 inches broad. Petioles 3-4 inches long. Scapes equal in height to the petioles, rarely higher. Flowers and involucels purple.

Long-leaved Didymocarpus. Pl. ¼ to ½ foot.

2 D. cine'rea (D. Don, prod. fl. nep. p. 122.) leaves cordate-oval, obtuse, unequally crenated, clothed with cinereous tomentum above, as well as the petioles; scapes mealy, few-flowered, shorter than the leaves; involucra a little toothed, and are, as well as the involucels, clothed with greyish tomentum; calycine segments ovate, acute. 4. G. Native of Nipaul. Leaves 1½ to 2 inches long, about equal in length to the petioles, grey on both surfaces. Scapes filiform. Flowers large, purple.

Cinereous Didymocarpus. Pl. ¼ foot.

3 D. plica'ta (D. Don, l. c.) leaves twin, nearly sessile, orbicularly cordate, fleshy, rugosely plicate above, silky white, and lacunosely veined beneath, with revolute edges; scapes pubescent, many-flowered. 4. G. Native of Nipaul. Root much branched, fibrous, densely tufted. Leaves an inch long. Scapes 5 inches high.

Plicate-leaved Didymocarpus. Pl. ½ foot.

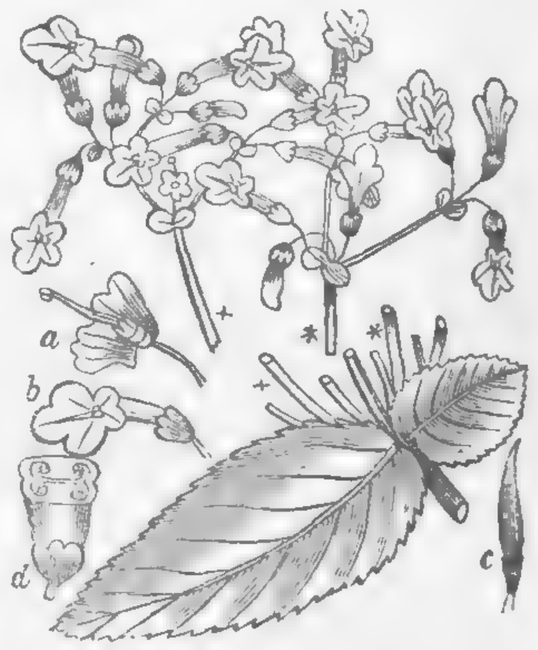
§ 2. *Caulescéntes. Caulescent plants.*

4 D. villòsa (D. Don, l. c. p. 123.) stem 4-leaved, very villous; leaves unequal, oval, petiolate, doubly crenated, clothed with silky villi on both surfaces; peduncles solitary, or twin, many-flowered, glabrous, longer than the leaves; calyxes smooth. 4. G. Native of Nipaul. Leaves 1-2 inches long, rounded at the base: radical ones none. Segments of calyx very short, rounded. Corolla large, purple.

Villous Didymocarpus. Pl. ¼ to ½ foot.

5 D. oblònga (Wall. pl. rar. asiat. 2. p. 34. t. 140. D. Don, prod. fl. nep. p. 123.) stem furnished with 2-4 leaves at top, woolly, or downy; leaves elliptic-oblong, or ovate-oblong, acuminated, rather villous; peduncles terminal, crowded, twice forked, with 2 sessile, cordate sessile bracteas under each bifurcation, downy. 4. G. Native of Nipaul, among rocks on Sheopore. Radical leaves none. Leaves 2½ inches long, and below an inch broad. Middle pedicels 1-flowered, and lateral ones generally 2-flowered. Corollas dark purple. Bracteas or involucral leaves quite entire, and are, as well as the calyxes, coloured. (Fig. 73.)

FIG. 73.



Oblong-leaved Didymocarpus. Pl. ¼ to ½ foot.

6 D. aroma'tica (Wall. in edinb. phil. journ. 1. p. 378. pl. rar. asiat. 2. p. 31. t. 141. D. Don, prod. fl. nep. 123.) stem leafy, pubescent; radical leaves few, pressed to the ground, ovate-cordate, obtuse, crenated, on short petioles, the two lower cauline ones broad-cordate, on long petioles, coarsely and

acutely toothed, and with two pairs of others at the top of the stem, which are crowded, ovate, acutely toothed; peduncles 2-3, terminal, twice or thrice dichotomous or trichotomous; central pedicels twin, or solitary: terminal ones by threes. ♃. G. Native of Nipaul and Kamaon, on rocks and trunks of trees. Plant pubescent. Bracteas or involucels cordate under each division of the peduncles. Calyx campanulate, fleshy, bluntly 5-toothed. Corollas purple. This species yields an aromatic drug, which is in high repute among the Hindoos, especially their ladies, who use it as a perfume. It is called *Kumkuma*, also *Rani-Goindhi*, and consists of the dried primordial leaves, which are wrinkled, small ovate, covered with dense silvery, soft hairs, intermixed with numerous brown, resinous dots. When rubbed between the fingers they assume a reddish tinge. Their fragrance is of a very delightful kind, and continues long after they have been dried. The leaves of all the species possess in a greater or less degree a peculiar fragrance, which is elicited by rubbing the green parts, but is entirely lost in the dried state, except in the present species.

Aromatic Didymocarpus. Pl. ½ to 1 foot.

7 D. PRIMULIFÒLIA (D. Don, prod. fl. nep. p. 123.) stem downy, bearing 4 crowded leaves at top; leaves cordate-oval, petiolate, twice crenated, wrinkled and silky on both surfaces; peduncles twin, many-flowered, and are, as well as the calyxes, pilose; bracteas or involucels roundish oval, mucronate, connate at the base. ♃. G. Native of Nipaul. Radical leaves none. Leaves very like those of *Primula vèris*. Calycine segments roundish. Corolla purple.

Primrose-leaved Didymocarpus. Pl. ¼ to ½ foot.

8 D. CRINÌTA (Jack. mal. misc. vol. 1. Lin. trans. 14. p. 33. t. 2. f. 2. a. i.) stem short, thick, erect; leaves alternate, long, spatulate, acute, serrated, pilose, red; peduncles 2-5 together, axillary, 1-flowered, cohering with the petioles at the base; calyx reddish, hairy. ♃. S. Native of Pulo-Penang, in the forests, where it is called *Timmu* by the natives. Root long, tapering. The whole plant hairy. Leaves crowded, nearly sessile, 9-10 inches long. Peduncles furnished each with 2 alternate bracteas. Corolla white, tinged with purple; tube incurved, swelling above; limb sub-bilabiate. Anthers composed of 2 divaricate, transverse lobes.

Long-haired Didymocarpus. Pl. 1 foot with the leaves.

9 D. RACEMÒSA (Jack. in Lin. trans. 14. p. 34.) stem erect; leaves opposite, lanceolate, attenuated at both ends, doubly serrated, glabrous above; peduncles axillary, usually bifid; flowers racemose, disposed in two rows along the rachis. ♃. S. Native of Sumatra, on the west coast at Tappanooly. Leaves crowded, on short petioles, spreading about 9 inches long; all the nerves on the under surface, and the midrib on the upper, pilose; petioles short, stem-clasping. Peduncles covered with purple, glandular hairs. Bracteas lanceolate, acuminated, serrated, ciliated. Corolla white. Calyx reddish, hairy. Capsule linear, hairy.

Racemose-flowered Didymocarpus. Pl. ½ foot.

10 D. REPTANS (Jack. l. c. p. 35.) prostrate, creeping; leaves petiolate, elliptic, crenulated; peduncles 1-3 together, axillary, 1-flowered. ♃. S. Native of Pulo-Penang, in the forests, where it is called *Timmu-Kichel* by the Malays. Stem villous. Leaves lying flat, slightly cordate, opposite, obtuse, covered with white hairs, rather reddish beneath. Petioles villous. Peduncles furnished with bracteas near the summit. Corolla white, funnel-shaped, somewhat irregular, similar to those of *D. crinìta*. Anthers approximate, reniform, 2-celled. Disk surrounding the ovarium, 5-toothed.

Creeping Didymocarpus. Pl. creeping.

11 D. CORNICULÀTA (Jack, l. c. p. 36.) villous; stem erect; leaves alternate, obovate, acuminated, serrated; flowers fastigiate, secund; peduncles solitary, axillary, elongated. ♃. S. Native of Sumatra, at Tappanooly. Peduncles bearing several dense fascicles of secund flowers, spreading in a kind of semicircle somewhat in the manner of *Lòtus corniculàtus*. Pedicels and calyxes covered with glandular hairs. Bracteas linear, acute. Corolla white, form of the genus; anthers cohering; cells transverse. The capsules spreading horizontally like radii in a semicircle, of which the peduncle is the axis.

Horned Didymocarpus. Pl. 1 to 2 feet.

12 D. BARBÀTA (Jack. l. c. p. 38.) shrubby, erect; leaves opposite, ovate, somewhat unequal sided, hairy; peduncles slender, axillary, fascicled, 2-6-flowered; stamens 4, bearded at top, 2 of which are sterile; calyx smooth, funnel-shaped. ♄. S. Native of Sumatra. Branches scabrous. Leaves petiolate, entire, strigose above. Peduncles bifid, or trifid, sometimes again divided, so as to be dichotomous. At each division of the peduncle is situated a funnel-shaped bracteal cup, apparently composed of two opposite bracteas, which are united nearly their whole length. In the axillæ at the base of the peduncles the bracteas are distinct and woolly. Mouth of calyx 5-cleft. Corolla with nearly equal, rounded segments. Anthers with transverse lobes. Stigma sublobate.

Bearded-stamened Didymocarpus. Shrub.

13 D. ELONGÀTA (Jack, l. c. p. 37.) erect, pilose; leaves opposite, ovate, acute at both ends, serrated; spikes axillary, secund; pedicels binate, remote; calyx tomentose, as well as the spike; corolla elongated. ♃. S. Native of Pulo Bintangor, an island lying off the west coast of Sumatra. Leaves petiolate, papillose and pilose above, but villous beneath; petioles ciliated. Bracteas linear at the base of the pedicels. Corolla tubular, a little curved, white, with a purplish tinge, slightly tomentose; limb bilabiate: lower lip elongated. Stamens 4, all fertile and didynamous; anthers connected by pairs, 2-lobed, reniform. Stigma thickened, emarginate.

Elongated-flowered Didymocarpus. Pl. ½ foot.

14 D. FRUTE'SCENS (Jack, mal. misc. vol. 1. Lin. trans. l. c. p. 39.) stem suffrutescent, erect; leaves opposite, on long petioles, ovate-lanceolate, attenuated at both ends, glabrous above, canescent beneath; flowers axillary, fascicled; stamens didynamous; calyx tomentose, with glandular hairs. ♄. S. Native of Pulo Penang. Stem simple, densely covered with ferruginous, adpressed scales, or chaffy hairs. Leaves slightly serrated, 8-10 inches long, tomentose beneath; petioles villous. Peduncles 1-3-flowered, shorter than the petioles, purplish. Bracteas lanceolate, acute. Calyx tubular, 5-parted. Corolla white, tomentose, incurved; segments obtuse. Anthers connected by pairs, adnate, consisting of 2 nearly parallel lobes. Stigma truncate.

Shrubby Didymocarpus. Shrub.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

XXIII. CHIRÀTA (altered from the vernacular name of one of the species.) Hamilt. mss. D. Don, prod. fl. nep. p. 89. Royle, ill. himal. t. 70. Wall. pl. rar. asiat. 1. p. 43. t. 50.—Calosácme, Wall.—Didymocárpus species, Wall.

LIN. SYST. *Didynàmia, Angiospérmia.* Calyx deciduous, tubular, 5-cleft. Corolla tubular at the base, ventricose at top; limb campanulate, 5-lobed, bilabiate; lobes rounded, imbricate in æstivation. Stamens 2, antheriferous, inclosed, sometimes without any rudiments of sterile ones, and sometimes with 3; filaments glabrous; anthers roundish, naked, adnate. Stigma bipartite; lobes linear, obtuse. Capsule siliquose, 2-celled,

many-seeded; dissepiment parallel. Seeds naked, acute at both ends.—Perennial hairy herbs. Stems simple. Leaves opposite, unequal in size. Peduncles axillary, opposite, bibracteate, usually 1-flowered. Flowers large red, or purple.

1 C. urticifòlia (Hamilt. mss. ex D. Don, prod. fl. nep. p. 90.) leaves elliptic, acute, nearly equal, serrated; peduncles 1-flowered, shorter than the leaves; calycine segments linear-lanceolate, obtuse. ♃. G. Native of Nipaul, at Narainhetty. Didymocárpus speciòsus, Wall. mss. Stem ascending, rooting at the base, tetragonal, hairy. Leaves often 4 inches long. Bractea ovate-oblong, bluntish, remote from the flower. Flowers reddish purple, size of those of *Digitàlis purpùrea*.

Nettle-leaved Chirata. Pl. ½ to 1 foot.

2 C. pu'mila (D. Don, prod. fl. nep. p. 90.) leaves unequal, elliptic, bluntish, serrated, red beneath; peduncles 2-flowered, about equal in length to the leaves. ♃. G. Native of Nipaul. Stem low, tetragonal. Larger leaves 2½ inches long, and 1½ inch broad. Peduncles bibracteate in the middle. Very like the preceding, but much more humble, and the flowers smaller.

Dwarf Chirata. Pl. ¼ foot.

3 C. bifòlia (D. Don, prod. fl. nep. p. 90. Royle, ill. himal. t. 70.) stem 2-leaved, pubescent; leaves very unequal in size, pubescent, crenated, the one small and petiolate, and the other large, cordate, sessile; peduncle terminal, 1-flowered. ♃. G. Native of Nipaul and Kamaon, Wall.; from Jurreepanee upwards towards Mussooree, and near Simla, Royle. Didymocárpus bifòlia, Wall. in lit. Calosácme ampléctens, Wall. cat. no. 800. Stem filiform. Largest leaf 2 inches long, and 1½ broad, rounded at top. Flowers like those of the preceding, reddish purple, but smaller.

Two-leaved Chirata. Pl. ¼ foot.

4 C. macrophy'lla (Wall. pl. rar. asiat. 1. p. 56. t. 72.) root creeping; leaves on long petioles, ovate-cordate; scape elongated, few-flowered; corolla cylindrical, ventricose in the middle. ♃. G. Native of Nipaul, on Sheopore, in shady woods. Corolla yellow. Stamens 5, the 3 sterile ones subcapitate. Anthers oblong.

Large-leaved Chirata. Pl. 2 feet.

5 C. grandiflòra (Wall. pl. asiat. rar. 1. p. 43. t. 50.) stem ascending; leaves ovate, acuminated, pilose; peduncles axillary, few-flowered. ♃. G. Native of Nipaul, on the high mountains in humid places, upon rocks. Flowers large, rose-coloured. Calyx 5-nerved, 5-angled, 5-cleft, inflated. Corolla funnel-shaped, pilose. Stamens 5, the 2 lower fertile, bearing reniform, cohering, 1-celled anthers; the 3 sterile ones subulate, pilose, and subcapitate. Stigma funnel-shaped, 2-lobed. Seeds small, subulate, naked, acute at both ends.

Great-flowered Chirata. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

Subtribe III.

CYRTA'NDREÆ (this tribe contains plants agreeing with the genus *Cyrtándra*, in the fruit being baccate, and in the seeds being erect.) Fruit baccate. Seeds pendulous, naked.

XXIV. CYRTA'NDRA (from κυρτος, *kyrtos*, a curve; and ανηρ ανδρος, *aner andros*, a male.) Forst. gen. 3. no. 1. Jack, in Lin. trans. 14. p. 25. t. 2. f. 1. a. g. Blum. bijdr. 767. Gaud. in Freyc. voy. pt. bot. p. 446. t. 56. &c. Beslèria species, Forst. prod. no. 236.

Lin. syst. *Diándria*, *Monogýnia*. Calyx tubular, 5-cleft, nearly equal, or sometimes somewhat bilabiate. Corolla funnel-shaped, having the tube widened upwards; the limb 5-lobed and sub-bilabiate. Stamens 5, ex Blume, 4, ex Jack, 2 of which are antheriferous, the other 2 or 3 sterile; cells of anthers parallel. Stigma obtuse, or capitate, often emarginate. Fruit baccate, longer than the calyx. Lobes of dissepiment with revolute, seminiferous margins. Seeds naked, usually pitted, or dotted.—Shrubs or herbs with erect or procumbent stems. Leaves opposite, those opposed to each other unequal in size, one of them being almost abortive. Flowers capitate, or in fascicles, rarely solitary, axillary, bracteate, or involucrated, white, or of a dull purple colour.

§ I. *Stems herbaceous, procumbent, or erectish. Flowers white, capitate, almost inclosed in the large one-leaved involucrum.—Species natives of Java and Sumatra.*

1 C. gla'bra (Jack, in Lin. trans. 14. p. 28. Blum. bijdr. p. 768.) almost stemless; leaves alternate, (the opposed ones being very small, and almost abortive,) on long petioles, broad-ovate, sometimes subcordate at the base, serrulated, glabrous; heads of flowers on short peduncles, involucrated; involucrum large, campanulate, closely embracing the flowers. ♃. S. Native of Java, in the humid parts of woods in the provinces of Bamtam, Buitenzorg, &c. Blume. Interior of Bencoolen, Jack. Flowers large, white, with a pale yellowish throat. Antheriferous filaments thick. Leaves about 7 inches long by 5 broad.

Glabrous Cyrtandra. Pl. ¼ to ½ foot.

2 C. pe'ndula (Blum. bijdr. p. 768.) stem creeping at bottom; leaves opposite, on long petioles, elliptic-oblong, acuminated, serrated, smooth above, but rather villous on the nerves beneath; heads of flowers involucrated on long peduncles, pendulous. ♃. S. Native of Java, in humid places on the mountains. Flowers dirty white, dotted with purple at the bottom. Calyx tubular, 5-cleft, split on one side. Sterile stamens 3, minute. Nearly allied to *C. bícolor*.

Pendulous-flowered Cyrtandra. Pl. creeping.

3 C. bi'color (Jack, in Lin. trans. 14. p. 27.) stem erectish, creeping at bottom; ? leaves opposite, elliptic-lanceolate, cordate at the base, glabrous above, villous and purple beneath, about the length of the petioles; heads of flowers on peduncles which are shorter than the petioles, embraced by a deciduous involucrum. ♃. S. Native of Sumatra. Leaves on long petioles, 9-10 inches long, the opposite ones nearly abortive. Peduncles reflexed, bearing each a head of 6-10 flowers. Corollas large, white. Sterile filaments 2.

Two-coloured-leaved Cyrtandra. Pl. erectish.

4 C. pi'cta (Blume, bijdr. p. 769.) stems procumbent at bottom; leaves remote, opposite, one of which is almost abortive, on long petioles, broad-ovate, acute, a little attenuated at the base, or subcordate, serrated, but rather villous on the nerves beneath; heads of flowers involucrated, axillary, almost sessile. ♃. S. Native of Java, in humid places on the mountains. Flowers large, white, having the throat dotted with purple. Stigma dilated, obtuse. Sterile stamens 3, minute. Nearly allied to *C. maculàta*.

Painted-flowered Cyrtandra. Pl. procumbent.

5 C. macula'ta (Jack, in Lin. trans. 14. p. 26.) plant low; leaves opposite, one abortive, the other roundish cordate, acute, serrated, glabrous above, and rather villous beneath, petiolate; heads of flowers involucrated, axillary. ♃. S. Native of Sumatra. Leaves 4 inches long by 4½ broad. Calyx tubular, 5-toothed. Corolla white, with a large purple spot on each of the 3 lower lobes. Sterile stamens 2. Fruit oblong. Seeds disposed round the lobes of the dissepiment.

Spotted-flowered Cyrtandra. Pl. low.

6 C. hu'milis (Blum. bijdr. 769.) stem procumbent, creeping; leaves approximate, opposite, on long petioles, oval oblong,

obtuse at both ends, rounded at the base, serrated, glabrous above, but rather downy on the veins beneath; heads of flowers axillary, involucrated, sessile. ♃. S. Native of the island of Nusæ-Kambanga, in woods. Corolla pale yellowish. Filaments of the fertile stamens rather villous on the back. Stigma emarginate. Nearly allied to *C. pícta*.

Humble Cyrtandra. Pl. creeping.

7 C. macrophy'lla (Jack, in Lin. trans. 14. p. 25. t. 2. f. 1. a. g.) erectish; branches 4-sided, with rounded angles, and two opposite sides deeply furrowed; leaves roundish-ovate, serrated, glabrous, the opposite ones abortive, on long petioles; peduncles shorter than the petioles; flowers capitate, nearly sessile, supported by a 1-leaved involucrum. ♃. S. Native of the interior of Sumatra. Leaves dark green above, and whitish beneath. Corollas white. Sterile filaments 2. Stigma funnel-shaped.

Large-leaved Cyrtandra. Pl. 1 foot.

8 C. hirsu'ta (Jack, l. c. p. 27.) plant ascending, pilose; leaves elliptic-ovate, cordate at the base, crenated, pilose on both surfaces, on long petioles, the opposed ones generally abortive; heads few-flowered, involucrated by a 2-parted involucrum. ♃. S. Native of Sumatra. Stem terete. Leaves 5 inches long, and 3 broad; petioles as long as the leaves, embracing the stem at the base, and uniting with the base of the opposite one. Peduncles axillary, reflexed, villous. Corolla white, pilose outside. Stigma thick, depressed. Sterile filaments 2.

Hairy Cyrtandra. Pl. ascending.

9 C. incómpta (Jack, l. c. p. 29.) plant erect, shaggy with brown hairs; leaves elliptic-ovate, serrated, on long petioles, the opposed ones abortive; heads of flowers propped by a 2-leaved involucrum, densely woolly. ♃. S. Native of Sumatra, where it is called *Langkavang* by the Malays. Leaves villous, 6 inches long. Peduncles shorter than the petioles. Corolla villous; limb nearly equal. Ovarium embraced by a nectarial ring.

Undecked Cyrtandra. Pl. erect.

10 C. au'rea (Jack, l. c.) showy, erect; stem thick, 4-sided, pilose from adpressed hairs; leaves opposite, roundish ovate, acuminated, serrated, clothed with silky pili, on long petioles; heads of flowers dense, nearly sessile, involucrated. ♃. S. Native of the interior of Bencoolen, at the foot of Gunong Bunko. Leaves both perfect. Involucrum closely investing the head of flowers. Corolla yellow, sub-campanulate: limb nearly equal. Stigma bilabiate.

Golden-flowered Cyrtandra. Pl. erect.

11 C. pelta'ta (Jack, l. c. p. 30.) leaves peltate, ovate, acuminated; heads on very short peduncles, involucrated. ♃. S. Native of Sumatra. Stem ascending, terete, smooth. Leaves on long petioles, the opposite petioles, abortive, bluntly serrated, smooth, paler beneath, 8-10 inches long. Corolla white, funnel-shaped; limb rather irregular. Sterile filaments 2. Ovarium embraced by a nectarial ring.

Peltate-leaved Cyrtandra. Pl. ascending.

§ 2. *Stems herbaceous. Peduncles bibracteate,* 1-2-3-*flowered. Flowers not capitate.—Species natives of the Sandwich Islands.*

12 C. cordifòlia (Gaud. in Freyc. voy. pt. bot. p. 446. t. 56.) leaves roundish-ovate, acute, obliquely cordate, toothed, hairy above, but clothed with villous tomentum beneath, rusty; peduncles 3-flowered; calyxes clothed with rusty villi. ♃. S. Native of the Sandwich Islands, from the altitude of 100 to 300 hexapods, along with the following species.

Cordate-leaved Cyrtandra. Pl. erect.

13 C. grandiflòra (Gaud. l. c. p. 447. t. 55.) leaves oblong, acuminated, narrowed at the base, obsoletely denticulated, ciliated, smoothish above, but paler beneath, with the nerves and veins clothed with powdery down; peduncles 2-leaved and 2-flowered at the apex; calyxes glabrous. ♃. S. Native of the Sandwich Islands.

Great-flowered Cyrtandra. Pl. erect.

14 C. Lessonia'na (Gaud. l. c. t. 54.) leaves oblong, acuminated, narrowed at the base, denticulated, puberulous above, but clothed with silky tomentum beneath, rusty; peduncles 1-flowered, bibracteate; calyx rather villous, 5-parted, with the edges of the segments undulately inflexed. ♃. S. Native of the Sandwich Islands.

Lesson's Cyrtandra. Pl. erect.

15 C. triflòra (Gaud. l. c. t. 52.) leaves oblong, sub-acuminated, cuneated at the base, somewhat doubly serrated, glabrous; nerves and veins clothed with adpressed down beneath; peduncles 3-flowered; calyxes smoothish. ♃. S. Native of the Sandwich Islands.

Three-flowered Cyrtandra. Pl. erect.

16 C. biflòra (Forst. gen. 3. no. 1.) leaves ovate, quite entire; involucrum caducous, inflated; peduncles 2-flowered. ♃. G. Native of Otaheite. Beslèria biflòra, Forst. floral. no. 236.

Two-flowered Cyrtandra. Pl. erect.

17 C. Carnotia'na (Gaud. l. c. t. 53.) leaves elliptic-oblong, acute, running into the petioles, remotely serrulated, hairy above, and clothed with soft tomentose pubescence beneath, canescent; peduncles few-flowered, subdichotomous; calyxes villously pubescent. ♃. S. Native of the Sandwich Islands.

Carnoti's Cyrtandra. Pl. erect.

18 C. paludòsa (Jack, l. c. p. 447.) leaves oblong, acuminated, narrowed at the base, coarsely serrated, glabrous, paler beneath; peduncles 1-flowered. ♃. S. Native of the Sandwich Islands.

Marsh Cyrtandra. Pl. erect.

19 C. Menzie'sii (Hook. et Arn. in Beech. voy. pt. bot. p. 91.) leaves 4 in a whorl, ? oblong, short-acuminated, cuneated at the base, somewhat denticulately ciliated towards the apex, rather scabrous above, glabrous beneath, but the nerves and veins are clothed with adpressed down; peduncles bearing many flowers, which are disposed in an umbellate manner; calyx hairy, with subulate teeth. ♃. S. Native of the Sandwich Islands.

Menzies's Cyrtandra. Pl. erect.

§ 3. *Stems suffruticose, erect. Corollas bilabiate, dirty purplish, or dirty yellow, for the most part small, and disposed in fascicles. Habit different from the other sections, and have more resemblance to the Didymocárpus frutéscens. The species of this section might form a distinct genus, on account of their bilabiate corolla and longer fruit, and in the whole superfices of the lobes of the dissepiment being seminiferous.*

20 C. pilòsa (Blum. bijdr. p. 770.) stem ascending, simple, tetragonal at top; leaves opposite, obovate-oblong, sharply serrated, sessile, pilose above, and strigose on the veins beneath; fascicles many-flowered, on short peduncles, axillary, involucrated by foliaceous bracteas. ♄. S. Native of Java, in humid places on the mountains of Salak, Gede, Seribu, &c. Flowers dirty yellow, having the lower lip reddish inside, and 3-lobed: upper lip emarginate, smaller. Sterile filaments 3, small. Allied to *C. rubiginòsa*.

Pilose Cyrtandra. Shrub small.

21 C. rubiginòsa (Jack, in Lin. trans. 14. p. 32.) stem erect, 4-angled, bristly in the young parts; leaves opposite, petiolate, obovate-lanceolate, acuminated, acutely serrated; the nerves pilose on the lower surfaces; peduncles axillary, fascicled, 1-flowered, and, like the calyxes, clothed with clammy pili. ♄. S. Native of Sumatra. Bracteas linear, acute. Corolla of a dusky purple colour, pilose outside: lower lip of 3 small shallow lobes: upper lip bifid, shorter. Stigma bluntly bilabiate. Berry cylindrical. Sterile filaments 2.

Rusty Cyrtandra. Shrub small.

22 C. sulca'ta (Blum. bijdr. p. 770.) stem erect, tetragonal, furrowed above, clothed with brown tomentum; leaves opposite, petiolate, oblong, long-acuminated, unequally narrowed at the base, unequally and sharply serrated at top, smoothish above, but rather villous on the nerves beneath; fascicles of flowers almost sessile, axillary, bracteate. ♄. S. Native of Java, on Mount Megamendung. Corolla dirty purple: upper lip 2-lobed: lower one larger and 3-lobed. Sterile filaments 3, small.

Var. β; leaves larger; flowers white. ♄. S. Native of Java, on the Seribu mountains.

Furrowed Cyrtandra. Shrub small.

23 C. nemoròsa (Blum. bijdr. p. 771.) stem erect, tetragonal, downy at top; leaves opposite, petiolate, oblong, acuminated, obliquely attenuated at the base, unequally and deeply serrated, rather downy on the veins on both surfaces; fascicles of flowers pedunculate. ♄. S. Native of Java, in groves. Calyx sub-bilabiate: lower lip bifid: upper trifid. Corolla bilabiate: upper lip emarginate, brown: lower lip 3-lobed, and larger, dirty white, and brownish in the throat. The fertile filaments are thickened at top; and the middle one of the 3 sterile shortest.

Grove Cyrtandra. Shrub small.

24 C. rostra'ta (Blum. bijdr. 771.) stem almost terete, erectish; superior leaves alternate, those opposed being very small, petiolate, oblong, beaked, unequally attenuated at the base, and unequally and sharply serrated at top, glabrous above, but rather villous on the ribs beneath; fascicles of flowers pedunculate, axillary. ♄. S. Native of Java, in woods on the Seribu mountains, and on mount Salak. Corolla dirty purple, rather villous outside, sub-bilabiate, with a gibbous throat. Sterile filaments 3. Nearly allied to *C. nemoròsa* and *C. sulcàta*.

Var. β; flowers purple and white. ♄. S.

Beaked-leaved Cyrtandra. Shrub small.

25 C. flave'scens (Blum. bijdr. p. 772.) stem terete, erectish; leaves opposite, petiolate, oblong-lanceolate, acuminated at both ends, unequally and remotely serrated, downy on the veins beneath; flowers solitary, axillary, almost sessile. ♄. S. Native of the Island of Nusæ-Kambanga, in humid places among bushes. Corolla sulphur-coloured, funnel-shaped, bilabiate, rather villous outside. Sterile filaments 2, minute.

Yellowish-flowered Cyrtandra. Shrub small.

26 C. cocci'nea (Blum. bijdr. p. 772.) stem erect, tetragonal; leaves opposite, on long petioles, oblong, acuminated, glandularly serrated, oblique at the base, having the ribs for the most part blood-coloured beneath, smooth; fascicles of flowers pedunculate, axillary, umbellate. ♄. S. Native of Java, in woods in the interior. Calyx ventricose, 5-cleft, sub-bilabiate. Corolla somewhat bilabiate, scarlet, sometimes whitish-brown. Sterile filaments 3, minute. Berry elongated, beaked.

Scarlet-flowered Cyrtandra. Shrub small.

27 C. Cele'bica (Blum. bijdr. p. 772.) stem erect, tetragonal; leaves opposite, on long petioles, elliptic-oblong, acuminated, unequally attenuated at the base, crenulated, glabrous, but clothed with cobwebbed down while young; fascicles of flowers panicled, axillary. ♄. S. Native of the Celebes, in woods. Allied to *C. coccínea*, from which it differs in the fascicles of flowers being panicled.

Celebes Cyrtandra. Shrub small.

28 C. gra'ndis (Blum. bijdr. p. 773.) stem erect, nearly terete; leaves opposite, on long petioles, elliptic-ovate, acute, sometimes obliquely cordate at the base, doubly and glandularly serrated, sometimes tomentose beneath on the nerves and veins; fascicles of flowers pedunculate, axillary, involucrated; involucrum bifid. ♄. S. Native of Java, in the higher woods on mounts Gede and Salak.

Var. β; leaves deeply serrated. ♄. S.

Great Cyrtandra. Shrub.

29 C. arbore'scens (Blum. bijdr. p. 773.) stem erect, tetragonal; leaves large, opposite, elliptic-oblong, running into the petioles at the base, unequally toothed, smooth above, but rather tomentose beneath; heads of flowers pedunculate, involucrated; involucrum large, foliaceous, bifid. ♄. S. Native of Java, in the province of Tjangor, on the mountains, in humid parts of woods.

Arborescent Cyrtandra. Shrub.

30 C. cunea'ta (Blum. bijdr. p. 773.) stem erect, tetragonal; leaves opposite, the one smaller than the other, petiolate, cuneate-oblong, acuminated, obsoletely denticulated at top, smoothish above, but rather strigose on the veins beneath; umbels axillary, on long peduncles. ♄. S. Native of the Moluccas.

Cuneate-leaved Cyrtandra. Shrub.

31 C. frute'scens (Jack, in Lin. trans. 14. p. 31.) stem erect; leaves opposite, lanceolate, serrated, glabrous, petiolate; peduncles axillary, generally 3-flowered, not so long as the petioles. ♄. S. Native of Sumatra. Leaves 7-9 inches long. Bracteas linear at the base of the pedicels. Calycine segments subulate. Corolla purplish: lower lip longer, 3-lobed; lobes shallow. Sterile filaments 2. Stigma dilated, sub-bilabiate. Berry cylindrical: lobes of the dissepiment revolute, and seminiferous on their whole surfaces, like most of the other species in this section.

Shrubby Cyrtandra. Shrub.

Cult. For culture and propagation of the herbaceous species see *Streptocárpus*, p. 658, and for the shrubby species see *Rytidophýllum*, p. 550.

XXV. WHI'TIA (evidently dedicated to some person of the name of White, of whom we know nothing.) Blum. bijdr. p. 774.

Lin. syst. *Diándria, Monogýnia.* Calyx small, deeply 5-cleft, equal. Corolla funnel-shaped, having the tube widened upwards; limb 5-lobed, irregular, sub-bilabiate. Stamens 5, 2 of which are antheriferous and hardly exserted, and the other 3 setaceous and sterile. Cells of anthers unequal in the insertion. Stigma somewhat funnel-shaped. Fruit baccate, silique-formed: lobes of dissepiment fleshy, and bearing the seeds on their revolute edges. Seeds naked, striated, surrounded by thin pulp.—Climbing shrubs, with opposite, simple, entire, oblique leaves; those opposed to each other of unequal size. Fascicles of flowers axillary, bracteate, on short peduncles. This genus differs from *Cyrtándra*, in the calyx being small, and divided nearly to the base, not tubular; in the stamens being exserted, not inclosed; in the insertion of the anthers being unequal, not parallel; in the stigma being funnel-shaped, not capitate nor emarginate.

1 W. oblongifòlia (Blum. bijdr. p. 774.) leaves oblong-lanceolate, glabrous; fascicles of flowers on short peduncles; brac-

teas lanceolate; fruit elongated. ♄. S. Native of Java, in mountain woods, where it is called *Lida-bebek*.

Oblong-leaved Whitia. Fl. Year. Shrub climbing.

2 W. carnòsa (Blum. bijdr. p. 775.) leaves oblong-lanceolate, rather tomentose beneath; fascicles of flowers on short peduncles, axillary, involucrated by 2 bracteas; fruit oblong. ♄. ᴗ. S. Native of Sumatra, and of Java, in woods on the Seribu mountains. Cyrtándra carnòsa, Jack, in Lin. trans. 14. p. 30. Stems obscurely 4-sided, smooth. Largest leaves 7-8 inches long: the opposite ones small, roundish-cordate. Corolla white.

Fleshy Whitia. Fl. Year. Shrub climbing.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XXVI. RHYNCHOTE'CHUM (from ρυγχος, *rhynchos*, a beak; but the application is not evident.) Blum. bijdr. 775.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx 5-cleft, equal. Corolla with a short campanulate tube, and an unequal, 5-lobed limb. Stamens 4, somewhat didynamous, inclosed; anthers 1-celled, free. Style incurved; stigma obtuse. Fruit baccate, globose, girded by the calyx: lobes of fleshy dissepiment revolute and seminiferous. Seeds naked. This genus differs from *Cyrtándra* in all 4 stamens being fertile; in the anthers being 1-celled, and in the berry being globose.

1 R. parviflòrum (Blum. p. 775.) stem simple, terete; leaves opposite, oblong-lanceolate, serrated, rather villous beneath; corymbs dichotomous, axillary; pedicels subfasciculate. ♄. S. Native of Java, on the Seribu mountains.

Small-flowered Rhynchotechum. Shrub.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XXVII. LOXO'NIA (from λοξος, *loxos*, oblique; flowers.?) Jack. in Lin. trans. 14. p. 4. Blum. bijdr. 776.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx tubular, angular, 5-cleft. Corolla funnel-shaped, with a 5-lobed, unequal, somewhat bilabiate limb. Stamens 4, didynamous, inclosed; anthers sagittate, with divaricate lobes. Stigma bilamellate. Fruit baccate? inclosed in the calyx, and probably dehiscent, 2-celled; lobes of dissepiment revolute, seminiferous. Seeds naked, pitted.—Herbaceous plants, with opposite leaves: the opposed ones small, generally unequal sided. Flowers racemose.

1 L. díscolor (Jack, in Lin. trans. 14. p. 40.) leaves glabrous above, but purplish and retrorsely scabrous beneath; racemes simple, elongated. ♃. S. Native of the interior of Bencoolen. Stem tomentose, purple, terete, rather flexuous, recurved. Leaves opposite, bifarious: the one minute and reniform, the other subsessile, semicordate, ovate-oblong, falcate, acuminated, 4-5 inches long, slightly serrated; serratures recurved, in old leaves almost obsolete. Calyx covered with red hairs. Corolla of a delicate yellowish-green colour, streaked with purple inside.

Two-coloured-leaved Loxonia. Pl.?

2 L. hirsu'ta (Jack, l. c. p. 41.) hairy; leaves semi-ovate, broad; peduncles 2-4-cleft; flowers racemose. ♃. S. Native of Sumatra and the interior of Bencoolen. Stem recurved. Leaves on very short petioles: the one small and semicordate, the other semi-ovate, acuminated, slightly serrated, about 5 inches long, and 2 or $2\frac{1}{2}$ broad. Peduncles dividing into 2 or 4 unilateral racemes.

Hairy Loxonia. Pl.?

3 L.? decu'rrens (Blum, bijdr. p. 776.) leaves opposite, oblong, acuminated, cuneated at the base, decurrent, serrated, glabrous; flowers in fascicles, axillary. ♃. S. Native of Java, on the Seribu mountains, in humid places.

Decurrent-leaved Loxonia. Fl. Feb. Shrub.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

XXVIII. CENTRO'NIA (from κεντρον, *kentron*, a spur; back of anthers spurred at the base.) Blum. bijdr. p. 776.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx spathaceous, cleft on one side. Corolla funnel-shaped, with a bilabiate, nearly equal limb; upper lip 2-lobed: lower lip 3-lobed, spreading. Stamens 4, inclosed; anthers 1-celled, spurred on the back at the base, free. Style thick; stigma capitate. Fruit baccate, silique-formed; lobes of fleshy dissepiment revolute, seminiferous. Seeds naked.—A small, rather fleshy, parasitical plant, furnished with ovate obtuse stipulas and bracteas.

1 C. mira'bilis (Blum. bijdr. p. 777.) ♃. S. Native of Java, on Mount Salak, in humid parts of woods.

Showy Centronia. Fl. Sept. Oct. Pl. small.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

XXIX. UTA'NIA (an alteration from its vernacular name Tjankuda-Utan.) Kùhlia, Reinwdt. herb. ex Blum. bijdr. p. 777. but not of Kunth.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx 5-cleft; segments imbricate, permanent. Corolla funnel-shaped, with a 5-lobed, nearly equal limb. Stamens 5, exserted; anthers incumbent, bifid at the base. Style erect; stigma capitate. Fruit baccate, olive-formed; lobes of fleshy dissepiment revolute, seminiferous. Seeds naked.—A branched shrub, with rather large, opposite, oval leaves, which are acutish at both ends, quite entire, coriaceous, glabrous, and undulated. Panicles terminal, drooping; pedicels subcorymbose.

1 K. morindæfòlia; ♄. S. Native of Java, at the foot of Mount Salak, where it is called *Tjankuda-Utan*. Kúhlia morindæfòlia, Blum. bijdr. p. 777.

Morinda-leaved Kuhlia. Fl. Year. Shrub.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

XXX. FIE'LDIA (named after Baron Field, F.L.S., &c. late Judge of the Supreme Court of New South Wales.) Cunningh. in Field's New South Wales, p. 363. icone. Hook. exot. fl. t. 1. p. 232.

Lin. syst. *Didynàmia*, *Angiospérmia*. Calyx deeply 5-parted, permanent, inclosed in a spath-formed bractea, which is cleft on one side. Corolla tubularly ventricose; limb 5-lobed, equal, somewhat bilabiate. Stamens 4, didynamous, with the rudiment of a fifth; filaments dilated; anthers 2-celled, roundish. Stigma bilamellate. Berry white, spongy, fleshy, 1-celled. Seeds small, numerous, dotted, attached to two fleshy, parietal, bilamellate placentas.—A climbing, radicant shrub, almost parasitical upon the trunks of trees, clothed with dense rusty down when young. Leaves simple, opposite, remote: those opposed to each other, unequal in size, elliptic, acute at both ends, deeply serrated in the upper half, downy, of a deep green colour; petioles downy. Peduncles axillary, solitary, 1-flowered. Flowers pendulous, greenish-white.

1 F. Austra'lis (Cunningh. l. c. Hook. l. c.) ♄. ᴗ. G. Native of New South Wales, on the Blue Mountains, Caley, in 1804; and upon naked rocks on the Five Islands, Cunningh. in 1822.

Southern Fieldia. Shrub creeping.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

Subtribe IV.

LOXOTIE'Æ (this subtribe agrees with the genus *Loxòtis*, in the seeds being erect.) Capsule 2-valved or circumcised. Seeds erect, naked.

§ 1. *Capsule 2-valved.*

XXXI. LOXO'TIS (from λοξος, *loxos*, oblique ; corollas.) R. Br. ex Benth. scrop. ind. p. 57. Antònia, R. Br. but not of Pohl. Wulfènia species, Wall.

Lin. syst. *Diándria, Monogýnia.* Calyx tubular, 5-cleft. Corolla with a tubular base, and a short, bilabiate limb. Stamens 2, fertile ; anthers cohering : sterile ones wanting, or very minute.—Herbaceous plants.

1 L. obli'qua (Benth. scroph. ind. p. 57.) calyx shortly 5-cleft ; segments broad-lanceolate, bluntish. ♃. ? S. Native of Nipaul and Silhet ; common on the Himalaya. Wulfènia oblìqua, Wall. tent. fl. nap. p. 45. t. 35.

Oblique-flowered ? Loxotis. Pl. erect.

2 L. interme'dia (Benth. l. c.) calyx 5-cleft beyond the middle ; segments lanceolate, very acute. ♃. ? S. Native of Martaban, at Moolmyme. Wulfènia intermèdia, Wall. cat. no. 408. Habit of the preceding, but the young leaves are often pubescent.

Intermediate Loxotis. Pl. erect.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

XXXII. GLOSSA'NTHUS (from γλωσσα, *glossa*, a tongue ; and ανθος, *anthos*, a flower ; in allusion to the large concave lower lip of the corolla.) Klein, mss. ex Benth. scroph. ind. 57. Wulfènia species, Wall.

Lin. sÿst. *Didynàmia, Angiospérmia.* Calyx tubular, 5-cleft. Corolla tubular at the base : limb bilabiate ; upper lip very short : lower one large, convex. ? Stamens 4, fertile ; anthers cohering. Capsule 2-valved.—Herbaceous plants.

1 G. Malaba'rica (Klein, mss. ex Benth. l. c.) stem divaricately branched ; leaves and inflorescence of *Loxòtis*. ♃. ? S. Native of Malabar and the Nielghery mountains, in the Indian Peninsula. Wulfènia Notoniàna, Wall. tent. fl. nap. p. 46. cat. no. 409.

Malabar Glossanthus. Pl.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

XXXIII. PLATYSTE'MMA (from πλατυς, *platys*, broad ; and στεμμα, *stemma*, a garland of flowers ; in reference to the broad corollas.) Wall. pl. rar. asiat. 2. p. 41. t. 151.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx ovate, 5-cleft, equal. Corolla rotate, very flat, without a tube : limb bilabiate, 5-lobed : lower lip larger, 3-lobed, contracted at the base : upper lip obcordate. Stamens 4, very short, equal ; anthers large, reniform, 1-celled. Style very long and thick ; stigma capitate, entire. Ovarium roundish-ovate, 2-celled. Ovula densely inserted in twin placentas.—Small, pilose, rock, 1 or 2-leaved herbs. Flowers few, large, blue, terminal, on long pedicels, twin or subumbellate. Corollas flat, hence the generic name.

1 P. violoi'des (Wall. pl. rar. 2. p. 42. t. 151. Royle, ill. himal. t. 70. f. 2.) leaves 2, opposite under the peduncles, one smaller than the other, but none radical ; peduncles 2-flowered, one from the axil of each leaf. ♃. G. Native of Upper Nipaul, upon rocks among moss, Wall. ; from Jureepanee upwards, towards Mussooree ; and near Simla, Royle. Plant 2-6 inches high, downy. Leaves sessile, orbicularly cordate, sinuately toothed.

Violet-like Platystemma. Pl. 2 to 6 inches.

2 P. ma'jor (Wall. pl. rar. asiat. 2. p. 42.) stem longer, furnished with one ovate-cordate, acute, sharply and sinuately-toothed leaf ; peduncles umbellately bifid, each division bearing 2 flowers, besides 1 or 2 solitary flowers from the bifurcation. ♃. G. Native of Kamaon. Bracteas 2, opposite, small under the divisions of the stem or peduncles in both species.

Larger Platystemma. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

XXXIV. OURI'SIA (named after Ouris, once Governor of the Moluccas, who received this plant from Commerson, who had given it his name.) Comm. ex Juss. gen. p. 100. ed Usteri, p. 112. Gærtn. fil. carp. 3. p. 44. t. 185. R. Br. prod. p. 438. Poppig, et Endlicher, nov. gen. 1. p. 2. Dichròma, Cav. ann. des scienc. 3. t. 32. icon. 6. p. 59. t. 282. Chelòne species, Lin. fil. suppl. and Willd.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx 5-cleft, nearly equal. Corolla funnel-shaped : limb 5-cleft, nearly equal ; segments obtuse. Stamens 4, didynamous. Stigma capitate, emarginate or 2-lobed. Capsule 2-celled, 2-valved ; valves septiferous in the middle. Placentas globose, adnate to the dissepiment. Seeds numerous, with an aril-formed, reticulated testa.—Creeping herbs, with opposite leaves, and terminal and axillary, bractless peduncles.

Sect. I. Ouri'sia (see genus for derivation.) Poppig, et Endlicher, nov. gen. 1. p. 2. Calyx sub-bilabiate. Corolla funnel-shaped ; tube widened a little in the middle, and curved : limb erect, hardly equalling a sixth part of the tube.

1 O. Magella'nica (Juss. l. c. Gærtn. l. c. Poppig, et Endlicher, l. c. t. 4.) stem creeping ; radical leaves cordate-ovate or elliptic, doubly serrated, on long petioles ; cauline leaves reniform, opposite, half stem-clasping ; peduncles axillary, solitary, elongated, 1-flowered ; calyx ciliated : upper lip tridentate : lower one bifid. ♃. G. Native of Chili, on the Andes, among rocks ; and of the Straits of Magellan, in the fissures of rocks. Chelòne ruelloìdes, Lin. fil. suppl. 271. Forster, in Comm. goett. 9. p. 35. Willd. spec. 3. p. 226. Corolla purple.

Magellan Ourisia. Pl. 3 to 6 inches.

Sect. II. Dichròma (from δις, *dis*, double ; and χρωμα, *chroma*, colour ; in reference to the scarlet colour of the corolla, and green of the other parts of the plant.) Poppig, et Endlicher, nov. gen. 1. p. 3. Calyx equal : segments hardly cohering at the base. Corolla funnel-shaped : limb spreading, equal in length to a third or half the length of the erect cylindrical tube.

2 O. integrifòlia (R. Br. prod. p. 439.) glabrous ; stem creeping ; leaves subovate, quite entire ; peduncles terminal, generally solitary ; calyx deeply 5-cleft, equal. ♃. G. Native of Van Diemen's Land. This differs from *O. Magellánica*, in the calyx being equally 5-cleft, and in the corolla being shorter.

Entire-leaved Ourisia. Pl. creeping.

3 O. cocci'nea (Pers. ench. 2. p. 169. Poppig, et Endlicher, l. c.) radical leaves cordate, doubly crenated, violaceous be-

neath, downy above; petioles and stem villous; peduncles panicled, equal to the calyx in length, but 6 times shorter than the corolla, pilose. ♃. G. Native of the South of Chili, in shady places at the river Rucal; and of Chiloe, in humid shady places. Dichròma coccínea, Cav. icon. 6. p. 59. t. 282. Corolla scarlet. Seeds minute, ovate.

Scarlet-flowered Ourisia. Pl. ½ to 2 feet.

4 O. pa'llens (Poppig, et Endlicher, nov. gen. chil. 1. p. 3. t. 5.) radical leaves orbicularly cordate, crenated, smoothish; petioles villous; tops of stem sub-panicled; peduncles equal in length to the calyx, and almost twice shorter than the tube of the corolla, which is regular, all quite glabrous. ♃. G. Native of the South of Chili, on the Andes at Antuco, in rocky places.

Pale Ourisia. Pl. ¼ to ½ foot.

5 O. microphy'lla (Poppig, et Endl. l. c. p. 3. t. 7.) suffruticose, glabrous; leaves oval, sessile, closely and quadrifariously imbricated, coriaceous; peduncles axillary, solitary, 1-flowered, short; stamens one half shorter than the tube. ♄. G. Native of the South of Chili, in the fissures of basaltic rocks on the Andes of Antuco. A small, branchy shrub, with the habit of *Erìca*. Corolla rose-coloured, or lilac.

Small-leaved Ourisia. Shrub.

6 O. alpi'na (Poppig, et Endl. l. c. t. 6.) radical leaves cordate-oblong, doubly crenated, and are, as well as the petioles and stem, villous; peduncles corymbose and equal; calyxes one-half shorter than the tube of the regular corolla, quite glabrous. ♃. G. Native of the South of Chili, on the top of Pico de Pilque, among the Andes. Corolla scarlet.

Alpine Ourisia. Pl. ¼ to ½ foot.

7 O. polya'ntha (Poppig, et Endl. l. c. p. 4.) suffruticose; branches downy; leaves oval, sessile, by remote pairs, membranous; peduncles axillary, solitary, 1-flowered, elongated; stamens length of tube. ♄. G. Native of the South of Chili, on the Andes, in cold places. Corolla scarlet; limb yellow inside.

Many-flowered Ourisia. Shrub.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

§ 2. *Capsule circumcised.*

XXXV. AIKI'NIA (named in honour of Arthur Aikin, F.L.S., Secretary to the Society of Arts.) R. Br. in Wall. pl. rar. asiat. 3. p. 65. t. 288. Epíthema, Blume, but not of Jack.

Lin. syst. *Diándria, Monogýnia.* Calyx tubular, 5-cleft, equal. Corolla hypogynous, irregular; limb spreading; upper lip bifid: lower tripartite, with nearly equal segments. Stamens 4, the 2 superior ones fertile, with cohering anthers: lower 2 sterile. Stigma capitate. Capsule girded by the calyx, 1-celled, circumcised; placentas 2, free, seated on adnate, parietal pedicels, seminiferous all over. Seeds erect, with elongated funicles.—Annual, rather pilose herbs. Leaves cordate, a little toothed: lower usually one or more alternate: superior ones nearly opposite. Spikes unilateral, circinate while young, and head-formed, but corymbose while bearing the fruit, peduncular; pedicels disposed in a double row along the rachis, crowded, bractless, but the racemes are involucrated by one roundish cucullate leaf each at base. Flowers small, blue. Nearly allied to *Loxòtis*.

1 A. Brunònis (Wall. l. c. 3. p. 66. t. 288.) leaves petiolate; peduncles solitary, or many. ☉. F. Native of the Island of Timor, near Colping. Gratìola involucràta, Roxb. fl. ind. 1. p. 138.? Plant branched, or simple.

Brown's Aikinia. Pl. ¼ foot.

2 A. Horsfie'ldii (R. Br. l. c. p. 66.) leaf solitary, sessile, terminating the stem; peduncles solitary, many. ☉. F. Native of Java. Epíthema, Blum.

Horsfield's Aikinia. Pl. ¼ foot.?

3 A. carnòsa; leaves petiolate; peduncles solitary, or many seriate; racemes capitate; bractea small, ovate; corollas exceeding the calyx a little. ☉. F. Native of Nipaul. Epíthema carnòsum, Benth. scroph. ind. p. 57. Pæderotoìdes carnòsa, Wall. mss.

Fleshy Aikinia. Pl. ¼ foot.?

Cult. For culture and propagation see *Streptocárpus*, p. 658.

XXXVI. STAURANTHE'RA (from σταυρος, *stauros*, a cross; and ανθηρα, *anthera*, an anther; in allusion to the anthers cohering in a cruciate manner.) Benth. scroph. ind. p. 57.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx subrotately campanulate, 5-plicate, very broadly sub-10-cleft. Corolla ample, oblique, with a very short tube, spurred behind at the base, subquinquefid at top. Stamens 4, fertile; anthers heart-shaped, cohering cruciately. Capsule circumcised. Ramification of stem, and obliquity of leaves, like that of *Glossánthus*. Leaves large, wrinkled. Racemes ditrichotomously panicled, 8-20-flowered.

1 S. grandiflòra (Benth. l. c.) ♃.? S. Native of Penang, Wall. Glossánthus? grandiflòrus, Benth. in Wall. cat. no. 6395.

Great-flowered Stauranthera. Pl. branched.

Cult. For culture and propagation see *Streptocárpus*, p. 658.

† *A genus hardly known whether it belongs to the order Bignoniaceæ or the present.*

XXXVII. AMPHICO'ME (from αμφι, *amphi*, on both sides; and κωμη, *kome*, a head of hair; in reference to the seeds being furnished with a tuft of hairs at both ends.) Royle, ill. himal. t. 72. f. 1. Incarvíllea species, R. Br. ex Royle, l. c.

Lin. syst. *Didynàmia, Angiospérmia.* Calyx tubular, pentagonal; angles stiffer than the membranous ciliated sides, 5-toothed; teeth subulate, slightly hairy. Corolla tubular near the base, ventricose above; limb 5-lobed: lobes short, rounded, ciliated, imbricate in æstivation. Stamens 4, didynamous, with the rudiment of a fifth. Cells of anthers converging, each furnished about its middle with a small tail-like process; filaments terminated above in a broad, membranous process. Stigma bilamellate. Capsule long, slender, silique-formed, 2-valved, but only opening on one side; dissepiment free, opposite the valves, bearing on both sides along the margins suspended seeds. Seeds oblong, rough, slightly winged at both ends, and terminated in a much divided coma of fine hairs, exalbuminous. Embryo straight, almond-shaped; radicle above. Cotyledons foliaceous.—A diffuse shrub, with impari-pinnate, alternate leaves, and axillary and terminal racemes of flowers.

1 A. argu'ta (Royle, l. c.) ♄. G. Native of Himalaya. Incarvíllea argùta, Royle, l. c.) Leaflets opposite, on short petioles, 3-4 pairs, lanceolate, acuminated, unequal at the base, dentately serrated. Corollas red.

Sharp-serrated-leaved Amphicome. Shrub 3 feet.

Cult. For culture and propagation see *Rytidophýllum*, p. 650.

Order CLXXV. LABIA'TÆ (so named from *labium*, a lip; in consequence of the two-lipped corolla.) Juss. gen. p. 110.

R. Br. prod. p. 499. Mirb. ann. mus. 15. p. 213. Bartl. ord. nat. 180. Benth. lab. p. xiii.

Calyx tubular, regular, 5-cleft, or 5-10-toothed, or bilabiate; lips entire, or divided. Corolla tubular, irregular, bilabiate; superior lip undivided or bifid, lying over each other in æstivation: lower lip trifid. Stamens 4, didynamous, 2 of which are sometimes sterile; filaments inserted under the sinuses of the lower lip and interlabiate; anthers 2-lobed: lobes usually divaricate; but sometimes dimidiate, and therefore somewhat 1-celled, with an obsolete division and a continuous suture. Ovaria 4, 1-seeded, connected with the base of the style, seated on a glandular disk, and girded at bottom; ovula erect. Style 1. Stigma bifid, usually acute, sometimes unequal, or dilated. Achenia 4, hidden by the permanent calyx, some of them generally abortive. Albumen wanting, or very sparing. Embryo erect. Cotyledons flat.—Herbs, rarely shrubs. Stems and branches tetragonal. Leaves opposite, exstipulate, simple, undivided, or lobed; petioles or bases of the leaves not articulated with the branch. Flowers opposite, verticillate, capitate, spicate, racemose, or solitary, axillary or terminal, bracteate or naked.

The order *Labiàtæ* is one of the most natural and distinctly marked of all. The opposite leaves, monopetalous corolla, 2 or 4 stamens, and the free 4-lobed ovarium, are characters so easily observed, and so constantly accompanying the general habit of the whole series, that from the time of Linnæus to the present day but two or three genera have been improperly associated with, or separated from it. Its immediate affinities are few. The same 4-lobed ovarium is only found in *Borragineæ*, but here the fifth stamen is always present and fertile, and the corolla is usually regular, with gyrate inflorescence. *Scrophularineæ*, and other allied tribes are at once separated by the capsular fruit. In *Verbenàceæ* alone, having frequently the same inflorescence and many of the characters of *Labiàtæ*, approach near enough to occasion any hesitation in drawing the line of separation. The ovarium is slightly lobed in *Verbèna* and other neighbouring genera, and in *Cymària* and some *Teùcria* it is less lobed than in other *Labiàtæ*, but yet the distance is considerable in this respect between the former and the two latter genera, ex Bentham.

The species are to be found in more or less abundance over the surface of the globe, but the greater mass within the tropics. Many are extremely odoriferous; some bear handsome flowers, others are mere weeds. They are remarkable for their tonic, cordial, stomachic virtues; they contain both a bitter and an aromatic principle in different proportions. The bitterness which is given out in decoctions resides in a gum resinous secretion abounding in some *Teùcria*, which are particularly employed as stomachics, and sometimes as febrifuges; those which abound in essential oil, and are consequently aromatic, are used as stimulants. From the different degree of combination of these principles in different plants, they have obtained various uses, such as savory, thyme, marjoram for the seasoning of food; sage, balm, ground ivy for tea; cat thyme, marjoram, lavender, and thyme for sternutories; others, such as lavender, mint, balm, and rosemary, for perfume. The essential oil of all contain camphor, which is said to exist in such quantity in sage and lavender, that it has been supposed that the separating of it might become an object of commerce.

In the arrangement of this truly natural family, I have followed Mr. Bentham, whose elaborate work, entitled "Labiatarum Genera et Species," is a model for future monographers.

Synopsis of the genera.

TRIBE I.

OCYMOÌDEÆ. Stamens declinate. Corolla sub-bilabiate; the superior 4 lobes flat, and nearly equal, or the two uppermost ones are joined: the lower segment is declinate, usually of a different form from the others, sometimes flat, but usually concave, boat-shaped, or saccate. Old anthers usually saucer-shaped.

§ 1. *Segments of corolla almost of equal length: lower one the narrowest, declinate, and flattish.—Tropical plants.*

1 O'CYMUM. Fructiferous calyx deflexed; the uppermost tooth ovate, large, usually decurrent.—Whorls 6-flowered, rarely with so many as 10 flowers.

2 GENIÓSPORUM. Fructiferous calyx almost erect, or declinate, usually transversely wrinkled at base; teeth irregular: upper one not decurrent. Filaments naked. Lobes of style subulate.—Whorls many-flowered.

3 MESÒNA. Upper lip of corolla divided; lower one small, and inflexed. Shorter stamens appendiculate at the base.

4 ACROCE'PHALUS. Calyx erectish, having the 4 lower teeth combined into an entire or 4-toothed lip.—Whorls of flowers capitate.

5 MOSCHÓSMA. Fruit-bearing calyx declinate; upper tooth ovate, not decurrent. Tube of corolla inclosed. Lobes of style very short.—Whorls few-flowered, secund, usually disposed in axillary racemules.

6 ORTHOSI'PHON. Fructiferous calyx deflexed; superior tooth ovate. Tube of corolla straight, exserted. Style headed by the stigma.—Habit of *O'cymum*.

§ 2. *Lower segment of corolla elongated, concave.—Tropical plants.*

7 HOSLU'NDIA. Superior stamens abortive. Fructiferous calyx baccate.

8 PLECTRA'NTHUS. Fructiferous calyx 5-toothed, not spiny, with an open mouth. Filaments free.

9 CÒLEUS. Fructiferous calyx toothed, not spiny, with an open mouth. Filaments monadelphous.

10 ANISOCHI'LUS. Fructiferous calyx closed.—Whorles of flowers spicate.

11 ŒOLLA'NTHUS. Calyx truncate, circumcised at the base in the fructiferous state.

12 Pychnóstachys. Teeth of fructiferous calyx subulately spinose.—Whorls of flowers spicate.

§ 3. *Lower segment of corolla somewhat stipitate, transversely subcallous at the base, and at length saccate, but bent down abruptly at the time of florescence.*

13 Pe'ltodon. Teeth of calyx subulate, peltate at apex.—Habit of *Hýptis capitàta*.

14 Marsypia'nthus. Achenia concave, boat-shaped, with membranous, involute, fringed margins.—Habit of *Hýptis capitàta*.

15 Hy'ptis. Calyxes not peltate, fructiferous ones not bilabiate. Achenia not cymbiform.

16 Eriòpe. Floriferous calyx equal, fructiferous one increasing and bilabiate: upper lip tridentate: lower lip bidentate.

§ 4. *Corolla bilabiate: upper lip 2-lobed: lower lip 3-lobed. Stamens inclosed in the tube.*

17 Lava'ndula. Character the same as that of the section.

Tribe II.

Menthoi'deæ. Corolla subcampanulate, or funnel-shaped; tube shorter than the calyx, or hardly longer; limb 4-5-cleft, with the lobes nearly equal, rarely sub-bilabiate. Stamens distant, straight, or diverging, not approximating by pairs, nearly equal; the lower ones are a little longer; the superior ones sometimes abortive.

§ 1. *Anthers terminal, also the younger ones are confluently 1-celled. Stamens somewhat declinate.*

18 Pogoste'mon. The 3 superior segments of corolla approximate: lower one declinate.

19 Dysophy'lla. Corolla almost regular.

§ 2. *Anthers versatile; cells divaricate, at length confluent. Stamens sometimes somewhat ascending.*

20 Elshóltzia. Corolla tubular; limb short, bilabiate. Lobes of gynóphore shorter than the ovarium.

21 Tetrade'nia. Corolla regular. Lobes of gynophore longer than the ovarium.

§ 3. *Anthers 2-celled; cells parallel. Corolla normal, as in the whole tribe.*

22 Colebroòkia. Fructiferous calyx pappose, adhering to the achenia.

23 Peri'lla. Upper tooth of fructiferous calyx small. Style deeply bifid.

24 Isa'nthus. Achenia rather large, wrinkled reticulately.

25 Pre'slea. Calyx 4-toothed.

26 Me'ntha. Calyx 5-toothed, not pappose. Achenia smooth. Fertile stamens 4.

27 Lyco'pus. Superior stamens abortive.

§ 4. *Cells of anthers disjoined, with a filiform connective.*

28 Meria'ndra. Character the same as that of the section.

Tribe III.

Mona'rdeæ. Corolla bilabiate. Superior stamens abortive, or if fertile bearing linear, connate anthers: lower stamens fertile, ascending; anthers linear, sometimes confluently 1-celled, connate, sometimes dimidiate, free, or connate behind, with a linear connective, which is articulated to the filament, and bearing the fertile cell at top, truncate behind, but generally drawn out, filiform, elevated, bearing the other cell, which is sometimes difformed and empty, and sometimes fertile.

§ 1. *Connective filiform, articulated to the filament.*

29 Sa'lvia. Connective drawn out under the insertion, naked or bearing a cell behind.

30 Audibe'rtia. Connective not drawn out under the insertion.

§ 2. *Connective small. Fertile stamens 2.*

31 Rosmari'nus. Calyx bilabiate: upper lip entire: lower lip bifid. Filaments toothed at the base.

32 Mona'rda. Calyx 5-toothed. Lower lip of corolla linear, shortly trifid at apex.

33 Blephi'lia. Calyx 5-toothed, sub-bilabiate; throat naked inside. Lower lip of corolla broad, trifid.

34 Zizi'phora. Throat of calyx villous inside. Corolla of *Blephília*.

§ 3. *Connective small. Fertile stamens 4.*

35 Hormi'num. Character the same as that of the section.

Tribe IV.

Saturei'neæ. Calyx 5-toothed, equal, or bilabiate, $\frac{3}{2}$. Tube of corolla exannulate, shorter than the calyx, and imbricating bracteas, or hardly longer; limb sub-bilabiate: upper lip flat, entire, or emarginately bifid; lobes of lower lip flat. Stamens straight, diverging, or hardly ascending, equal, or the superior ones are shortest, or abortive. Anthers not dimidiate.

§ 1. *Fertile stamens 4. Calyx 10-13-nerved.*

36 Bystropògon. Calyx equal; throat villous inside.—Inflorescence cymose, or spicate.

37 Pychna'nthemum. Calyx equal, or sub-bilabiate, naked inside. Upper lip of corolla oblong, entire, or emarginate.—Whorls many-flowered, bracteate.

38 Monarde'lla. Throat of calyx naked inside. Segments of corolla 5, oblong, or linear, somewhat bilabiately disposed.

39 Amara'cus. Superior lip of calyx erect, entire: lower one truncate, almost wanting, or shortly bidentate.—Spikelets membranaceously bracteate.

40 Ori'ganum. Calyx somewhat equally 5-toothed; throat villous.—Spikelets broadly bracteate, rather loose.

41 Marjora'na. Limb of calyx cleft, quite entire above, orbicular, with the margin implicate beneath at the base.

42 Thy'mus. Calyx bilabiate: upper lip tridentate: lower lip bifid; throat villous.

43 Sature'ia. Calyx nearly equal; throat almost naked inside. Superior lip of corolla ovate.—Whorles of flowers axillary, or aggregate into an oblong head.

§ 2. *Fertile stamens* 4. *Calyx* 15-*nerved.*

44 Hyssòpus. Character the same as that of the section.

§ 3. *Two lower stamens alone fertile.*

45 Collinsònia. Lobes of corolla 4: superior ones nearly equal: lower one large, toothed or fringed.

46 Cuni'la. Corolla normal with the tribe.

Tribe V.

Melissi'neæ. Calyx 13, rarely 10-nerved, 5-toothed, bilabiate, $\frac{3}{2}$, or rarely equal. Tube of corolla exannulate, usually exserted; limb bilabiate; lips flat, or the upper one as in *Glèchon*, galeate. Stamens ascending: superior ones shorter, or abortive.

47 Hedeòma. Tube of corolla rarely exserted. Throat of calyx villous inside. Superior stamens abortive.

48 Microme'ria. Tube of corolla rarely exserted. Calyx nearly equal: superior stamens antheriferous.

49 Meli'ssa. Calyx bilabiate: upper lip tridentate: lower lip bidentate. Tube of corolla usually exserted. Superior stamens antheriferous.

50 Gardòquia. Calyx tubular, somewhat incurved, with an equal or sub-bilabiate mouth. Tube of corolla much exserted. Stamens 1-3, now and then sterile.

51 Gle'chon. Superior stamens abortive. Superior lip of corolla galeate.

52 Kei'thia. Superior stamens altogether abortive. Lips of corolla flat; tube exserted.

53 Thy'mbra. Calyx much compressed, flat above. Superior stamens antheriferous.

54 Dicera'ndra. Stamens 4, antheriferous; anthers bicalcarate.

55 Pogo'gyne. Stamens 4, antheriferous. Style villous.

Tribe VI.

Scutellari'neæ. Calyx bilabiate; upper lip truncate, entire or somewhat tridentate. Tube of corolla exserted, ascending: upper lip of limb arched, rarely flat. Stamens ascending: superior ones the shortest.

§ 1. *Gynophore equal, straight; lips of calyx toothed.*

56 Prune'lla. Style bifid at apex.

57 Clònia. Style quadrifid at apex.

§ 2. *Gynophore elongated, incurved, oblique at apex. Lips of calyx entire.*

58 Scutella'ria. Achenia naked. Superior lip of corolla arched.

59 Peritòmia. Achenia membranously winged. Segments of corolla flattish.

Tribe VII.

Prostanthe'reæ. Calyx campanulate, sometimes bilabiate; lips flat, entire, or the lower one bidentate or bifid; throat naked inside. Corolla with a short ample tube, a campanulate throat, and a bilabiate limb: lips flattish. Stamens 4, didynamous, shorter than the corolla: lower ones sometimes longer, and sometimes sterile. Achenia coriaceous, reticulately wrinkled. Style permanent.

§ 1. *Calyx bilabiate: lips entire, or the lower one is bifid or bidentate.*

60 Chilòdia. Upper lip of calyx entire: lower one bifid. Anthers mutic.

61 Cry'phia. Both lips of calyx entire. Anthers mutic.

62 Prostanthe'ra. Both lips of calyx entire, or hardly $\frac{3}{1}$. Anthers spurred.

63 Hemia'ndra. Upper lip of calyx entire: lower one bifid. Anthers dimidiate.

§ 2. *Calyx equal, 5-toothed.*

64 Hemige'nia. Anthers all with one of the cells fertile, and the other abortive.

65 Westri'ngia. Anthers of upper stamens dimidiate, glabrous: lower ones sterile.

66 Micrócorys. Anthers of upper stamens dimidiate, bearded: lower ones sterile.

Tribe VIII.

Nepe'teæ. Calyx equal or oblique, or sub-bilabiate, usually 15-nerved: superior teeth the largest. Corolla bilabiate. Stamens didynamous: superior ones the longest, ascending or diverging.

§ 1. *Stamens diverging.*

67 Lopha'nthus. Character the same as that of the section.

§ 2. *Stamens ascending.*

68 Ne'peta. Calyx not bilabiate; upper tooth a little

broader than the rest. Bracteas entire. Cells of anthers diverging or divaricate.

69 Marmori'tis. Calyx tubularly campanulate, longer than the corolla. Cells of anthers parallel.

70 Dracocé'phalum. Calyx bilabiate, or the upper tooth is large, or the bracteas are ciliately toothed.

71 Cedroné'lla. Tube of corolla exserted. Cells of anthers parallel.

Tribe IX.

Stachy'deæ. Calyx irregularly veined, 5-10-nerved, equal, oblique, or rarely sub-bilabiate, 3-10-toothed. Tube of corolla usually annulate inside; limb bilabiate. Stamens 4, ascending, didynamous: superior ones the shortest. Achenia dry, not reticulately wrinkled.

§ 1. *Calyx inflated after florescence, or 2-4-lobed. Corolla much exserted.*

72 Meli'ttis. Calyx membranous, campanulate: lobes 3-5, roundish. Corolla ample, much exserted.

73 Physoste'gia. Calyx obscurely veined, inflated after florescence. Corolla much exserted, with an ample throat.

74 Macbri'dea. Calyx membranous, campanulate; lobes 3: upper one oblong: lower one roundish. Corolla much exserted, with a very ample throat.

75 Syna'ndra. Calyx 4-parted. Upper cells of superior anthers empty, connate.

§ 2. *Calyx 5-toothed: limb not dilated. Stamens exserted from the tube. Corolla flattish or arched.*

76 La'mium. Calyx 5-nerved, 5-toothed: teeth not spiny. Superior lip of corolla a little arched or galeate; lateral segments hardly any, tooth-formed, or rarely oblong. Achenia acutely triquetrous, truncate.—Leaves entire.

77 Lagochi'lus. Calyx 5-nerved; teeth 5, stiff, somewhat spiny. Upper lip of corolla oblong, bifid at apex. Achenia acutely triquetrous, truncate at apex.

78 Leonu'rus. Calyx 5-nerved; teeth 5, stiff, rather spiny. Superior lip of corolla oblong, flattish, or arched; lateral segments oblong. Achenia acutely triquetrous, truncate.—Leaves jagged.

79 Anisómeles. Stamens exserted from the short upper lip of the corolla.

80 Galeópsis. Calyx somewhat 5-nerved, 5-toothed, somewhat spinescent. Cells of anthers transversely and bivalvately dehiscent; inner valve smaller, ciliated.

81 Sta'chys. Calyx 5-10-nerved, 5-toothed. Throat of corolla hardly dilated; galea a little arched, rarely oblong, flat, emarginate. Stamens exserted from the tube. Achenia obtuse, rarely truncate.

82 Spha'cele. Calyx reticulately veined; teeth nearly equal. Tube of corolla ample. Cells of anthers linear, diverging.

83 Lepechi'nia. Calyx bilabiate: upper lip tridentate: lower lip bidentate. Corolla small.

§ 3. *Stamens inclosed within the tube.*

84 Craniótome. Superior lip of corolla very short, truncate.

85 Sideri'tis. Lower lobe of style dilated, clasping the superior one at the base, which is truncate.

86 Marru'bium. Lobes of style nearly equal. Calyx tubular.

§ 4. *Limb of calyx dilated or 5-10-toothed, or with a truncate mouth, rather membranous between the teeth, or broadly and membranaceously campanulate. Superior lip of corolla generally compressedly galeate. Stamens exserted from the tube.*

87 Ballòta. Calyx regular, somewhat funnel-shaped, 5-10-toothed. Anthers 2-celled.

88 Lasiócorys. Calyx nearly equal; teeth 5, ovate, rarely with other 5 small acute ones in the recesses between the others. Galea of corolla very hairy. Anthers 2-celled.

89 Òylea. Segments of calyx 5, equal, oblong, membranous.

90 Otoste'gia. Limb of calyx somewhat bilabiately and membranously drawn out; lower lip large. Anthers 2-celled.

91 Leu'cas. Limb of calyx 8-10-toothed. Cells of anthers confluent. Galea of corolla very hairy, short; lower lobe of style very short.

92 Leonòtis. Calyx of *Leùcas section Plagióstoma*. Corolla yellow or scarlet. Galea much longer than the lip.

93 Phlòmis. Calyx tubular, 5 or 10-striped, usually plicate, 5-toothed, the margins rather membranous between the teeth. Superior filaments generally appendiculate. Cells of anthers confluent.

94 Notochæ'te. Mouth of calyx membranous, with 5 nerves, which are drawn out into as many subulate awns, which are hooked at apex.

95 Eremóstachys. All as in *Phlòmis*, except that the calyx is more ample, and the limb often large and membranous.

96 Eriophy'tum. Calyx membranous, amply campanulate. Galea of corolla large, incumbent: lip small, trifid.

97 Moluce'lla. Limb of calyx ample, oblique, with 5-10 mucrones or spines. Filaments naked at the base.

98 Holmskióldia. Calyx large, coloured, somewhat rotately campanulate. Ovarium bipartite; lobes bifid.

99 Hymenocra'ter. Calyx 13-nerved, with a 5-cleft spreading limb. Achenia tubercular.

100 Achyrospe'rmum. Achenia covered with scales at top.

101 Colquhou'nia. Achenia membranously drawn out at top.

Tribe X.

Prasie'æ. Corolla bilabiate. Stamens 4, ascending: lower ones the longest. Achenia fleshy, sub-baccate.

102 Gomphoste'mma. Throat of corolla dilated. Cells of anthers transverse, parallel.

103 Phylloste'gia. Throat of corolla nearly equal. Cells of anthers diverging. Lobes of style not subulate.

104 Stenógyne. Throat of corolla dilated. Cells of anthers at length divaricate. Lobes of style subulate.

105 Pra'sium. Calyx bilabiate. Tube of corolla inclosed.

Tribe XI.

Ajugoi'deæ. Upper lip of corolla sometimes very short, and sometimes cleft; segments cast down, rarely erect, arched: lower one elongated Stamens ascending, usually exserted: superior ones shorter, or abortive.

106 Amethy'stea. Superior stamens abortive.

107 Trichoste'mma. Limb of corolla nearly equally 5-cleft: segments declinate.

108 Teu'crium. Segments of corolla 4, nearly equal, or the 2 superior ones are larger, all declinate, or very shortly truncate: lower one large, rounded or oblong, usually concave. Stamens exserted.

109 A'juga. Superior lip of corolla short or very short. Stamens usually exserted.

110 Cyma'ria. Superior lip of corolla elongated, galeate.

Tribe I.

OCYMOI'DEÆ (from *Ocymum*, Basil.; and *idea*, similar; because the plants contained in this section agree with *O'cymum* in the characters given below.) Benth. lab. p. 1. Stamens declinate. Corolla sub-bilabiate; 4 upper lobes flat, and nearly equal: or the 2 uppermost ones are joined: lower one declinate, usually of different form, flat, but more often concave, boat-shaped, or saccate. Old anthers usually saucer-shaped.

I. O'CYMUM (said by Mathiolus to be derived from *oζω, ozo*, to smell; on account of the powerful scent of the plants.) Benth. lab. p. 1. O'cymum species of Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate or campanulate, 5-toothed: the upper tooth membranous, with winged, decurrent margins, at length deflexed. Corolla with a short tube; throat usually campanulate: upper lip quadrifid: lower lip hardly longer, declinate, quite entire, flattish. Stamens 4: lower ones the longest; filaments free: superior ones usually furnished with a tooth or a fascicle of hairs at the base; anthers ovate-reniform; cells confluent. Style bifid at top: lobes subulate or flattish; stigmas minute or marginal. Achenia smooth.—Herbs or subshrubs; whorls 6-flowered, rarely so much as 10-flowered, disposed in interrupted spikes or racemes; racemes simple, or a little branched at the base, rarely disposed in a thyrsoid panicle.

Sect. I. Ocymòdon (from *Ocymum*, and *οδους οδοντος, odous odontos*, a tooth; so called because the upper filaments are furnished with a tooth at the base.) Benth. lab. p. 3. Superior filaments furnished each with a toothlet at the base.—Whorls usually 6-flowered. Pedicels reflexed, usually shorter than the fructiferous calyxes.

1 O. ca'num (Sims, bot. mag. t. 2452.) herbaceous, erect, pubescent; leaves petiolate, ovate, narrowed at both ends, almost quite entire, canescent beneath; petioles ciliated; racemes simple; calyxes longer than the pedicels, reflexed in the fructiferous state: upper tooth of calyx orbicular, concave, shortly acuminated. ⊙. H. Native of Madagascar, East Indies, China, Brazil, &c. O. Americànum, Lin. amœn. 4. p. 276. spec. 833. but not of Jacq. O. álbum, Roxb., but not of Lin. O. staminèum, Sims, bot. mag. 2452. in text. O. incanéscens, Mart et Spix, reise. bras. 2. p. 787.—Very nearly allied to *O. Basílicum*, but the flowers are not half the size, and the habit distinct. Corollas white.

Hoary Basil. Fl. July. Clt. 1822. Pl. 1 foot.

2 O. Basi'licum (Lin. spec. 833.) herbaceous, glabrous, erect, or ascending; leaves petiolate, ovate or oblong, narrowed at the base, a little toothed; petioles ciliated; racemes simple; calyxes longer than the pedicels, reflexed in the fructiferous state: upper tooth ovate, concave, shortly acuminated. ⊙. H. Native of the East Indies, and tropical Africa. Corollas of all white. The sweet or larger Basil, *O. Basilicum, Basilic*, Fr.; *Basilikum*, Germ.; *Basilico*, Ital.; is a tender annual plant, highly aromatic. The bush, or Least Basil, is the *O. minimum*, is also an aromatic plant, but more diminutive than the sweet Basil, forming a round bushy head. The leaves and small branches, or leafy tops of both these species, are the parts gathered for culinary purposes, on account of their strong flavour of cloves, to be used in highly seasoned dishes. A few leaves are sometimes introduced into salad, and not unfrequently into soups. Both species are raised from seeds; and a seed bed of 3 feet by $1\frac{1}{2}$, to furnish plants for a final transplanting, in a bed 4 feet by 12; a quarter of an ounce will be sufficient. Sow on a hot-bed, in the end of March, and plant out in a warm border of rich soil; the larger at 8 or 10 inches every way. Sometimes both sorts are sown in the open border; but so treated they come up late and small. In transplanting from the hot-bed, take care to raise the plants in small tufts or single plants, with balls attached, by which they receive no check; and if watered after planting, and in dry weather, will soon produce abundance of tops. Seed can only be saved in England in warm dry seasons, and under the most favourable circumstances of situation and precocity. In general it is procured from Italy by the seedsmen.

Var. α, pilòsum (Benth. lab. p. 4.) stem much branched, ascending; leaves small, oblong, quite entire; petioles and whorles of flowers very pilose; racemes elongated; corolla usually glabrous. O. mínimum, Burm. p. 129. but not of Lin. O. basílicum, Burm. ind. 129. O. híspidum, Lam. dict. 1. p. 384. O. pilòsum, Willd. enum. 2. p. 29. Roxb. hort. beng. p. 45. O. ciliàtum, Horn. hort. hafn. O. hispídulum, Schum. pl. guin. in act. acad. hafn. 4. p. 42. Basílicum I'ndicum, Rumph. amb. 5. p. 263. t. 92. f. 1.

Var. β, anisàtum (Benth. l. c.) habit of var. α, but more erect and less pilose; leaves larger, thicker, a little toothed; corollas usually villous. ⊙. H. O. Basílicum, Lin. spec. 833. O. anisàtum, Hort. Soladi-Tirtàva, Rheed. mal. 10. p. 173. t. 87. Basílicum citràtum, Rumph. amb. 5. p. 266. t. 93. f. 1.

Var. γ, glabràtum (Benth. l. c.) stem erect; petioles and calyxes sparingly ciliated; leaves hardly toothed; racemes elongated, simple. ⊙. H. O. integérrimum, Willd. spec. 3. p. 162. O. caryophyllàtum, Roxb. hort. beng. p. 45. O. lanceolàtum, Schum. pl. guin. in act. acad. hafn. 4. p. 42.

Var. δ, màjus (Benth. l. c.) leaves ovate, and are, as well as the calyxes, large; racemes elongated, simple. ⊙. H. O. màjus, Hort.

Var. ε, álbum (Benth. l. c.) leaves broad-ovate, thickish, toothed; raceme short, dense, hardly ciliated, canescent; corollas glabrous or villous. ⊙. H. O. álbum, Lin. mant. 85. O. láxum, Vahl, herb. O. Americànum. Jacq. hort. vind. 3. t. 86.

Var. ζ, diffórme (Benth. l. c.) leaves blistered, curled, or variously laciniately toothed; corollas usually villous; raceme various. ⊙. H. O. bullàtum, Lam. dict. 1. p. 384. Var. ι, *thyrsiflòrum* (Benth. l. c.) erect, glabrous; petioles and calyxes hardly ciliated; raceme thyrsoid, branched. ⊙. H. O. thyrsiflòrum, Lin. mant. 84. Murr. comm. goett. 8. p. 47. t. 5. Jacq. hort. vind. 3. t. 72.

Common or Sweet-Basil. Fl. June, Aug. Clt. 1548. Pl. 1 to 1½ foot.

3 O. Forskœ'lii (Benth. lab. p. 6.) stem herbaceous, pubescent; leaves on short petioles, ovate, rounded at the base, almost quite entire, smoothish: petioles and nerves ciliated; racemes simple; fructiferous calyxes longer than the pedicels, inflated, campanulate, reflexed, ciliated above the gibbosities at the base; upper tooth orbicular, concave. ⊙. H. Native of Arabia Felix. O. gratíssimum, Forsk. fl. ægypt. p. 110. but not of Lin. Allied to the two preceding. Leaves canescent, glabrous above, and hispid on the nerves beneath, hardly crenated on the margins.

Forskoel's Basil. Pl. 1 to 1½ foot.

4 O. mi'nimum (Lin. spec. 833.) stem herbaceous, erect, finely pubescent; leaves on long petioles, ovate, almost quite entire, glabrous; petioles naked: floral leaves almost like the others; raceme simple, short; whorls loose; calyxes rather shorter than the pedicels, reflexed in the fructiferous state; upper tooth orbicular: lower ones short, acute. ⊙. H. Native of Chili, near Valparaiso. Schkuhr, handb. 2. t. 166.? O. salìnum Molina, Nat. hist. chil. 291. Much branched. Leaves hardly larger than those of *Thymus serpyllum*. Corollas white.

Least Basil. Fl. July, Aug. Clt. 1573. Pl. ½ to 1 foot.

5 O. Sellòi (Benth. lab. p. 6.) quite glabrous; stem herbaceous, erect, nearly simple; leaves petiolate, broad-ovate, acute, coarsely serrated, subcuneated at the base: floral ones sessile, shorter than the calyx, deciduous; raceme simple; fructiferous calyxes longer than the pedicels, ovate, reflexed, a little incurved, quite glabrous: upper tooth ovate, obtuse, concave. ♃. S. Native of South America; Brazil, Sello; New Spain, Mocino et Sesse. Stem branched from the perennial base; branches simple. Corolla white.

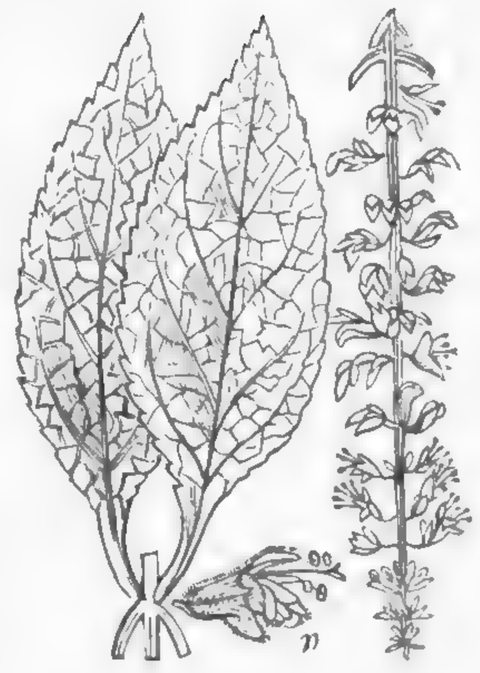
Sello's Basil. Pl. 1 to 2 feet.

6 O. vi'ride (Willd. enum. 639.) stem shrubby, branched, pubescent; leaves petiolate, ovate-oblong, acuminated, crenated, narrowed at the base, glabrous or downy on the ribs: floral leaves bractea-formed, ovate, acuminated, deciduous; raceme branched; calyxes about equal in length to the pedicels, nutant in the fructiferous state: upper tooth ovate, acuminated, concave; corolla hardly exceeding the calyx; stamens a little exserted. ♄. S. Native of the west coast of Africa, within the tropics. O. viridiflòrum, Roth. catal. 54. nov. spec. 279. O. héptodon, Beauv. fl. d'ow. 2. p. 59. t. 94. bad. O. febrífugum, Lindl. bot. reg. 753. Branches subtetragonal, pilose. Leaves glandularly dotted beneath. Calyxes pilose, and glandularly dotted. Corolla small, greenish-white. The leaves of this species are used in the manner of tea, as a febrifuge, at Sierra Leone, under the name of Fever-plant.

Green Basil. Fl. July, Oct. Clt. 1816. Shrub 2 to 4 feet.

7 O. grati'ssimum (Lin. spec. 832.) stem shrubby, smoothish; leaves petiolate, ovate, acute, crenated or coarsely toothed, narrowed at the base, glabrous or downy along the ribs; floral leaves bractea-formed, lanceolate, acuminated, hastate at the base; raceme simple or a little branched at the base, pubescent; fructiferous calyxes nutant: upper tooth ovate-oblong: lower ones very short; corolla hardly exceeding the calyx; stamens exserted. ♄. S. Native of the East Indies. O. Zeylánicum, Burm. zeyl. 174. t. 80. f. 1. O. frutéscens, Mill. dict. no. 6. O. petiolàre, Lam. dict. 1. p. 385. O. gratíssimum, Jacq. icon. rar. 3. t. 495. Cattu Tirtava, Rheed. mal. 10. p. 171. t. 86. Branches bluntly tetragonal. Pedicels short, and are, as well as the calyxes, pubescent. Corollas white. (fig. 74.)

FIG. 74.



Very-grateful Basil. Fl. July, Aug. Clt. 1751. Shrub 2 to 3 feet.

8 O. sua've (Willd. enum. 629.) stem shrubby, villous; leaves petiolate, ovate-oblong, acuminated, crenated, narrowed at the base, wrinkled, villous; floral leaves bractea-formed, ovate, acuminated; raceme somewhat panicled; whorls 6-flowered; fructiferous calyxes nutant: upper tooth ovate: lateral ones truncate; corolla larger than the calyx. ♄. S. Native of Madagascar. O. urticæfòlium, Roth. catal. p. 52. nov. spec. p. 279. O. gratíssimum, Lam. dict. 1. p. 386. but not of Lin. O. Zeylánicum, Desf. hort. par. ed. 2d. p. 75. O. villòsum, Weinm. in syll. pl. ratisb. 1. p. 121. but not of Roxb. O. holoseríceum, Breit. ex Steudel. nom. p. 559. Branches bluntly tetragonal. Corolla white, larger than those of the preceding species. Stamens exserted.

Sweet Basil. Fl. July, Sept. Clt. 1816. Shrub 2 to 3 feet.

9 O. Boje'ri (Benth. lap. p. 8.) stem shrubby, tomentose; leaves petiolate, ovate, crenated, rounded at the base or cordate, wrinkled, tomentose; floral leaves ovate, acuminated; raceme simple; whorls about 10-flowered; calyxes nutant: upper tooth ovate: lower ones very short; corolla twice as long as the calyx; stamens exserted. ♄. S. Native of Madagascar. O. cordifòlium, Bojer ex Loud. hort. brit. p. 240.?

Bojer's Basil. Clt. 1825. Shrub 2 to 3 feet.

10 O. filamentòsum (Forsk. fl. ægypt. p. 108.) stem shrubby, branched, clothed with hoary tomentum; leaves on short petioles, ovate-oblong, narrowed at both ends, acutely serrated, finely pubescent; raceme simple; calyxes longer than the pedicels, reflexed in the fructiferous state: lateral teeth truncate: lower ones shortly mucronate; corolla 4 times as long as the calyx; genitals much exserted. ♄. S. Native of the eastern coast of Africa, within the tropics; Abyssinia, Bruce; Arabia Felix, near Mount Melhan, Forsk. O. Abyssínicum, Hort. par. O. grandiflòrum, Lher. stirp. 89. t. 43. Branches bluntly tetragonal. Floral leaves coloured. Corolla white; tube exserted.

Thready Basil. Fl. July, Oct. Clt. 1802. Shrub 2 to 3 feet.

11 O. serpyllifòlium (Forsk. fl. ægypt. p. 110.) stem shrubby; branches canescent; leaves oblong, cuneated, quite entire, clothed with hoary tomentum, narrowed at the base; raceme simple, few-flowered; whorls loose, 6-flowered; calyxes declinate, canescent: upper tooth ovate, obtuse: lateral ones ovate, acute: lower ones lanceolate, acuminated; corolla about twice as long as the calyx; stamens much exserted. ♄.

G. Native of Arabia Felix, on Mout Chadra, Forsk.; Cape of Good Hope, Burchell. O. Burchellìànum, Benth. lab. p. 8. O. fruticulòsum, Burch. Leaves about the size of those of *Thymus vulgàris*, fascicled. Processes of filaments large, villous. Corollas purplish.

Wild-Thyme-leaved Basil. Shrub dwarf.

12 O. ADSCE'NDENS (Willd. spec. 3. p. 166.) stem herbaceous, prostrate; branches pubescent; leaves petiolate, ovate-oblong, obtuse, a little toothed, narrowed at the base, pubescent; floral leaves bractea-formed, deciduous; raceme simple; fructiferous calyxes nutant: tube striated: lateral segments truncate, with membranous ciliated edges; corolla twice longer than the calyx; stamens much exserted. ♃. H. Native of the East Indies, in sandy places. O. I'ndicum, Roth, nov. spec. p. 273. Plectránthus I'ndicus, Spreng. syst. 2. p. 691. O. cristàtum, Roxb. hort. beng. p. 45. Leaves hardly larger than those of *O. minimum*, often clothed with hoary tomentum beneath.

Ascending Basil. Fl. July, Sept. Clt. 1822. Pl. prostrate.

† *Species belonging to the present section, but are not sufficiently known.*

13 O. GUINEE'NSE (Schum. pl. guin. l. c.) suffruticose, branched; branches hairy; leaves petiolate, ovate, attenuated at both ends, serrated, pilose beneath, dotted and wrinkled; racemes terminal, branched; calyxes glabrous; bracteas deltoid, acuminated, deciduous. ♄. S. Native of Guinea, in the woods of Accra, Thonning. Branches quadrangular. Corolla length of calyx. Upper tooth of calyx broadly orbicular, acuminated, concave outside; middle tooth of the lower lip emarginate, deflexed.

Guinea Basil. Shrub 2 to 3 feet.

14 O. ARISTA'TUM (Blum. bijdr. 833.) leaves ovate, obtuse, repandly crenulated, attenuated at the base, quite entire, puberulous on the margins and veins beneath; branches tetragonal, and are, as well as the nearly simple raceme, obversely pubescent; whorls remote, 6-flowered; bracteas ovate-acuminated, ciliated, sessile; lower lip of calyx 4-toothed: middle teeth with long awns.—Native of Java, about Batavia, in grassy places.

Awned-calyxed Basil. Pl.

15 O. BRACHIA'TUM (Blum. bijdr. p. 833.) leaves lanceolate-ovate, acutish at both ends, remotely serrulated above, puberulous on the margins and ribs beneath; branches fastigiate, tetragonal, obversely hispid; whorls distinct, 6-flowered; bracteas ovate, petiolate, and are, as well as the pubescent calyx, ciliated; lower lip of calyx 4-toothed: middle teeth the longest.—Native of Java, in dry places about Batavia.

Armed Basil. Pl.

Sect. II. Hieróscymum (from *ιερος, hieros*, holy; and *Ocymum*; so called because this section contains *O. sánctum.*) Benth. lab. p. 11. Superior filaments appendiculate by a fascicle of hairs at base. Raceme loose, slender; whorls 6-flowered. Pedicels spreading. Calyxes nutant.

16 O. CARNÒSUM (Link, et Otto, ex Benth. lab. p. 11.) stem herbaceous, nearly glabrous; leaves petiolate, ovate, acutish, coarsely serrated, smoothish, rather fleshy; floral leaves bractea-formed, deciduous; raceme simple, many-flowered; whorls 6-flowered; calyxes campanulate, glabrous: throat naked inside: upper tooth with reflexed margins: lateral ones truncate; corolla hardly exceeding the calyx. ⊙.? S. Native of South America, Brazil, Buenos Ayres, and New Spain. Lumnítzera carnòsa, Spreng. cur. post. 223.? Stem sometimes pubescent towards the top. Leaves glandular beneath. Corolla small, purplish.

Fleshy Basil. Pl. erect.

17 O. SA'NCTUM (Lin. mant. 85.) stems pilose; leaves petiolate, oval, obtuse, toothed, pubescent, with the nerves and petioles pilose: floral ones bractea-formed, sessile, shorter than the pedicels; raceme slender, simple, or branched at the base; calyxes shorter than the pedicels, smoothish: throat naked inside: upper tooth obovate, concave; corolla hardly exceeding the calyx. ⊙. S. Native of the East Indies, in dry places, common. O. hirsùtum, Benth. in Wall. pl. rar. asiat. 2. p. 14. O. villòsum, Roxb. hort. beng. 44.? but not of Weinm. O. tomentòsum, Lam. dict. 1. p. 387. Lumnítzera tenuiflòra, Spreng. syst. 2. p. 687. O. tenuiflòrum, Lam. Willd. but not of Lin. Plectránthus monachòrum, Lin. mant. 58. O. inodòrum, Burm. fl. ind. 130. O. frutéscens, Burm. fl. ind. p. 129. —Burm. thes. zeyl. 174. t. 80. f. 2. and f. 1. Basílicum agréste, Rumph. amb. 5. p. 265. t. 92. f. 2. The whole plant is generally purplish. Leaves small, on long petioles. Corollas pale purplish. Stamens a little exserted.

Holy Basil. Fl. July, Sept. Clt. 1758. Pl. 1 foot.

18 O. TENUIFLÒRUM (Lin. spec. 833. exclusive of the synonymes) stems herbaceous,? ascending, branched, pilose; leaves on long petioles, oblong, bluntish, crenated, rather narrowed at the base, pubescent; racemes filiform, branched a little at the base; whorls few-flowered, remote; floral leaves broad-ovate, sessile; calyxes on short pedicels, rather nutant, smoothish: throat naked inside: upper tooth ovate, obtuse: lower ones short; corolla rather shorter than the calyx.—Native of the East Indies. Very nearly related to *O. sánctum*, but the racemes are shorter, the floral leaves broader, and the flowers very small and sessile.

Thin-flowered Basil. Pl. 1 foot.?

19 O. GRA'CILE (Benth. lab. p. 12.) stems ascending, pilose, panicled at top; leaves on short petioles, oblong-ovate, obtuse, crenated, narrowed at the base, pubescent: superior ones lanceolate, nearly sessile: floral ones bractea-formed, sessile, much shorter than the pedicels; racemes numerous, simple; fructiferous calyxes longer than the pedicels, declinate: throat villous inside: upper tooth ovate-obtuse; corolla rather shorter than the calyx.—Native of the Eastern coast of Africa, within the tropic; Island of Zanquebar. Very nearly related to *O. sánctum*, but differs in the leaves being narrower, the flowers smaller, and in the calyx being villous inside.

Slender Basil. Pl. 1 foot.?

20 O. TENE'LLUM (Benth. lab. p. 12.) glabrous; stem small, creeping; leaves petiolate, ovate-roundish, crenated; racemes loose, simple, the whorls 6-flowered; calyxes on long pedicels, declinate, glabrous: upper tooth ovate, very blunt: throat naked inside; corolla hardly exceeding the calyx; genitals exserted.—Native of Madagascar, Lyall. Habit of *Sálvia tenélla*. Sterile branches creeping, generally pubescent, floriferous ones ascending, glabrous. Leaves like those of *Linària cymbalària*: floral ones very minute. Corolla of *O. sánctum*.

Slender Basil. Pl. creeping.

Sect. III. Gymnócymum (from *γυμνος, gymnos*, naked; and *Ocymum*; so called in allusion to the filaments being naked.) Benth. lab. 12. Filaments all naked and toothless. Whorls 6-flowered, rarely 10-flowered. Pedicels shorter than the calyxes.

21 O. MICRA'NTHUM (Willd. enum. 630.) stem herbaceous, erect, branched, nearly glabrous; leaves petiolate, ovate, acute, serrated, rounded at the base, or cuneated, nearly glabrous: floral ones bractea-formed, deciduous; fructiferous calyx deflexed, oblong: upper tooth obtuse, concave; corolla inclosed. ⊙. H. Native of Tropical America, from Caraccas to Rio Janeiro. O. frutéscens, Sieb. pl. exsic. O. Americànum, of

many authors. O. pubéscens, Mill. dict. O. montànum, Hook. bot. mag. 2996. Stem bluntly tetragonal. Leaves glabrous, or pubescent, glandular beneath. Corolla white, or pale purple, inclosed in the calyx.

Small-flowered Basil. Fl. May, Aug. Clt. 1816. Pl. 1 foot.

22 O. Campechia'num (Mill. dict. no. 5.) stem erect, villous, at length glabrous; leaves petiolate, ovate, or ovate-lanceolate, acute, a little serrated, cuneate or narrowed at the base, canescent beneath; petioles and nerves of leaves hairy; floral leaves bractea-formed, broad, deciduous; fructiferous calyx deflexed, oblong, hispid: upper tooth obtuse, concave: lower ones ending in long awns like most of the species.—Native of New Spain; at Campeachy, Miller. This species differs from *O. micránthum* in the stem being hairy, especially at the nodi, as well as on the nerves and petioles of the leaves, and in the leaves being smaller and canescent beneath. Corollas white.

Campeachy Basil. Pl. 2 feet.

23 O. ova'tum (Benth. lab. p. 13.) stems erect, a little branched; leaves nearly sessile, broad-ovate, a little toothed, rounded at the base, smoothish, or hispid: floral ones bractea-formed, deciduous; racemes short; fructiferous calyx ovate, inflated, deflexed: upper tooth ovate-oblong, obtuse, concave; corolla hardly exceeding the calyx. ♃. S. Native of the South of Brazil, Sello. Stem villous. Leaves bluntish, entire, or 1-2-toothed.

Ovate-leaved Basil. Pl. ½ to 1 foot.

24 O. nudicau'le (Benth. lab. p. 14.) stem simple, naked; leaves approximate at the base of the stem, hardly petiolate, ovate roundish, rather pilose; racemes elongated; calyx ovate, deflexed: upper tooth running beyond the middle of the calyx; corolla twice as long as the calyx.—Native of the South of Brazil, Sello. Stems rising from a thick woody base, tetragonal, glabrous, or downy.

Naked-stemmed Basil. Pl. ascending.

25 O. ri'gidum (Benth. l. c.) branches erect, strict, pubescent; leaves sessile, stem-clasping, lanceolate, acute, quite entire, rounded at the base, stiff, ciliated: floral ones bractea-formed, ciliated; raceme loose; whorls 2-flowered; throat of corolla naked inside; corolla hardly exceeding the calyx. ♄. S. Native of Angola. Branches compressedly tetragonal. Rachi of flowers clothed with glandular down.

Stiff Basil. Shrub.

26 O. tereticau'le (Poir. dict. suppl. 1. p. 595.) stem suffruticose, villous; leaves on short petioles, oblong, irregularly serrated, narrowed a long way at the base, pubescent on both surfaces: floral ones conform, longer than the flowers: upper ones permanent; calyx declinate, tubular, hispid; corolla hardly longer than the calyx. ♄. S. Native of Guinea. O. Thonníngii, Schum. pl. guin. in act. roc. hafn. 4. p. 39. Branches terete. Whorls 6-flowered. Genitals inclosed in the tube.

Terete-stemmed Basil. Shrub diffuse.

27 O. bracteòsum (Benth. lab. p. 14.) stem herbaceous, erect, pilosely hispid; leaves on short petioles, oblong-lanceolate, acutish, remotely serrated, narrowed at the base, smoothish above, and rather hispid beneath: floral ones bractea-formed, 2-3-times longer than the calyxes, cuneated, coloured; fructiferous calyxes reflexed, ovate, a little inflated: upper tooth ovate; stamens a little exserted. ⊙. S. Native of the west coast of Africa, within the tropic. Branches bluntly tetragonal. Leaves 1-2 inches long, pale beneath.

Bracteate Basil. Pl. 1 to 1½ foot.

28 O.? diffu'sum (Benth. in Wall. pl. rar. 2. p. 14. lab. p. 15.) stem suffruticose, diffuse, villous; leaves petiolate, ovate, crenated, roundedly cuneated at the base, villously tomentose; racemes slender, few-flowered; corolla hardly twice as long as the calyx, with a straight tube, and nearly equal throat; stamens shorter than the corolla. ♄. S. Native of the East Indies, in arid places. Shrub much branched, clothed with rather clammy down all over. Whorls 2-4, rarely 6-flowered.

Diffuse Basil. Shrub diffuse, humble.

29 O.? membrana'ceum (Benth. lab. p. 15.) stem erect, villous; leaves on short petioles, ovate, obtuse, crenated, rounded at the base, wrinkled, villous: lower floral ones conform: superior ones bractea-formed, lanceolate, membranous, villous; racemes simple; whorls usually 10-flowered; calyxes oblong, pubescent: upper tooth orbicular, hardly decurrent, membranous; stamens shorter than the corolla. ⊙.? S. Native of Angola. Leaves minutely glandular: floral ones sessile. Corolla hardly exceeding the calyx.

Membranous-calyxed Basil. Pl. erect.

† *Species not sufficiently known.*

30 O. Africa'num (Lour. coch. p. 370.) leaves lanceolate, quite entire, pilose; spike terminal, verticillate, interrupted. ⊙. S. Native of the eastern coast of Africa, in sandy places. Stem tetragonal, pilose. Leaves pilose, petiolate, ovate-lanceolate. Flowers white, minute. Spikes hairy. Plant sweet-scented.

African Basil. Pl. 1 foot.

31 O. Zatarhe'ndi (Forsk. fl. ægypt. arab. p. 110.) leaves fleshy, cuneate-oblong, generally 4-toothed on both sides, villous, sessile. ♄. G. Native of Arabia Felix. Stem diffuse. Branches terete, villous. Leaves villous, hoary above, and scattered with rusty dots beneath. Whorls 6-flowered. Plant very fragrant.

Zatarhendi's Basil. Shrub 1 foot.

32 O. Vaa'læ (Forsk. fl. ægypt. p. 111.) stem tetragonal, bracteate; roots filamentose; fruit pilose.—Native of Arabia Felix. Plant very sweet-scented.

Vaala's Basil. Pl.

33 O. macrosta'chyum (Poir. dict. suppl. 1. p. 392.) stem suffruticose; leaves ovate-sublanceolate, obtuse, a little toothed, nearly glabrous; spike dense, terminal. ♄. S. Native of the East Indies, at Pondicherry. Stem much branched; branches pilose. Leaves small, hardly petiolate, oval, or oval-oblong, rather fleshy. Flowers dense; calyxes hairy.

Long-spiked Basil. Shrub.

34 O. viscòsum (Roth, nov. spec. 274.) plant clammy, very pilose; leaves obovate-roundish, coarsely and bluntly serrated, reticulately wrinkled beneath; raceme simple; bracteas ovate, petiolate; lower lip of calyx 4-toothed: middle teeth the longest.—Native of the East Indies. Whorls 4-6-flowered. Corolla blood red. Filaments toothless. Perhaps a species of *Orthosìphon*.

Clammy Basil. Pl. ½ to 1 foot.

35 O. acu'tum (Thunb. fl. jap. 248.) racemes filiform; leaves ovate, acuminated, serrated; bracteas hairy.—Native of Japan. Stem tetragonal, glabrous. Petioles a little shorter than the leaves, hairy on the midrib beneath. Bracteas ovate, acute, hispid.

Acute-leaved Basil. Pl.

36 O. cri'spum (Thunb. fl. jap. 248.) racemes terminal; leaves ovate, serrated, curled; calyxes hispid.—Native of Japan, about Nagasaki. Stem tetragonal, villous, branched. Leaves petiolate, acuminated, glabrous, purplish, an inch long; petioles villous. A decoction of this species is used in Japan to give a deep red colour to radishes, turnips, and various kinds of fruits.

Curled-leaved Basil. Pl.?

37 O. rugòsum (Thunb. fl. jap. p. 249.) racemes terminal;

leaves ovate, acute, serrated, wrinkled beneath.—Native of Japan. Stem tetragonal, furrowed, tomentose. Racemes of flowers terminal, contracted.

Wrinkled-leaved Basil. Pl. 2 to 3 feet.

38 O. sca'brum (Thunb. in Lin. trans. 2. p. 338.) racemes simple, erect; leaves ovate, dotted beneath.—Native of Japan. O. punctàtum, Thunb. jap. 249. Stem panicled, tetragonal, scabrous from pili, like the whole plant. Leaves oblong, acute, serrated. Racemes terminal; flowers opposite.

Scabrous Basil. Pl. 1 foot.

39 O. infle'xum (Thunb. fl. jap. 249.) panicle terminal, racemose; stem and branches flexuous.—Native of Japan. Stem and branches inflexed at top, tomentose, tetragonal. Leaves ovate, acute, serrated, scabrous. This species powdered is used by the Japanese to perfume their idols.

Inflexed-branched Basil. Pl. 1 foot.

40 O. virga'tum (Thunb. fl. jap. p. 250.) racemes verticillate, twiggy; leaves oblong, serrated.—Native of Japan. Stem tetragonal, deeply furrowed, tomentose, branched. Leaves obovate-oblong, tomentose, 1 inch and more long. Whorles 6-flowered.

Twiggy Basil. Pl.

41 O. cine'reum (R. Br. in append. to Salt. Abyss.) Native of Abyssinia. This species has not yet been described.

Grey Basil. Pl.

Cult. Plants of easy culture and propagation. Any light rich soil will suit the species. The shrubby and perennial kinds are readily increased by cuttings. The seeds of annual kinds should be reared on a hot-bed, and afterwards planted out. See *O. Basílicum*, p. 671.

II. GENIO'SPORUM (meaning unknown to us.) Wall. mss. Benth. lab. 19. O'cymum, species of Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate-tubular, with an irregularly, somewhat 5-toothed, membranous margin, when bearing the fruit erectish, or declinate, usually transversely wrinkled at the base; throat naked inside; upper tooth not decurrent: lateral ones often joined by turns with the upper one and lower ones. Corolla with a straight tube, which is rather shorter than the calyx; throat campanulate, sub-bilabiate; upper lip 4-cleft; lower one hardly longer, declinate, quite entire, flattish. Stamens 4, declinate, didynamous: lower ones the longest; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style shortly bifid at top; lobes usually flattened; stigmas submarginal. Achenia smooth, or wrinkled, when examined by a lens. Annual, or perennial herbs, usually procumbent at the base. Whorles many-flowered, disposed in nearly simple racemes or spicate-racemes. Floral leaves usually cartilaginous at the base, white or yellow. Flowers small. The corolla is that of *O'cymum* and *Moschósma*, but the habit is very different. The form of the calyx and the many-flowered whorls separate it from the first; and the calyx, inflorescence, and style readily separate it from the latter.

Sect. I. Geniósporum (see genus for derivation.) Two lower teeth of calyx free.

1 G. Madagascarie'nsis (Benth. lab. p. 20.) stem suffruticose, procumbent, branched; leaves petiolate, ovate, bluntish, crenated, rounded at the base, or cordate, wrinkled, rather villous on both surfaces: floral ones bractea-formed, ovate, acute, white at the base. ♄. S. Native of Madagascar, on Mount Tanonarivan. Stem bluntly tetragonal. Floral leaves small, sessile. Whorles 10-flowered. Genitals exserted.

Madagascar Geniosporum. Shrub procumbent.

2 G. strobili'ferum (Wall. pl. asiat. rar. 2. p. 18. Benth. lab. p. 20.) stem erect, branched; leaves nearly sessile, ovate-oblong, narrowed at both ends, toothed, rough, hispid above, and rather glabrous beneath; whorls many-flowered, spicate on the tops of the branches: lower ones rather remote; floral leaves ovate, acuminated, exceeding the flowers; calyxes nearly sessile, erect in the fructiferous state, tubular, transversely wrinkled at the base, with an irregularly 5-toothed, membranous border. ♄. S. Native of the East Indies; as of Nipaul and Silhet. Plectránthus coloràta, D. Don. prod. fl. nep. p. 116. Cauline leaves 2-3 inches long. Corolla hardly longer than the calyx, blue. Genitals rather shorter than the corolla.

Strobile-bearing Geniosporum. Shrub.

3 G. parvifl'orum (Benth. in Wall. pl. rar. asiat. 2. p. 18. lab. p. 20.) stem erect, branched; leaves oblong-lanceolate, acute, narrowed at the base, serrated, strigosely hispid; raceme elongated, loose, many-flowered; calyxes pedicellate, declinate while bearing the fruit, transversely wrinkled at the base, with a bilabiate border: upper lip tridentate: middle tooth larger, ovate; lower lip quite entire, inflexed, closing the calyx.—Native of Silhet. Stem glabrous at the bottom, but hispid from pili at top, and furnished with a fascicle of hairs in the axils of the cauline and floral leaves. Leaves tapering into the short petioles. Calyx hispid at the base. Corolla small. Stamens exserted.

Small-flowered Geniosporum. Pl. 1 to 1½ foot.

4 G. elonga'tum (Benth. lab. p. 21.) stem prostrate at the base, and are, as well as the erectish, elongated branches, pubescent; leaves on short petioles, oblong-lanceolate, acute, serrated, attenuated at the base, rather hispid; whorls many-flowered, approximate, spicate; calyxes on short pedicels, rather declinate in the fructiferous state, ovate, striated at the base, and wrinkled transversely, with a contracted mouth: upper tooth ovate, membranous, obtuse, 4 lower ones smaller, and acute.—Native of Ceylon, on the mountains, Macrae. Rhinánthus I'ndica, Burm. fl. ind. 131. t. 39. f. 1.

Elongated-branched Geniosporum. Pl. prostrate.

5 G. gra'cile (Benth. lab. p. 21.) quite glabrous; stems prostrate, much branched; leaves oblong-linear, subserrated, narrowed a long way at the base; whorls many-flowered, loosely racemose: lower ones remote; pedicels capillary, about twice as long as the calyxes; calyxes tubular, striated at the base, transversely wrinkled, with a membranous, acutely 5-toothed, sub-bilabiate mouth.—Native of Ceylon, on the sea-shore near Colombo, Macrae; Coromandel, Klein. Very nearly allied to *G. prostràta*, but is distinguished at first sight by its smoothness, narrower leaves, and more loose inflorescence.

Slender Geniosporum. Pl. prostrate.

6 G. prostra'tum (Benth. in Wall. pl. asiat. rar. 2. p. 18. lab. p. 21.) stem prostrate, and is, as well as the branches, hispid; leaves petiolate, oblong-lanceolate: lower ones sub-ovate: upper ones lanceolate-linear, serrated, narrowed at the base; whorls many-flowered, spicate: lower ones rather remote; calyxes pedicellate, declinate in the fructiferous state, striated at the base, and transversely somewhat wrinkled, with an irregularly bilabiate, membranous mouth; upper lip tridentate, with the middle tooth the largest: lower lip erect, bidentate.—Native of the East Indies, Coromandel, Ceylon, &c. Lumnítzera prostràta, Spreng. syst. 2. p. 687. O'cymum prostràtum, Lin. mant. p. 566. O'cymum menthoìdes, Burm. fl. ind. p. 129. Lin. mant. 84. Thy'mus I'ndicus, Burm. fl. ind. p. 129. Méntha ocymoìdes, Lam. dict. 4. p. 103. Elshóltzia ocymoìdes, Pers. ench. 2. p. 114. Méntha Zeylánica, &c. Burm. thes. zeyl. 158. t. 70. f. 2.—Katu-tumba, Rheed. mal. 10. p. 183. t.

92. ? Much branched. Leaves ½ to 1 inch long. Whorls 10-20-flowered. Corollas minute. Stamens exserted a little.

Prostrate Geniosporum. Fl. July, Aug. Clt. 1783. Pl. prostrate.

7 G. thymifòlium (Benth. lab. p. 21.) stem herbaceous, procumbent at the base, pubescent; leaves sessile, ovate, obtuse, crenated: floral ones conform, smaller: upper ones and bracteas white and cartilaginous; whorls distant; calyxes nearly sessile, irregularly bilabiate: superior lip ovate, entire, or toothed on both sides at the base: lower lip entire, or bifid. —Native of Madagascar. Stamens a little exserted. Leaves ½ an inch long.

Thyme-leaved Geniosporum. Pl. prostrate.

Sect. II. Platóstoma (from πλατυς, *platys*, wide; and στομα, *stoma*, a mouth; calyx.) Benth. lab. p. 22. Calycine teeth combined into two almost entire lips.

8 G. Palisòti (Benth. lab. p. 22.) stem erect, pubescent; leaves petiolate, ovate, cuneately rounded at the base: floral ones hardly longer than the whorls of flowers; raceme slender; lips of calyx membranous, nearly entire. ⊙. S. Native of Guinea, and Congo. Platóstoma Africànum, Beauv. fl. d'ow. 2. p. 61. t. 95. f. 2. O'cymum sylvàticum, Schum. pl. guin. in act. acad. hafn. 4. p. 44. Flowers small.

Palisot de Beauvois's Geniosporum. Pl. 1 foot.?

Cult. For culture and propagation see *O'cymum*, p. 674.

III MESO'NA (from μεσος, *mesos*, middle; so called because the genus was supposed by the author to be intermediate between the genus *O'cymum* and *Scutellària*.) Blum: bijdr. p. 838. Benth. lab. p. 22.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx bilabiate: upper lip divided: lower one small, at length inflexed. Upper lip of corolla arched: lower one longer, undivided. Stamens didynamous, declinate; of these the two shorter are appendiculate at the base; anthers 1-celled, beardless. A genus intermediate between *O'cymum* and *Scutellària*, ex Blum. l. c. This genus is nearly allied to *Geniósporum*, but differs in the shorter stamens being appendiculate at the base; and from *O'cymum* in the superior lip of calyx being divided, and in the inflorescence, ex Benth.

1 M. palu'stris (Blum. l. c.) ♃.? S. Native of Java, in marshes about Buitenzorg. Herb scentless. Leaves ovate-oblong, toothed, wrinkled, rather pilose. Flowers densely and verticillately spiked; whorls bracteate; pedicles fascicled.

Marsh Mesona. Pl.

Cult. For culture and propagation see *O'cymum*, p. 674.

IV. ACROCE'PHALUS (from ακρος, *akros*, the highest; and κεφαλη, *kephale*, a head; in allusion to the flowers being disposed in small, dense, terminal, imbricate heads.) Benth. in bot. reg. vol. 15. lab. p. 23. — O'cymum species, Lin. and other authors.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx ovate in the floriferous state, but elongated in the fructiferous state, tubular, gibbous at the base, bilabiate: upper lip entire, flattish: lower lip entire, or 4-toothed; throat naked inside. Corolla about equal in height to the calyx, sub-bilabiate: upper lip 4-toothed: lower one entire; lobes all nearly equal. Stamens 4, declinate; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style shortly bifid at apex; lower lobe a little dilated, flattened; stigmas submarginal. Achenia glabrous, smooth.—Herbs. Flowers small, disposed in densely imbricate, terminal, almost globose heads. This genus differs from *O'cymum*, *Geniósporum* and *Moschósma* by the form of the calyx, and more especially by the inflorescence. The form of the corolla distinguishes it from all other genera of the tribe *Ocymoídeæ*.

1 A. capita'tus (Benth. in Wall. pl. rar. 2. p. 18. lab. p. 23.) stem procumbent, and are, as well as the leaves, which are ovate, nearly glabrous; lower lip of calyx 4-toothed. ⊙. S. Native of the East Indies, China, &c. Lumnítzera capitàta, Spreng. syst. 2. p. 687. O'cymum capitàtum, Roth, nov. spec. 276. O'cymum capitellàtum, Lin. mant. 276. Prunélla I'ndica, Burm. fl. ind. p. 130. Branches glabrous, or with a pilose line on each side. Leaves petiolate, oblong-ovate, remotely serrated: floral ones 2-4 under each head, and longer than it, sessile. Heads ovate, pedunculate, or sessile.

Capitate-flowered Acrocephalus. Fl. July, Aug. Clt. 1806. Pl. procumbent.

2 A. Blu'mei (Benth. lab. p. 23.) stem diffuse, tetragonal; leaves linear-lanceolate, coarsely serrated; flowers densely capitate, terminal, girded by ovate, nerved bracteas. ⊙. S. Native of Java, in grassy humid places about Rompien. O'cymum acrocéphalum, Blum. bijdr. p. 834.

Blume's Acrocephalus. Pl. diffuse.

3 A. villòsus (Benth. lab. p. 23.) stem erect, and is, as well as the leaves, hairy; lower lip of calyx quite entire. ⊙. S. Native of Madagascar. Stem tetragonal, often glandular, as well as the under sides of the leaves. Floral leaves 2-4 under each head.

Villous Acrocephalus. Pl. 1 foot.

Cult. For culture and propagation see *O'cymum*, p. 674.

V. MOSCHO'SMA (from μοσχος, *moschos*, musk; and οσμη, *osme*, a smell; plant exhaling a smell like that of musk.) Rchb. consp. reg. veg. p. 171. Lumnítzera, Jacq. fil. ecl. 2. but not of Willd.—O'cymum species, Lin. and other authors.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx ovate, 5-toothed: upper tooth the largest, with the margins not decurrent: lower teeth nearly equal, and somewhat declinate after florescence; throat naked inside. Corolla with an inclosed tube, and a sub-bilabiate limb; upper lip shortly quadrifid: lower one quite entire, flattish; lobes all nearly equal. Stamens 4, declinate; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style clavately capitate, and shortly bifid at apex; stigmas minute. Achenia ovate, compressed, smooth. — Herbs. Whorls few-flowered, secund, loosely racemose; racemes axillary, subpanicled. The clavate style and form of the calyx separates this genus from the preceding genera. Flowers very minute.

1 M. polysta'chya (Benth. in Wall. pl. rar. asiat. 2. p. 13. lab. p. 24.) stem acutely tetragonal, with smooth or hardly rough angles; whorls 6-10-flowered. ⊙. S. Native of the East Indies; Arabia, at Senaar, Bové; tropical New Holland, Bauer. Lumnítzera polystàchya, Jacq. l. c. O'cymum polystàchyon, Lin. mant. 567. Murr. comm. goett. nov. 3. p. 71. t. 3. O'cymum tenuiflòrum, Burm. ind. 129. but not of Lin. Plectránthus parviflòrus, R. Br. prod. p. 506.? Plectránthus micránthus, Spreng. syst. 2. p. 691. Plant branched. Leaves on long petioles, ovate, acutish, crenated, rounded at the base, glabrous, or finely downy above. Corolla minute, pale purple.

Many-spiked Moschosma. Fl. July, Aug. Clt. 1783. Pl. 1 to 2 feet.

2 M. Austra'le (Benth. lab. p. 708.) stem acutely tetragonal, with smooth angles; leaves ovate or ovate-lanceolate, pubescent; whorls loosely 6-10-flowered, distant; style bifid at apex. ⊙. S. Native of New Holland, within the tropic. Plectránthus moschàtus, R. Br. prod. 506. Lumnítzera moschàta, Spreng. syst. 2. p. 687. Hardly distinct from *M. polystàchya*, except that the leaves are pubescent, the racemes

longer and more loose, the lower teeth of the calyx narrowed, and the style more deeply bifid.

Southern Moschosma. Pl. 1 to 2 feet.

3 M. DIMIDIA'TUM (Benth. lab. 24.) stem acutely tetragonal, with smooth angles; racemes elongated; whorls about 10-flowered, glomerate, remotish. ⊙. S. Native of the west coast of Africa, within the tropics. O'cymum dimidiàtum, Schum. pl. guin. l. c. p. 41. Very nearly allied to the preceding; but differs in the larger leaves, longer racemes, smaller flowers, and usually 10-flowered, distant whorls.

Dimidiate Moschosma. Pl. 1 to 2 feet.

4 M. OCYMOI'DES (Benth. in Wall. pl. rar. 2. p. 13.) stem tetragonal, with rough angles; whorls loose, 6-flowered. ⊙. S. Native of the East Indies, in Silhet. Lumnítzera ocymoìdes, Jacq. l. c. O'cymum polýcladum, Link. enum. 2. p. 119. Habit of *M. polystàchya*; but the leaves are more acutely serrated, hispid above, and canescent beneath. Upper lip of calyx tridentate: teeth ovate: middle tooth the broadest; lower lip bidentate: teeth lanceolate, acute.

Basil-like Moschosma. Fl. July, Sept. Clt. 1823. Pl. 1 to 2 feet.

† *A species doubtful whether belonging to the genus.*

5 M. CÆ'SIA (Benth. lab. p. 25.) branches smoothish, terete; leaves ovate, dentately crenated; peduncles subverticillate, bracteate at the base. ⊙. S. Native country unknown. Lumnítzera cæ'sia, Spreng. cur. post. 223.

Grey Moschosma. Pl. 1 to 2 feet.?

Cult. For culture and propagation see *Ocy'mum*, p. 674.

VI. ORTHOSI'PHON (from *ορθος*, *orthos*, straight; and *σιφων*, *siphon*, a tube; in reference to the straight tube of the corolla.) Benth. in Bot. reg. vol. 15. lab. p. 25.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx ovate-tubular, 5-toothed; margins of superior tooth, which is ovate, membranous, decurrent, winged, deflexed after florescence. Corolla with a straight or incurved exserted tube, neither gibbous nor refracted; throat equal or rarely inflated, bilabiate; upper lip 3-4-cleft: lower one quite entire, concave. Stamens 4, declinate; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style clavately capitate at apex, nearly entire or shortly emarginate; stigmas confluent in the fork, sometimes minute, sometimes capitately thickened. Achenia rugged from minute dots.—Perennial herbs or undershrubs. Racemes simple, usually elongated, rarely ovate-spike-formed; whorls 6-flowered, distant, loose. Floral leaves bractea-formed, ovate, acuminated, reflexed, usually shorter than the pedicels. Fructiferous pedicels recurved. The chief characters which distinguish this genus are the length of the tube of the corolla, and the capitate apex of the style.

1 O. RUBICU'NDUS (Benth. in Wall. pl. rar. asiat. 2. p. 14.) stems tufted, leafy at the base, branched; leaves oblong-ovate, coarsely toothed, narrowed at the base: lower ones petiolate: superior ones sessile; tube of corolla straight; throat nearly equal, twice as long as the calyx; stamens equal in length to the corolla. ♃. S. Native of the East Indies. Plectránthus rubicúnda, D. Don, prod. fl. nep. p. 116. Lumnítzera rubicúnda, Spreng. cur. post. p. 223. Root often tuberous. Stems tetragonal, more or less villous from articulated clammy hairs. Leaves 2-3 inches long, full of glandular dots. Corolla white or pale purple.

Var. α, *mollíssimus* (Benth. lab. p. 26.) leaves clothed with soft villi on both surfaces. ♃. S. Native of Nipaul and Kamaon, Wall. Plectránthus mollíssimus, Wall. mss.

Var. β, *canéscens* (Benth. l. c.) leaves clothed with short tomentose pubescence. ♃. S. Native of the mountains of Orixa, Roxb.; and at Segain, in the Birman Empire. Plectránthus tuberòsus, Roxb. mss. O'cymum tuberòsum, Roxb. in herb. Banks.

Var. γ, *rígidus* (Benth. l. c.) leaves smoothish, or clothed with very short tomentum. ♃. S. Native at Nathpur and Monghyr, Hamilt.

Reddish Orthosiphon. Pl. 1 to 1½ foot.

2 O. VIRGA'TUS (Benth. in Wall. pl. rar. 2. p. 14. lab. p. 26.) stems tufted at the base; branches erect, strict; leaves oblong-lanceolate, a little toothed, narrowed at the base, sessile, or the lower ones stand on short petioles; corolla twice as long as the calyx: tube straightish: throat nearly equal; stamens about equal in length to the corolla. ♃. S. Native of the East Indies, at Gorakpur, and in the mountains of Morang, Hamilt.; mountains about Mohun, Jacquemont. Plectránthus virgàta, D. Don, prod. fl. nep. p. 116. Lumnítzera virgàta, Spreng. syst. cur. post. 223. This species differs from *O. rubicúndus* in the stems being taller; in the leaves being narrower; in the racemes being shorter and fewer flowered; in the whorls being more remote; in the corollas being smaller; in the stems being less leafy, and in the whole plant being smoothish.

Twiggy Orthosiphon. Pl. 1 foot.

3 O. TOMENTÒSUS (Benth. l. c.) stem suffruticose; branches ascending, clothed with tomentose pubescence; leaves petiolate, ovate, cuneated at the base, rounded or subcordate, thickish, clothed with very short tomentose pubescence on both surfaces; petioles and axils naked; racemes elongated; corolla 3 times as long as the calyx: tube incurved a little: throat widened a little; stamens shorter than the corolla. ♄. S. Native of the East Indies, near Madras, Wight. O'cymum tríste, Roth. nov. spec. 270.? Plectránthus trístis, Spreng. syst. 2. p. 690. Intermediate between *O. viscòsus* and *O. glabràtus*.

Tomentose Orthosiphon. Shrub.

4 O. PA'LLIDUS (Royle, mss. Benth. in Hook. bot. misc. 3. p. 370. lab. p. 708.) glabrous or finely pubescent; stem ascending; leaves ovate, petiolate, bluntly and coarsely toothed, quite entire at the base, cuneated, and running into the petioles; corolla small: tube about equal in length to the calyx: throat nearly equal; stamens shorter than the corolla. ♃. S. Native of the East Indies, on the banks of the Jumna, Royle; Cashmere; and the Peninsula. Allied to *O. tomentòsus*.

Pale Orthosiphon. Pl.

5 O. GLABRA'TUS (Benth. in Wall. pl. rar. asiat. 2. p. 14. lab. p. 28.) stems ascending, branched, glabrous; leaves on long petioles, ovate, acute, toothed, rounded or subcordate at the base, smoothish; corolla incurved a little: tube twice as long as the calyx: throat nearly equal; stamens shorter than the corolla. ♄. S. Native of the East Indies, Arabia, Guinea, Madagascar. O'cymum thymiflòrum, Roth. nov. spec. 269. Plectránthus thymiflòrus, Spreng. syst. 2. p. 690. O'cymum suffruticòsum, Schum. pl. guin. in act. hafn. suppl. O'cymum Thonníngii, Schum. pl. guin. in act. acad. hafn. 4. p. 43. Corollas small, dark purple. Branches and often the leaves are purplish, glabrous, or scabrous from minute pili.

Glabrous Orthosiphon. Pl. 1 to 1½ foot.

6 O. INCU'RVUS (Benth. l. c.) stem procumbent at the base, ascending; leaves petiolate, oblong, crenated, narrowed at both ends, and clothed with fine pubescence; whorls subsecund; corolla villous, incurved, 3 times longer than the calyx: throat nearly equal; stamens about equal in length to the corolla. ♃. S. Native of the East Indies, in Silhet. Leaves 2-3 inches long. Tube of corolla exserted, usually very much incurved: lips spreading, as in *Stàchys* and *Betónica*.

Incurved-flowered Orthosiphon. Pl. 1 foot.

7 O. SCA'PIGER (Benth. l. c.) stems erect, simple, scape-

formed, rising from a thick, creeping, radicant base; leaves approximate at the base of the stem, petiolate, ovate-oblong, coarsely toothed, narrowed at the base, smoothish; racemes elongated; corolla about 3 times as long as the calyx: tube straight: throat very wide; stamens hardly longer than the corolla. ♃. G. Native of Nipaul. Stems smoothish. Leaves nearly all radical, 3-5 inches long. Corolla blue; upper lip 4-toothed.

Scape-bearing Orthosiphon. Pl. 1 to 2 feet.

8 O. stami'neus (Benth. l. c.) stem herbaceous, erect, a little branched; leaves petiolate, ovate, acuminated, coarsely toothed, cuneate and rounded at the base, or the upper ones are subcordate; racemes loose; corolla 3 times as long as the calyx: tube erectish: upper lip dilated; genitals much exserted. ♃. S. Native of the East Indies. O'cymum grandiflòrum, Blum. bijdr. p. 835. but not of Lher. Herb smoothish, or clothed with tomentose pubescence. Flowers beautiful white; upper lip 4-toothed. Flowers sometimes lilac.

Long-stamened Orthosiphon. Pl. 2 to 3 feet.

9 O. capita'tus (Benth. lab. p. 29.) stem herbaceous, erect, a little branched; leaves petiolate, ovate, acuminated, coarsely toothed, narrowed at the base; racemes spike-formed, short, dense, few-flowered; corolla more or less longer than the calyx; genitals much exserted. ♃. S. Native of the tropical parts of America. Stems with 2 rows of short brown hairs. Leaves 2-3 inches long, with a few short hairs above the rest glabrous: floral leaves half stem-clasping. Corollas almost like those of *O. stamíneus*, but the segments of the superior lip are narrower.

Capitate-flowered Orthosiphon. Pl. 1 to 1½ foot.

Cult. For culture and propagation see *O'cymum*, p. 674.

VII. HOSLU'NDIA (named by Thonning, in memory of Olaus Hoslund Smith, a young naturalist, who died of fever on his way to Aquapim, in Western Africa.) Vahl, enum. 1. p. 212. Benth. lab. p. 706.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 5-toothed. Corolla ringent; upper lip concave. Stamens 4, 2 of which are fertile. Achenia baccate, within the calyx.—Shrubs with tetragonal branches, opposite or verticillate leaves, and terminal panicles of flowers.

1 H. opposi'ta (Beauv. fl. d'ow. 1. p. 53. t. 52.) leaves opposite, oblong-ovate. ♄. S. Native of Guinea. Shrub much branched. Branches with a villous line between the leaves. Leaves sweet-scented, 2 inches long, remotely serrated, quite entire at the base. Corolla white, twice as long as the calyx.

Opposite-leaved Hoslundia. Shrub 5 to 6 feet.

2 H. verticilla'ta (Vahl, enum. 1. p. 213.) leaves lanceolate, 3 in a whorl. ♄. S. Native of Senegal, Dupuis. Branches pubescent, canescent at top. Leaves 1½ inch long, tapering to both ends, serrated, but entire at base and apex, glabrous above, canescent beneath, and beset with scattered, shining, resinous dots. Panicle less branched than the preceding. Flowers small, clothed with canescent villi outside.

Whorled-leaved Hoslundia. Shrub 4 to 6 feet.

Cult. For culture and propagation see *O'cymum*, p. 674.

VIII. PLECTRA'NTHUS (*from* πληκτρον, *plectron*, a cock's spur; and ανθος, *anthos*, a flower; in reference to the corolla being spurred or gibbous above the base.) Lher. stirp. 1. p. 85. Benth. lab. p. 29. Plectránthus species of authors. O'cymum species of Lin. and other authors.—Germànea, Lam. dict. 2. p. 682.—Dentídia, Lour. coch. p. 369.—I'sodon, Schrad.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate in the floriferous state, 5-toothed: teeth equal, or the upper one is largest; increasing in the fructiferous state, sometimes declinate, straight, incurved, or inflated, with equal or variously bilabiate teeth: sometimes erect, tubular, or campanulate, equally 5-toothed. Corolla with an exserted tube, gibbous or spurred above the base, at length declinate, defracted, or straightish; throat equal, rarely inflated, bilabiate: upper lip 3-4-cleft, lower one entire, usually longer, concave. Stamens 4, declinate, didynamous: lower ones the longest; filaments free, toothless; anthers ovate, reniform: cells confluent, rarely a little distinct and divaricate. Style shortly bifid at apex: lobes nearly equal, subulate; stigmas minute, terminal.—Herbs, subshrubs, and shrubs. Whorls of flowers loose, usually cymose, many-flowered, loosely racemose, or panicled.

Sect. I. Germa'nea (named after M. de Saint Germain, an amateur, and very distinguished cultivator of plants.) Benth. lab. p. 32. Fructiferous calyx declinate; upper tooth ovate: the 4 lower ones lanceolate. Corolla spurred above the base.—A shrub, with panicled flowers.

1 P. fruticòsus (Lher. stirp. 1. p. 85. t. 41.) stem shrubby; branches pubescent; leaves petiolate, broad-ovate, subcordate, doubly toothed, smoothish: floral ones bractea-formed; racemes loose, panicled; whorls loosely 6-flowered; calyx campanulate. ♄. G. Native of the Cape of Good Hope. Germànea urticifòlia, Lam. dict. 2. p. 682. Corollas blue, elegant. Plant furnished with a few scattered hairs. Leaves 4 inches long.

Shrubby Plectranthus. Fl. June, Sept. Clt. 1744. Shrub 2 to 4 feet.

Sect. II. Coleoi'des (from *Coleus*, and *idea*, like; plants with the habit of species of *Coleus*.) Fructiferous calyx declinate; upper tooth ovate: lower ones narrower, and nearly equal: or the lower ones are longer, and subconnate at the base. Corolla gibbous above the base, not spurred, declinate or defracted.—Herbs or shrubs. Flowers racemose or subpanicled.

2 P. vesti'tus (Benth. lab. p. 32.) stem shrubby; branches densely clothed with rufous villi; leaves petiolate, oblong-elliptic, bluntish, crenulated, cuneated, and quite entire at the base, wrinkled, clothed with fuscous pubescence above, and rufous villi beneath; racemes simple; whorls loose, 6-flowered; lower teeth of calyx subulate; tube of corolla straight. ♄. S. Native of Madagascar, Bojer. Branches hardly tetragonal.

Clothed Plectranthus. Shrub.

3 P. cane'scens (Benth. lab. p. 33.) branches clothed with short tomentum; leaves petiolate, cordate-ovate, acute, crenated, clothed with rufous tomentum above, a little wrinkled, canescent beneath, and finely pubescent; upper leaves lanceolate: floral ones bractea-formed; racemes simple, terminal, exceeding the leaves; whorls loose, 6-flowered; calyx campanulate: lower teeth subulate; tube of corolla inflated above, hardly gibbous. ♃. S. Native of Madagascar. Leaves coriaceous, 2-3 inches long.

Canescent Plectranthus. Pl. ?

4 P. longiflòrus (Benth. lab. p. 33.) stem nearly simple, densely tomentose; leaves on long petioles, amply cordate-ovate, acute, coarsely crenated, rather wrinkled, pubescent on both surfaces: floral ones bractea-formed; raceme simple, shorter than the leaves; whorls loose, 6-flowered, approximate; calyxes campanulate: upper tooth roundish: lower ones subulate; tube of corolla straight. ♃. S. Native of Madagascar, Bojer. Crenatures of leaves often serrated: floral leaves sessile. Corolla nearly an inch long.

Long-flowered Plectranthus. Pl.

5 P. puncta'tus (Lher. stirp. 1. p. 87. t. 42.) stem herba-

ceous, erect, thick, pilosely hispid; leaves on short petioles, ovate, obtuse, crenated, rounded at the base, or subcordate, hispid on the nerves on both surfaces; racemes simple or branched at the base; whorls 6-10-flowered: upper ones approximate; calyxes hispid, inflated in the fructiferous state: lower teeth lanceolate; upper lip of corolla very short. ♃.? S. Native of Abyssinia, Bruce. O'cymum punctàtum, Lin. mant. p. 275. Galeópsis maculòsa, Lam. dict. 2. p. 601. Germànea maculòsa, Lam. dict. 2. p. 691. Germànea punctàta, Poir. dict. 2. p. 763. Stem often spotted. Hairs on the stem and leaves articulated, and often glandular. Leaves 2 inches long. Corollas small, pale blue; disk of the upper lip lined with purple: lower lip deeply spotted at apex.

Spotted-flowered Plectranthus. Fl. Jan. May. Clt. 1775. Pl. 2 feet.

6 P. LESCHENA'ULTII (Benth. lab. p. 34.) stem erect, rather fleshy, smoothish; leaves on long petioles, oblong, acuminated, bluntly-serrated, cuneately rounded at the base, and quite entire, glabrous: floral ones deciduous; racemes simple; whorls loose, many-flowered; peduncles rather fleshy, irregularly branched; lower teeth of calyx ovate-acuminated: middle ones the longest; tube of corolla elongated: throat dilated. ⊙. S. Native of Java, Leschenault. Allied to *P. cordifòlius* and *P. incìsus*. Leaves 4-6 inches long, minutely glandular beneath.

Leschenault's Plectranthus. Pl.?

7 P. ROTUNDIFÒLIUS (Spreng. syst. 2. p. 690.) stem procumbent, and rooting at the base; branches erect, thick, smoothish; leaves petiolate, ovate-roundish, bluntish, crenated, rounded at the base or cuneated, running somewhat down the petioles, quite glabrous, thick, nerved; floral leaves bractea-formed; racemes simple; whorls loose, many-flowered, approximate; calyx campanulate: upper tooth broad-oblong: lateral ones truncate: lower one broad-ovate, connate, shortly acuminated; corolla declinate: throat scarcely inflated. ♃. S. Native of the Mauritius and Coromandel. Còleus rugòsus, Benth. in Wall. pl. rar. asiat. 2. p. 15. Germànea rotundifòlia, Poir. dict. 2. p. 763. Népeta Madagascariénsis, Lam. dict. 1. p. 712.?—Kúrka, Rheed. mal. 11. p. 49. t. 25.? The whole plant, when dried, is beset with minute black glands. Floral leaves minute. Calyx downy. Corollas blue.

Round-leaved Plectranthus. Fl. July, Aug. Clt. 1823. Pl. 1 to 2 feet.

8 P. TERNA'TUS (Sims. bot. mag. t. 2460.) stem erect; branches clothed with hoary tomentum; leaves on long petioles, ovate-roundish, acute, coarsely crenated, narrowed a long way at the base, rather fleshy, clothed with fine pubescence above, and canescent beneath; floral leaves bractea-formed; racemes simple; whorls rather loose, many-flowered, approximate; calyx campanulate: lower teeth broad-ovate, acute, very short; corolla declinate: throat hardly inflated. ♃. S. Native of Madagascar. Root fibrous, bearing oblong tubercles, for which it is cultivated, as well as the *P. rotundifòlius*. Leaves usually 3 in a whorl. Corollas purple.

Ternate-leaved Plectranthus. Fl. Aug. Clt. 1821. Pl. 1 foot.

9 P. OVA'TUS (Benth. lab. 709.) plant clothed with fine pubescence; stem herbaceous, erect; leaves on short petioles, ovate, acuminated, crenated, rounded at the base, scabrous above; floral leaves bractea-formed; racemes loose, panicled; whorls equal, usually 10-flowered; fructiferous calyx drooping, ovate, incurved, striated, reticulated, finely pubescent: lower teeth lanceolate, acute. ♃.? S. Native of Arabia Felix, on the mountains. O'cymum gratíssimum, Forsk. fl. ægypt. p. 110. but not of Lin. This plant differs from the other species contained in this section in the form of the leaves; but the habit is that of *P. cordifòlius*. Racemes of *P. Austràle*. Flowers of *P. fruticòsus*, but the corolla is not spurred.

Ovate-leaved Plectranthus. Pl. 1 to 2 feet.

10 P. FŒ'TIDUS (Benth. lab. p. 35.) stem thick, villous; leaves on short petioles, broad-ovate, crenated, truncate at the base, or cordate, thick, a little wrinkled, very villous: floral ones deciduous; racemes dense, branched a little; whorls many-flowered, approximate; calyxes villous: lower teeth setaceous; tube of corolla defracted in the middle: throat hardly inflated. ♃.? S. Native of New Holland, within the tropic, at Endeavour river. O'cymum fœ'tidum, Banks, herb. Plant rufescent. Stem bluntly tetragonal. Floral leaves broad-ovate, cordate, acuminated, glabrous above.

Fetid Plectranthus. Pl.?

11 P. CORDIFÒLIUS (D. Don, prod. fl. nep. p. 116.) plant clothed with fine pubescence; stem herbaceous, erect, thickened and fleshy at base; leaves petiolate, broad-ovate, crenated, broadly cordate at the base; floral leaves bractea-formed, ovate-cuneated; racemes loose, panicled; whorls secund, few-flowered; fructiferous calyxes nutant, ovate: lower teeth lanceolate, acuminated; throat of corolla dilated. ♃. S. Native of the East Indies; Nipaul, Wall.; Himalaya, Royle. P. móllis, Spreng. syst. 2. p. 69. Benth. lab. 35. P. divaricàtus, Weinm. in syll. pl. soc. ratisb. 1. p. 66. flora, 1826. 1. p. 174. O'cymum mólle, Ait. hort. kew. ed. 1st. vol. 2. p. 322. P. incànus, Link, enum. 2. p. 120. P. secúndus, Roxb. hort. beng. p. 45. P. Maypurénsis, Roth. nov. spec. p. 271. Perin Tolassi, Rheed. mal. 10. p. 167. t. 84. Root tuberous. Leaves 2-3 inches long. Corollas blue.

Heart-leaved Plectranthus. Fl. July. Clt. 1823. Pl. 2 to 3 feet.

12 P. SUBINCI'SUS (Benth. in Wall. pl. rar. asiat. rar. 2. p. 16.) smoothish; stem herbaceous, erect, hardly fleshy; leaves petiolate, broad-ovate, deeply toothed, cordate at the base: floral ones bractea-formed, ovate; racemes loose, panicled a little; whorls secund; fructiferous calyx rather nutant, ovate: upper tooth ovate: lower ones ovate-lanceolate, acuminated; corolla 4 times longer than the calyx: tube rather gibbous beneath the base, defracted at the middle: throat dilated a little. ♃.? S. Native of the East Indies, near Courtallum, Dindigul, and Ceylon. Nearly allied to *P. cordifòlius*.

Rather-cut-leaved Plectranthus. Pl.

13 P. CONGE'STUS (R. Br. prod. 506.) stem clothed with hoary pubescence; leaves petiolate, ovate, obtuse, crenated, cuneated at the base, thick, wrinkled, villously tomentose: floral ones minute, deciduous; racemes dense, many-flowered, panicled; whorls many-flowered, approximate; calyx declinate, incurved in the fructiferous state, striated, pubescent: upper tooth ovate, obtuse, not decurrent: lower ones lanceolate, acute: corolla about twice as long as the calyx. ♃.? S. Native of tropical New Holland. Racemes spike-formed, elongated. Whorls 20-flowered. Flowers minute, on short pedicels.

Crowded-flowered Plectranthus. Pl.

14 P. ZEYLA'NICUS (Benth. lab. p. 36.) stem procumbent, ascending, thick, pubescent; leaves petiolate, ovate-rounded, crenated, pubescent: floral ones ovate-roundish, obtuse, bifariously imbricated before the expansion of the flowers; racemes elongated, branched a little at the base; whorls rather loose, usually 10-flowered; calyxes declinate: upper lip ovate, acute, shortly decurrent: lower teeth lanceolate-acute; corolla 4 times longer than the calyx: tube gibbous beneath at the base, defracted at the middle: upper lip spreading: lower one ascending, stretched out, concave. ♃.? S. Native of Ceylon, Macrae. Allied to *P. Austràlis;* but differs in the stature, and larger leaves, and size and form of the corolla, &c.

Ceylon Plectranthus. Pl. 2 to 3 feet.?

15 P. AUSTRA'LIS (R. Br. prod. p. 506.) stem herbaceous, erect, pubescent; leaves petiolate, broad-ovate, obtuse, deeply crenated, rounded at the base, rather wrinkled, pubescent;

floral leaves ovate-roundish, deciduous; racemes elongated, simple; whorls rather loose, usually 10-flowered; calyxes declinate, incurved, striated, and smoothish in the fructiferous state: upper tooth ovate, acuminated, scarcely decurrent: lower teeth lanceolate, setaceously acuminated; corolla about 3 lines longer than the calyx: tube rather gibbous at the base, declinate: upper lip spreading: lower one stretched out, concave. ⊙. G. Native of New Holland, about Port Jackson. Lindl. bot. reg. 1098. Leaves 1 to 1½ inch long, truncate at the base, or subcordate. Corollas pale purple.

Southern Plectranthus. Fl. Aug. Sept. Clt. 1826. Pl. 2 to 3 feet.

16 P. parviflòrus (Willd. hort. berol. 1. p. 65. but not of R. Br.) stem suffruticose, erect, branched, tomentosely villous, bluntly tetragonal; leaves petiolate, broad-ovate, obtuse, crenated, rounded at the base or cordate, wrinkled, villous on both surfaces, white beneath; floral leaves ovate-roundish, deciduous; racemes elongated, simple; whorls rather loose, usually 10-flowered; calyxes declinate, incurved in the fructiferous state, striated: upper tooth acuminated, scarcely decurrent: lower teeth lanceolate, setaceously acuminated; corolla about 3 times as long as the calyx: tube subgibbous at base, declinate. ♄. G. Native of New Holland, within the tropic, and on the mountains about Port Jackson; and Sandwich Islands. Germànea parviflòra, Poir. dict. 2. p. 764. ? P. gravèolens, R. Br. prod. p. 506. P. paniculàtus, Jacq. fragm. p. 62. t. 91. Flowers blue or purple. Very nearly allied to *P. Austràlis*; but differs in the more humble stature, in the shrubby stem, in the more villous leaves, and smaller leaves and flowers.

Small-flowered Plectranthus. Fl. June, Aug. Clt. 1805. Shrub 2 to 3 feet.

17 P. Thunbe'rgii (Benth. lab. p. 37.) stem procumbent, glabrous; leaves petiolate, roundish, bluntly crenated, fleshy, quite glabrous: racemes elongated, simple; whorls loosely 4-6-flowered; floral leaves acute, shorter than the pedicels; fructiferous calyx declinate, striated, hardly incurved: upper tooth ovate, acute, scarcely decurrent: lateral teeth lanceolate, setaceously acuminated; corolla 5 times as long as the calyx: with a decurved tube, and an elongated incurved lower lip. ♃. ? G. Native of the Cape of Good Hope. O'cymum verticillàtum, Lin. suppl. 276. O'cymum racemòsum, Thunb. prod. fl. cap. p. 96. Allied to *P. Madagascariénsis*, but differs from it in the leaves being glabrous and fleshy. Corolla like that of *P. Austràlis*, but longer and more slender.

Thunberg's Plectranthus. Pl. procumbent.

18 P. Madagascarie'nsis (Benth. lab. p. 37.) stem herbaceous, procumbent, villous; branches ascending; leaves petiolate, roundish, obtuse, deeply crenated, very villous; racemes elongated, simple; whorls rather loose, usually 10-flowered, sessile, membranous, roundish-cuneated, deciduous, villous beneath and glabrous above; calyxes declinate, incurved in the fructiferous state, striated: upper tooth ovate, hardly acuminated, shortly decurrent: lower teeth lanceolate, setaceously acuminated; corolla about 3 times as long as the calyx, declinate: tube rather gibbous at the base, and defracted at the middle. ♃. ? S. Native of Madagascar and Mauritius, and Arabia Felix. O'cymum aurícula, Forsk. mss. in herb. Banks. O'cymum Madagascariénsis, Pers. ench. 2. p. 135. P. villòsus, Sieb. fl. maur. exsic. no. 152. O'cymum Hadiénse, Forsk. fl. ægypt. p. 109. P. Forskœ'lii, Vahl, symb. p. 44. but not of Willd.

Madagascar Plectranthus. Pl. procumbent.

19 P. hi'rtus (Benth. lab. p. 38.) stem procumbent, hispid; leaves petiolate, ovate, obtuse, crenated, cuneated at the base, very much wrinkled, hispid; floral leaves minute; racemes elongated, nearly simple; whorls loosely 6-10-flowered; calyxes declinate, incurved and striated in the fructiferous state: upper tooth ovate, acute: lower teeth lanceolate, setaceously acuminated; corolla 4 times longer than the calyx: tube rather gibbous at the base, defracted in the middle. ♃. ? G. Native of the Cape of Good Hope, Masson. O'cymum hírtum, Banks, herb. Nearly allied to *P. Madagascariénsis*; but differs in the smaller, more wrinkled, and more hispid leaves, and in the larger corolla, &c.

Hairy Plectranthus. Pl. procumbent.

20 P. Siebe'ri (Benth. lab. p. 710.) stem herbaceous, procumbent, pubescent; leaves on short petioles, ovate, bluntish, cuneated at the base, coarsely crenated, cut a little, thickish, pubescent: floral ones almost wanting; racemes loose, simple; whorls 6-flowered; calyxes pubescent, declinate in the fructiferous state, rather shorter than the pedicels, incurved, striated: upper tooth roundish, acutish, hardly decurrent: lower lateral ones lanceolate: middle ones setaceous; corolla twice as long as the calyx. ♃. ? S. Native of New Holland, within the tropic, Sieber. Root thickened at apex. Lower segment of corolla elongated, concave. Allied to the three preceding species.

Sieber's Plectranthus. Pl. procumbent.

21 Forste'ri (Benth. lab. p. 38.) stem herbaceous, erect, ? smoothish; leaves petiolate, ovate, bluntish, cuneated at the base, remotely crenated, smoothish: floral leaves very minute, or almost wanting; racemes loose, simple; whorls loosely 6-10-flowered; calyx glabrous, declinate in the fructiferous state, shorter than its pedicel: upper tooth ovate, acute, hardly decurrent: lower lateral teeth lanceolate, acute: middle one setaceous; corolla minute, hardly twice as long as the floriferous calyx. ⊙. ? S. Native of the New Hybrides; in the islands of Tanna, Forster. Plant slender, nearly glabrous. Racemes slender.

Forster's Plectranthus. Pl. 1 foot.

Sect. III. Heteroca'lyx (from ἕτερος, *heteros*, variable; and καλυξ, *calyx*, a calyx.) Benth. lab. p. 39. Fructiferous calyx declinate, bilabiate; both lips almost quite entire, nearly equal. Corolla gibbous above the base, not spurred, defracted.—Herbs. Flowers racemose.

22 P. ? Palisòti (Benth. lab. p. 39.) stem erect, pubescent; leaves ovate, obtuse, crenated, rounded at the base, or cordate, pubescent on the nerves on both surfaces: floral leaves bracteaformed; raceme simple; whorls 6-flowered, remote; corolla about twice as long as the calyx. ⊙. S. Native of Tropical Africa. O'cymum monostàchyum, P. Beauv. fl. dow. 2. p. 60. t. 95. f. 1.

Palisot de Beauvois's Plectranthus. Pl. 1 foot.

Sect. IV. Melissoìdes (so called from the plants having the habit of species of *Melissa*.) Benth. lab. p. 39. Fructiferous calyx declinate, bilabiate: upper lip tridentate: lower one bidentate. Corolla spurred above the base.—Herbs, with axillary, few-flowered cymes.

23 P. melissoìdes (Benth. lab. p. 39.) stem herbaceous, with rough angles; leaves petiolate, broad ovate, cuneated at the base, nearly glabrous, rough: floral ones conform; whorls axillary, loose, remote; peduncles trifid on both sides; calyx campanulate, glabrous; teeth of calyx all ovate, acute.—Native of the East Indies, in Silhet. Leaves small, scabrous from minute bristles on the nerves.

Melissa-like Plectranthus. Pl. procumbent. ?

Sect. V. I'sodon (from ισος, *isos*, equal; and οδους οδοντος, *odous odontos*, a tooth; in allusion to the teeth of the calyx being all equal.) Schrad. in Benth. lab. p. 40. Fructiferous

calyx declinate; teeth all equal, or disposed into two lips; the upper lip tridentate, and the lower one bidentate. Corolla declinate, or defracted, gibbous above the base, not spurred.—Herbs or under shrubs. Flowers panicled, rarely racemose.

24 P. lanceola'tus (Bojer. mss. ex Benth. lab. p. 40.) stem erect, pubescent; leaves oblong-lanceolate, stiff, pubescent, narrowed into the short petioles at the base; racemes simple; whorls loose, many-flowered; calyx campanulate, equal, inflated, and incurved in the fruit-bearing state, with a contracted mouth: teeth equal, short, obtuse, connivent; corolla 5 times longer than the calyx. ⊙.? S. Native of Madagascar, Bojer. Stem tetragonal. Leaves bluntish, irregularly serrated. Tube of corolla slender.

Lanceolate-leaved Plectranthus. Pl.

25 P. oblongifòlius (Wall. pl. rar. asiat. 2. p. 16. Benth. lab. p. 40.) stem herbaceous, ascending, branched, glabrous; leaves petiolate, oblong, toothed, narrowed at both ends, rather hispid above, glabrous beneath: floral ones and bracteas very minute, or almost wanting; panicles loose, branched, many-flowered; calyx hardly bilabiate, bluntly toothed, ovate, and striated in the floriferous state, but lagenæform and inflated at the base, and with a contracted mouth in the fructiferous state; corolla 3 times as long as the calyx; stamens shorter than the corolla. ♃.? S. Native of Nipaul. Leaves 2 inches long. Branches of peduncle 3-4-flowered. Calyx glabrous, beset with red glands. Corolla hardly gibbous.

Oblong-leaved Plectranthus. Pl. 3 to 4 feet.

26 P. scrophularioìdes (Wall. pl. rar. asiat. 2. p. 16. Benth. lab. p. 40.) stem herbaceous, erect, branched, nearly glabrous; leaves on long petioles, broad-ovate, crenated, rounded at the base, unequally cordate, or subcuneated: floral leaves and bracteas minute; panicles loose; fructiferous calyx declinate, inflated, deeply bilabiate: teeth all obtuse; corolla about 3 times as long as the calyx, inflated above the gibbosity; stamens exserted. ♃.? S. Native of Nipaul, and Kamaon. Stem much branched, with pubescent angles. Leaves a hand long, rather hispid above, and glandular beneath, with pubescent nerves. Corolla whitish red, inodorous like the rest of the plant.

Scrophularia-like Plectranthus. Pl. 3 to 4 feet.

27 P. Wi'ghtii (Benth. lab. p. 41.) stem herbaceous, erect, branched; leaves petiolate, broad-ovate, or roundish, acuminated, cordate at the base, glabrous on both surfaces: lower floral ones like the others: upper ones and bracteas membranous, roundish-spathulate, shorter than the peduncles and pedicels; panicles much branched, many-flowered; fructiferous calyx declinate, oblong, incurved, striated, glabrous, with an obliquely bilabiate mouth: teeth nearly equal, ovate; corolla inflated, declinate above the gibbosity: tube one half longer than the calyx; stamens exserted. ♃.? S. Native of the Peninsula of India; on mountains about Madura and Tenivelly; and on Mount Kadrougon, Leschenault. Habit of *P. striàtus*. Corolla like that of *P. scrophularioìdes*, but much smaller. Leaves $1\frac{1}{2}$ inch long, and 2 inches broad, long-acuminated, with bluntly serrated edges.

Wight's Plectranthus. Pl. 3 to 4 feet.

28 P. nigre'scens (Benth. lab. 710.) stem herbaceous, erect, branched; leaves petiolate, broad-ovate, cordate at the base, rounded or narrowed; panicles or racemes many-flowered; fructiferous calyx declinate, ovate, incurved, striated, deeply bilabiate: upper lip truncate, shortly tridentate: lower one bifid, with ovate teeth; corolla declinate, hardly gibbous above, but with the tube twice as long as the calyx; stamens exserted. ♃.? S. Native of Ceylon. P. Wíghtii, β, Benth. lab. p. 41. Plant clothed with clammy articulated hairs.

Blackish Plectranthus. Pl. 3 to 4 feet.

29 P. stria'tus (Benth. in Wall. pl. rar. asiat. 2. p. 17. lab. p. 41.) stem herbaceous, erect, branched, nearly glabrous; leaves nearly sessile, ovate, acuminated, crenated, cuneated at the base, stiff, hispid above, and glabrous beneath; panicle loose, much branched, many-flowered; calyx declinate, oblong, sub-bilabiate, with obtuse, nearly equal teeth, incurved, striated, glabrous, but glandular in the fructiferous state; corolla with a declinate tube, which is rather gibbous above the base, straight at the middle; stamens a little exserted. ♃. S. Native of Silhet and Nipaul, Wall.; Mussooree, Royle. Deyra Dhoon, Jacquemont. Stem sometimes pubescent. Leaves 2 inches long, and $1\frac{1}{2}$ broad.

Striated-calyxed Plectranthus. Pl. 2 to 3 feet.

30 P. hìspidus (Benth. in Wall. pl. rar. asiat. 2. p. 17. lab. p. 41.) stem herbaceous, erect, branched, pubescent; leaves nearly sessile, ovate, acuminated, toothed, cuneated at the base, stiff, hispid above, and pubescent beneath, and densely glandular; panicles loose, much branched, many-flowered; calyx declinate, oblong, bluntly 5-toothed, bilabiate in the fructiferous state, hardly incurved, very hispid; tube of corolla declinate, rather gibbous above the base, straight at the middle. ♃.? S. Native of Silhet. Very nearly allied to *P. striàtus*.

Hispid Plectranthus. Pl. 2 to 3 feet.

31 P. Gerardia'nus (Benth. in Wall. pl. rar. asiat. 2. p. 17. lab. p. 42.) stem herbaceous, erect, a little branched, nearly glabrous; leaves ovate, acuminated, crenated, rather hispid above, and glabrous beneath, sparingly glandular: lower ones petiolate, narrowed at the base: upper ones nearly sessile, cordate at the base: floral ones shorter than the peduncles: uppermost ones and bracteas minute; racemes panicle-formed, hardly branched; cymes loose, slender, many-flowered; calyx declinate, oblong, bilabiate, with obtuse teeth, incurved, striated, glabrous, and hardly glandular in the fructiferous state; tube of corolla declinate, sub-gibbous above the base, straight at the middle. ♃.? S. Native of Nipaul and Kamaon. Sansedarra and Deyrah Dhoon, Royle. Hyssòpus lophanthoìdes, D. Don, prod. fl. nep. p. 110. Nearly allied to *P. striàtus*, but differs in the smaller stature, larger green leaves, and nearly simple raceme, with a pubescent rachis.

Gerard's Plectranthus. Pl. 2 to 3 feet.

32 P. Coe'tsa (D. Don, prod. fl. nep. p. 117. Benth. lab. p. 42.) stem herbaceous, erect, branched, clothed with hoary pubescence; leaves petiolate, ovate, narrowed at both ends, crenated in the middle, rather hispid above, and pubescent beneath; panicles branched, many-flowered; calyx declinate, oblong, bilabiate, with ovate, acutish, nearly equal teeth, incurved, striated, and clothed with hoary pubescence in the fructiferous state, but hardly glandular; tube of corolla gibbous above the base, defracted at the middle. ♃.? S. Native of the East Indies, in Nipaul, Kamaon, Simla, Mussooree; on Mount Taong Dong, in the Birmann Empire; Japan, and Java, &c. Scutellària Japónica, Burm. nid. p. 130. O'cymum Coétsa, Spreng. cur. post. p. 223. Leaves 2 inches long. Corolla small, blue.

Coetsa Plectranthus. Fl. Oct. Clt. 1823. Pl. 2 to 3 feet.

33 P. menthoìdes (Benth. in Wall. pl. rar. 2. p. 17. lab. p. 42.) stem herbaceous, erect, branched, clothed with hoary pubescence; leaves petiolate, ovate, narrowed at both ends, coarsely toothed, pubescent on both surfaces; panicle loose, few-flowered; fructiferous calyx declinate, oblong, incurved,? clothed with hoary pubescence: teeth acutish: upper one the broadest; corolla sub-gibbous above the base, with a hardly defracted tube, and an inflated throat; anthers somewhat 2-celled. ♃.? S. Native of the East Indies, in the southern parts of the Peninsula. Habit of *P. Coétsa*, but the racemes are small and few-flowered, &c.

Mint-like Plectranthus. Pl. 2 to 3 feet.

34 P. MACRÆ'I (Benth. lab. p. 42.) stem herbaceous, branched, clothed with rufous villi; leaves petiolate, nearly sessile, ovate, acute, toothed a little, rounded at the base, clothed with soft pubescence on both surfaces: floral ones conforming to the rest; panicles branched, many-flowered; calyx declinate, oblong, sub-bilabiate: teeth nearly equal, ovate; fructiferous calyx incurved, striated, and villous; corolla 3 times as long as the calyx: tube gibbous above the base, defracted at the middle; anthers 2-celled. ♃.? S. Native of the East Indies, on the Madura mountains, in the Peninsula; Ceylon. P. rugòsus, β, tomentòsus, Benth. in. Wall. pl. rar. asiat. 2. p. 17. Habit of *P. Coétsa*, but more humble, and the stem is decumbent at the base, &c.

Macrae's Plectranthus. Pl. 2 to 3 feet.

35 P. RUGÒSUS (Wall. pl. rar. asiat. 2. p. 17. Benth. lab. p. 43.) stem shrubby, erect; branches hoary; leaves petiolate, ovate, obtuse, crenulated, rounded at the base, pubescent above, wrinkled, clothed with hoary tomentum beneath, reticulately nerved; panicles branched, many-flowered; calyxes declinate, oblong, hardly bilabiate: teeth lanceolate, acute, nearly equal; fructiferous calyx sub-incurved, striated, pubescent; tube of corolla gibbous above the base, defracted at the middle. ♄. G. Native of the East Indies; at Choor, &c., Royle; in Sirmore, Gerard. O'cymum densiflòrum, Roth, nov. spec. 275.? Lumnítzera densiflòra, Spreng. syst. 2. p. 687. I'sodon plectranthoìdes, Schrader. Corolla white, or pale blue, smaller than that of *P. Coétsa*.

Wrinkled-leaved Plectranthus. Shrub 4 to 6 feet.

36 P. RE'PENS (Wall. pl. rar. asiat. 2. p. 17. Benth. lab. p. 43.) stem creeping at the base, radicant, ascending, nearly simple, hairy; leaves petiolate, ovate-roundish, obtuse, coarsely crenated, rounded at the base, or cordate, hairy on both surfaces; raceme loose, nearly simple; cymes pedunculate; calyx declinate, oblong, a little incurved, striated, glabrous: teeth hardly unequal, lanceolate, acute; tube of corolla declinate, gibbous above the base, straight to the middle. ♃. S. Native of Nipaul, Wall. Stamens shorter than the corolla. Flowers size of those of *P. striàtus*.

Creeping Plectranthus. Pl. ½ to 1 foot.

37 P.? MONTA'NUS (Benth. in Wall. pl. rar. asiat. 2. p. 17. lab. p. 44.) stem herbaceous, erect, branched above, tomentosely villous; leaves on short petioles, ovate, obtuse, thick, wrinkled, densely tomentose; racemes branched, pyramidately panicled, tomentose; whorls rather distinct, dense, many-flowered; fructiferous calyx declinate, incurved, tomentose, almost equally and bluntly 5-toothed. ⊙.? S. Native of the Peninsula of India, about Nundydroog. Superior leaves clothed with rufous tomentum. Panicles almost like those of *P. ternifòlius*.

Mountain Plectranthus. Pl. 1 foot.

SECT. VI. PYRAMI'DIUM (from πυραμις, *pyramis*, a pyramid; in reference to the disposition of the flowers.) Benth. lab. p. 44. Fructiferous calyx erect, tubular, equally 5-toothed. Corolla gibbous above the base, not spurred, defracted.—Herbs. Flowers pyramidately panicled.

38 P. TERNIFÒLIUS (D. Don, prod. fl. nep. p. 117.) plant villously tomentose; stem erect, a little branched; leaves 3 in a whorl, nearly sessile, lanceolate-oblong, acuminated, serrated, cuneated at the base, wrinkled; panicle branched, many-flowered, pyramidal. ♃. G. Native of Nipaul, Silhet, Kamaon, Birman Empire, &c. O'cymum ternifòlium, Spreng. cur. post. p. 224. Stem hexangular. Corolla very villous on the outside, bluish. Stamens equal in height to the corolla.

Tern-leaved Plectranthus. Fl. Aug. Sept. Clt. 1820. Pl. 2 to 3 feet.

SECT. VII. AMETHYSTOÌDES (so named from the plant having the calyx of *Amethystea cærùlea*.) Benth. lab. p. 45. Fructiferous calyx erect, campanulate, equally 5-toothed. Corolla gibbous above the base, not spurred, defracted. Flowers loosely panicled.

39 P. AMETHYSTOÌDES (Benth. lab. p. 45.) stem erect, branched, pubescent; leaves ovate-rounded, crenated, narrowed a long way at the base, and quite entire; flowers loosely panicled; fructiferous calyx erect, campanulate, quite glabrous, equally 5-toothed. ♃.? G. Native of China, Reeves. Stem tetragonal. Corolla 4 times longer than the calyx. Stamens equal in length to the corolla.

Amethystea-like Plectranthus. Pl.

40 P. DU'BIUS (Vahl, mss. ex Benth. lab. p. 711.) stem erect, branched, pubescent; leaves ovate, crenated, cuneated at the base, or narrowed, wrinkled; flowers loosely panicled; fructiferous calyx erect, campanulate, clothed with hoary pubescence, equally 5-toothed. ♃.? G. Native of Japan, Thunberg. This differs from *P. amethystoìdes* in the narrower, wrinkled leaves, more veiny, and finely pubescent beneath, and, like the calyx, canescent.

Doubtful Plectranthus. Pl.

41 P. INFLE'XUS (Vahl, mss. ex Benth. lab. p. 711.) glabrous; stem erect, nearly simple; leaves ovate, acute, coarsely toothed, narrowed a long way at the base; raceme loose, few-flowered; fructiferous calyx erect, campanulate, glabrous, equally 5-toothed. ♃.? G. Native of Japan, Thunberg. This differs from *P. amethystoìdes* in the narrower leaves, and simple few-flowered raceme.

Inflexed Plectranthus. Pl.

† *Species doubtful whether belonging to the present genus.*

42 P. SALVIOÌDES (Benth. lab. p. 45.) leaves ovate-oblong, crenulated, running into the petioles at the base, and quite entire, pilose on both surfaces, ciliated; stem hoary from reversed pili at bottom, but beset with glandular clammy villi above, as well as the calyxes; raceme terminal, simple; bracteas roundish-ovate, on short petioles; lower lip of calyx (superior?) tridentate: middle tooth the smallest. ♃.? G. Native of the East Indies. O'cymum salvioìdes, Heyne, in Roth. nov. spec. p. 272. Lumnítzera salvioìdes, Spreng. syst. 2. p. 687. Stem quadrangular, hoary. Calyx nerved, sub-bilabiate. Corolla small, brownish purple, hardly one half longer than the calyx, resupinate, villous outside. The inflorescence and form of corolla is that of *O'cymum*, but the calyx is very different. It is perhaps a species of *Moschósma* or *Perílla*.

Salvia-like Plectranthus. Pl.

43 P. JAVA'NICUS (Benth. lab. p. 45.) panicles twiggy, leafy; pedicels subumbellate; leaves ovate-oblong, coarsely-toothed, pubescent on both surfaces. ♃.? S. Native of Java, in mountain marshes. Elshóltzia Javánica, Blum. bijdr. 825. Calyx tubular, 5-toothed; teeth nearly equal. Lower lip of corolla long, concave, almost quite entire: upper one arched, semi-quadrifid. Stamens inclosed. Anthers 1-celled, naked. Stigma semi-trifid. Perhaps a species of *Geniósporum*.

Java Plectranthus. Pl.

44 P. NUDIFLÒRUS (Willd. spec. 3. p. 168.) nectarium gibbous; panicle racemose, naked; leaves cordate, wrinkled; superior ones stem-clasping. ⊙.? S. Native of China. Stem quadrangular, pubescent. Lower leaves petiolate, 2-3 inches long, acuminated, coarsely toothed, glabrous, except on the veins beneath. Calyx bilabiate; segments linear, subulate. Corolla small, closed, pubescent; tube refracted, gibbous above.

Naked-flowered Plectranthus. Pl. ½ foot.

45 P. Nankine'nsis (Spreng. syst. 2. p. 691.) stem erect, glabrous, branched; leaves reniform, concave, glabrous, but fringed, on long petioles; spikes prismatic, axillary, tetragonal; calyx 5-cleft, shining, pilose, 6-nerved: the 3 upper segments obtuse, denticulated: the 2 lower ones subulate and longer; corolla pilose: upper lip 4-cleft: lower lip larger, entire, incurved, inflexed; anthers shorter than the corolla. ⊙. H. Native of China, about Nankin. Dentídia Nankinénsis, Lour. coch. p. 369. Plant brownish purple. Anthers 2-lobed. Stigma acute, bifid. Aspect of plant elegant, with the scent and colour of *Melissa crética*; but the leaves, spikes, calyx, and corolla are different. Perhaps a species of *Anisochìlus*, or *Æollánthus*.

Nankin Plectranthus. Pl. 1 foot.

Cult. For culture and propagation see *O'cymum*, p. 674.

IX. CO'LEUS (from κολεος, *koleos*, a sheath; in allusion to the filaments being connected into a tube at the base, which sheaths the style.) Lour. coch. p. 372. Benth. lab. p. 47. O'cymum species, Lin. and other authors. Plectránthus species, R. Br. and other authors. Solenostèmon, Schum. pl. guin.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate-campanulate, erect, or often declinate or reflexed in the fructiferous state: throat naked, or hispid, 5-toothed: upper tooth ovate, membranous, with the margins rarely decurrent: lower teeth narrower, all acute, or the lateral ones are ovate-truncate; the two lowermost ones often combined. Corolla with an exserted, defracted tube, an inflated or equal throat, and a bilabiate limb: upper lip short, bluntly 3-4-cleft: lower one entire, elongated, concave, usually boat-shaped, involving the genitals. Stamens 4, declinate: lower ones the longest; filaments toothless, connected at the base into a tube, which sheaths the style; anthers ovate, reniform, with confluent cells. Style subulate at apex, equally bifid; stigmas subterminal. Achenia roundish, compressed, smooth.—Herbs annual or perennial at the base, rarely suffruticose. Whorls usually 6-flowered, but often many-flowered, sometimes very dense, and sometimes loose, cyme-formed. Floral leaves bractea-formed, more or less comose at the tops of the racemes before florescence, but afterwards deciduous, rarely subpersistent, reflexed. The monadelphous stamens distinguish this genus from all other of the order.

Sect. I. Calce'olus (from *calceolus*, a slipper.) Benth. lab. p. 49. Whorls 6-10-flowered. Fructiferous calyx reflexed; throat villous inside.

1 C. spica'tus (Benth. in Wall. pl. rar. asiat. 2. p. 15. lab. p. 49.) stem procumbent at the base; branches ascending, beset with spreading pili; leaves petiolate, obovate, narrowed at the base, fleshy: floral leaves membranous, concave, exceeding the flowers, at length deciduous; spikes simple, elongated, dense; whorls 6-10-flowered, approximate; calyx hispid; upper tooth of calyx roundish, a little decurrent: lower teeth lanceolate, acute, nearly equal; lower lip of corolla stipitate, boat-shaped. ⊙.? H. Native of the Peninsula of India, on the mountains of Dindygul. Plectránthus canìnus, Roth, nov. spec. 279. Stem bluntly tetragonal. Leaves entire, or sparingly crenated, 1-2 inches long, pubescent on both surfaces: floral leaves very broad, ciliated, the rest glabrous. Corolla like that of *C. barbàtus*, but smaller.

Spicate-flowered Coleus. Pl. 1 to 1½ foot.

2 C. barba'tus (Benth. in Wall. pl. rar. asiat. 2. p. 15. lab. p. 49.) stem shrubby at the base, ascending, tomentosely hispid; leaves petiolate, ovate, crenated, narrowed at the base, clothed with soft tomentum when young, hispid from strigæ; floral leaves membranous, broad-ovate, acuminated, comose at the tops of the racemes, deciduous; racemes simple; whorls 6-flowered, distant; calyx hispid: upper tooth ovate, sub-decurrent: lower teeth lanceolate, acute, nearly equal; lower lip of corolla large, stipitate, boat-shaped. ♄. S. Native of the East Indies, in the southern mountains of the Peninsula, Mysore, Bangalore, Nipaul, and Kamaon. Plectránthus Forskœ'lii, Willd. spec. 3. p. 169. Sims, bot. mag. 2036. Germànea Forskœ'lii, Poir. dict. 2. p. 764. Plectránthus barbàtus, Andr. bot. rep. t. 594. Plectránthus comòsus, Sims, bot. mag. 2318. O'cymum ásperum, Roth. nov. spec. 268. Plectránthus ásper, Spreng. syst. 2. p. 690. Plectránthus monadélphus, Roxb. hort. beng. p. 45. Corolla beset with white hairs.

Bearded Coleus. Fl. Aug. Nov. Clt. 1806. Pl. 2 to 3 feet.

3 C. He'ynei (Benth. lab. p. 50.) stem herbaceous, ascending, simple; leaves ovate, coarsely serrated, pubescent; raceme terminal, simple; bracteas ovate-lanceolate, reflexed; filaments connate at the base. ⊙.? S. Native of the East Indies. Plectránthus monadélphus, Heyne, mss. O'cymum monadélphum, Roth, nov. spec. p. 267. R. Br. append. to Salt, abyss.? Stem tetragonal, pubescent. Leaves petiolate, obtuse. Whorls distinct, 6-flowered. Upper lip of calyx roundish-ovate, mucronate, finely crenulated, ciliated; segments of the lower lip setaceous, 2 middle ones longer than the lateral ones. Lower lip of corolla ovate, concave, crenulated.

Heyne's Coleus. Pl. ½ to 1 foot.

4 C. Zatarhe'ndi (Benth. lab. p. 50.) leaves fleshy, stiff, broad-ovate, acute, crenated, villous, truncate at the base. ♃. S. Native of Arabia Felix. O'cymum a Zatarhéndi, Forsk. fl. ægypt. p. 109. Plectránthus crassifòlius, Vahl. symb. 1. p. 44. Germànea crassifòlia, Poir. dict. 2. p. 764. Stem slightly tetragonal, beset with short bristles. Leaves 1½ inch long. Whorls 12-flowered. Corolla with a violet-coloured lower lip, and a white upper lip.?

Zaterhendi's Coleus. Pl.

Sect. II. Aroma'ria (so named from the aromatic scent of the species.) Benth. lab. p. 51. Whorls dense, nearly globose, many-flowered. Fructiferous calyx hardly declinate; throat naked inside.

5 C. aroma'ticus (Benth. in Wall. pl. rar. asiat. 2. p. 15. bot. reg. 1520.) stem shrubby at the base; branches tomentosely pubescent, or hispid; leaves petiolate, broad-ovate, crenated, rounded at the base, or cuneated, very thick, hispid on both surfaces, or clothed with white villi; floral leaves hardly equal in length to the calyx; racemes simple; whorls remote; calyx tomentose: lower teeth short, setaceous, nearly equal. ♄. G. Native of the East Indies. Plectránthus aromáticus, Roxb. hort. beng. p. 45. C. Amboínicus, Lour. coch. p. 372. Plectránthus Amboinénsis, Spreng. syst. 2. p. 690.? Plectránthus crassifòlius, Hort. C. crassifòlius, Benth. lab. p. 51. Marrùbium álbum Amboínicum, Rumph. amb. 5. p. 295. t. 102. f. 3. Leaves very fragrant, 1-2 inches long. Whorls 20-30-flowered and more. Tube of corolla about twice as long as the calyx, defracted at the middle; throat inflated: lower lip a little dilated, boat-shaped.

Aromatic Coleus. Fl. Clt. Shrub 2 to 3 feet.

Sect. III. Solenoste'mon (from σωλην, *solen*, a tube; and στημων, *stemon*, a stamen; in reference to the stamens being combined into a tube at the base.) Benth. lab. p. 52. Whorls loose, many-flowered. Fructiferous calyx declinate; throat naked inside.

§ 1. *Lateral teeth of calyx short, truncate, free from the lower ones, which are elongated and connate beyond the middle.*

6 C. Boje'ri (Benth. lab. p. 52.) stem humble, pubescent; leaves petiolate, ovate, obtuse, crenated, rounded at the base, or subcordate, hispid on the nerves on both surfaces: floral leaves minute; racemes elongated, simple; whorls loose, usually 10-flowered; common peduncles and their branches very short; calyx pubescent: upper tooth ovate, obtuse, hardly decurrent; throat of corolla hardly inflated. ♃. S. Native of Madagascar, Bojer. Plectránthus maculàtus, Bojer, mss. Mítsa maculàta, Chapm. ex Bojer, mss. Leaves spotted with purple, glandular beneath. Corolla glabrous. Stamens exserted a little.

Bojer's Coleus. Pl. humble.

7 C. scutellarioìdes (Benth. in Wall. pl. rar. asiat. 2. p. 16. lab. p. 53.) plant nearly glabrous; stem shrubby at the base; leaves petiolate, ovate, shortly acuminated, toothed, rounded at the base, glabrous, or hardly tomentose: floral leaves at length deciduous, shorter than the whorls of flowers; racemes elongated, slender, a little branched at the base; whorls loosely many-flowered; common peduncles almost wanting; pedicels about equal in length to the short branches; upper tooth of calyx ovate, acutish, hardly decurrent: lateral teeth bluntish; throat of corolla scarcely widened. ⊙. S. Native of the Indian Archipelago; Tropical New Holland, and Mauritius. O'cymum scutellarioìdes, Lin. spec. p. 834. Burm. fl. ind. p. 130. Sims, bot. mag. 1446. Plectránthus scutellarioìdes, R. Br. prod. p. 506. Branches bluntly tetragonal, glabrous, or beset with fine down. Leaves 1½ to 2 inches long, often purplish beneath. Whorls 10-15-flowered. Corolla 5 times longer than the calyx: upper lip pale; lower one blue.

Scutellaria-like Coleus. Fl. July, Aug. Clt. 1764. Pl. 2 to 3 feet.

8 C. acumina'tus (Benth. in Linnæa, 6. p. 81. lab. p. 53.) stem pilose above; leaves petiolate, ovate, long-acuminated, deeply serrated, rounded, or cuneated at the base, puberulous on both surfaces; petioles ciliated with rufous hairs; floral leaves rather comose, deciduous; raceme simple; whorls loosely many-flowered; common peduncles none; upper tooth of calyx ovate, obtuse, scarcely decurrent; tube of corolla slender. ⊙.? S. Native of Manilla. Very nearly allied to the preceding.

Acuminated-leaved Coleus. Pl. 2 to 3 feet.?

9 C. ingra'tus (Benth. lab. p. 53.) pubescent; leaves petiolate, ovate, acuminated, serrately crenated, cuneated at the base, or roundish, pubescently villous on both surfaces; floral leaves deciduous; racemes simple; whorls loosely many-flowered; common peduncles almost wanting, with short branches; pedicels elongated; calyx hispid: upper tooth ovate, not decurrent; throat of corolla widened a little.—Native of Java, in the western provinces, among the mountains. Plectránthus ingràtus, Blum. bijdr. p. 836. The whole plant is purplish. Petioles and axils pilose. Whorls distant. Calyx very villous at the base. Corolla like that of *C. scutellarioìdes*.

Ungrateful-scented Coleus. Pl. 2 to 3 feet.

10 C. grandifòlius (Benth. lab. p. 54.) stem pubescent; leaves petiolate, large, broad-ovate, acuminated, coarsely crenated, rounded or subcordate at the base, rather fleshy; floral leaves coloured, comose before the expansion of the flowers; racemes simple, elongated; whorls loosely many-flowered; common peduncles and their branches almost wanting; pedicels elongated; calyx hispid: upper tooth ovate, acute, not decurrent; throat of corolla wide. ⊙.? S. Native of the Island of Timor. Leaves pubescent: floral ones almost permanent. Allied to *C. secundiflòrus*, but differs in the inflorescence.

Great-leaved Coleus. Pl.

11 C. Africa'nus (Benth. lab. p. 54.) stem herbaceous, erect, branched, pubescent; leaves ovate, obtuse, crenated, rounded at the base, running into the petioles, nearly glabrous; racemes elongated; whorls loose; cymes many-flowered on both sides; common peduncles almost wanting, their branches elongated; upper tooth of calyx ovate, membranous, acute, shortly decurrent: lateral teeth minute: lower teeth joined into a membranous, bidentate lip. ⊙.? S. Native of the western coast of Africa. Solenostèmon ocymoìdes, Schum. pl. guin. in act. acad. hafn. 4. p. 45. Leaves 2-3 inches long, and 2 broad; floral ones bractea-formed, small. Corolla whitish.?

African Coleus. Pl.

12 C. atropurpu'reus (Benth. in Wall. pl. rar. asiat. 2. p. 16. lab. p. 53.) stem erect, clothed with fine pubescence; leaves petiolate, broad-ovate, crenated, rounded at the base, clothed with fine pubescence: floral leaves ovate, minute, deciduous; racemes nearly simple; whorls quadrifariously cyme-formed; common peduncles almost wanting, their branches elongated; pedicels very short; calyx pubescent: upper tooth ovate, acutish, scarcely decurrent: lateral teeth very blunt, equal in length to the upper one: lower ones longer; throat of corolla dilated. ⊙.? S. Native of the Indian Archipelago.

Var. β, densiflòrus (Benth. lab. p. 54.) leaves hardly purplish; racemes branched a little; whorls more approximate. ⊙. S. Native of the Islands of Manilla and Tanna.

Dark-purple-leaved Coleus. Pl.

13 C. Persoònii (Benth. lab. p. 55.) stem erect, finely downy; leaves petiolate, ovate, obtuse, crenated, truncate, or subcordate at the base, wrinkled, clothed with soft villi; floral leaves deciduous; racemes simple; whorls quadrifariously cyme-formed; common peduncles almost wanting on both sides, with elongated branches; pedicels shorter than the calyxes; calyx canescent: upper tooth orbicular, concave: lateral ones shorter, very blunt: lower ones lanceolate-setaceous; throat of corolla somewhat dilated. ⊙.? S. Native of Madagascar, and the Island of Luçon. O'cymum paniculàtum, Pers. syn. 2. p. 135. Leaves wrinkled, villous. Racemes canescent. Stamens exserted.

Persoon's Coleus. Pl.

14 C. multiflòrus (Benth. lab. p. 55.) stem ascending, villous, pubescent; leaves on long petioles, ovate-oblong, acute, crenately-serrated, cuneated, or narrowed at the base, clothed with soft pubescence; floral leaves deciduous; racemes elongated, simple; whorls quadrifariously cyme-formed; common peduncles almost wanting on both sides, with elongated branches; pedicels shorter than the calyxes; calyx clothed with glandular pubescence: upper tooth orbicular, shortly decurrent: lateral ones shorter, very blunt; corolla with a slender tube, and a sub-inflated limb: lower lip large, very broad, concave. ⊙.? S. Native of the Island of Manilla. Habit of *C. acuminàtus*, but differs in the leaves being hardly acuminated, in the inflorescence, calyx, and corolla.

Many-flowered Coleus. Pl.

15 C. macrophy'llus (Benth. lab. p. 55.) calyx hairy: lower lip trifid, the middle segment the longest, and semi-bifid; filaments monadelphous at the base; whorls distinct; peduncles branched; leaves roundish-ovate, acute, unequally and bluntly serrated, scarcely attenuated at the base, quite entire, puberulous on both surfaces. ⊙.? S. Native of Java, in humid parts of woods among the mountains. Plectránthus macrophýllus, Blum. bijdr. p. 835. Very nearly allied to *C. ingràtus*, but the leaves are purplish beneath.

Large-leaved Coleus. Pl.

16 C. bícolor (Benth. lab. p. 55.) calyx hairy, having the lower lip trifid, the middle segment the longest and semibifid; filaments monadelphous at the base; whorls distinct; pedun-

cles ramosely bifid; leaves unequal, ovate, acuminated, crenated, rounded at the base, or unequally attenuated, and quite entire, puberulous on both surfaces. ⊙.? S. Native of Java, at the foot of Mount Salak. Leaves purplish beneath. Allied to *C. macrophýllus*.

Two-coloured-leaved Coleus. Pl.

17 C. secundiflòrus (Benth. lab. p. 55.) plant clothed with fine pubescence; leaves petiolate, ovate, acuminated, coarsely crenated, roundish, or cordate at the base, wrinkled, rather fleshy; floral leaves deciduous; racemes elongated, simple; whorls cyme-formed, secund; common peduncles almost wanting on both sides, but with elongated branches; calyxes pendulous, hispid: upper tooth oblong, acute, not decurrent: lateral ones short, ovate, acutish, free: lower ones elongated, acute, combined almost to the top; throat of corolla dilated a little. ⊙.? S. Native of the Island of Timor. Allied to *C. grandiflòrus*, but differs from it in the inflorescence. Stem bluntly tetragonal.

Secund-flowered Coleus. Pl.?

18 C. Blu'mei (Benth. lab. p. 56.) leaves ovate, acuminated, coarsely and bluntly serrated, acute, and quite entire at the base, puberulous on both surfaces; whorls distinct; pedicels racemose, secund; calyx hairy: lower lip trifid, the middle segments the longest, and semi-bifid; filaments monadelphous at the base. ⊙.? S. Native of Java, in gardens. Plectránthus scutellarioìdes, Blum. bijdr. 837, but not of Lin. Leaves painted with dark purple spots above.

Blume's Coleus. Pl.

19 C. lacinia'tus (Benth. lab. p. 56.) leaves ovate, acuminated, jagged, or deeply serrated, acute, and quite entire at the base, puberulous on both surfaces; pedicels branched a little, secund; calyx hairy: lower lip trifid, the middle segment semibifid, and longer; filaments monadelphous at the base. ⊙.? S. Native of Java, in gardens. Plectránthus laciniàtus, Blum. bijdr. p. 838. Perhaps a variety of *C. scutellarioìdes*. Leaves marked with dark purple spots above. Nearly allied to *C. secundiflòrus*.

Jagged-leaved Coleus. Pl.

20 C. galea'tus (Benth. lab. p. 56.) leaves ovate, acuminated, rounded, or subcordate at the base, acutely and deeply toothed, puberulous on both surfaces; whorls distinct; pedicels branched; calyx hairy: lower lip trifid, the middle segment longer and bifid; filaments monadelphous at the base. ⊙.? S. Native of Java, in shady, humid, mountainous places. Plectránthus galeàtus, Vahl, symb. 1. p. 43. Blum. bijdr. 836. Stem villous, furrowed. Leaves villous, particularly on the veins beneath. Corolla pubescent. Allied to *C. macrophýllus*, ex Blume.

Galeate-flowered Coleus. Fl. July, Aug. Clt. 1820. Pl. 2 feet.

§ 2. *Lateral teeth of calyx acute, about equal in length to the upper one: lower ones the longest, and combined beyond the middle, and with the lateral ones at the base.*

21 C. macróstachys (Benth. lab. p. 57.) stem pubescent; leaves petiolate, ovate, acuminated, crenately serrated, rounded at the base, hispid above, and on the nerves beneath: floral ones deciduous; racemes elongated, nearly simple; whorls remote, loose; common peduncles with the branches and pedicels on both sides, shorter than the fructiferous calyxes; calyx glabrous, membranous in the fructiferous state: throat naked inside: upper tooth ovate, acute, with revolute edges; corolla with a slender tube, and dilated throat: lower lip elongated, broad, concave. ⊙.? S. Native of Java, Commerson. Stem purplish. Leaves minutely glandular beneath; floral ones bracteaformed, concave, ciliated. Whorls 10-15-flowered. Leaves and inflorescence of *C. ingràtus*. Calyx and corolla of *C. Malabárica*.

Long-spiked Coleus. Pl.

22 C. ova'tus (Benth. lab. p. 57.) stem smoothish, clothed with clammy pubescence above; leaves petiolate, ovate, scarcely acuminated, coarsely crenated, rounded or cordate at the base, rather hispid above, and glabrous beneath; floral leaves deciduous; racemes branched a little; whorls loose; common peduncles and branches almost wanting; calyx glabrous, membranous, inflated in the fructiferous state: upper tooth ovate, with subrevolute edges; corolla with a slender tube, and a dilated throat: lower lip elongated, broad, concave. ⊙.? S. Native of the Indian Peninsula; Coromandel, Wight. Very nearly allied to the preceding, but much smaller in all its parts. Floral leaves hardly ciliated.

Ovate-leaved Coleus. Pl.

23 C. Malaba'ricus (Benth. in Wall. pl. asiat. rar. 2. p. 16. lab. p. 57.) clothed with fine pubescence; leaves petiolate, large, broad-ovate, shortly acuminated, crenated, roundly truncate at the base; floral leaves deciduous; racemes loosely branched; whorls usually 10-flowered, loose; common peduncles almost wanting on both sides, with short branches; fructiferous calyx deflexed, glabrous, subinflated at the base: throat naked inside: upper tooth ovate, acutish; corolla with a slender exserted tube, and a wide throat: lower lip elongated. ⊙.? S. Native of the Peninsula of India, at Travancore, Klein. Plectránthus Malabáricus, Klein, mss. Lower leaves 3-4 inches long: floral leaves minute.

Malabar Coleus. Pl.

24 C. infla'tus (Benth. lab. p. 58.) glabrous; leaves petiolate, ample, ovate, acuminated, toothed, narrowed a long way at the base, quite entire; floral leaves deciduous; racemes branched a little; whorls irregularly cyme-formed; common peduncles almost wanting on both sides: branches alternate, or all elongated; pedicels short; fructiferous calyxes nutant, glabrous, inflated, with the throat naked inside: upper tooth ovate-lanceolate, acuminated, flat; corolla with an elongated tube, and a nearly equal throat: lower lip longer than the upper one. ⊙.? S. Native of Ceylon, Macrae. Allied to *C. Malabáricus*. Stem rather fleshy. Leaves 1 foot long, with the petioles: floral ones comose.

Inflated-calyxed Coleus. Pl.

25 C. Macræ'i (Benth. lab. p. 58.) pubescent; leaves on long petioles, ovate, acuminated, rounded or cuneated at the base; floral leaves deciduous; racemes paniculately branched; whorls quadrifariously cymose; common peduncles almost wanting on both sides, with much elongated branches, and very short pedicels; fructiferous calyx nutant, glabrous, a little inflated at the base: throat naked inside: upper tooth ovate, acutish, with revolute edges; corolla with an exserted tube, a very wide throat, and an elongated lower lip. ⊙.? S. Native of Ceylon, Macrae. Plant clothed with rufescent clammy pubescence. Leaves 2-3 inches long. Genitals hardly exserted.

Macrae's Coleus. Pl.

§ 3. *Teeth of calyx 4: lower ones nearly equal, free to the base, or hardly combined.*

26 C. glabra'tus (Benth. lab. p. 58.) leaves petiolate, ovate-roundish, serrately crenated, thick, stiff, glabrous; floral leaves minute, deciduous; racemes terminal, pubescent, simple, panicle-formed; whorls loosely cyme-formed; common peduncles elongated on both sides, as well as their branches; fructiferous calyx glabrous, elongated: upper tooth ovate, concave above:

lower ones combined at the base, lanceolate-acute. ⊙.? S. Native of the Peninsula of India, about Madura, Wight.

Glabrous Coleus. Pl. 1 foot.?

27 C. Wíghtii (Benth. lab. p. 58.) stem pubescent; leaves petiolate, ovate, crenated, rounded or subcordate at the base, thick, wrinkled, hispid on both surfaces: floral leaves deciduous; raceme terminal, simple, panicle-formed; whorls loosely cyme-formed; common peduncle elongated on both sides, as well as its branches; calyxes rather longer than the pedicels, declinate in the fructiferous state, pubescent: upper tooth ovate, flattish: lower ones lanceolate, acute, scarcely connate at the base; throat of corolla widened; lower lip about 4 times longer than the upper one. ⊙.? S. Native of the Indian Peninsula, on the Nielgherry mountains.

Wight's Coleus. Pl.

28 C. paniculàtus (Benth. in Wall. pl. rar. asiat. 2. p. 16. lab. p. 59.) stem procumbent at the base, pubescent; leaves petiolate, broad ovate, deeply toothed, rounded or cuneated at the base, thick, fleshy, hispid: floral ones deciduous; raceme simple, terminal, panicle-formed; whorls loosely cyme-formed; common peduncles with their branches and pedicels elongated on both sides; fructiferous calyx declinate, pubescent: throat naked inside: upper tooth ovate, flat: lower lanceolate-subulate, hardly connate at the base; corolla with an ample throat, and with the lower lip hardly twice as long as the upper one. ⊙.? S. Native of the Indian Peninsula, on the mountains of Dindygul. This differs from *C. Wightii* in the broader, thicker, fleshy, more cut leaves, which are cuneated or narrowed at the base, not cordate, &c.

Panicled-flowered Coleus. Pl.

† *A species not known to which section of the genus it belongs.*

29 C. tuberòsus (Benth. lab. p. 59.) leaves ovate-crenated, cuneated, and quite entire at the base, rather scabrous on both surfaces; whorls distinct; pedicels 1-flowered; calyx hairy: lower lip trifid, the middle segment semi-bifid; filaments monadelphous at the base. ♃.? S. Native of Java, in gardens. Plectránthus tuberòsus, Blum. bijdr. p. 838.—Rumph. amb. 5. p. 372. t. 132. f. 1.?

Tuberous-rooted Coleus. Pl.

Cult. For culture and propagation see *O'cymum*, p. 674.

X. ANISOCHI'LUS (from *ανισος, anisos,* unequal; and *χειλος, chilos,* a lip; in reference to the inequality of both lips of calyx and corolla.) Wall. pl. rar. asiat. 2. p. 18. Benth. lab. p. 59. Lavándula species, Lin. Plectránthus species, Roxb., Smith, and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, erectish, bilabiate; upper lip entire, after florescence lying upon the lower one, which is truncate, entire, or shortly 4-toothed, closing the calyx. Corolla with an exserted, defracted tube, a somewhat inflated throat, and a bilabiate limb: upper lip short, bluntly 3-4-cleft: lower lip entire, elongated, concave. Stamens 4, declinate; lower ones the longest; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style subulate at apex, equally bifid; stigmas almost terminal.—Annual or perennial herbs. Whorls densely imbricate into oblong cylindrical spikes. Floral leaves bractea-formed, imbricated.

1. A. carnòsum (Wall. pl. asiat. rar. 2. p. 18. Benth. lab. p. 59.) stem erect; leaves petiolate, ovate-roundish, obtuse, crenated, cordate at the base, thick, fleshy, tomentosely villous on both surfaces; spikes on long peduncles; floral leaves ovate, obtuse; lower lip of calyx truncate, quite entire: upper lip ovate, acute, membranous, with ciliated edges. ♂. S. Native of the East Indies, in many places. Lavándula carnòsa, Lin. amœn. 10. p. 56. t. 3. Plectránthus carnòsus, Smith, in Rees, cycl. vol. 27. Plectránthus strobilíferus, Roxb. hort. beng. p. 45. Plectránthus dùbius, Spreng. syst. 2. p. 691. Plectránthus crassifòlius, Hortul.—Rheed. mal. 10. p. 179. t. 90. Stem branched, tetragonal, villous. Corolla lilac.

Var. β, purpuráscens (Benth. lab. p. 60.) spikes smoothish, purplish.

Var. γ, glàbrum (Benth. lab. p. 711.) Native of Ceylon. A. glàbra, Schrad. ind. sem. hort. goett. 1833. p. 1.

Fleshy Anisochilus. Fl. June, Sept. Clt. 1788. Pl. 2 feet.

2 A. pa'llidum (Wall. l. c. Benth. l. c.) stem erect; leaves petiolate, oblong-elliptic, narrowed at both ends, membranous, or hardly fleshy, nearly glabrous; spikes panicled; floral leaves lanceolate, acuminated; lower lip of calyx obliquely truncate, shortly 4-toothed: upper lip lanceolate, acute. ♂.? S. Native of the Birman Empire, on Mount Taong Dong. Leaves 2-3 inches long, and 1-2 broad, hardly hispid above, and almost glabrous beneath. Spikes pedunculate. Corolla of *A. carnòsum*, but more slender.

Pale Anisochilus. Pl. 2 feet.

3 A.? polysta'chyum (Benth. in Wall. pl. rar. asiat. 2. p. 19. lab. p. 60.) stem erect, branched; leaves nearly sessile, ovate-oblong, acuminated, serrated, cuneated at the base, clothed with fine pubescence, nerved beneath; spikes panicled; calyx incurved at top, with an obliquely 5-toothed mouth: upper tooth hardly longer than the rest. ⊙.? G. Native of Nipaul, near Hetownrah, in boggy places. Stem bluntly tetragonal, tomentose. Calyx clothed with rufous tomentum. Leaves 2-4 inches long.

Many-spiked Anisochilus. Pl.

4 A. dysophylloìdes (Benth. l. c.) stem procumbent at the base; branches ascending, clothed with silky villi; leaves nearly sessile, oblong-lanceolate, obtuse, quite entire, narrowed at the base; spikes axillary and terminal, pedunculate; lower lip of calyx minute, truncate: superior one small, acute, deflexed. ⊙.? G. Native of the Peninsula of India, on the Nielgherry mountains. Habit almost of *Dysophýlla rugòsa*. Plant clothed with soft, silky, rufescent pubescence. Stamens exserted.

Dysophylla-like Anisochilus. Pl. procumbent.

Cult. For culture and propagation see *O'cymum*, p. 674.

XI. Œolla'nthus (from *αιολλω, aiollo,* to vary; and *ανθος, anthos,* a flower.) Mart. amœn. bot. monac. 4. Benth. lab. p. 61.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, campanulate, truncate; teeth obsolete; throat naked inside, closed in the fructiferous state, and circumcised at the base. Corolla with an exserted tube, which is decurved beyond the calyx, and somewhat dilated above: limb bilabiate; upper lip broad, bluntly 4-toothed: lower lip entire, longer, concave. Stamens 4, declinate, didynamous; lower ones the longest; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style shortly bifid at top; lobes subulate; stigmas minute, nearly terminal. This genus is nearly allied to *Anisochìlus*, from which it appears to differ only by the calyx.

1 Æ. sua'vis (Mart. l. c. 4. t. 2.) ⊙. H. Native of the East Indies.? Gathered by Martius in the Chinese Gardens at Santa Cruz, in Brasil. Stem obsoletely tetragonal, branched, pubescent. Leaves nearly sessile, obovate, entire, or obsoletely denticulated, narrowed at the base, thickish, pale green, glabrous, marked with impressed dots. Cymes or floriferous branches axillary and terminal, erect, usually trifid, furnished with floral

leaves under the divisions. Flowers secund, lilac. Plant with a sweet odour.

Sweet-scented Œollanthus. Fl. July, Aug. Clt. 1825. Pl. 1 foot.

Cult. For culture and propagation see *Ocymum*, p. 674.

XII. PYCHNO'STACHYS (from πυχνος, *pychnos*, dense; aed σταχυς, *stachys*, a spike; in allusion to the spikes being dense-flowered.) Hook. exot. fl. 2. t. 202. Benth. lab. p. 61.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, nearly equal, with 5 subulately-spinose teeth. Corolla with a defracted exserted tube, and a bilabiate limb; upper lip 4-toothed: lower one entire, concave. Stamens 4, declinate; lower 2 the longest; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style subulate at apex, shortly and equally bifid.—Herbs. Whorls of flowers densely approximate into simple spikes. This genus differs from section *Pyramídium* of *Plectránthus* in the form of the calyx, and in habit.

1 P. cæru'lea (Hook. l. c.) ⊙. S. Native of Madagascar, Bojer. Stem and branches glabrous, tetragonal. Leaves sessile, oblong-linear, or lanceolate, acute, remotely serrated, narrowed at the base, glabrous, glandular beneath; floral ones bractea-formed, shorter than the calyx. Spikes dense, terminal, 1-2 inches long. Corollas small, blue.

Blue-flowered Pychnostachys. Fl. Aug. Clt. 1825. Pl. 2 to 3 feet.

Cult. For culture and propagation see *Ocymum*, p. 674.

XIII. PE'LTODON (from πελτη, *pelte*, a buckler; and οδους οδοντος, *odous odontos*, a tooth; in reference to the teeth of the calyx being terminated each by a peltate, sub-concave, ciliated, dilated appendage.) Pohl. pl. bras. 1. p. 66. Benth. lab. p. 62.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, equal, 5-toothed; teeth equal, erect, subulate, dilated at top into a peltate, sub-concave, ciliated appendage; throat bearded; increasing in the fruit-bearing state, membranous, and a little inflated. Tube of corolla straight, a little inflated, about equal in length to the calycine teeth; limb sub-bilabiate: upper lip bifid, spreading: lower lip trifid, longer and declinate: lateral lobes oblong, spreading: middle one somewhat stipitate, narrowed at the base, transversely somewhat callous, at length oblong, saccate, acute, quite entire, abruptly dejected at the time of expansion. Stamens 4, didynamous: lower ones the longest; filaments free, toothless, glabrous; anthers ovate-reniform, with sub-confluent cells. Style shortly bifid at apex; stigmas terminal, or sub-marginal. Achenia roundish, compressed, naked, smooth.—Herbs with the habit of *Hýptis capitàta*, from which they hardly differ, unless by the calyx.

1 P. pusi'llus (Pohl, pl. bras. 1. p. 67. t. 54.) stem humble, nearly simple; leaves sessile, elliptic, crenated, glabrous, pilose at the nerves; bracteas roundish, or cuneated at the base, pilose, rather exceeding the flowers. ♃. S. Native of Brazil, in dry pastures in the province of Goyaz, and the South of Brazil. Heads of flowers hemispherical. Corollas white.

Least Peltodon. Pl. procumbent, or erectish.

2 P. lóngipes (St. Hil. mss. ex Benth. lab. p. 63.) stem short, procumbent, nearly simple, glabrous, or pubescent; leaves sessile, elliptic, crenated, glabrous, or pilose on the nerves; bracteas rounded, or cuneated at the base, glabrous, or pilose, rather shorter than the flowers. ♃.? S. Native of Brazil, about rivulets near Santa Borja, in the missions of the Uruguay; and in fields near Curitiba, in the province of St. Paul. Very nearly allied to *P. pusíllus*, but differs in the peduncles being twice as long, in the bracteas being shorter, and in the calyxes and corollas being dark purple, not whitish yellow as in that species.

Long-peduncled Peltodon. Pl. procumbent.

3 P. radìcans (Pohl, pl. bras. 1. p. 68. t. 55.) stem creeping, branched, radicant, villous; leaves petiolate, ovate, bluntish, crenated, rounded, or somewhat cordate at the base, hispid on the nerves on both surfaces; bracteas crenated, cordate at the base. ♃. S. Native of Brazil, in grassy places in the provinces of Rio Janeiro and Minas Geraes; and south of these provinces. Stem tetragonal, elongated. Leaves 1-2 inches long. Inflorescence capitate. Corollas white.

Rooting Peltodon. Pl. creeping.

4 P. tomentòsus (Pohl, pl. bras. 1. p. 69. t. 56.) stem branched, villous; leaves oval, crenated, roundly cuneated at the base, and running into the petioles, pilose, tomentose beneath; outer bracteas cordately auricled, crenated, villous. ♃.? S. Native of Brazil, in the provinces of St. Paul and Minas Geraes, in dry pastures. Plant beset with rufous villi. Stem bluntly tetragonal. Inflorescence capitate. Corollas yellowish purple.

Tomentose Peltodon. Pl. 2 feet, ascending.

Cult. For culture and propagation see *Ocymum*, p. 674.

XIV. MARSYPIA'NTHUS (from μαρσυπος, *marsupos*, a purse; and ανθος, *anthos*, a flower; in reference to the shape of the flowers.) Mart. mss. Benth. lab. p. 64. Hýptis species of authors. Clinopòdium species, Vahl.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, narrowed at the base, equal, 5-toothed; teeth equal, lanceolate, erectly spreading; throat naked inside. Tube of corolla straight, about equal in length to the calycine teeth; limb sub-bilabiate; upper lip bifid; lower one trifid: lateral lobes like the lobes of the superior lip, ovate, erectly spreading, nearly equal: lower segment saccate, somewhat stipitate at the base, acuminated at apex, abruptly dejected at the time of florescence. Stamens 4, didynamous, declinate; lower 2 the longest; filaments free, toothless, glabrous; anthers ovate-reniform, with somewhat confluent cells. Style shortly bifid at top; lobes flattened a little; stigmas submarginal. Achenia ovoid, compressed, concave inside, with a membranous, involute, fringed border. This genus is very closely allied to the capitate flowered species of *Hýptis*, but differs in the calyx, and especially by the fruit.

1 M. hyptoìdes (Mart. mss. Benth. lab. p. 64.) ⊙. S. Native of Tropical America, in various places, as of Mexico, Trinidad, Porto Rico, Cayenne, Brazil, Guayaquil, &c. Herb annual, procumbent, branched, villous, glabrous, pubescent, or tomentose. Leaves more or less petiolate; upper ones nearly sessile, roundish-ovate, ovate-lanceolate, lanceolate, oblong, acute, or bluntish, serrated or crenated, narrowed, cuneated or roundish at the base, rarely subcordate. Whorls secund. Heads 6-30-flowered, sessile, or more or less pedunculate. Corolla blue, or purple, hardly exceeding the calyx.

Hyptis-like Marsypianthus. Fl. July, Aug. Clt. 1823. Pl. procumbent.

Cult. For culture and propagation see *Ocymum*, p. 674.

XV. HY'PTIS (from ὑπτιος, *hyptios*, resupinate; limb of corolla turned on its back.) Jacq. coll. 1. p. 101, 102. Poit. et Turp. ann. mus. vol. 7. Benth. lab. p. 64, and other recent authors.—Bystropògon species, Lher.—Ballòta and Népeta species, Lin. and other old authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, or

tubular, with a straight or oblique mouth; teeth 5, nearly equal, acute, or subulately awned. Corolla with the tube about equal in length to the calyx, 3-4-cleft, sub-bilabiate; the 4 upper lobes quite entire, flat, all distinct, or the upper 2 are joined: lower one abruptly deflexed at the time of florescence, saccate, contracted, and subarticulated at the base. Stamens 4, declinate; filaments free, toothless; anthers ovate-reniform, with confluent cells. Style about equally bifid at top; lobes subulate; stigmas for the most part terminal, minute on the inside of the lobes of the style, rarely altogether stigmatiferous; disk equal, the lower side generally furnished with an obtuse tooth. Achenia ovoid, oblong, or compressed, smooth, rarely wrinkled, and in some species margined by a flat wing, but never navicular.—Herbs or subshrubs. Inflorescence and habit very variable. "Looking to the large number of species, and to the great variety in their habit, it would seem at first more convenient to divide this group into a number of genera; but on examination the essential characters have proved to be so nearly the same in all, the difference consisting chiefly in the uncertain characters of inflorescence, that I have preferred considering the different groups into which they have been distributed as mere sections." Benth. lab. p. 65.

Sect. I. Gymne'ia (from *γυμνος*, *gymnos*, naked; in allusion to the stem being naked above.) Benth. lab. p. 77. Flowers sessile. Whorls many-flowered, nearly globose, disposed in dense spikes, or interrupted racemes. Bracteas numerous, adpressed, subulate. Fructiferous calyx rather membranous, recurved at apex; teeth subulate. Stem naked above; floral leaves minute.

1 H. virga'ta (Benth. lab. p. 77.) herbaceous; branches elongated, strict, nearly naked; leaves small, remote, nearly sessile, ovate-oblong, wrinkled, villous; whorls many-flowered, crowded into a short, terminal spike; bracteas small, subulate; calyx tubular, pubescent, recurved in the fructiferous state, with an oblique, membranous, reflexed mouth: teeth subulate, glabrous, about equal in length to the tube. ⊙. S. Native of Brazil. Stems many, tetragonal, glabrous, or pubescent at the base. Leaves 4-6 lines long. Spike 1 to 1½ inch long. Corolla short, white; upper lip marked with purple dots.

Twiggy Hyptis. Pl. 1 to 2 feet.

2 H. interru'pta (Pohl, pl. bras. ined. ex Benth. lab. p. 77.) herbaceous, tall, clothed with viscid pubescence; leaves petiolate, oblong-elliptic, erosely toothed, wrinkled, green on both surfaces, pubescent; whorls many-flowered, disposed into an interrupted, somewhat branched raceme; bracteas linear-subulate, acute, about equal in length to the calyx; calyx downy, tubular, recurved in the fructiferous state, with an oblique membranous mouth: teeth subulate, about equal in length to the tube. ⊙. S. Native of Brazil, in the provinces of Minas Geraes and Goyaz. Stem nearly simple. Leaves 1½ to 4 inches long. Corolla shorter than the calyx, downy, yellowish; upper lip spotted with purple.

Interrupted-racemed Hyptis. Pl. 2 to 3 feet.

3 H. platanifòlia (Mart. mss. ex Benth. lab. p. 77.) herbaceous, perennial; stem creeping, radicant; branches ascending, floccosely-woolly at the base, naked above; leaves on short petioles, broad-ovate, doubly crenated, and angularly lobed, subcordate at the base, pubescent above, but clothed with white tomentum beneath; whorls densely many-flowered, globose, remote, disposed in a terminal raceme; bracteas subulate, adpressed, about equal in length to the floriferous calyxes; calyx pubescent, recurved in the fructiferous state, membranous, with an oblique mouth, and subulate teeth. ♃. S. Native of Brazil, in the province of Bahia. Stems tetragonal. Leaves 2 inches long, like those of *Pópulus álba*. Floriferous calyx tomentose. Corolla rather shorter than the calycine teeth, white; upper segments spotted with brown; lower one somewhat rose-coloured.

Plane-tree-leaved Hyptis. Pl. 2 feet.

Sect. II. Spica'ria (from *spica*, a spike; in reference to the spiked inflorescence.) Benth. lab. p. 78. Flowers sessile. Whorls many-flowered, disposed in a dense spike, which is hardly interrupted at the base. Bracteas numerous, adpressed, linear-subulate. Fructiferous calyx straight, with subulate teeth.—Leafy herbs.

4 H. spicígera (Lam. dict. 3. p. 185.) herbaceous; stem tall, erect, branched, nearly glabrous, with rough angles; leaves petiolate, ovate, acuminated, serrated, cuneated at the base, pubescent, or nearly glabrous, pale beneath; floral leaves bractea-formed; bracteas equal in length to the calyxes. ⊙. S. Native of Tropical Africa and America, Madagascar, Manilla. Hýptis Madagascariénsis, Bojer, mss. ex Sweet, hort. brit. ed. 2d. p. 594. Népeta foliis serràtis, Plum. icon. t. 162.—Sloane, hist. 1. p. 173. t. 108. f. 1. Stem bluntly tetragonal, glabrous, or pubescent. Leaves 1½ to 2 inches long. Corolla small, white, hardly longer than the calycine teeth.

Spike-bearing Hyptis. Fl.? Clt.? Pl. 2 to 3 feet.

5 H. lopha'ntha (Mart. mss. ex Benth. lab. p. 78.) herbaceous; stem humble, erect, branched, nearly glabrous, with hardly rough angles; leaves petiolate, oblong, obtuse, crenately serrated, narrowed at the base, nearly glabrous on both surfaces, pale beneath: floral leaves bractea-formed; whorls 6-10-flowered, approximate into terminal, interrupted spikes; bracteas linear, rather shorter than the calyxes; calyx pubescent, straight, with an equal, truncate mouth, and subulate, strict, rigid teeth. ⊙. S. Native of Brazil, in grassy pastures in the province of Minas Geraes, on Serro Frio. Nearly allied to *H. spicígera*, but differs in the humble stem, which is much branched at the base, in the small, obtuse leaves, and interrupted spikes, and larger calyxes.

Crest-flowered Hyptis. Pl. ½ to 1 foot.

6 H. stri'cta (Benth. lab. p. 79.) herbaceous; stem erect. clothed with scabrous pubescence; leaves on short petioles, oblong-lanceolate, obtuse, coarsely serrated, narrowed at the base, rather villous above, but clothed with hoary tomentum beneath; raceme branched a little; whorls many-flowered: upper ones disposed in interrupted spikes: lower ones in short spikelets; bracteas subulate, shorter than the calyxes; calyx nearly glabrous, tubular, straight, with a truncate mouth, and subulate teeth. ⊙. S. Native of the South of Brazil, Sello. Stem nearly simple, tetragonal. Lower leaves 1½ to 2½ inches long. This is an intermediate species between the sections *Spicària*, *Apodòtes*, and *Polydésmia*.

Strict Hyptis. Pl. 2 to 3 feet.

Sect. III. Apodòtes (from *a*, priv.; and *πους*, *pous*, a foot; in reference to the heads of flowers being sessile.) Benth. lab. p. 79. Flowers sessile. Whorls composed of two sessile heads, which are sometimes distinct, axillary, remote, rarely disposed in a terminal, interrupted raceme. Bracteas subulate, or lanceolate. Fructiferous calyx straight; teeth subulate, or lanceolate-subulate, stiffish. Herbs with leafy, or naked stems.

7 H. nudicau'lis (Benth. lab. p. 79.) herbaceous; stems simple, erect, nearly naked, clothed with silky wool; leaves almost all radical, oval, obtuse, crenated, wrinkled, hispid; racemes simple; whorls globose, many-flowered: upper ones approximate; bracteas subulate, equal in length to the flowers; calyx pubescent, tubular, with short, acute teeth. ⊙.? S. Native of Brazil, in the provinces of Minas Geraes and Goyaz,

&c. Stems rising from a woody base. Leaves 2-3 inches long. Corolla small, dirty purple, hardly downy, about equal in length to the tube of the calyx.

Naked-stemmed Hyptis. Pl. 2 to 3 feet.

8 H. seri'cea (Benth. lab. p. 79.) stems simple, clothed with silky wool, almost leafless at top; leaves nearly sessile, ovate, obtuse, almost quite entire, thick, nerved, clothed with silky wool on both surfaces; heads globose, densely many-flowered, on short peduncles, racemose; bracteas subulate, about equal in length to the heads; calyx tubular, clothed with silky wool, with subulate teeth, which at length spread a little. ♃. S. Native of the South of Brazil, Sello. Stems many from a perennial base. Leaves approximate towards the middle of the stem, 2 inches long. Corolla exceeding the calyx. Genitals exserted.

Silky Hyptis. Pl. 2 feet.

9 H. uncina'ta (Benth. lab. p. 80.) branches clothed with rufous tomentum; leaves nearly sessile, ovate-oblong, serrately crenated, roundly cuneated at the base, rather scabrous above, hispid, but clothed with rufous tomentum on the nerves beneath; heads globose, densely many-flowered, axillary, sessile; bracteas lanceolate, about equal in length to the heads, subulate and hooked at top; calyx campanulate, with stiff, subulately awned, hooked teeth. ☉.? S. Native of Peru, Ruiz. et Pav. Throat of calyx clothed with rufous wool inside. Corolla rather shorter than the calycine teeth.

Hooked-calyxed Hyptis. Pl. 2 to 3 feet.?

10 H. hirsu'ta (H. B. et Kunth, nov. gen. amer. 2. p. 318. t. 161.) branches clothed with rufous hairs; leaves sessile, or on short petioles, oblong-ovate, cuneated, and narrowed at the base, erosely crenated, wrinkled, villous; heads sessile, globose, densely many-flowered; bracteas lanceolate, about equal in length to the calyx; calyx hispid, with lanceolate-subulate, stiff teeth, which at length spread a little; achenia wrinkled. ☉.? S. Native of New Andalusia, in arid places on Mount Tumiriquiri, Humb. et Bonpl.; Brazil, in the province of Minas Geraes, &c., Mart. Sello. Branches tetragonal. Heads sessile, or on short peduncles, the whole forming an interrupted raceme. Corolla hispid outside, a little longer than the calyx. Genitals a little exserted.

Hairy Hyptis. Pl. 2 to 4 feet.?

Sect. IV. Plagiòtis (from πλαγιος, *plagios*, transverse; and ους ωτος, *ous otos*, an ear.) Benth. lab. p. 80. Heads axillary, pedunculate, globose, densely many-flowered. Bracteas numerous, adpressed, ovate. Fructiferous calyx inflated at the base, elongated, with an incurved mouth, and short, ovate, unequal teeth. Habit of species unlike the rest.

11 H. odora'ta (Benth. lab. p. 81.) stems clothed with rusty tomentum; leaves on short petioles, oblong-elliptic, crenated, rounded at the base, scabrous above, and tomentose beneath; heads globose, densely many-flowered, paniculately much branched; calyx villous, elongated in the fructiferous state, incurved, with an oblique, shortly 5-toothed mouth. ♄. G. Native of Peru, Ruiz. et Pav. A shrub with the habit of a species of *Búddlea*. Leaves 2-3 inches long. Calyx tomentosely hispid. Corolla a little exserted.

Sweet-scented Hyptis. Shrub.

12 H. uliginòsa (St. Hil. mss. ex Benth. lab. p. 81.) herbaceous, small, glabrous; leaves sessile, lanceolate, acute, serrated, cordately stem-clasping at the base; peduncles axillary, simple; heads small, globose, dense; bracteas ovate, about equal in length to the heads; fructiferous calyx inflated at the base, with a contracted, oblique mouth, and very short, unequal teeth. ♃.? S. Native of Brazil, in the province of St. Paul, in boggy parts of woods. Habit of *Gratìola*. Stem nearly simple. Leaves ½ to 1 inch long. Lower peduncles shorter than the leaves. Corolla minute.

Bog Hyptis. Pl. ¼ to ½ foot.

Sect. V. Cy'rta (from κυρτος, *cyrtos*, a curve, in allusion to the curved apex of the fructiferous calyx.) Benth. lab. p. 81. Heads axillary, pedunculate, globose, densely many-flowered. Bracteas numerous, adpressed, subulate. Fructiferous calyx elongated, recurved at top, with subulate teeth. "The first species of this section come very near the second and third divisions of *Cephalohýptis;* the four latter only differ from *Cyanocéphalus* in the ripe calyxes being recurved at the extremity." Benth. l. c.

13 H. recurva'ta (Poit. ann. mus. 7. p. 467. t. 28. f. 2.) stem herbaceous, erectish, villous; leaves on short petioles, ovate, crenated, rounded at the base, or subcordate, wrinkled, villous: upper ones small, nearly sessile; heads globose, densely many-flowered, on long peduncles; receptacle naked; bracteas subulate, about equal in length to the calyxes; fructiferous calyx tubular, villous, recurved, with a truncate mouth, and subulate teeth. ♃.? S. Native of America, within the tropic, in various places. H. macrocéphala, Bert. mss. Angles of stem acute, rough. Leaves hardly an inch long. Teeth of calyx purplish. Corolla pale yellow.

Var. β, *hirsùtior* (Benth. lab. p. 81.) stem and leaves more densely hairy. ♃.? S. Native of Brazil, in the province of Minas Geraes.

Var. γ, *grandifòlia* (Benth. l. c.) leaves twice the size of those of the species, membranous, and green like the rest of the plant. ♃.? S. Native near Rio Janeiro.

Recurved-calyxed Hyptis. Fl. July. Clt. 1820. Pl. 4 to 6 feet.

14 H. paludòsa (St. Hil. mss. ex Benth. lab. p. 82.) herbaceous, clothed with soft, silky villi; leaves on short petioles, ovate, acute, serrated, roundly cuneated at the base, wrinkled, clothed with soft villi, canescent beneath; heads globose, densely many-flowered; peduncles 2-3 times longer than the heads; bracteas subulate, adpressed, about equal in length to the calyxes; receptacle naked; fructiferous calyx tubular, downy, recurved, with a somewhat dilated mouth, and lanceolate-subulate teeth. ♃.? S. Native of Brazil, in many places by the sea-side. Flowers white. Nearly allied to *H. recurvàta*.

Marsh Hyptis. Pl. 2 to 3 feet.?

15 H. microphy'lla (Pohl, icon. ined. ex Benth. lab. p. 82.) herbaceous, clothed with hoary pubescence; leaves on short petioles, ovate, crenated, narrowed at the base, wrinkled; heads globose, densely many-flowered; peduncles 2-3 times longer than the heads; receptacle naked; bracteas subulate, adpressed, about equal in length to the calyxes; fructiferous calyx tubular, tomentose, recurved, with a somewhat dilated mouth, and lanceolate-subulate segments. ♃.? S. Native of Brazil, in the provinces of Minas Geraes and St. Paul, in humid pastures, and inundated places. Leaves and heads smaller than those of *H. recurvàta*, and the peduncles shorter. Corolla flesh-coloured.

Small-leaved Hyptis. Pl. 2 to 3 feet.?

16 H. divarica'ta (Pohl, icon. ined. ex Benth. lab. p. 82.) herbaceous, divaricate; branches ascending, twiggy, clothed with hoary pubescence; leaves linear-lanceolate, remote, serrated at top, narrowed a long way at the base, green above, canescent beneath; heads globose, densely many-flowered, pedunculate; bracteas subulate, adpressed, about equal in length to the calyx; receptacle nearly naked; calyx tubular, pubescent, with the mouth at length rather oblique, and the teeth subulate. ♃.? S. Native of Brazil, in fields near rivulets in the province of Goyaz. Stem much branched at the base, leafy; branches

bluntly tetragonal. Lower leaves 1-2 inches long. Corolla pale purplish.

Divaricate Hyptis. Pl. 2 to 3 feet.

17 H. LAVANDULA'CEA (Pohl, icon. ined. ex Benth. lab. p. 82.) herbaceous, clothed with white tomentum, erect; branches twiggy; leaves linear, denticulated at apex, narrowed at the base; heads globose, densely many-flowered, on long peduncles; bracteas subulate, adpressed, about equal in length to the calyxes; receptacle naked; calyx tubular, pubescent, with the mouth at length oblique, and the teeth subulate. ♃.? S. Native of Brazil, in the province of Goyaz, near Fazenda de Camelliera. Allied to the preceding, but the habit is erect, and the whole plant hoary, and the leaves longer and narrower.

Lavender-like Hyptis. Pl. 2 to 3 feet.?

18 H. CAPRARIÆFÒLIA (Pohl, icon. bras. ined. ex Benth. lab. p. 83.) suffruticose, branched at the base; branches tall, almost naked at top, clothed with short pubescence; leaves small, fascicled, nearly sessile, lanceolate-cuneated, acute, toothed, narrowed at the base, green, pubescent; heads on long peduncles, small, globose, densely many-flowered; bracteas subulate, about equal in length to the head; receptacle naked; fructiferous calyx elongated, recurved: teeth subulate, pubescent, shorter than the tube. ♄. S. Native of Brazil, in the province of Goyaz, on Serra do Chrysais, and on Mount Clarvo.

Capraria-leaved Hyptis. Shrub.

19 H. DESERTÒRUM (Pohl, icon. ined. ex Benth. lab. p. 83.) branches erect, clothed with rufous tomentum; leaves petiolate, ovate, obtuse, crenated, narrowed at the base, thick, wrinkled, clothed with rusty villi on both surfaces; heads on long peduncles, globose, densely many-flowered; receptacle naked; bracteas equal in length to the head, linear, clothed with rufous villi; fructiferous calyx elongated, recurved: teeth linear, clothed with rufous villi. ♃.? S. Native of Brazil, in the pastures of deserts at Rio Parahybuna, in the province of Minas Geraes.

Desert Hyptis. Pl. 2 to 3 feet.?

20 H. BRUNNE'SCENS (Pohl, icon. ined. ex Benth. lab. p. 83.) shrubby;? branches clothed with short, rufous tomentum; leaves petiolate, ovate-oblong, obtuse, crenated, narrowly rounded at the base, wrinkled, scabrous above, and clothed with rufous tomentum beneath; heads on long peduncles, globose, densely many-flowered; receptacle naked; bracteas subulate, about equal in length to the calyxes; fructiferous calyx elongated, recurved: teeth subulate, clothed with soft villi, shorter than the tube. ♄.? S. Native of Brazil, in the province of Goyaz, at Engendo dos Bois.

Brunnescent Hyptis. Shrub.?

21 H. REFLE'XA (St. Hil. mss. ex Benth. lab. p. 83.) herbaceous, erect, densely clothed with rufous villi; leaves nearly sessile, ovate, acute, sharply and unequally toothed, narrowly cuneated at the base, clothed with very soft villi; heads on long peduncles, globose, densely many-flowered; bracteas subulate, about equal in length to the calyxes; receptacle nearly naked; fructiferous calyx elongated, recurved: teeth subulate, clothed with soft villi, shorter than the tube. ♃.? S. Native of Brazil, in grassy fields near Araxa, in the province of Minas Geraes. Stems many, a little branched. Corolla purplish violet, downy. Plant fetid.

Reflexed-calyxed Hyptis. Pl. 1 to 2 feet.

22 H. CARDIOPHY'LLA (Pohl, icon. ined. ex Benth. lab. p. 84.) stems erect, strict, densely clothed with white hairs; leaves sessile, stem-clasping, broadly heart-shaped, acute, a little serrated, clothed with soft silky wool; heads pedunculate, globose, densely many-flowered; bracteas subulate, beset with soft villi, about equal in length to the head; receptacle naked; fructiferous calyx elongated, recurvedly deflexed: teeth subulate, villous. ♃. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Stems many, simple, or sparingly branched. Corollas blue.?

Heart-leaved Hyptis. Pl. 1 to 1½ foot.

SECT. VI. CYANOCE'PHALUS (from κυανος, *kyanos*, blue; and κεφαλη, *kephale*, a head; the heads of flowers are blue.) Benth. lab. p. 84. Heads globose, densely many-flowered. Bracteas numerous, adpressed, equal in length to the head, subulate, soft, villous, reflexed on the peduncle. Receptacle naked, or clothed with short pubescence. Fructiferous calyx membranous, turbinately tubular, straight, or a little incurved, glabrous at base; teeth subulate, straight, clothed with soft villi, about equal in length to the tube. Corolla scarcely exceeding the calycine teeth.—Usually hard herbs, or sub-shrubs. Heads of flowers few towards the tops of the branches, generally on long peduncles. When young several of the first species of this section cannot be distinguished from some species of the sect. *Cyrta*. Others, by the slight inflation of the tube of the calyx at its maturity, come very near the section *Xanthiophæ'a*, ex Benth.

23 H. LANA'TA (Pohl, icon. ined. ex Benth. lab. p. 84.) suffruticose; branches clothed with wool like hairs; leaves numerous, sessile, ovate, acutish, crenated, cordately stem-clasping at the base, clothed with wool like hairs on both surfaces, nervosely wrinkled beneath; heads pedunculate, densely many-flowered; receptacle nearly naked; bracteas subulate, about equal in length to the head; calyx nearly straight, with subulate teeth, which are clothed with woolly villi, and are about equal in length to the tube. ♃. S. Native of Brazil, in the province of Goyaz, at Agua Gente and Traheras.

Woolly Hyptis. Pl. 1 to 2 feet.?

24 H. ADPRE'SSA (St. Hil. mss. ex Benth. lab. p. 84.) stems erect, strict, nearly simple, pubescent; leaves sessile, erect, ovate-lanceolate, acute, crenately serrated, rounded at the base, subcordately stem-clasping, stiff, nerved, glabrous, or tomentose; heads globose, densely many-flowered, on long peduncles; receptacle naked; bracteas subulate, equal in length to the head; calyx straight: teeth subulate, clothed with soft villi, about equal in length to the tube. ♃.? S. Native of Brazil, in the province of Goyaz, in fields near Torquilla. Habit and flowers similar to *H. cardiophylla*.

Adpressed Hyptis. Pl. 1 to 2 feet.

25 H. RÍGIDA (Pohl, icon. ined. ex Benth. lab. p. 85.) suffruticose; branches pubescent, erect; leaves sessile, ovate, acutish, serrately crenated, cordately stem-clasping at the base, wrinkled, clothed with very short rufous pubescence beneath; heads on long peduncles, globose, densely many-flowered; receptacle nearly naked; bracteas subulate, about equal in length to the head of flowers; calyx straightish: teeth subulate, clothed with soft villi, about equal in length to the tube. ♄. S. Native of Brazil, in the province of Minas Geraes. This species differs from *H. nervòsa* in the leaves being narrower and less canescent, and in the heads being smaller, &c.

Rigid Hyptis. Shrub.

26 H. FRAGILIFÒLIA (St. Hil. mss. ex Benth. lab. p. 85.) suffruticose; branches erect, pubescent; leaves sessile, ovate-roundish, obtuse, crenated, cordately stem-clasping at the base, stiff, nearly glabrous above, and at length shining, reticulately veined beneath, and nearly glabrous; heads pedunculate, globose, densely many-flowered; receptacle naked; bracteas subulate, about equal in length to the head; calyxes straight: teeth subulate, clothed with soft villi, about equal in length to the tube. ♄. S. Native of Brazil, in the province of Minas Geraes, near Pentra. Corolla pale purple.

Brittle-leaved Hyptis. Shrub.

27 H. nervòsa (Pohl, icon. ined. ex Benth. lab. p. 85.) suffruticose; branches villously hispid; leaves sessile, ovate-roundish, obtuse, crenated, cordately stem-clasping at the base, wrinkled, pubescent above, and clothed with hoary tomentum beneath; heads on long peduncles, globose, densely many-flowered; receptacle nearly naked; bracteas subulate, about equal in length to the head; calyx straightish: teeth subulate, clothed with soft villi, about equal in length to the tube. ♄. S. Native of Brazil, in the province of Minas Geraes, between Estiva and Rio de Prata.

Nerved-leaved Hyptis. Shrub.

28 H. ca'ndida (Pohl, icon. ined. ex Benth. lab. p. 85.) suffruticose; branches clothed with white tomentum; leaves sessile, ovate, bluntish, crenated, cordately stem-clasping at the base, wrinkled, canescent above, but clothed with white tomentum beneath; heads on long peduncles, globose, densely many-flowered; receptacle nearly naked; bracteas subulate, about equal in length to the head; calyx nearly straight: teeth subulate, clothed with soft villi, about equal in length to the tube. ♄. S. Native of Brazil, between Rio Jequitinhonha and Barreros, in the province of Minas Geraes.

Whitened Hyptis. Shrub.

29 H. molli'ssima (Benth. lab. p. 85.) suffruticose; branches elongated, villous; leaves sessile, ovate-roundish, acutish, crenated, cordately stem-clasping at the base, nervosely wrinkled, clothed with very soft villi on both surfaces; peduncles longer than the leaves; heads globose, densely many-flowered; bracteas subulate, equalling the head; receptacle naked; calyxes nearly straight: teeth subulate, clothed with soft villi, rather longer than the tube. ♄. S. Native of Brazil, in the province of Minas Geraes, &c., in hedges and cultivated places. Stem woody at base. Branches almost simple, tetragonal. Corolla obscure violet, shorter than the calycine teeth.

Very soft Hyptis. Shrub 4 to 5 feet.

30 H. argu'ta (Pohl, icon. ined. ex Benth. lab. p. 86.) suffruticose? tall; branches densely clothed with rufous villi; leaves petiolate, broad-ovate or roundish, sharply toothed, thick, wrinkled, densely villous on both surfaces; heads on long peduncles, globose, densely many-flowered; receptacle naked; bracteas subulate, equal in length to the head; calyx nearly straight: teeth subulate, clothed with very soft villi, about equal in length to the tube. ♄. S. Native of Brazil, in pastures of deserts at Rio Parahybuna, in the province of Minas Geraes. This species differs from its nearest allies, in the more densely villous, larger leaves.

Sharp-toothed-leaved Hyptis. Shrub.

31 H. rugòsa (Benth. lab. p. 86.) stem shrubby; branches pubescently villous; leaves on short petioles, ovate-roundish, acute, sharply and serrately crenated, rounded or cordate at the base, wrinkled, clothed with short rufous villi on both surfaces; heads on long peduncles, globose, densely many-flowered; bracteas subulate, about equal in length to the head; calyx nearly straight: teeth subulate, clothed with soft villi, rather longer than the tube. ♄. S. Native of Brazil, on Serra das Carancas, in the province of Minas Geraes, &c. Leaves 6-9 lines long, usually 3 in a whorl, thick, hard.

Wrinkled-leaved Hyptis. Shrub 2 feet.

32 H. cunea'ta (Pohl, icon. ined. ex Benth. lab. p. 86.) suffruticose?; branches erect, tomentosely pubescent; leaves on short petioles, obovate, broadly crenated, narrowed at the base, stiff, rather scabrous above, reticulated beneath, and clothed with rufous pubescence; heads globose, on long peduncles; receptacle naked; bracteas subulate, equalling the head; calyx straight: teeth subulate, clothed with soft villi, about equal in length to the tube. ♄. S. Native of Brazil, in deserts at Rio Parahybuna, in the province of Minas Geraes.

Cuneate-leaved Hyptis. Shrub.

33 H. lippioi'des (Pohl, icon. ined. ex Benth. lab. p. 86.) shrubby?; branches clothed with rufous tomentum; leaves on short petioles, ovate, crenated, rounded at the base, pubescent above, but reticulated and clothed with rufous tomentum beneath, rigid; heads on long peduncles, globose, densely many-flowered; receptacle naked; bracteas subulate, equalling the head; calyx nearly straight: teeth subulate, clothed with soft villi, about equal in length to the tube. ♄. S. Native of Brazil, in the province of Goyaz. Nearly allied to *H. rígida*, with the habit of *H. nervòsa*; but the leaves are constantly petiolate, and ovate at the base, and not cordately stem-clasping.

Lippia-like Hyptis. Shrub.

34 H. selaginifòlia (Mart. mss. ex Benth. lab. p. 87.) shrubby; branches subfasciculate, stiff, nearly glabrous, nodose; leaves small, nearly sessile, linear, acute, sharply serrated, narrowed at the base, stiff, glabrous, smooth; heads on long peduncles, globose, densely many-flowered; receptacle naked; bracteas subulate, equalling the head; calyxes erectish: teeth subulate, soft, villous, about equal in length to the tube. ♄. S. Native of Brazil, in the province of Minas Geraes. Habit and heads like those of *H. rugòsa*, but the form of the leaves is very distinct.

Selago-leaved Hyptis. Shrub.

35 H. peduncula'ris (Benth. lab. p. 87.) pubescent; leaves remote, sessile, lanceolate, obtuse, serrated, rounded at the base, rather coriaceous, glabrous above, shining and nerved beneath, clothed with fine down; heads on long peduncles, globose, densely many-flowered; receptacle nearly naked; bracteas subulate, equal in length to the heads; calyx nearly straight: teeth subulate, clothed with soft villi, about equal in length to the tube. ♃.? S. Native of Brazil, in the province of Minas Geraes, in grassy fields at Serro Frio and Villa de Tepico, &c. Stem nearly simple. Leaves 2 inches long, but shorter than the internodes. Peduncles twice as long as the leaves. Calyx tubular.

Long-peduncled Hyptis. Pl. 1 to 2 feet.?

36 H.? bidenta'ta (Pohl, icon. ined. ex Benth. lab. p. 87.) herbaceous?; branches erect, strict, clothed with short tomentose pubescence; leaves on short petioles, lanceolate-ovate, sharply and doubly serrated, cuneate at the base, nervosely wrinkled, pubescent on both surfaces, or clothed with rufous tomentum beneath; heads on long peduncles, globose, densely many-flowered; receptacle naked; bracteas subulate, about equal in length to the head; fructiferous calyx elongated, a little recurved: teeth subulate, clothed with soft pubescence, shorter than the tube. ♃.? S. Native of Brazil, in pastures of deserts at Rio Parahybuna, in the province of Minas Geraes. Habit of *H. incìsa*, but the fructiferous calyx is a little recurved. Perhaps belonging to this or the preceding section.

Twice-toothed-leaved Hyptis. Pl. 2 to 3 feet.?

37 H. inci'sa (St. Hil. et Mart. mss. ex Benth. lab. p. 87.) nearly glabrous, or clothed with clammy pubescence; stems procumbent at the base, ascending; leaves on short petioles, ovate or lanceolate, acute, irregularly and deeply serrated, undulated, roundedly cuneated at the base, stiff, nearly glabrous on both surfaces; heads on long peduncles, globose, densely many-flowered; receptacle naked; bracteas subulate, equalling the heads; calyx nearly straight: teeth subulate, soft, villous, about equal in length to the tube. ♃.? S. Native of Brazil, in the province of Minas Geraes, on Serro Frio. Allied to *H. pedunculàris*, but differs in the leaves. Leaves about an inch long, and, like the peduncles, are often 3 in a whorl.

Cut-leaved Hyptis. Pl. procumbent.

38 H. lóngipes (St. Hil. mss. ex Benth. lab. p. 88.) suffruticose, nearly glabrous, or clothed with tomentose pubescence;

leaves petiolate, oblong-lanceolate, bluntish, irregularly and bluntly toothed, with undulated margins, narrowly cuneated at the base, stiff, complicate, clothed with rufous down on both surfaces; heads on long peduncles, globose, densely many-flowered; bracteas subulate, equalling the heads; receptacle naked; calyx pubescent, straight: teeth subulate, soft, villous, about equal in length to the tube. ♄. S. Native of Brazil, in the woods called Carrascos, in that part of the province of Minas Geraes called Minas Novas. This species differs from *H. incìsa*, in the longer, petiolate, complicate leaves. Corollas purplish. The whole herb is clammy and fetid.

Long-peduncled Hyptis. Pl. 2 to 3 feet.

39 H. A'LBIPES (St. Hil. mss. ex Benth. lab. p. 88.) hairs adpressed, woolly; stems procumbent; leaves nearly sessile, ovate-lanceolate, acute, serrately crenated, cuneated at the base, clothed with soft villi on both surfaces; heads on long peduncles, globose, densely many-flowered; bracteas subulate, equalling the heads; receptacle naked; calyx villous, with soft villous teeth, which are rather shorter than the tube. ♃.? S. Native of Brazil, in the province of Minas Geraes, in fields near Salgado. Leaves 1 to $1\frac{1}{2}$ inch long: lower ones petiolate. Heads of the preceding.

White-peduncled Hyptis. Pl. procumbent.

40 H. ELONGA'TA (Benth. lab. p. 88.) clothed with soft pili; leaves on short petioles, oblong, acute, remotely and deeply crenated or serrated, narrowed at the base, clothed with soft hoary villi on both surfaces; heads on long peduncles, globose, densely many-flowered; receptacle nearly naked; bracteas linear-subulate, exceeding the calyxes; calyx densely villous: teeth subulate, clothed with very soft villi, longer than the tube. ♄. S. Native of Peru, in various places, Ruiz. et Pav. and Mathews. Stem woody at the base, procumbent. Branches erect, nearly terete. Leaves glandular beneath. Corolla scarcely exceeding the calyx.

Elongated Hyptis. Pl. 1 foot.

SECT. VII. ERIOSPHÆ'RIA (from εριον, *erion*, wool; and σφαιρα, *sphaira*, a sphere; in allusion to heads of flowers being woolly.) Benth. lab. p. 88. Heads semiglobose, densely many-flowered. Bracteas numerous, adpressed, lanceolate, or linear; those of the fruit bearing heads, spreading, not reflexed on the peduncles, clothed with silky tomentum or wool. Receptacle very villous or woolly. Calyx campanulate, straight, almost glabrous near the base, very villous or woolly at top; teeth generally short, straight. Corolla hardly exceeding the calyx.—Herbs or subshrubs, generally hard. Heads of flowers usually on short peduncles, few towards the tops of the branches, clothed with soft silky tomentum or woolly villi.

41 H. LEUCOCE'PHALA (Mart. mss. ex Benth. lab. p. 89.) suffruticose, procumbent at the base; branches ascending, clothed with hoary pubescence above, and glabrous below; leaves nearly sessile, lanceolate, bluntly serrated, narrowed at the base, wrinkled, clothed with hoary tomentum beneath; heads small, on long peduncles, nearly globose, densely many-flowered, clothed with white wool; receptacle woolly; bracteas equalling the heads, and are, as well as the calycine teeth, which are subulate, clothed with soft villi. ♄. S. Native of Brazil, in sandy fields near Joazeiro, along the river San Francisco, in the province of Bahia. Corolla exceeding the calyx a little, rose-coloured. Plant aromatic. With the exception of this species, which has many of the characters of the sections *Cyanocéphalus* and *Cephalohýptis*, the rest of them form a very natural section.

White-headed Hyptis. Shrub procumbent.

42 H. PASSERI'NA (Mart. mss. ex Benth. lab. p. 89.) shrubby, divaricate; branches clothed with silky tomentum; leaves nearly sessile, small, obovate-oblong, obtuse, quite entire, undulated, narrowed at the base, veinless, clothed with silky tomentum; heads small, semiglobose, densely many-flowered, on short peduncles; receptacle villous; bracteas lanceolate, obtuse, clothed with silky tomentum, about equal in length to the heads; calyx campanulate, clothed with silky villi: teeth short, lanceolate. ♄. S. Native of Brazil, on Serra de Piedade, in the province of Minas Geraes. Nearly allied to *H. Sellòi*, but differs in the ovate undulated leaves.

Sparrow Hyptis. Shrub.

43 H. SELLÒI (Benth. lab. p. 89.) stem shrubby, procumbent; branches clothed with silky tomentum; leaves sessile, linear, obtuse, quite entire, flat, narrowed at the base, veinless, clothed with hoary tomentum; heads small, semiglobose, densely many-flowered, on short peduncles; receptacle villous; bracteas lanceolate, clothed with silky tomentum, about equal in length to the heads; calyx campanulate, clothed with silky villi: teeth short, lanceolate. ♄. S. Native of the South of Brazil. Shrub divaricate. Branches nearly terete. Corolla glabrous, exceeding the tube of the calyx a little.

Sello's Hyptis. Shrub.

44 H. ANGUSTIFÒLIA (Pohl, icon. ined. ex Benth. lab. p. 89.) stem shrubby, erectish; branches clothed with silky tomentum; leaves nearly sessile, linear, acute, toothed at top, quite entire at the base, and narrowed a long way, veined, clothed with silky tomentum on both surfaces; peduncles longer than the heads, which are semiglobose and densely many-flowered; receptacle villous; bracteas lanceolate, clothed with silky tomentum, equalling the heads; calyx campanulate, clothed with silky villi: teeth short, very soft, lanceolate. ♄. S. Native of Brazil, on Serra de Ourada, in the province of Goyaz. Allied to *H. Sellòi*, and as if it was intermediate between it and *H. velutìna*. Leaves $1\frac{1}{2}$ to $2\frac{1}{2}$ inches long: floral ones exceeding the head.

Narrow-leaved Hyptis. Shrub.

45 H. SAXA'TILIS (St. Hil. mss. ex Benth. lab. p. 90.) suffruticose; branches clothed with silky tomentum; leaves nearly sessile, oblong-lanceolate, acute, toothed at apex, quite entire at the base, and narrowed, veiny, clothed with silky tomentum on both surfaces; peduncles longer than the heads; heads semiglobose, densely many-flowered; receptacle villous; bracteas lanceolate, clothed with silky tomentum, about equal in length to the heads; calyx campanulate, clothed with silky wool: teeth short, lanceolate. ♄. S. Native of Brazil, in the province of Goyaz. Allied to *H. angustifòlia*, but differs in the form of the leaves.

Rock Hyptis. Shrub 1 to 2 feet.

46 H. HILA'RII (Benth. lab. p. 90.) herbaceous? hard, clothed with long, loose, silky wool; leaves nearly sessile, ovate-roundish, obtuse, crenulated, rounded at the base, thick, stiff; heads semiglobose, densely many-flowered, on short peduncles; receptacle very villous; bracteas ovate-lanceolate, about equal in length to the head; calyx clothed with woolly villi: teeth short, acute. ♃.? S. Native of Brazil, in the southern part of the province of Goyaz, on the stony mountain called Morro de Tisao. Stems nearly simple, 1 to $1\frac{1}{2}$ foot long. Leaves 1 to $1\frac{1}{2}$ inch long.

St. Hilaire's Hyptis. Shrub 1 to $1\frac{1}{2}$ foot.

47 H. VELUTI'NA (Pohl, icon. ined. ex Benth. p. 90.) herbaceous; the whole plant velvety from silky hairs; leaves oblong-lanceolate, obtuse, crenated, narrowed a long way into the petioles; heads semiglobose, densely many-flowered, on short peduncles; receptacle very villous; bracteas ovate or lanceolate, about equal in length to the heads; calyx very villous: teeth subulate, shorter than the tube. ♃. S. Native of Brazil, not far from Villa Boa, &c., in the province of Goyaz; and

near Paracatu, in the province of Minas Geraes. Habit of *Bupthálmum aquáticum*. Corolla pale purplish violet.

Velvety Hyptis. Pl. 1 to 2 feet.

48 H. origanoi'des (Pohl, icon. ined. ex Benth. lab. p. 91.) suffruticose, procumbent, clothed with adpressed pubescence; leaves oblong-ovate, obtuse, crenated, narrowed a short way into the petioles at the base; heads semiglobose, densely many-flowered, on short peduncles; receptacle villous; bracteas lanceolate-linear, about equal in length to the head; calyx very villous: teeth subulate, shorter than the tube. ♄. S. Native of Brazil, in the province of Goyaz, on the tops of the mountains called Chapado do Serra San Marcos, and elsewhere in the same province. Allied to *H. velutìna*, but differs in being less woolly, and in the stem being procumbent, &c.

Marjoram-like Hyptis. Shrub procumbent.

49 H. dictyoi'dea (Pohl, icon. ined. ex Benth. lab. p. 91.) branches stiff, panicled above, clothed with hoary villi; leaves on short petioles, oval, obtuse, crenately toothed, roundly cuneated at the base, scabrous above, reticulated beneath, and lacunosely wrinkled, pubescent on the nerves: upper ones acute, canescent beneath; heads pedunculate, semiglobose; receptacle woolly; bracteas ovate-lanceolate, villous, equalling the heads; calyx villous: teeth subulate, stiffish, villous, rather shorter than the tube. ♄.? S. Native of Brazil, at Fazenda Dios and Caldas; and on Serra San Felix, in the province of Goyaz.

Net-like Hyptis. Shrub.?

50 H. Adama'ntum (St. Hil. mss. ex Benth. lab. p. 91.) suffruticose, the whole plant velvety from silky hairs; leaves sessile, oval, acute, a little toothed, rounded at the base; heads semiglobose, densely many-flowered, on short peduncles; receptacle villous; bracteas lanceolate, acute, about equal in length to the head; calyx clothed with woolly villi: teeth short, lanceolate-subulate. ♄. S. Native of Brazil, in the province of Minas Geraes, in the diamond district, on the banks of the rivulet called Corrego Novo. Leaves hardly half an inch long. Corolla rose-coloured.

Diamond-district Hyptis. Shrub 2 to 2½ feet.

51 H. cæru'lea (St. Hil. mss. ex Benth. lab. p. 91.) herbaceous; stems procumbent, branched, villous; leaves small, numerous, sessile, ovate, obtuse, crenated, cordate at the base, wrinkled, pubescent; heads semiglobose, densely many-flowered; peduncles rather longer than the heads; bracteas lanceolate-linear, recurved, equal in length to the head; receptacle woolly; calyx very villous; teeth short, subulate. ♃.? S. Native of Brazil, in the province of Minas Geraes, on the mountain called Serra da Canastra. Herb much branched, humble, procumbent. Corollas blue.

Blue-flowered Hyptis. Pl. procumbent.

52 H. alpe'stris (St. Hil. mss. ex Benth. lab. p. 92.) herbaceous; stems ascending or erect, sparingly branched, clothed with rufous villi; leaves numerous, sessile, ovate-oblong, obtuse, crenated, cordately stem-clasping at the base, reflexed, wrinkled, clothed with velvety pubescence; heads semiglobose, densely many-flowered; peduncles about equal in length to the heads; bracteas lanceolate-linear, equalling the head; receptacle woolly; calyx very villous, with short subulate teeth. ♃.? S. Native of Brazil, in humid grassy places near Serra da Canastra, in the province of Minas Geraes. All parts of the plant are larger than in *H. cærùlea* and *H. gratiolæfòlia*.

Alp Hyptis. Pl. elongated.

53 H. gratiolæfòlia (St. Hil. mss. ex Benth. lab. p. 92.) herbaceous; stems erect, branched at the base; branches twiggy, clothed with rufous villi; leaves small, numerous, sessile, ovate-obtuse, crenated, cordate at the base, wrinkled, clothed with rufous pubescence; heads semiglobose, densely many-flowered; peduncles equal in length to the heads; receptacle woolly; bracteas lanceolate-linear, rather longer than the head, recurved at top; receptacle woolly; calyx very villous: teeth subulate, about equal in length to the tube. ♃.? S. Native of Brazil, in elevated plains in the western parts of the province of Minas Geraes. Very like *H. cærùlea*, in stature, leaves, and heads, but differing in the bracteas and calycine teeth being longer. Heads few, approximating into a terminal corymb.

Gratiola-like Hyptis. Pl. 2 to 3 feet.?

54 H. Goyave'nsis (St. Hil. mss. ex Benth. lab. p. 92.) herbaceous or suffruticose? ascending or erect; branches densely villous; leaves sessile, ovate-elliptic, obtuse, crenated, cordate at the base, wrinkled, villous; heads semiglobose, densely-many-flowered; peduncles shorter than the heads; bracteas linear, straight, equalling the heads; receptacle woolly; calyx very villous: teeth short, subulate. ♄.? S. Native of Brazil, in fields near Laage, in the southern region of the province of Goyaz. Plant with a hard or shrubby base. Corollas azure blue, downy. Differs from *H. cærùlea* in the form of the leaves and habit; and from *H. crenàta* in the mutic bracteas and short calycine teeth.

Goyaz Hyptis. Shrub 1 foot.

55 H. ova'ta (Pohl, icon. ined. ex Benth. lab. p. 92.) stem herbaceous, erect, stiff, villous; leaves sessile, ovate, obtuse, crenated, cordate at the base, reticulately wrinkled, clothed with tomentose pubescence on both surfaces; heads semiglobose, densely many-flowered, on short peduncles; receptacle very villous; bracteas lanceolate at the base, and are, as well as the calyxes, very villous; teeth of calyx long-subulate, glabrous. ♃.? S. Native of Brazil, between Allegres and Trinidada, in the province of Minas Geraes. Differing from *H. crenàta*, in the broader smoother leaves, &c.

Ovate-leaved Hyptis. Pl. 1 to 2 feet.?

56 H. crena'ta (Pohl, icon. ined. ex Benth. lab. p. 93.) herbaceous; stem erect, stiff, villous; leaves sessile, oblong-ovate, obtuse, crenated, rounded at the base, villous on both surfaces, reticulately wrinkled; heads semiglobose, densely many-flowered; receptacle woolly; bracteas lanceolate at the base, long-subulate at apex, exceeding the calyxes; calyx densely villous, with villous subulate teeth, which are hardly longer than the tube. ♃.? S. Native of Brazil, in the provinces of Minas Geraes, Goyaz, and Bahia, &c. A very polymorphous species, beset with long spreading hairs, and more or less clothed with rusty tomentum. It is distinguished from its nearest ally, *H. cærùlea*, by the bracteas ending in long subulate points.

Crenated-leaved Hyptis. Pl. 1 foot.

57 H. turneræfòlia (Mart. mss. ex Benth. lab. p. 93.) suffruticose; branches pubescent; leaves nearly sessile, oblong-lanceolate, obtuse, a little crenated, rounded at the base or cordate, clothed with soft adpressed villi, pale beneath; heads semiglobose, densely many-flowered, on short peduncles; receptacle woolly; bracteas lanceolate-linear, equal in length to the head; calyx very villous at top: teeth subulate, shorter than the tube. ♄. S. Native of Brazil, in the province of Minas Geraes, at Serro Frio, &c. Habit of *Pulicària dyssentérica*. Leaves rather tomentose beneath. Corolla hardly longer than the calyx, white: the upper lip marked with purple.

Turnera-leaved Hyptis. Shrub 1 to 2 feet.?

58 H. asteroi'des (St. Hil. mss. ex Benth. lab. p. 93.) stems erect, lanceolate, obtuse, crenated, cordate at the base, with revolute edges, wrinkled, villous; heads pedunculate, globose, densely many-flowered; bracteas lanceolate-subulate, about equal in length to the head; receptacle woolly; calyx very

villous at top: teeth subulate, longer than the tube. ♃.? S. Native of Brazil. Stems numerous. Habit of *A'ster*, section *Galatélla*. Leaves like those of *Myosòtis láppula*. Heads like those of *H. crenàta*, but the calycine teeth are less recurved.

Aster-like Hyptis. Pl. 1 foot.

Sect. VIII. Ooce'phalus (from *ωον*, *oon*, an egg; and *κεφαλη*, *kephale*, a head; in allusion to the ovoid or egg-shaped heads of flowers.) Benth. lab. p. 94. Heads ovoid, dense, few-flowered. Bracteas numerous, adpressed, ovate. Calyx tubularly campanulate, straight: teeth subulate, clothed with soft villi, longer than the tube.—Subshrubs or shrubs. Heads peduncled, panicled at the tops of the branches.

59 H. halimifòlia (Mart. mss. ex Benth. lab. p. 94.) suffruticose?; branches ascending, hoary; leaves nearly sessile, ovate, obtuse, quite entire, rounded at the base, hoary on both surfaces; heads pedunculate, ovate, hoary, densely many-flowered; receptacle naked; bracteas ovate, bluntish, about equal in length to the head; calyx tubular, with villous subulate teeth. ♄. S. Native of Brazil, in high stony fields at Villa do Rio de Contas, in the province of Bahia. Colour of plant that of *A'triplex Hálimus*. Corolla exserted a little.

Halimum-leaved Hyptis. Shrub.

60 H. crassifòlia (Mart. mss. ex Benth. lab. p. 94.) suffruticose; branches densely and tomentosely hispid; leaves numerous, sessile, rounded, very blunt, cordately stem-clasping at the base, very hairy on both surfaces, with revolute edges; heads on short peduncles, ovate-globose, dense, 6-10-flowered; receptacle naked; bracteas lanceolate, equal in length to the heads, very hispid; calycine teeth subulate, very villous, about equal in length to the tube. ♄. S. Native of Brazil, in rocky places at Villa do Rio de Contas, in the province of Bahia. A humble shrub, with a divaricate base. Leaves hardly $\frac{1}{2}$ an inch long. Corolla exserted, downy outside.

Thick-leaved Hyptis. Shrub dwarf.

61 H. lacunòsa (Pohl, icon. ined. ex Benth. lab. p. 94.) shrubby; branches clothed with soft villi; leaves nearly sessile, ovate, bluntish, scarcely crenated, cordate at the base, wrinkled, rufescent beneath, or canescent, tomentosely pubescent; heads pedunculate, ovate, densely few-flowered; receptacle naked; bracteas ovate, adpressed, one half shorter than the calycine teeth; calyx villous, with subulate, softly villous teeth, which are longer than the tube. ♄. S. Native of Brazil, in the province of Minas Geraes, in various places. Heads 4-10-flowered. Corolla hardly exceeding the calycine teeth.

Lacunose Hyptis. Shrub.

Sect. IX. Trichosphæ'ria (from *θριξ τριχος*, *thrix trichos*, a hair; and *σφαιρα*, *sphaira*, a sphere; in allusion to the plumose calycine teeth, which gives a hair-like appearance to the heads of flowers.) Benth. lab. p. 95. Heads globose, densely many-flowered. Bracteas numerous, adpressed, subulate, reflexed on the peduncle in the fructiferous heads. Receptacle naked. Calyx campanulate, straight: teeth filiform, softly plumose, much longer than the tube. Corolla shorter than the calycine teeth.—Shrubs or subshrubs, usually clothed with tomentum. Heads numerous, on long peduncles, amply panicled, usually bluish.

62 H. crini'ta (Benth. lab. p. 95.) stem shrubby; branches clothed with hoary tomentum; leaves nearly sessile, oblong-lanceolate, acutish, quite entire or somewhat serrated, narrowed at the base, clothed with hoary tomentum, a little wrinkled; floral leaves shorter than the peduncles; heads globose, densely many-flowered; bracteas linear or subulate, shorter than the head; receptacle naked; calyx villous. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Leaves opposite or 3 in a whorl. Corollas pale red.

Var. β, polycéphala (Benth. lab. p. 95.) leaves smaller, and more tomentose; heads numerous. ♄. S. Native of Brazil.

Long-haired Hyptis. Shrub 2 to $2\frac{1}{2}$ feet.

63 H. spiræfòlia (Mart. mss. ex Benth. lab. p. 95.) shrubby; branches clothed with hoary tomentum; leaves on short petioles, cuneate-oblong or obovate, obtuse or mucronulate, crenated, cuneated at the base, clothed with hoary tomentum beneath, stiffish; panicle ample; heads on short peduncles, globose, densely many-flowered; bracteas subulate, about equal in length to the head; calyx villous. ♄. S. Native of Brazil, in the province of Minas Geraes, in desert fields, on Serro Frio, at the river Jequitinhonha. Branches tetragonal. Leaves 3 in a whorl.

Spiræa-leaved Hyptis. Shrub 2 to 3 feet.

64 H. Martiu'sii (Benth. lab. p. 95.) shrubby; branches finely tomentose; leaves petiolate, ovate-oblong, obtuse, crenated, roundly cuneated at the base, a little wrinkled above, and pubescent, but clothed with hoary tomentum beneath; heads globose, densely many-flowered, pedunculate, panicled; bracteas subulate, rather shorter than the head; fructiferous calyx elongated, with an inflated tube. ♄. S. Native of Brazil, in the province of Bahia, in woods between Santa Anna and Santo Antonio das Quebradas. Corollas white.

Martius's Hyptis. Shrub 5 to 6 feet.

65 H. eriophy'lla (Pohl, icon. ined. ex Benth. lab. p. 96.) shrubby; branches clothed with white or rufous wool; leaves nearly sessile, oval, obtuse, crenated, rounded at the base, villous or tomentose above, but clothed with hoary tomentum, or floccose wool beneath: heads densely globose, many-flowered, pedunculate, panicled; bracteas linear-subulate, rather shorter than the head. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Corollas blue.

Var. β, coriifòlia (Benth. l. c.) plant less tomentose. ♄. S.

Woolly-leaved Hyptis. Shrub 2 to 3 feet.

66 H. brachyphy'lla (Mart. mss. ex Benth. lab. p. 96.) shrubby; leaves petiolate, broad-ovate, obtuse, crenated, rounded at the base, wrinkled, clothed with short, rather rufous tomentum; heads globose, densely many-flowered, pedunculate, panicled; bracteas subulate, rather shorter than the head; fructiferous calyx elongated, with an inflated tube. ♄. S. Native of Brazil, in the province of Minas Geraes, in fields at Serro Frio. Nearly allied to *H. eriophýlla*, but differs in the leaves being shorter and broader.

Short-leaved Hyptis. Shrub.

67 H. multiflòra (Pohl, icon. ined. ex Benth. lab. p. 96.) shrubby; branches clothed with hoary tomentum; leaves on short petioles, ovate-roundish, sharply crenated, clothed with white tomentum beneath, coriaceous, stiff; panicle very ample; heads on short peduncles, globose, densely many-flowered; bracteas subulate, about equal in length to the head; calyx villous. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Bahia.

Many-flowered Hyptis. Shrub.

Sect. X. Xanthiophæ'a (from *ξανθος*, *xanthos*, yellow; and *φαιος*, *phaios*, brown; so called probably from the colour of the plants.) Mart. mss. ex Benth. lab. p. 97. Heads globose, densely many-flowered. Bracteas numerous, adpressed, subulate. Calyx turbinately campanulate, membranous in the fructiferous state, inflated in the middle, and contracted at the mouth; teeth subulate, stiff, erect, or spreading. Tube of corolla equal in length, or rather longer than the calyx.

—Procumbent or divaricate herbs, with the heads of flowers on long peduncles.

68 H. sideri'tis (Mart. mss. ex Benth. lab. p. 97.) herbaceous, procumbent; branches ascending, very pilose; lower leaves petiolate: rameal ones nearly sessile, ovate, acute, sharply serrated, rounded or cordate at the base, stiff, green on both surfaces, and pilosely hispid; heads few, pedunculate, globose, densely many-flowered; bracteas equal in length to the heads; receptacle naked; calyx hispid, with 5-10 unequal, subulate, stiff, divaricate teeth. ♃.? S. Native of Brazil, in the province of Minas Geraes, in places which are inundated during the winter. Herb pale green. Corolla violaceous, twice as long as the calyx.

Sideritis-like Hyptis. Pl. procumbent.

69 H. loba'ta (St. Hil. mss. ex Benth. lab. p. 97.) herbaceous, procumbent, pilosely pubescent; leaves broad-ovate, acute, sinuately lobed, crenated, cordate at the base, green on both surfaces; heads on long peduncles, globose, densely many-flowered; bracteas about equal in length to the head; receptacle naked; calyx hispid, with 5-6 nearly equal, subulate, stiff, pubescent teeth, which are shorter than the tube. ♃.? S. Native of Brazil, in pastures near San Joze, in the province of St. Paul. Stems usually rooting at the nodi. Leaves like those of *Althæ'a hirsùta*: floral ones sessile. Corolla blue. Odour fetid.

Lobed-leaved Hyptis. Pl. procumbent.

70 H. lagena'ria (St. Hil. mss. ex Benth. lab. p. 98.) herbaceous; branches ascending, nearly glabrous; leaves petiolate, ovate, acuminated, acute, doubly toothed, rounded at the base, green, pubescent; heads pedunculate, panicled, nearly globose, densely many-flowered; receptacle naked; bracteas about equal in length to the head; calyx glabrous, with subulate teeth, which are shorter than the tube. ♃.? S. Native of Brazil. Bracteas, as well as the teeth of the calyx, generally hooked at top. Calyx usually 5-toothed.

Bottle-shaped-calyxed Hyptis. Pl. ascending.

Sect. XI. Cephalohy'ptis (from κεφαλη, *kephale*, a head; and *Hýptis*.) Benth. lab. p. 98. Heads semi-globose, or at length globose, densely many-flowered. Bracteas numerous, adpressed, ovate, lanceolate, linear, rarely subulate. Receptacle glabrous, rarely villous. Calyx campanulate or tubular, straight, glabrous, pubescent, or villously hispid, never woolly: teeth subulate or lanceolate at the base, rarely very short and obtuse. Corolla exceeding the calyx a little.—Herbs or subshrubs, with axillary, pedunculate, or nearly sessile heads of flowers.

§ 1. Gnidiæfòlia (from *Gnidia and fòlia*; in reference to the leaves resembling those of the genus *Gnìdia*.) Benth. lab. p. 98. *Leaves small, quite entire, cordate at the base, with revolute edges. Fructiferous heads globose, villous. Bracteas ovate, or lanceolate.*

71 H. imbrica'ta (Pohl, icon. ined. ex Benth. lab. p. 98.) branches erect or ascending, twiggy, pilose; leaves sessile, erect, adpressed to the stem, imbricate, with revolute ciliated edges, dilately cordate at the base, glabrous; heads globose, densely many-flowered; peduncles rather shorter than the leaves; bracteas ovate, acute, stiff, rather longer than the head; calyx campanulate, hispid, glabrous at the base, with subulate villous teeth, which at length spread. ♃. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Corolla with the 2 upper segments red, the lower one rose-coloured, and the lateral ones yellowish. Receptacle glabrous.

Imbricate-leaved Hyptis. Pl. ascending.

72 H. ditassoi'des (Mart. mss. ex Benth. lab. p. 99.) suffruticose; branches villous; leaves small, sessile, numerous, spreading, very blunt, quite entire, with revolute edges, cordately stem-clasping at the base, blistered, and quite glabrous above, one-nerved, and villous beneath; heads densely globose, many-flowered, on very short peduncles; bracteas lanceolate, villous; calyx nearly glabrous at the base, elongated, with very villous subulate teeth. ♄. S. Native of Brazil, in the province of Minas Geraes, on Serro Frio. Habit of *Penæ'a* or *Ditássa*. Receptacle very pilose.

Ditassa-like Hyptis. Shrub.

§ 2. Lavandula'ceæ (so called from the leaves being like those of Lavender.) Benth. lab. p. 99. *Leaves narrowed at the base, and quite entire, a little toothed at top. Fructiferous heads globose, villous. Bracteas lanceolate, or linear.*

73 H. linarioi'des (Pohl, icon. ined. ex Benth. lab. p. 99.) suffruticose; branches erect, strict, tall, somewhat canescent; leaves sessile, linear, almost quite entire, clothed with fine hoary pubescence; heads nearly globose, densely many-flowered, on long peduncles; bracteas lanceolate, clothed with white tomentum: exteror ones exceeding the head; receptacle nearly naked; calyx villous, with subulate, erect, softly villous teeth, which are about equal in length to the tube. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes, in fields. Corollas white, spotted with purple. Very nearly allied to *H. strictíssima*, and only differs in the heads being larger and more villous, &c.

Linaria-like Hyptis. Shrub.

74 H. stricti'ssima (Pohl, icon. ined. ex Benth. lab. p. 99.) suffruticose; branches erect, strict, tall, clothed with short adpressed pubescence; leaves sessile, linear, almost quite entire, narrowed at the base, clothed with fine hoary pubescence; heads nearly globose, densely many-flowered, on long peduncles; bracteas linear: exterior ones about equal in length to the head; receptacle naked; calyx tubularly campanulate, villous: teeth subulate, erect, one half shorter than the tube. ♄. S. Native of Brazil, in the provinces of Goyaz, on the tops of the mountains called Chapada do Serra San Marcos.

Very-strict Hyptis. Shrub.

75 H. densifòlia (Pohl, icon. ined. ex Benth. lab. p. 100.) suffruticose; branches erect, clothed with short adpressed pubescence; leaves sessile, oblong, quite entire, or denticulated at top, narrowed at the base, veiny, nearly glabrous, or clothed with fine tomentose pubescence; heads globose, densely many-flowered, on long peduncles; bracteas lanceolate: outer ones longer than the heads, obtuse; receptacle naked; calyx tubularly campanulate, villous: teeth subulate, erect, much shorter than the tube. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Habit of *H. linarioìdes*, from which it appears to differ only in the broader leaves.

Dense-flowered Hyptis. Shrub.

76 H. veronicæfòlia (Pohl, icon. ined. ex Benth. lab. p. 100.) stem procumbent, pubescent; leaves sessile, oval, toothed at top, rounded at the base, cuneated, nearly glabrous on both surfaces; heads on long peduncles, nearly globose, densely many-flowered; bracteas lanceolate, obtuse, about equal in length to the head; receptacle naked; calyx tubular, villous: teeth subulate, erect, one half shorter than the tube. ♃.? S. Native of Brazil, in the province of Goyaz, at Engenho, near San Sebastian.

Speedwell-leaved Hyptis. Pl. procumbent.

§ 3. Pedunculòsæ (so called from the heads being supported by long peduncles.) Benth. lab. p. 100. *Heads of flowers*

semi-globose, on long peduncles. Bracteas subulate. Calyx glabrous, or pubescent : teeth subulate.

77 H. TETRAGÒNA (Pohl, icon. ined. ex Benth. lab. p. 100.) stem erect, nearly glabrous : angles acute, pubescent; leaves on short petioles, oval, obtuse, crenated, narrowed at the base, wrinkled, rather scabrous above, but clothed with rusty pubescence beneath; peduncles elongated : lower ones branched; heads nearly globose, densely many-flowered; bracteas subulate, equal in length to the calyxes; calyx tubularly campanulate, rather villous : teeth lanceolate, stiff, nearly glabrous. ♃.? S. Native of Brazil, in the province of Goyaz, at Engenho dos Boys.

Tetragonal-stemmed Hyptis. Pl.?

78 H. MULTIBRACTEA'TA (Benth. lab. p. 100.) herbaceous, glabrous or pubescent at top, pilose on the nodi; leaves on short petioles, ovate, acuminated, serrated, rounded at the base, or running down the petioles, very villous, wrinkled; peduncles tomentose, rather longer than the heads, which are semiglobose, and densely many-flowered; bracteas very numerous, linear, somewhat radiant, rather longer than the head; calyx nearly glabrous, with short, linear, lanceolate, stiff teeth. ♃.? S. Native of Brazil, in the provinces of Bahia, Rio Janeiro, and Minas Geraes. Allied to *H. lantanæfòlia*, from which it differs in the petiolate leaves, and in all the bracteas being linear-subulate. Leaves 1 to 1½ inches long.

Many-bracted Hyptis. Pl.?

§ 4. LATIBRACTEA'TÆ (so named on account of the broad bracteas.) Benth. lab. p. 401. *Heads of flowers semi-globose. Bracteas broad-ovate. Calyx glabrous, or pubescent, with subulate teeth.*

79 H. PETIOLA'RIS (Pohl, icon. ined. ex Benth. lab. p. 101.) herbaceous, erect; stem nearly glabrous : angles hispid; leaves on long petioles, broad-ovate, acute, doubly serrated, glabrous or hispid above; heads semiglobose, on long peduncles, densely many-flowered; bracteas ovate, acute, veiny, ciliated, nearly glabrous, equal in length to the head; calyx nearly glabrous : teeth lanceolate-subulate, stiff, equalling the tube. ♃.? S. Native of Brazil, in the province of Goyaz, at Aldeja Maria.

Long-*petioled* Hyptis. Pl. 1 to 2 feet.?

80 H. LANTANÆFÒLIA (Poit. in ann. mus. 7. p. 468. t. 29. f. 1.) herbaceous, villous; leaves nearly sessile, ovate or oblong, serrately crenated, narrowed at the base, wrinkled, tomentose beneath; heads globose, densely many-flowered, on long peduncles; bracteas ovate, acuminated : outer ones very broad, rather longer than the calyxes; receptacle villous; calyx pubescent at the base, with lanceolate, subulate, acute, stiff teeth, which are rather spiny. ♃. S. Native of tropical America, from Mexico to the province of Minas Geraes, in Brazil, Trinidad, and Porto Rico. Stem creeping and rooting at the base. Branches ascending. Corolla hardly longer than the calyx, white : upper lip spotted with purple.

Lantana-leaved Hyptis. Pl. 2 feet.

81 H. ATRORU'BENS (Poit. ann. mus. 7. p. 466. t. 27. f. 2.) stem creeping and rooting at the base; branches ascending, pilosely pubescent; leaves petiolate, ovate, crenated, roundly cuneated at the base, hispid above, but pale, glabrous, or pilose beneath; heads pedunculate, globose, densely many-flowered; bracteas broad-ovate, membranous, veiny, hardly shorter than the heads; calyx membranous, tubular, truncate, with subulate, strict teeth. ♃. S. Native of tropical America, in shady places, from Mexico to Maranham, in Brazil; St. Domingo, Martinica, St. Vincent, &c. H. procúmbens, Schiede et Deppe, in Linnæa, 5. p. 101. Plant beset with long spreading hairs. Corolla white : 2 upper segments spotted with red : lower ones pale brown, pubescent outside.

Dark-red Hyptis. Pl. procumbent.

§ 5. MARRUBIA'STRÆ (so called from the plants having the appearance or habit of *Marrùbium*, or Horehound.) Benth. lab. p. 102.) *Heads of flowers at length globose. Bracteas linear. Calyx campanulate, membranous at the base, glabrous, generally villous at top : teeth lanceolate-subulate. Leaves more or less sinuated.*

82 H. MÓLLIS (Pohl, icon. ined. ex Benth. lab. p. 102.) herbaceous, clothed with rufous villi; leaves on short petioles, ovate, obtuse, irregularly serrate-crenated, rounded at the base, cuneated or cordate, clothed with soft, rufous, adpressed villi, on both surfaces; peduncles equal in length to the heads, which are nearly globose, and densely many-flowered; receptacle pilose; calyx campanulate, with a very villous mouth, and lanceolate-subulate teeth, which are shorter than the tube. ♃. S. Native of Brazil, in the province of Minas Geraes. Leaves 1 to 1½ inch long.

Soft Hyptis. Pl. 2 feet.

83 H. MARRUBIA'STRA (Pohl, icon. ined. ex Benth. lab. p. 102.) herbaceous; stem erect, clothed with rufous villi; leaves on short petioles, irregularly toothed, somewhat sinuated, roundedly cordate at the base, villous on both surfaces; peduncles villous, longer than the heads, which are nearly globose, and densely many-flowered; calyx membranous, nearly glabrous : teeth subulate, villous, longer than the tube. ♃. S. Native of Brazil, in the province of Goyaz, Pohl.; and towards Cochabamba, in Peru.

Horehound-like Hyptis. Pl. 2 feet.?

84 H. ANGULÒSA (Schott. mss. Pohl, icon. ined. ex Benth. lab. p. 102.) herbaceous; stem erect, clothed with rufous villi; leaves petiolate, ovate, acute, somewhat hastate, deeply serrated or irregularly and sinuately lobed, roundly truncate at the base, villous above and on the nerves beneath, or at length glabrous; peduncles villous, shorter than the heads, which are nearly globose, and densely many-flowered; bracteas lanceolate or oblong-linear : outer ones hardly exceeding the heads; receptacle naked; calyx campanulate, nearly glabrous, with short lanceolate teeth, which spread at length in a stellate manner. ♃.? S. Native of Brazil, in the provinces of Rio Janeiro and Minas Geraes. Stem more or less beset with rufous hairs. Leaves 2-4 inches long.

Angular-stemmed Hyptis. Pl. 4 to 5 feet.

85 H. SINUA'TA (Pohl, icon. ined. ex Benth. lab. p. 103.) herbaceous; stem erect, glabrous; leaves petiolate, ample, broad-ovate, acute, sinuately lobed, crenated, truncate at the base, or subcordate, hispid above, and on the nerves beneath; peduncles nearly glabrous, about equal in length to the heads, which are nearly globose, and densely many-flowered; bracteas lanceolate or oblong-linear, about twice as long as the heads; receptacle nearly naked; calyx campanulate : teeth lanceolate-subulate, at length spreading in a stellate manner. ♃.? S. Native of Brazil, in the provinces of Minas Geraes and Goyaz.

Sinuated-leaved Hyptis. Pl. 3 to 4 feet.

§ 6. GENUI'NÆ (so called on account of the species contained in this section being supposed to be legitimate.) Benth. lab. p. 103. *Heads of flowers at length globose. Bracteas lanceolate. Calyx tubular, or campanulate, usually elongated after the time of flowering : teeth subulate, glabrous.*

86 H. LAPPA'CEA (Benth. lab. p. 103.) herbaceous, erect; branches glabrous, or clothed with adpressed pubescence;

leaves petiolate, oblong-lanceolate, acuminated, irregularly serrated, narrowed at the base, a little wrinkled, pubescent on both surfaces; heads at length globose, densely many-flowered, on short peduncles, subcorymbose at the tops of the branches; bracteas lanceolate, acuminated, about equal in length to the calyxes; calyx campanulate: teeth lanceolate at the base, rigidly and subulately awned. ♃. S. Native of Brazil, in the province of Entre Rios, Parker; in humid pastures from San Joze, in the province of Rio Grande to Santa Borja, in the missions of the Uruguay, &c. Stem acutely tetragonal. Leaves 1-3 inches long. Corolla white, hardly exceeding the calyx. Nearly allied to *H. radiàta*.

Burdock Hyptis. Pl. 2 to 3 feet.?

87 H. INVOLUCRA'TA (Benth. lab. p. 103.) herbaceous, erect, glabrous, or clothed with fine down; leaves sessile, elliptic or lanceolate, acute, serrated, cordate at the base; peduncles longer than the heads; heads semiglobose, densely many-flowered; bracteas broad-lanceolate, acute, much exceeding the head; receptacle naked; calyx campanulate, pubescent: teeth subulate, equalling the tube in length. ♃.? S. Native of Mexico, at Saltepec, Karwinski. Nearly allied to *H. capitàta* and *H. radiàta*.

Involucrated-headed Hyptis. Pl. 2 to 3 feet.?

88 H. LAPPULA'CEA (Mart. mss. ex Benth. lab. p. 104.) herbaceous, ascending, glabrous or pubescent; leaves petiolate, oblong-ovate, acute, serrated, cuneated at the base, or narrowed; peduncles longer than the heads; heads semiglobose, densely many-flowered; bracteas lanceolate or linear, equal in length to the head; fructiferous calyx campanulate: teeth subulate, stiff, longer than the tube. ♃. S. Native of Brazil, in marshy parts of woods, in the provinces of St. Paul and Rio Janeiro.

Lappula-like Hyptis. Pl. 2 to 3 feet.?

89 H. RAMÒSA (Pohl, icon. ined. ex Benth. lab. p. 104.) erect, glabrous; leaves petiolate, oblong-ovate, deeply serrated, or irregularly and sinuately toothed, quite entire at the base, cuneated or narrowed; peduncles longer than the heads, which are densely many-flowered; bracteas lanceolate-linear, obtuse, exceeding the head; calyx tubularly campanulate: teeth lanceolate, subulate, stiff, shorter than the tube. ♃. S. Native of Brazil, at Fazenda Allegres, in the province of Minas Geraes.

Branched Hyptis. Pl. 2 to 3 feet.?

90 H. INAMÆ'NA (Benth. lab. p. 104.) herbaceous, erect, glabrous; leaves nearly sessile, broad-ovate, bluntish, crenated, cuneately narrowed at the base; heads few, on long peduncles, globose, densely many-flowered; bracteas lanceolate, obtuse, equal in length to the heads; receptacle naked; calyx glabrous, tubular: teeth lanceolate-subulate, shorter than the tube. ♃. S. Native of Brazil, in fields at Rio Doce, Maximilian.—An inelegant plant, with the habit of *Verbesìna*.

Inelegant Hyptis. Pl. 2 to 3 feet.

91 H. CAPITA'TA (Jacq. icon. rar. 1. t. 114.) herbaceous, erect, nearly glabrous; leaves petiolate, oblong-ovate, deeply serrated, quite entire at the base, and cuneated or narrowed, glabrous on both surfaces, or hispid from a few pili; peduncles longer than the heads, which are globose and densely many-flowered; bracteas ovate-lanceolate or linear, shorter than the fructiferous heads; receptacle naked; fructiferous calyx elongated, tubular, truncate: teeth subulate, strict at length, shorter than the tube. ♃. S. Native of America, and of Mexico, West India Islands, &c.; also in Manilla, ex Cham. Poit. ann. mus. 7. p. 464. t. 27. f. 1. Clinopòdium capitàtum, Swartz, prod. fl. ind. occ. p. 88. Clinopòdium rugòsum, Lin. spec. 822. ex Jamaica.—Siderìtis, &c., Sloan. hist. jam. 1. p. 174. t. 109. f. 2. Stem bluntly tetragonal. Corollas white, tinged with red.

Capitate-flowered Hyptis. Fl. June, July. Clt. 1714. Shrub 3 to 4 feet.

92 H. BRE'VIPES (Poit. ann. mus. 7. p. 465.) stem nearly glabrous at the base, pubescent above; leaves petiolate, ovate-oblong or lanceolate, acute, irregularly serrated, narrowed at the base, rather hispid above, nearly glabrous beneath, rarely on both surfaces; peduncles shorter, or hardly longer than the heads, which are globose, and densely many-flowered; bracteas lanceolate-linear, acute, exceeding the head a little; calyx pubescent, truncate: teeth erect, subulate, strict, rather longer than the tube. ♃. S. Native of tropical America, from Mexico to Rio Janeiro, Philippines, Manilla, Celebes, &c., in humid places by the sides of rivers or rivulets. H. globífera, Meyer, esseq. p. 207.? H. acùta, Benth. in Linnæa, 6. p. 82. Stem tetragonal; angles hairy. Heads size of cherries. Corolla hardly longer than the calyx, white.

Var. β; plant more glabrous; calycine teeth stiffer, and more blunt. ♃. S. Native of Demerara and Orinoco. H. radiàta, H. B. et Kunth, nov. gen. amer. 2. p. 318.

Short-peduncled Hyptis. Fl. June, Aug. Clt. 1820. Pl. 2 to 3 feet.

93 H. GAUDICHAU'DI (Benth. in Linnæa, 6. p. 77. lab. p. 106.) herbaceous, erectish, glabrous, or clothed with fine pubescence: leaves petiolate, ovate, acute, irregularly serrate-crenated, or a little cut, rounded or cuneated at the base, or the upper ones are narrowed, rather hispid above, and nearly glabrous beneath; peduncles rather shorter than the heads, which are globose and densely many-flowered; bracteas lanceolate, about equal in length to the head; calyx rather membranous, tubular: teeth linear, erect, much shorter than the tube. ♃.? S. Native of Brazil, in grassy places at Rio Janeiro. Habit of *H. capitàta*, but smaller.

Gaudichaud's Hyptis. Pl. 1 to 2 feet.

94 H. LANCEOLA'TA (Poir. dict. suppl. 3. p. 114.) plant nearly glabrous; leaves petiolate, oblong-lanceolate or linear, narrowed at both ends, remotely serrated, quite entire at the base; peduncles shorter than the heads of flowers, which are globose and densely many-flowered; outer bracteas oblong-lanceolate, bluntish, longer than the head; fructiferous calyx smoothish, elongated, truncate: teeth subulate, strict, shorter than the tube. ♃. S. Native of Brazil, in Maranham.

Lanceolate-leaved Hyptis. Pl. 2 to 3 feet.

95 H. LONGIFÒLIA (Pohl, icon. ined. ex Benth. lab. p. 106.) stem erect, pubescent; leaves petiolate, oblong-lanceolate, acuminated, irregularly toothed, narrowed at the base, glabrous above, and rather villous beneath; peduncles longer than the heads, which are densely many-flowered; bracteas linear, exceeding the heads; calyx tubularly campanulate: teeth subulate, longer than the tube. ♃.? S. Native of Brazil, in the province of Goyaz, at Rio Trahiras, and on Serra San Felix. Hardly distinct from *H. lacústris*.

Long-leaved Hyptis. Pl. 2 to 3 feet.?

96 H. LANCEÆFÒLIA (Schum. pl. guin. in acad. hafn. 4. p. 35.) stem herbaceous, pubescent; leaves on short petioles, oblong-lanceolate, acutish, coarsely serrated, narrowed at the base, and quite entire; peduncles shorter than the heads, which are globose and densely many-flowered; bracteas lanceolate, obtuse, about equal in length to the head; calyx ovate, subinflated: teeth lanceolate-subulate, stiff, erect. ♃. S. Native of tropical Africa, in marshes about the Gambia. Stem procumbent at the base. Peduncles hispidly villous. Bracteas pubescent. Probably the same as *H. lacústris*. Branches bluntly tetragonal.

Lance-leaved Hyptis. Pl.

97 H. LACU'STRIS (St. Hil. mss. ex Benth. lab. p. 107.) glabrous; leaves petiolate, oblong-lanceolate, or the lower ones are ovate, acuminated, irregularly serrate-crenated, narrowed at the base, glabrous on both surfaces; peduncles longer than the heads, which are globose and densely many-flowered; bracteas lanceolate, obtuse, about equal in length to the head; fructiferous calyx membranous: teeth linear, shorter than the tube; upper tooth the broadest. ♃.? S. Native of Brazil, in water, in the province of St. Paul; and in humid places near Lake das Couchas, in the province of Rio Grande do Sul. Habit of *H. lanceolàta*. This species approaches the section *Plagiòtis*, in the upper calycine teeth being the longest.

Lake Hyptis. Pl. 2 to 3 feet.?

98 H. HOMALOPHY'LLA (Pohl, icon. ined. ex Benth. lab. p. 107.) branches clothed with rufous hairs; leaves on short petioles, oblong, or oblong-lanceolate, obtuse, cuneated or narrowed at the base, crenated, wrinkled, villous; heads on short peduncles, semiglobose, densely many-flowered; bracteas lanceolate, equalling the calyx; fructiferous calyx tomentose, elongated, inflated at the base: teeth very short, lanceolate, acute. ♃.? S. Native of Brazil, in elevated fields in the province of Minas Geraes, &c. Allied to *H. hirsùta*. Corolla white, spotted with purple.

Equal-leaved Hyptis. Pl. 1 to 1½ foot.

§ 7. BRACHYODÓNTES (from *βραχυς, brachys*, short; and *οδους οδοντος, odous odontos*, a tooth; in allusion to the short calycine teeth.) Benth. lab. p. 107. *Heads semiglobose, and at length hardly globose. Bracteas ovate or lanceolate. Calyx campanulate, with short, ovate, obtuse teeth.*

99 H. OBTUSIFLÒRA (Presl, mss. ex Benth. lab. p. 107.) suffruticose?; branches clothed with adpressed pubescence; leaves petiolate, ovate, or oblong-lanceolate, bluntish, crenated, narrowed at the base, hispid on both surfaces, or at length glabrous; peduncles shorter than the heads, which are nearly globose and densely many-flowered; bracteas ovate, striated, equalling the heads. ♄. S. Native of Peru, on Mount Huanuco, Hænke. Hairs on the younger branches and lower surfaces of the leaves rufescent. Corolla hardly exceeding the calyx.

Blunt-flowered Hyptis. Shrub.

100 H. PARKE'RI (Benth. lab. p. 108.) stem pubescent at top; leaves sessile, oblong-elliptic, or oblong-linear, acute, coarsely serrated, narrowed at the base, nerved, nearly glabrous; peduncles longer than the leaves; heads globose, densely many-flowered; bracteas lanceolate, linear, obtuse, rather longer than the head; calyx glabrous. ♃.? S. Native of Demerara. Peduncles pubescent. Leaves an inch long. Fructiferous calyx elongated, inflated at the base.

Parker's Hyptis. Pl. 2 to 3 feet.?

§ 8. XYLODÓNTES (from *ξυλον, xylon*, wood; and *οδους οδοντος, odous odontos* a tooth; in allusion to the teeth of the calyx being hard, and rather spiny.) Benth. lab. p. 108. *Heads of flowers semiglobose. Bracteas lanceolate or linear, subulate or very acute at apex. Calyx campanulate: teeth lanceolate at the base, subulate, stiff, glabrous, usually somewhat spinose.*

101 H. RADIA'TA (Willd. spec. 3. p. 84.) glabrous, herbaceous; leaves petiolate, ovate-lanceolate, acuminated, crenated, cuneated at the base, or narrowed; heads globose, densely many-flowered, pedunculate; bracteas oblong-lanceolate, obtuse, longer than the head; teeth of calyx rather spinose. ♃.? S. Native of the southern parts of North America, as of Carolina, Louisiana, and Mexico, at the Hacienda de La Laguna. Poit. ann. mus. 7. p. 466. t. 27. f. 2. Clinopòdium rugòsum, Lin. spec. 822.—Dill. hort. elth. 1. p. 88. t. 75. fig. 86. Stem acutely tetragonal. Leaves 1-3 inches long. Allied to *H. angustifòlia* and *H. capitàta*. Corolla pale purple.?

Rayed Hyptis. Fl. June, July. Clt. 1690. Pl. 4 to 5 feet.

102 H. RUBIGINÒSA (Benth. lab. p. 108.) suffruticose; branches divaricate, clothed with rubiginose tomentum; leaves on short petioles, ovate-oblong, very blunt, serrately crenated, cuneated at the base; heads semiglobose, densely many-flowered, on short peduncles; outer bracteas broad-ovate, rather exceeding the head; calyx villous, with stiff teeth. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes, &c., in fields. Leaves 1½ inch long, pubescent above, and tomentose beneath, and rusty like the whole plant. Corolla white, spotted with purple.

Rusty Hyptis. Shrub 2 to 2½ feet.

103 H. LUTE'SCENS (Pohl, icon. ined. ex Benth. lab. p. 109.) herbaceous, procumbent?, clothed with rusty villi; leaves on short petioles, ovate, obtuse, serrately crenated, cuneated at the base, rather scabrous above, and clothed with rufous pubescence beneath; heads semiglobose, densely many-flowered, on short peduncles; bracteas ovate-lanceolate, rather exceeding the head; calyx nearly glabrous, with stiff teeth, which are equal in length to the tube. ♃.? S. Native of Brazil, in the provinces of Goyaz, Minas Geraes, and Bahia. Very nearly allied to *H. rubiginòsa*.

Var. β, hirsùta (Benth. lab. p. 712.) heads numerous, axillary, on short peduncles. ♃.? S. Native of Rio Grande.

Yellowish Hyptis. Pl. procumbent.

104 H. AFFI'NIS (Benth. lab. p. 109.) erect,? clothed with rufous tomentum; leaves on short petioles, ovate, bluntish, narrowed at the base, wrinkled; heads semiglobose, densely many-flowered: superior ones panicled; peduncles rather shorter than the heads; bracteas ovate, acute, about equal in length to the heads; calyx villous, with stiff teeth, which are glabrous at top. ♃.? S. Native of Peru. Ruiz. et Pav. and Tafalla. Allied to *H. rubiginòsa*.

Allied Hyptis. Pl. 2 to 3 feet.?

105 H. FERRUGINÒSA (Pohl, icon. ined. ex Benth. lab. p. 109.) plant ascending, clothed with dense rubiginose tomentum; leaves on short petioles, roundish, very blunt, crenated, truncate at the base or cordate, very thick, wrinkled, hispid above and tomentose beneath; heads semiglobose, densely many-flowered: lower ones pedunculate: upper ones nearly sessile; outer bracteas ovate, acute, shorter than the calyxes; calyx villous, with stiff erectish teeth. ♃.? S. Native of Brazil, in the province of Goyaz, at Rio Pillocas. Allied to *H. rubiginòsa*.

Ferruginous Hyptis. Pl.

106 H. LU'CIDA (Pohl, icon. ined. ex Benth. lab. p. 109.) shrubby, glabrous; leaves nearly sessile, oval, acutish, scarcely toothed, cuneately rounded at the base, coriaceous, stiff, shining above and veiny beneath: floral ones equal in length to the head; heads ovoid, at length semiglobose, densely many-flowered; bracteas lanceolate, stiff, equalling the heads; calyx villous, with stiff, nearly glabrous teeth. ♄. S. Native of Brazil, in the province of Goyaz, at Serra Chrystais.

Shining Hyptis. Shrub.

107 H. PROTEOI'DES (St. Hil. mss. ex Benth. lab. p. 110.) shrubby? erect, stiff; branches clothed with short rufous tomentum; leaves on very short petioles, broad-ovate, obtuse, crenated, roundly subcordate at the base, coriaceous, stiff, shining above, pubescent on the veins beneath; heads few, subcorymbose, pedunculate, semiglobose, densely many-flowered; bracteas lanceolate, and are, as well as the calycine teeth, stiff

and glabrous. ♄. S. Native of Brazil. Leaves 1 to 1½ inches long. Corolla very villous outside.

Protea-like Hyptis. Shrub.

108 H. CORDA'TA (Pohl, icon. ined. ex Benth. lab. p. 110.) herbaceous, clothed with rufous villi; leaves nearly sessile, ovate-roundish, very blunt, crenated, roundly subcordate at the base, wrinkled, scabrously hispid above, and clothed with rufous villi on the nerves beneath; heads pedunculate, semiglobose, densely many-flowered; bracteas lanceolate, quite entire, equalling the head; calyx nearly glabrous, with erectish stiff teeth. ♃.? S. Native of Brazil.

Cordate-leaved Hyptis. Pl.

109 H. REMÒTA (Pohl, icon. ined. ex Benth. lab. p. 110.) herbaceous, tall, clothed with short rufous villi; leaves on short petioles, broad-ovate, very blunt, crenated, roundly cuneated at the base, wrinkled, scabrous above, and clothed with rufous villi at the nerves beneath; heads pedunculate, semiglobose, densely many-flowered, somewhat proliferous; bracteas ovate, quite entire, acute, equalling the head; calyx villous at the base, with erectish, stiff, glabrous teeth. ♃. S. Native of Brazil, in the province of Minas Geraes, on Serra Santa Isabel, at Paracatu. Perhaps only a variety of *H. cordàta*.

Remote Hyptis. Pl.

110 H. VILLÒSA (Pohl, icon. ined. ex Benth. lab. p. 110.) herbaceous? densely clothed with rufous villi; leaves sessile, roundish, very blunt, crenated, roundedly cordate at the base, very thick, wrinkled, scabrously hispid above, but clothed with rufous villi beneath; heads semiglobose, densely many-flowered, pedunculate; outer bracteas broad-ovate, foliaceous, toothed, exceeding the calyx; calyx villous, with stiff, nearly glabrous teeth. ♃.? S. Native of Brazil, in the province of Goyaz.

Var. β, *reticulàta* (Pohl, l. c.) stem more humble, the leaves more reticulately wrinkled, and the heads larger. ♃.? S. Native of the province of Minas Geraes, at Padrocino.

Villous Hyptis. Pl. 2 feet.

111 H. ORBICULA'TA (Pohl, icon. ined. ex Benth. lab. p. 111.) herbaceous, clothed with rufous villi; leaves sessile, rounded, very blunt, roundly cordate at the base, wrinkled, scabrously hispid above, and pubescent beneath; heads sessile, nearly globose, densely many-flowered; bracteas ovate-lanceolate, quite entire, equalling the head; calyx nearly glabrous, with stiff erect teeth. ♃.? S. Native of Brazil, in the province of Minas Geraes, on the summits of the mountains called Chapada do Serra San Marcos.

Orbicular-leaved Hyptis. Pl.

112 H. NIGRE'SCENS (Pohl, icon. ined. ex Benth. lab. p. 111.) herbaceous, procumbent? blackish, pubescent; leaves sessile, ovate, obtuse, crenated, cordate at the base, scabrous on both surfaces, lacunosely wrinkled beneath, and pubescent on the nerves; heads few, on very short peduncles, semiglobose, densely many-flowered; outer bracteas ovate, obtuse, wrinkled, shorter than the head: inner ones lanceolate, obtuse, longer than the head; calyx villous, with stiff teeth. ♃. S. Native of Brazil, in the province of Goyaz, between Rio Corumba and Rio San Marcos.

Blackish Hyptis. Pl. procumbent.?

113 H. COMPLICA'TA (St. Hil. mss. ex Benth. lab. p. 111.) shrubby; branches clothed with long silky pili; leaves numerous, sessile, broad-roundish, obtuse, a little crenated, cordately stem-clasping at the base, complicate, stiff, rather scabrous above, and lacunosely veined beneath; heads few, nearly sessile, semiglobose, densely many-flowered; bracteas lanceolate, acute, equalling the head; calyx pilose at the base, with stiff teeth, which are at length somewhat recurvedly spreading. ♄. S. Native of Brazil, in the province of Minas Geraes, in fields near Sabara. Habit of *H. rotundifòlia*, but very different in the form of the leaves, &c.

Complicate-leaved Hyptis. Shrub.

114 H. ROTUNDIFÒLIA (Benth. lab. p. 111.) stem shrubby, clothed with villous tomentum; leaves petiolate, ovate-roundish, crenated, rounded at the base, much wrinkled, stiff, scabrous, rather villous on both surfaces; heads semiglobose, densely many-flowered, pedunculate: upper ones fastigiate; bracteas linear, longer than the calyxes; calyx very villous at the base, with stiff teeth, which are at length somewhat recurvedly spreading. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes, &c. Shrub much branched, densely leafy. Leaves generally 3-4 in a whorl. Corolla hardly longer than the calyx.

Round-leaved Hyptis. Shrub 1 to 2½ feet.

115 H. MONTI'COLA (Mart. mss. ex Benth. lab. p. 111.) shrubby; branches clothed with rubiginose villi; leaves small, petiolate, ovate, obtuse, crenated, cuneated at the base, coriaceous, rather scabrous above, and reticulated and clothed with rufous pubescence beneath; peduncles about equal in length to the leaves, stiff; heads semiglobose, densely many-flowered; bracteas lanceolate, stiff, equalling the head; calyx tubular, villous at the base, with short stiff teeth. ♄. S. Native of Brazil, in the provinces of Rio Janeiro, Minas Geraes, and Goyaz, in sandy places. Shrub much branched. Corolla pale red, downy. Calycine teeth at length somewhat recurved.

Mountain Hyptis. Shrub 5 to 6 feet.

116 H. TRICE'PHALA (St. Hil. mss. ex Benth. lab. p. 112.) suffruticose; branches twiggy, villous; leaves petiolate, ovate-elliptic, obtuse, crenated, cuneately-rounded at the base, coriaceous, scabrous above, and clothed with rufous pubescence beneath; peduncles equal in length to the leaves; heads semiglobose, densely many-flowered; bracteas lanceolate, stiff, equalling the head; calyx tubular, villous, with stiff glabrous teeth. ♄. S. Native of Brazil, on Serra da Caraca, in the province of Minas Geraes. Allied to *H. monticola*; but the stems are elongated and less branched; the leaves larger and longer, and the calycine teeth shorter.

Three-headed Hyptis. Shrub 2 to 3 feet.

117 H. CONFE'RTA (Pohl, icon. ined. ex Benth. lab. p. 112.) erect, tall, clothed with rubiginose tomentum; leaves petiolate, ovate-elliptic, obtuse, crenated, cuneated at the base, wrinkled, scabrous above, but clothed with rubiginose tomentum beneath; heads pedunculate, large, semiglobose, densely many-flowered; bracteas ovate, quite entire, foliaceous, villous, exceeding the head; calyx villous, with stiff, rather spreading teeth. ♄.? S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Leaves 3-4 inches long. Corolla very villous, white, tipped with rose-colour.

Crowded-flowered Hyptis. Shrub 4 to 6 feet.

118 H. ALUTA'CEA (Pohl, icon. ined. ex Benth. lab. p. 112.) herbaceous, erect or ascending, humble, villous; leaves nearly sessile, oval, obtuse, crenated, cuneated at the base, wrinkled, scabrously hispid above, villous beneath; heads on long peduncles, large, hemispherical, densely many-flowered; bracteas exceeding the head, lanceolate: outer ones broader, villous; calyx villous, with stiff erect teeth. ♃.? S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Habit of *Péltodon hùmilis*. Leaves 2 inches long. Corolla pale red.

Tanned Hyptis. Pl. ½ foot.

119 H. FERRUGI'NEA (Benth. lab. p. 113.) erect, clothed with rufous tomentum; leaves nearly sessile, oblong, serrate-crenated, cuneated at the base, wrinkled; heads globose, densely many-flowered, rather panicled; peduncles longer than the heads; bracteas ovate, acute, equalling the heads; calycine teeth stiff. ♃.? S. Native of New Spain, Moçino et Sesse.

Stem bluntly tetragonal. Leaves 2-3 inches long. Bracteas densely villous.

Rusty Hyptis. Pl.

120 H. xanthioce'phala (Mart. mss. ex Benth. lab. p. 113.) herbaceous, ? erect, or ascending, quite glabrous; leaves on short petioles, ovate, serrated, roundly cuneated at the base, coriaceous, quite glabrous on both surfaces, shining above; peduncles stiff, compressed, longer than the leaves; heads semi-globose, densely many-flowered; bracteas ovate-lanceolate, stiff, outer ones cuneated, a little serrated; calyx woolly at base, with stiff, glabrous teeth. ♃. ? S. Native of Brazil, in fields in the province of Minas Geraes, in the Diamond district. Heads size of those of *H. conférta* and *H. ferrugínea*.

Yellow-headed Hyptis. Pl.

121 H. anómala (Benth. lab. p. 113.) branches clothed with tomentose pubescence; leaves petiolate, ovate, obtuse, crenated, rounded at the base, or cuneated, wrinkled, tomentose beneath; heads semi-globose, densely many-flowered, on short peduncles, somewhat panicled at the tops of the branches; bracteas ovate, acute, about equal in length to the calyxes; calycine teeth stiffly and subulately awned. ♃. ? S. Native of the South of Brazil, Sello. Stems many feet high, bluntly tetragonal. Leaves 1½ inch long. Bracteas tomentose. Calyx villous. Genitals a little exserted.

Anomalous Hyptis. Pl. tall.

122 H. cæspitòsa (St. Hil. mss. ex Benth. lab. p. 113.) stems numerous, erect, beset with rufous hairs; leaves sessile, ovate, bluntish, coarsely and unequally serrated, rounded at the base, or narrowed, rather coriaceous, nerved, nearly glabrous; heads semi-globose, densely many-flowered, on long peduncles; bracteas lanceolate, exceeding the head; calyx villous: teeth ovate at the base, and stiffly and subulately awned at apex. ♃. ? S. Native of Brazil, in the province of St. Paul, and in the South, among bushes, and in fields. Stem nearly simple, tetragonal. Leaves 1 inch long. Corolla pale red, rather shorter than the calycine teeth.

Tufted Hyptis. Pl. 1 foot.

Sect. XII. Polyde'smia (from πολυς, *polys*, many; and δεσμη, *desme*, a bundle; in reference to the many heads of flowers.) Benth. lab. p. 114. Heads of flowers nearly sessile, rarely on long peduncles, numerous, disposed in paniculately branched racemes, rarely in simple racemes, dense, sometimes many-flowered and depressed, or irregularly sub-globose, and sometimes ovoid and few-flowered. Bracteas numerous, adpressed, ovate, lanceolate, rarely linear. Fructiferous calyx sometimes increased into a cylindrical tube, which is truncate at apex, with setaceous, strict, rarely obsolete teeth, sometimes (in some of the species with ovoid heads) tubularly campanulate, with lanceolate, acute teeth. Tube of corolla generally exserted.—Herbs or undershrubs, usually many-flowered.

123 H. vestìta (Benth. lab. p. 114.) stem shrubby; branches clothed with floccose tomentum; leaves petiolate, roundish, obtuse, or hardly acuminated, erosely crenated, truncately cordate at the base, very much wrinkled, villous on both surfaces; heads sessile; whorls approximate, racemose; racemes panicled; bracteas ovate, or lanceolate, obtuse, equalling the calyxes; fructiferous calyx tubularly inflated, glabrous, with a truncate mouth, and obsolete teeth: throat naked inside. ♄. S. Native of Brazil, in woods in the provinces of Minas Geraes and St. Paul, &c. Shrub many feet high. Branches bluntly tetragonal. Corolla blue, glabrous. Genitals exserted. In Brazil the plant is called *Erva de Santa Anna*, *Ervo do Pape*, and *Berbena*, where it is used as a vulnerary.

Clothed Hyptis. Shrub tall.

124 H. duplica'to-denta'ta (Pohl, icon. ined. ex Benth. lab. p. 114.) shrubby; branches rather tomentose; leaves petiolate, ovate, bluntish, erosely crenated, rounded or cuneated at the base, scabrous above, and clothed with hoary tomentum beneath; heads sessile; whorls approximate, fasciculately racemose; racemes panicled; bracteas lanceolate, obtuse, thick, tomentose, exceeding the calyxes a little; fructiferous calyx tubularly inflated, villous, with a truncate mouth, and short, unequal, or obsolete teeth. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Goyaz, in open parts of woods.

Var. β, *viréscens* (Pohl, l. c.) ♄. S. Native of Minas Geraes, at Manuel Pareira.

Doubly-toothed-leaved Hyptis. Shrub.

125 H. althææfòlia (Pohl, icon. ined. ex Benth. lab. p. 115.) shrubby; branches clothed with floccose tomentum; leaves petiolate, broad-ovate, bluntish, erosely crenated, truncately cordate at the base, wrinkled, tomentose on both surfaces; heads sessile; whorls approximate, fasciculately racemose; racemes panicled; bracteas lanceolate, thick, tomentose, exceeding the calyxes; fructiferous calyx tubularly inflated, glabrous, with an obsoletely or irregularly toothed mouth: throat naked inside. ♄. S. Native of Brazil, in the province of Minas Geraes, in humid places. Allied to the two preceding.

Althæa-leaved Hyptis. Shrub.

126 H. barba'ta (Schranck, in densk. bot. gesell. regensb. 2. p. 52. Benth. lab. p. 115.) stem shrubby; branches tomentose; leaves petiolate, broad-ovate, acuminated, deeply toothed, truncate at the base, thick, wrinkled, clothed with soft villi; heads sessile; whorls loose, approximate, somewhat racemose; racemes panicled; bracteas ovate, acute, equalling the calyxes; calyx tomentose, campanulate, with a truncate mouth, and strict, subulate teeth, which are equal in length to the tube. ♄. S. Native of Brazil. Habit of *H. vestìta*, but the tomentum is softer, and lower surfaces of the leaves rather silky.

Bearded Hyptis. Shrub.

127 H. obvalla'ta (Spreng. ex Benth. lab. p. 115.) stem shrubby; branches tomentose; leaves on short petioles, ovate, acutish, erosely crenated, truncately cordate at the base, thick, much wrinkled, tomentose on both surfaces; heads sessile; whorls distinct, fasciculately racemose; racemes panicled; bracteas numerous, ovate-lanceolate, acute, 2-3 times longer than the calyxes; calyx villous, with a truncate mouth, and subulate, strict teeth, which are about equal in length to the tube. ♄. S. Native of Brazil, in the province of Goyaz, and in the South. Allied to *H. vestìta* and *H. barbàta*. Corolla pubescent.

Environed Hyptis. Shrub.

128 H. carpinifòlia (Benth. lab. p. 115.) stem shrubby; branches clothed with rufous villi; leaves sessile, ovate-roundish, obtuse, or acuminated, toothed, cordate at the base, coriaceous, nearly glabrous above, rugosely veined beneath, tomentose, at length glabrous; heads sessile; whorls approximate, distinct, fasciculately racemose; racemes panicled; bracteas ovate-lanceolate, acuminated, exceeding the calyxes; fructiferous calyx tubular, glabrous, with a truncate, ciliated mouth, and subulate, strict teeth, which are about equal in length to the tube. ♄. S. Native of Brazil, in the provinces of Goyaz, Minas Geraes, &c.; and of Peru, in dry fields and hills. Corolla blue, downy outside. Branches bluntly tetragonal. Odour very aromatic.

Hornbeam-leaved Hyptis. Shrub 3 to 5 feet.

129 H. aqua'tica (Pohl, icon. ined. ex Benth. lab. p. 116.) shrubby; branches beset with spreading hairs; leaves nearly sessile, ovate-oblong, bluntish, toothed, cordate at the base, coriaceous, nearly glabrous above, rugosely veined beneath, and tomentose, but at length glabrous; heads sessile; whorls approximate, distinct, fasciculately racemose; racemes somewhat panicled; bracteas ovate-lanceolate, subulately acuminated, ex-

ceeding the calyxes; fructiferous calyx tubular, with a truncate ciliated mouth, and subulate, unequal, strict teeth. ♄. S. Native of Brazil, in the province of Minas Geraes, at Rio da Prata. Nearly allied to the preceding.

Water Hyptis. Shrub 3 to 4 feet.?

130 H. A'RIDA (St. Hil. mss. ex Benth. lab. p. 116.) branches erect, twiggy, beset with spreading pili; leaves sessile, ovate-lanceolate, acute, serrated, roundedly cordate at the base, glabrous, scabrous above; floral leaves broad-heart shaped; heads sessile; whorls equal, interruptedly racemose; racemes simple, or a little panicled; bracteas ovate, bluntish, coloured, about equal in height to the calyxes; calyx tubular, with linear, unequal teeth, which are shorter than the tube. ♄. S. Native of Brazil, in dried up marshes in the southern deserts of the province of Minas Geraes. Corollas pale purple.

Arid Hyptis. Shrub 2 to 3 feet.

131 H. VIOLA'CEA (Pohl, icon. ined. ex Benth. lab. p. 116.) branches erect, twiggy, villous at apex, at length glabrous; leaves nearly sessile, ovate-lanceolate, or ovate, acute, doubly serrated, rounded at the base: or the lower ones are cordate, very scabrous on both surfaces, green, coriaceous; heads nearly sessile; whorls secund, interruptedly racemose; racemes short, simple, or a little panicled; bracteas ovate, acutish, membranous, coloured, exceeding the calyxes a little; calyx tubular, nearly glabrous, with subulate teeth. ♄.? S. Native of Brazil, in the province of Goyaz, at Trahiras.

Violaceous-flowered Hyptis. Shrub.

132 H. GLOMERA'TA (Mart. ex Schranck, in syll. pl. bot. ratisb. 2. p. 55.) branches clothed with fine pubescence; leaves on short petioles, or sessile, ovate-oblong, or lanceolate, acutish, serrated, rounded at the base, pubescent on both surfaces; heads nearly sessile, ovoid-globose, few-flowered; whorls interruptedly racemose; raceme elongated, a little panicled; bracteas ovate, acute, twice as long as the calyxes; calyx tubular, nearly glabrous, with lanceolate, acute teeth, which are about 3 times shorter than the tube. ♄. S. Native of Brazil, in the provinces of Minas Geraes, and Goyaz, and the South, in humid places. Stem herbaceous,? bluntly tetragonal, usually purplish. Corolla hardly exceeding the calyx, pubescent outside.

Glomerate-flowered Hyptis. Pl.?

133 H. PAUCIFLÒRA (Pohl, icon. ined. ex Benth. lab. p. 117.) herbaceous, pubescent; leaves petiolate, ovate, bluntish, serrated, rounded at the base, or cordate, clothed with soft hairs above, and nearly glabrous beneath, and somewhat canescent; heads ovate-globose, few-flowered, pedunculate, racemose; raceme elongated, loose; bracteas broad-ovate, membranous, a little coloured, longer than the calyxes; calyx tubular, membranous, nearly glabrous, with lanceolate, acute teeth, which are shorter than the tube. ♃. S. Native of Brazil, in the province of Goyaz. Leaves like those of *H. pectinàta*, and the heads like those of *H. glomeràta*, but smaller, few-flowered, and pedunculate.

Few-flowered Hyptis. Pl.

134 H. FOLIÒSA (St. Hil. mss. ex Benth. lab. p. 117.) shrubby;? branches ascending, clothed with rufous villi; leaves on short petioles, broad-ovate, obtuse, crenated, rounded at the base, or cordate, green on both surfaces, and clothed with viscid pubescence, or villous; racemes sub-secund, leafy, somewhat panicled; bracteas ovate-lanceolate, exceeding the calyxes; calyx tubular, with lanceolate, erect, acute teeth. ♄.? S. Native of Brazil. Leaves 1-2 inches long.

Leafy Hyptis. Shrub 1 to 2 feet.

135 H. PETRÆ'A (St. Hil. mss. ex Benth. lab. p. 117.) shrubby; branches erect, tomentose; leaves petiolate, ovate, obtuse, crenated, cuneated at the base, wrinkled, clothed with soft, rufous tomentum on both surfaces; heads ovoid, few-flowered, on short peduncles, crowded into a short, dense raceme; bracteas ovate-lanceolate, acute, coloured, exceeding the calyxes; calyx tubular, nearly glabrous, with lanceolate, acute, erect teeth. ♄. S. Native of Brazil, in the province of Minas Geraes, in the western desert, among rocks near Taioba. Shrub slender, naked at the base. Bracteas and calyxes reddish, glandular. Racemes sub-secund.

Rock Hyptis. Shrub.

136 H. SUBROTU'NDA (Pohl, icon. ined. ex Benth. lab. p. 118.) shrubby; branches erect, twiggy, clothed with fine pubescence; leaves small, sessile, oval-rounded, obtuse, crenated, broadly rounded at the base, obtuse, stiff, coriaceous, veiny, green on both surfaces, rather scabrous: floral ones similar; heads ovoid, few-flowered, racemose; racemes nearly simple; bracteas coloured, lanceolate, acutish, ciliated, exceeding the calyxes; fructiferous calyx tubular, with a truncate, ciliated, hardly toothed mouth. ♄. S. Native of Brazil, in the province of Goyaz, at Pontefeite.

Roundish-leaved Hyptis. Shrub.

137 H. LYTHROÌDES (Pohl, icon. ined. ex Benth. lab. p. 118.) shrubby; branches erect, twiggy, pubescent; leaves small, sessile, oval, obtuse, rounded at the base, rather scabrous on both surfaces, and clothed with rufous pubescence; heads ovoid, few-flowered, racemose; raceme elongated, simple; bracteas lanceolate, acute, coloured, pubescent, longer than the calyx; calyx tubularly campanulate, with a truncate mouth, and subulate teeth, ? which are about equal in length to the tube. ♄. S. Native of Brazil, in the province of Goyaz, at Fazenda Agua Fria. Differs from *H. subrotúnda* in the calyx.

Lythrum-like Hyptis. Shrub.

138 H. PARVIFÒLIA (Pohl, icon. ined. ex Benth. lab. p. 118.) shrubby; branches erect, twiggy, finely pubescent; leaves small, petiolate, oval, toothed at top, narrowed at the base, quite entire, stiff, coriaceous, veiny, green on both surfaces, rather scabrous: floral ones similar; heads ovoid, few-flowered, racemose; raceme nearly simple; bracteas lanceolate-linear, coloured, clothed with adpressed villi, longer than the calyxes; fructiferous calyx tubular, with a truncate, ciliated, hardly toothed mouth. ♄. S. Native of Brazil, in the province of Goyaz. Nearly allied to *H. subrotúnda*.

Small-leaved Hyptis. Shrub.

139 H. RUBICU'NDA (Pohl, icon. ined. ex Benth. lab. p. 118.) branches nearly glabrous, with scabrous angles; leaves petiolate, broad-ovate, shortly acuminated, doubly serrated, cuneately rounded at the base, scabrous above, and tomentose beneath, and more particularly on the nerves; heads ovoid, few-flowered, on short peduncles, paniculately racemose; bracteas lanceolate, coloured, twice as long as the calyxes; calyx tubular, with a truncate mouth, and setaceous, strict teeth, which are about equal in length to the tube. ♄. S. Native of Brazil, in several places of the province of Minas Geraes. The whole plant generally purplish. Leaves 1½ to 2 inches long.

Reddish Hyptis. Pl. 1½ to 2½ feet.

140 H. MURICA'TA (Schott, mss. ex Benth. lab. p. 119.) herbaceous;? stem nearly glabrous, with scabrous angles; leaves petiolate, broad-ovate, acuminated, doubly serrated, cuneately rounded at the base, rather scabrous above, and nearly glabrous beneath; heads depressed, nearly globose, few-flowered, almost sessile; whorls secund: upper ones approximate: lower ones remote; bracteas broad-ovate, acute, villous, exceeding the calyxes; fructiferous calyx tubular, pubescent, with a truncate mouth, and strict, setaceous teeth, which are shorter than the

tube. ♃.? S. Native of Brazil, at Rio Janeiro, and at Rio Abaite, in the province of Minas Geraes. Plant many feet high. Bracteas often coloured.

Muricated Hyptis. Pl. tall.

141 H. INODÒRA (Schranck, in syll. pl. soc. ratisb. 2. p. 56. Benth. lab. p. 119.) herbaceous; stem erect, glabrous, or bifariously pubescent, with smooth angles; leaves petiolate, broad-ovate, acutish, unequally serrated, broadly cuneated, or rounded at the base, thin, glabrous on both surfaces, pale beneath; heads depressed, nearly globose, few-flowered, almost sessile; whorls rather secund: upper ones approximate: lower ones remote; bracteas ovate-lanceolate, pubescent, equalling the calyx; fructiferous calyx tubular, pubescent, with a truncate mouth, and setaceous, strict teeth, which are much shorter than the tube. ♃. S. Native of Brazil, in humid places. Plant many feet high, pale green. Heads 6-10-flowered. Corollas white. Allied to *H. muricàta*, and probably only a variety of it.

Scentless Hyptis. Pl. tall.

142 H. SYLVULA'RUM (St. Hil. mss. ex Benth. lab. p. 119.) branches clothed with tomentose pubescence; leaves petiolate, broad-ovate, acute, doubly serrated, or cut, rounded at the base, green on both surfaces, wrinkled, villous, or clothed with tomentose pubescence; heads ovoid, few-flowered, nearly sessile, racemose; racemes panicled; bracteas ovate, or lanceolate, villous, exceeding the calyxes a little; calyx tubular, pubescent, with a truncate mouth, and setaceous, strict teeth, which are shorter than the tube. ♃. S. Native of Brazil, in the province of Minas Geraes, in cut down woods. Allied to *H. canéscens*, but greener. Bracteas green, or coloured at top.

Small-wood Hyptis. Pl. 2 to 3 feet.

143 H. POLYSTA'CHYA (H. B. et Kunth, nov. gen. amer. 2. p. 321.) branches pilosely pubescent, with rough angles; leaves petiolate, ovate, acute, doubly serrated, or cut, rounded at the base, rather pubescent above, and clothed with hoary tomentum beneath; heads ovoid, few-flowered, nearly sessile, secund; whorls racemose; racemes loosely panicled; bracteas ovate, acute, exceeding the floriferous calyxes, but shorter than the fructiferous calyxes; calyx pubescent, with setaceous, strict teeth, which are shorter than the tube. ♃. S. Native of Mexico, Trinidad, &c. Branches tetragonal. Corolla twice as long as the calyx.

Var. β, longiflòra (Benth. lab. p. 120.) calyxes at length twice as long as the bracteas. ♃. S.

Many-spiked Hyptis. Pl. 2 to 3 feet.?

144 H. CANE'SCENS (H. B. et Kunth, nov. gen. amer. 2. p. 321.) branches clothed with tomentose pubescence; leaves petiolate, rhomboid-ovate, acute, doubly serrated, or cut, rounded at the base, narrowed into the petioles, clothed with hoary tomentum beneath, or on both surfaces; heads ovoid, few-flowered, nearly sessile, rather secund, racemose; racemes panicled; bracteas ovate, acute, equalling the floriferous calyxes, but shorter than the fructiferous calyxes; calyx villous, elongated after florescence, with a truncate mouth, and strict, setaceous teeth, which are much shorter than the tube. ♃.? S. Native of New Spain, and Caraccas. Teùcrium rhombifòlium, Willd. Nearly allied to *H. polystàchya*. Angles of stem hardly rough. Corolla glabrous.

Var. β, arvénsis (Benth. lab. p. 712.) leaves hardly canescent. ♃.? S. Native of Peru, at Pariahuanca, Mathews. H. arvénsis, Poppig, pl. chil. exsic.

Canescent Hyptis. Pl. 1½ foot.

145 H. MICRA'NTHA (Pohl, icon. ined. ex Benth. lab. p. 120.) branches clothed with short pubescence, with smooth angles; leaves petiolate, ovate, acute, irregularly serrate-crenated, rounded and rather unequal at the base, pubescent above, pale, or clothed with hoary tomentum beneath; heads small, few-flowered, racemose; peduncles equalling the heads; racemes strict, elongated, panicled; bracteas ovate-lanceolate, acuminated, somewhat exceeding the calyxes; calyx pubescent, with a truncate mouth, and strict, setaceous teeth, which are rather shorter than the tube. ♃.? S. Native of Brazil, in the province of Goyaz, at Villa Boa. Allied to *H. polystàchya*, but more green, and less tomentose, and the heads much smaller.

Small-flowered Hyptis. Pl.

146 H. SPICA'TA (Poit. ann. mus. 7. p. 474. t. 28. f. 2.) branches nearly glabrous, with scabrous, prickly edges; leaves petiolate, ovate, acute, unequally serrate-crenated, roundedly cuneated at the base, nearly glabrous on both surfaces, or pubescent above; heads semi-ovoid, loosely racemose; peduncles equal in length to the fructiferous heads; racemes panicled; bracteas ovate, rather membranous, one-half shorter than the fructiferous calyx; calyx glabrous, elongated in the fructiferous state, inflated at the base, with a truncate mouth, and strict, setaceous teeth, which are shorter than the tube. ♂. S. Native of Tropical America, on the east coast, from Mexico to the provinces of Minas Geraes, and Cisplatin in Brazil; also of St. Domingo, Martinica, Mariane Island, &c. Népeta mutàbilis, Rich. in act. soc. hist. nat. par. Leaves 1-2 inches long. Corollas small, violaceous.

Spicate-flowered Hyptis. Fl. July, Aug. Clt. 1820. Pl. 4 to 6 feet.

147 H. ROSTRA'TA (Salzm. pl. bras. exs. ex Benth. lab. p. 121.) branches glabrous, with rough, prickly angles; leaves petiolate, ovate, acute, unequally serrate-crenated, roundly cuneated at the base, glabrous; heads globose at the base, loosely racemose; peduncles rather shorter than the fructiferous heads; bracteas ovate, membranous, glabrous, 3-4 times shorter than the fructiferous calyxes; fructiferous calyx glabrous, inflated at the base, long-beaked, with a truncate mouth, and short, setaceous, strict teeth. ♂. S. Native of Brazil, in shady places near Bahia. Stems branched. Whorls distant, secund.

Beaked-calyxed Hyptis. Pl. 4 to 5 feet.

148 H. TENUIFLÒRA (Benth. lab. p. 121.) branches bifariously pubescent, with smooth angles; leaves petiolate, ovate, acute, unequally serrated, roundly cuneated at the base, glabrous; heads ovoid, few-flowered, loosely racemose; peduncles twice as long as the fructiferous heads; racemes panicled; bracteas ovate, membranous, one-half shorter than the fructiferous calyxes; fructiferous calyx glabrous, elongated, inflated at the base, with a truncate mouth, and strict, setaceous teeth, which are much shorter than the tube. ♂.? S. Native of Brazil, Leandro di Sacramento. Allied to *H. spicàta*.

Thin-flowered Hyptis. Pl. 3 to 4 feet.?

149 H. EXPA'NSA (Pohl, icon. ined. ex Benth. lab. p. 122.) nearly glabrous; angles of branches roughish; leaves petiolate, ovate, acuminated, unequally serrated, cuneated at the base, rather hispid above and on the nerves beneath; heads ovoid, few-flowered, loosely racemose; peduncles shorter than the fructiferous heads; racemes divaricately panicled; bracteas ovate, acute, membranous, ciliated; fructiferous calyxes nearly glabrous, scarcely longer than the bracteas, with a truncate mouth, and strict, setaceous teeth, which are one-half shorter than the tube. ♃.? S. Native of Brazil. Allied to *H. spicàta*, but differs in the shorter calyxes, and longer teeth, &c.

Expanded Hyptis. Pl.?

150 H. DU'BIA (Pohl, icon. ined. ex Benth. lab. p. 122.) pubescent; angles of branches smooth; leaves on short petioles, ovate, acute, doubly crenated, cuneated at the base, scabrously hispid above, and pubescent on the veins beneath, wrinkled; heads ovoid, few-flowered, racemose; peduncles very short; racemes a little branched; bracteas lanceolate, acuminated,

longer than the fructiferous calyxes, pubescent, ciliated; calycine teeth setaceous, strict, one-half longer than the tube. ♃.? S. Native of Brazil, in the province of Minas Geraes, at Rio Abaite. Allied to *H. expánsa*, but is less branched, and more villous, and the bracteas are narrower and longer.

Doubtful Hyptis. Pl.?

Sect. XIII. Mesophæ'ria (from *μεσος*, *mesos*, the middle; and *σφαιρα*, *sphaira*, a globe; in reference to the heads of flowers being semi-globose.) Benth. lab. p. 122. Heads rather loose, few-flowered. Bracteas sometimes minute, or scarcely any, sometimes subulate, about equal in length to the calyxes. Calyxes nearly sessile in the heads, obliquely campanulate in the fructiferous state, with a truncate mouth, and subulate, strict teeth; the throat closed inside by hairs, or more or less ciliated, with 5 fascicles of hairs, which are disposed between the teeth. Tube of corolla inclosed, or a little exserted.—Herbs, rarely shrubs, for the most part pilose. Heads pedunculate: lower ones rarely all from the axils of the leaves: cauline ones conforming, solitary, or in fascicles: the superior ones usually disposed into a loose panicle.

151 H. plectranthoìdes (Benth. lab. p. 122.) stem herbaceous, erect, clothed with long hairs, with smooth angles; leaves on very short petioles, broad-ovate, or roundish, obtuse, crenately serrated, rounded at the base, or subcordate, pilose; heads few-flowered, loosely racemose, pedunculate; racemes loose, panicled; bracteas lanceolate, acute, shorter than the calyxes, villous: teeth equalling the tube. ♃.? S. Native of the South of Brazil, Sello. Stem generally purplish. Leaves an inch long. Corolla twice as long as the calyx. Stamens exserted.

Plectranthus-like Hyptis. Pl.

152 H. pu'mila (Pohl, icon. ined. ex Benth. lab. p. 122.) herbaceous, humble, erect; stem beset with spreading pili; leaves on very short petioles, broad-ovate, roundish, serrately crenated, rounded, or subcordate at the base, green, pilose; heads loosely few-flowered, pedunculate, racemose; bracteas loose, subulate, shorter than the calyxes; fructiferous calyx sessile: throat villous inside. ♃.? S. Native of Brazil, in the province of Goyaz, on Serra de Chrystais. Very nearly allied to *H. commùnis*, but smaller, and more pilose, and the leaves are broader.

Dwarf Hyptis. Pl. ½ foot.

153 H. commu'nis (St. Hil. mss. ex Benth. lab. p. 123.) herbaceous, humble, glabrous, or more or less villous; leaves on short petioles, rounded, ovate, or oblong, crenated, cuneated, or narrowed at the base; heads loosely few-flowered, pedunculate, racemose; bracteas loosely subulate; calyxes sessile, villous: throat woolly inside. ♃. S. Native of Brazil, in the province of Minas Geraes, in elevated fields, and among rubbish on the mountains. H. flabellàta, Pohl, icon. ined. Stems often rooting at the base. Corolla blue, nearly glabrous outside.

Common Hyptis. Pl. ½ to 1 foot.

154 H. fruticòsa (Salzm. pl. bras. exsic. ex Benth. lab. p. 123.) branches divaricate, tomentose while young; leaves on short petioles, ovate, obtuse, crenated, cuneated at the base, much wrinkled, pale beneath; peduncles solitary, axillary, longer than the leaves; heads loosely few-flowered, nearly globose; bracteas loose, subulate; fructiferous calyx rather gibbous above the base, with an oblique, villous mouth, and spreading teeth. ♄. S. Native of Brazil, in the provinces of Bahia, Minas Geraes, in fields and woods. Corolla blue, scarcely pubescent, equalling the calycine teeth. Genitals inclosed.

Shrubby Hyptis. Shrub 4 to 6 feet.

155 H. melissoìdes (H. B. et Kunth, nov. gen. amer. 2. p. 320.) suffruticose; branches clothed with rufous villi; leaves on short petioles, ovate, acute, serrately crenated, rounded at the base, villous above, and densely clothed with hoary tomentum beneath; peduncles very short, axillary, usually twin; heads many-flowered, rather loose, secund; bracteas minute, setaceous; calyx pubescent, ovate, strict in the ripe state: throat villous inside: teeth short, setaceous, villous. ♄. S. Native of Tropical America, in bushy places in New Granada, on the banks of the river Juanambu. Shrub much branched, aromatic. Corolla white, downy.

Melissa-like Hyptis. Shrub 4 to 6 feet.

156 H. pilòsa (Benth. lab. p. 124.) branches rather pilose; leaves petiolate, ovate, acute, serrulated, cordate at the base, rather canescent; peduncles rather longer than the leaves; heads 6-10-flowered, nearly globose; bracteas minute, setaceous; fructiferous calyx much increased, ovate-tubular, equal, truncate, very hairy: teeth shorter than the breadth of the calyx. ♄. S. Native of Peru, Pavon. Leaves an inch long.

Pilose Hyptis. Shrub.

157 H. suave'olens (Poit. ann. mus. par. 7. p. 472. t. 29. f. 2.) stem herbaceous, erect, pilose; leaves petiolate, broad-ovate, sinuately serrated: lower ones cordate at the base: upper ones rounded, or cuneated, pubescent, villous, or tomentose; peduncles rather shorter than the few-flowered heads, solitary, or 2-3-together in the axils, racemose; racemes panicled; bracteas minute, setaceous; mouth of calyx truncate, villous. ⊙. S. Native of Tropical America, from Mexico to Rio Janeiro, Peru; also of several of the West India Islands; Philippines, Manilla, Moluccas, about Madras, Java, &c. Ballòta suavèolens, Lin. spec. 815. Jacq. hort. vind. 3. p. 24. t. 42. Bystropògon suavèolens, Lher. sert. angl. 19. Hyptis Plumièri, Poit. ann. mus. 7. p. 473. H. ebracteàta, R. Br. in Ait. hort. kew. ed. 2. vol. 3. p. 391. Bystropògon gravèolens, Blum. bijdr. p. 824.?—Plum. icon. t. 163. f. 1.—Browne, jam. 257. t. 18 f. 3.—Sloan. hist. 1. p. 171. t. 102. f. 2. Herb annual, branched. Leaves 1-2 inches long. Corollas blue.

Sweet-scented Hyptis. Fl. July, Aug. Clt. 1800. Pl. 2 to 6 feet.

158 H. grave'olens (Salzm. pl. bras. exsic. ex Benth. lab. p. 125.) stem herbaceous, erect, rather pilose, with smooth angles; leaves petiolate, ovate, acute, sinuately serrated, cordate at the base, wrinkled, clothed with clammy pubescence on both surfaces; peduncles axillary, many times longer than the few-flowered fascicles: superior ones irregularly panicled; bracteas minute. ⊙. S. Native of Brazil, on the sea-shore near Bahia. Nearly allied to *H. suavèolens*. Odour heavy and aromatic.

Heavy-scented Hyptis. Pl. 4 to 6 feet.

159 H. umbròsa (Salzm. pl. bras. exsic. ex Benth. lab. p. 125.) stem herbaceous, erect, villous, with scabrous angles, and nearly naked axils; leaves petiolate, broad-ovate, acute, irregularly serrated, or deeply lobed, rounded at the base, rather pilose above, pale and pubescent beneath, or at length glabrous; peduncles axillary, filiform, sub-fasciculate, much longer than the loose, 3-10-flowered heads; bracteas minute, setaceous; calyx pubescent: mouth villous. ⊙. S. Native of Brazil, in woods near Bahia; also very common in the provinces of Rio Janeiro, Minas Geraes, Goyaz, and St. Paul, in shady places; and of Peru, at Huanuco and Tarma, Mathews. H. gravèolens, Schranck, in syll. pl. ratisb. 2. p. 56.? Nearly allied to *H. víscida*, but the hairs are less clammy. Corollas bluish lilac.

Shaded Hyptis. Pl.

160 H. polya'ntha (Poit. ann. mus. 7. p. 470.) stem herbaceous, erect, pubescently villous; the axils very pilose; leaves petiolate, ovate, acutish, irregularly crenate-serrated, rounded,

or cordate at the base, scabrous from pili above, and clothed with white tomentum beneath; panicle ample; peduncles filiform, much longer than the loosely 5-20-flowered heads; bracteas minute, setaceous; calyx pubescent, with a villous mouth. ⊙.? S. Native of Peru, near Quito, Loxa, and Gonzanama. Bystropògon sidæfòlium, Lher. sert. angl. 19.? Herb sweet-scented. Leaves 1½ to 2 inches long. Corollas minute, pubescent, violaceous.

Many-flowered Hyptis. Fl. July, Aug. Clt. 1819. Pl. 4 to 6 feet.

161 H. LILA'CINA (Schiede, et Deppe, in Linnæa, 5. p. 101.) clothed with soft pubescence; leaves petiolate, ovate, or elliptic, acute, doubly serrated, cuneated at the base, or narrowed, pubescent above, canescently tomentose beneath; heads loosely few-flowered, axillary, opposite, pedunculate, small; bracteas loose, setaceous, scarcely shorter than the calyx; calyx villous, ovate, with spreading, subulately acuminated teeth. ⊙.? S. Native of Mexico, about Jalapa, &c., among bushes. Nearly allied to the preceding, but differs in the leaves and calyx, &c. Corolla lilac, puberulous.

Lilac-flowered Hyptis. Pl. 2 to 3 feet.

162 H. URTICOÌDES (H. B. et Kunth, nov. gen. amer. 2. p. 320.) stem herbaceous, erect, downy, with rather rough angles; leaves petiolate, ovate, acute, serrated, cuneated at the base, rather hispid above, and pubescent beneath; heads loosely few-flowered, on long peduncles, disposed in secund, panicled racemes; bracteas minute, setaceous; calyx pubescent, with a villous mouth. ⊙.? S. Native of Mexico, at the foot of Mount Macultipec, near Jalapa. Branches tetragonal. Corollas minute. An intermediate species between *H. polyántha* and *H. pectinàta*.

Nettle-like Hyptis. Pl.

163 H. RACEMULÒSA (Mart. mss. ex Benth. lab. p. 126.) stem herbaceous, erect, clothed with rufous pubescence, with smooth angles; leaves petiolate, ovate, acute, doubly serrated, rounded at the base, and running into the petioles, rather villous above, and clothed with rufous tomentum beneath; cymes capitate, few-flowered, on very short peduncles, disposed in subsecund, axillary racemes; bracteas minute, setaceous; calyx clothed with rufous tomentum: mouth villous: teeth shorter than the tube. ⊙. S. Native of Brazil, in the provinces of Minas Geraes and Rio Janeiro, in elevated pastures and woods. Habit of *H. polystàchya*, but the bracteas and calyxes are very distinct. Corolla pale violet, ex St. Hil., pale red, spotted with purple, ex Mart.

Racemulose Hyptis. Pl. 2 to 3 feet.

164 H. LAMIIFÒLIA (Weinm. in syll. pl. ratisb. 1. p. 226. ex Benth. lab. p. 127.) stem branched, pilose, radicant; leaves cordate-ovate, acuminated, crenately toothed, scabrous from pili, petiolate, whitish beneath; heads axillary, pedunculate, shorter than the internodes; bracteas setaceous, equalling the heads; calyx short, tubular, with equal, acuminated teeth. ♃. S. Native of Brazil. Stem acutely tetragonal. Leaves 1-2 inches long. Heads size of peas. Corolla small, white, spotted with violet.

Dead-nettle-leaved Hyptis. Pl. procumbent.

SECT. XIV. PECTINA'RIA (from *pecten*, a comb; so called from pectinate, unilateral cymes.) Benth. lab. p. 127. Cymes at first almost capitate, but at length elongated, unilateral, and pectinate. Bracteas loose, setaceous. Calyxes nearly sessile, tubular in the fructiferous state, with strict, setaceous teeth, and the throat closed by villi inside.

165 H. PECTINA'TA (Poit. ann. mus. 7. p. 474. Benth. lab. 127.) glabrous, or downy; leaves petiolate, ovate, crenately-serrated, rounded at the base, pale beneath; cymes many-flowered, rather loose, paniculately racemose, at length elongated and incurved; bracteas shorter than the calyxes?; teeth of calyx shorter than the tube. ♃. S. Native of Tropical America, common in cretaceous, sandy places from Mexico to Rio Janeiro; Peru; most of the West India Islands; Guinea; Madagascar; East Indies, at Madras; Arabia, at Sennaar, Bovè. Méntha perilloìdes, Lin. syst. ed. 13. p. 445, but not of others. Népeta pectinàta, Lin. spec. 799. Bystropògon pectinàtum, Lher. sert. angl. p. 19. Népeta aristàta, Rich. act. soc. hist. nat. par. p. 110. Brotèra Pérsica, Spreng. in Lin. trans. 6. p. 151. t. 4. Hýptis Pérsica, Poit. ann. mus. 7. p. 471. Ballòta dísticha, Rodsch. obs. p. 35. Meyer, esseq. p. 209, but not of Lin. Ballòta suavèolens, Rodsch. bald. diar. fasc. 28. p. 79. ex Meyer, l. c. but not of Lin. Hýptis racemòsa, Zucc. in act. acad. taur.? Bystropògon coarctàtum, Thonn. et Schum. in act. acad. hafn. 4. p. 34. Stem rather woody at the base. Leaves variable in form and size. Corolla small, pale purple, or yellow, spotted with purple.

Pectinate Hyptis. Fl. year. Clt. 1776. Pl. 2 to 5 feet.

SECT. XV. MENTHÍDIUM (so called from the habit of the species being that of Mentha, or Mint.) Benth. lab. p. 128. Flowers sessile, or on short pedicels, disposed usually in many-flowered whorls. Bracteas minute, or hardly any, or loose and setaceous. Calyx campanulate, equal; throat naked inside. Corolla hardly exceeding the calyx.—Herbs often panicled at apex.

166 H. PULEGIOÌDES (Pohl, icon. ined. ex Benth. lab. p. 128.) herbaceous, procumbent at the base; branches ascending, clothed with adpressed pubescence; leaves on short petioles, lanceolate, acute, serrated, narrowed at the base, wrinkled, very villous: floral ones conform, smaller; whorls all distinct, and globose, densely many-flowered; bracteas subulate, shorter than the calyx; calyx tubular, with a villous base, and lanceolate, subulate, erect, short teeth. ♃.? S. Native of Brazil, in the province of Minas Geraes, at Fazenda do Pari. This species is intermediate between the present section and sect. *Apodòtes*.

Penny-Royal-like Hyptis. Pl.?

167 H. A'LBIDA (H. B. et Kunth, nov. gen. amer. 2. p. 319.) shrubby, clothed with floccose wool; leaves nearly sessile, ovate, obtuse, or the upper ones are subulately acuminated, crenated, roundly cuneated at the base, wrinkled; whorls loose, globose, distinct; racemes sub-panicled; bracteas short, setaceous; fructiferous calyx nearly globose, densely woolly: teeth very soft, setaceous, about equal in length to the tube. ♄. S. Native of Mexico, at Lake Cusco, in the valley of St. Jago, and near Valladolid. Corollas hardly longer than the calyx.

Whitish Hyptis. Fl. July, Aug. Clt. 1824. Shrub 2 to 3 feet.

168 H. PUBE'SCENS (Benth. lab. p. 129.) suffruticose, clothed with tomentose pubescence; leaves nearly sessile, oblong, acutish, serrated, rounded at the base, a little wrinkled, pale beneath; whorls small, globose, many-flowered, remote; racemes panicled; bracteas short, setaceous; calyx villous: teeth stiff, subulate, equalling the tube, at length spreading in a stellate manner. ♄. S. Native of New Spain. Branches bluntly tetragonal. Corolla a little longer than the calycine teeth.

Pubescent Hyptis. Shrub.

169 H. MOCINIA'NA (Benth. lab. p. 129.) suffruticose, pubescent; leaves on short petioles, cordate-ovate, doubly serrated, wrinkled; whorls globose, many-flowered, distinct, racemose; racemes panicled; bracteas short, setaceous; calyx villous: teeth stiff, subulate, glabrous, twice as long as the tube, spreading

in a stellate manner. ♄.? S. Native of New Spain, Moçino et Sesse. Plant clothed with rubiginose pubescence. Leaves 1 to 1½ inch long. Corolla shorter than the calycine teeth.

Moçino's Hyptis. Shrub.

170 H. spinulòsa (Benth. lab. p. 129.) suffruticose, clothed with fine pubescence; leaves petiolate, ovate, acuminated, serrulately crenated, cordate at the base; whorls globose, many-flowered, distinct, racemose; racemes panicled; bracteas short, setaceous; calyx ovate, pubescent: teeth stiff, subulate, glabrous, shorter than the tube, spreading in a stellate manner. ♄. S. Native of New Spain, Moçino et Sesse. Stem clothed with rufous pubescence.

Spinulose-calyxed Hyptis. Shrub.

171 H. stellula`ta (Benth. lab. p. 129.) herbaceous; branches clothed with rusty villi; leaves on short petioles, ovate, acute, serrately crenated, rounded at the base, wrinkled, villous; racemes panicled; whorls densely globose; bracteas small, setaceous; calyx ovate, villous, with subulate, stellately spreading teeth. ⊙.? S. Native of Mexico, at Cuernavaca and Toluco, Berlandier. Corolla pubescent, hardly longer than the calyx.

Starry-calyxed Hyptis. Pl. 4 to 5 feet.

172 H. scopa`ria (Poit. ann. mus. 7. p. 475. t. 31. f. 2.) shrubby; branches glabrous, with prickly angles; leaves on short petioles, linear, obtuse, quite entire, or a little denticulated, glabrous; whorls loose, remote, 2-10-flowered; calyx nearly glabrous, with ovate, erect, obtuse teeth. ♄. S. Native of Porto Rico and St. Dominica. Saturèia Americàna, Poir. dict. 6. p. 571. Saturèia Condæ`a, Juss. ex Poir. l. c. Corolla glabrous, hardly exceeding the calyx. Leaves minutely glandular.

Broom Hyptis. Fl. June, Aug. Clt. 1825. Shrub.

173 H. verticilla`ta (Jacq. icon. rar. 2. t. 113.) suffruticose; branches erect, pubescent or pilose; leaves on short petioles, lanceolate, acute, serrated, roundly narrowed at the base, clothed with fine pubescence; whorls rather loose, many-flowered, distinct, racemose; calyx ovate, glabrous, with erect, ovate-lanceolate teeth. ♄. S. Native of Mexico, on waysides near Papantla; and of St. Dominica. Stàchys pàtens, Swartz, nov. gen. et spec. p. 88. Angles of stem smooth. Leaves 1-2 inches long. Corolla white, tinged with red, hardly exceeding the calyx.

Whorled-flowered Hyptis. Shrub 3 to 4 feet.

174 H. fascicula`ta (Benth. lab. p. 130.) herbaceous, glabrous, or clothed with fine down; leaves petiolate, ovate, acute, serrated, a little wrinkled, green on both surfaces; racemes elongated, panicled; whorls loose, many-flowered; bracteas minute, setaceous; fructiferous calyx inclosed, glabrous: teeth ovate, acute, much shorter than the tube. ♃.? S. Native of Brazil, near habitations, in humid places in the provinces of Minas Geraes, Rio Janeiro, &c.; and of Buenos Ayres, at Parano. Corollas minute, purplish.

Fascicled-flowered Hyptis. Pl. 1 to 3 feet.

175 H. fastigia`ta (Benth. lab. p. 130.) herbaceous, ascending; leaves petiolate, ovate, acute, doubly serrated, rounded at the base, green above and villous, but clothed with hoary pubescence beneath; racemes fastigiately panicled; whorls loose, few-flowered; bracteas minute, setaceous; fructiferous calyx increased, glabrous: teeth ovate, acute, much shorter than the tube. ♃.? S. Native of Brazil, Sello. Nearly allied to the preceding.

Fastigiate-flowered Hyptis. Pl. 1 to 3 feet.?

176 H. erioca`lyx (St. Hil. mss. ex Benth. lab. p. 131.) herbaceous; stem ascending, clothed with rufous tomentum; leaves petiolate, ovate, serrately crenated, wrinkled at the base, villous above, and clothed with rufous tomentum beneath; racemes elongated, panicled; whorls loose, few-flowered; bracteas minute, setaceous; fructiferous calyx woolly, increased: teeth ovate, acute, much longer than the tube. ⊙. S. Native of Brazil, in the province of Minas Geraes, at the rivulet called Simeon Pareira. Habit of *H. fasciculàta*, but the characters are different.

Woolly-calyxed Hyptis. Pl.

177 H. vepretòrum (Mart. mss. ex Benth. lab. p. 131.) shrubby; leaves petiolate, small, ovate, obtuse, somewhat crenated, rounded at the base, rather coriaceous, smoothish, shining above, but pale and reticulated beneath; whorls 2-6-flowered, secund, axillary; fructiferous calyx tubular, glabrous, with short, ovate-lanceolate teeth. ♄. S. Native of Brazil, in desert fields between Minas Novas and Rio de St. Francisco, in the province of Minas Geraes. Branches downy. Corolla exceeding the calyx a little.

Bramble Hyptis. Shrub.

178 H. vesiculòsa (Benth. lab. p. 131.) stem tall, branched, clothed with fine rusty tomentum; leaves on short petioles, oblong-elliptic, acute, cuneated at the base, crenulated, wrinkled, clothed with hoary tomentum beneath; whorls few-flowered, rather secund, distinct, racemose; racemes panicled; bracteas minute; fructiferous calyx campanulate, inflated, membranous, veiny, with a contracted mouth, and short setaceous teeth. ♄.? S. Native of Guayaquil, Tafalla. Leaves like those of *Búddlea salvifòlia*, 4-6 inches long and 1½ broad. Fructiferous calyx size of a pea, bladdery.

Bladdery-calyxed Hyptis. Shrub.?

179 H. ca'lida (Mart. mss. ex Benth. lab. p. 131.) shrubby; branches pubescent; leaves on short petioles, roundish, very blunt, a little crenated, wrinkled, canescent beneath: floral ones minute; cymes sessile, loose, approximating into a dense, rather branched raceme; calyxes pedicellate, tubular, with an equal, truncate mouth, and subulate, strict teeth, which are shorter than the tube. ♄. S. Native of Brazil, in the province of Minas Geraes, at Serro Frio. Branches divaricate. Whorls 10-15-flowered. This species is intermediate between sect. *Menthìdium* and sect. *Pectinària*.

Hot Hyptis. Shrub.

Sect. XVI. Buddleioi`des (from *Búddlea*, and *idea*, similar. Plants with the habit of species of that genus.) Benth. lab. p. 132. Cymes pedunculate, capitate, many-flowered, numerous, panicled. Bracteas minute. Calyxes almost sessile, tubular, campanulate, with short teeth and naked throat. Tube of corolla exserted, tomentose outside.—Tall shrubs, with the habit of species of *Búddlea*.

180 H. membrana`cea (Benth. lab. p. 132.) shrubby, clothed with rufous tomentum; leaves petiolate, oblong-elliptic, roundly cuneated at the base, very rough above, and clothed with rufous tomentum beneath; fascicles of flowers pedunculate, loose, numerous, many-flowered, widely panicled; calyxes on short pedicels, urceolate, clothed with rufous tomentum, with very short equal teeth. ♄. S. Native of Brazil, in the province of Minas Geraes; and south of Brazil, in woods. Branches bluntly tetragonal. Achenia compressed, girded by a very broad membranous wing. Leaves 4-5 inches long.

Membranous-winged-seeded Hyptis. Shrub 7 to 8 feet.

181 H. Tafa'llæ (Benth. lab. p. 132.) shrubby, tomentose; leaves petiolate, oblong-lanceolate, cordate at the base, wrinkled above, shining and glabrous, and clothed with hoary tomentum beneath; fascicles of flowers pedunculate, loose, many-flowered, panicled; calyxes on short pedicels,

elongated, tubularly campanulate, equally 5-toothed, tomentose; corolla about twice as long as the calyx. ♄. S. Native of Peru, Tafalla. Corollas tomentose outside. Achenia oblong, obtuse, flat, wingless. Leaves 4 inches long.

Tafalla's Hyptis. Shrub 4 to 6 feet.

SECT. XVII. UMBELLA'RIA (from *umbella*, an umbel; cymes umbel-formed.) Benth. lab. p. 133. Cymes pedunculate, umbel-formed, many-flowered. Bracteas minute, setaceous. Calyxes pedicellate, tubular, with lanceolate or setaceous teeth, and the throat naked inside. Tube of corolla inclosed or exserted.—Species dissimilar in habit.

182 H. RHABDOCA'LYX (Mart. mss. ex Benth. lab. p. 133.) shrubby; branches tomentosely pubescent; leaves on short petioles, roundish, sharply serrated, cordate at the base, wrinkled, clothed with soft pubescence on both surfaces: floral ones similar; cymes axillary, stiff, few-flowered; calyx pubescent; corolla equalling the teeth of the calyx. ♄. S. Native of Brazil, in the province of Rio Janeiro, in grassy places. Leaves 6-9 lines long.

Twig-calyxed Hyptis. Shrub.

183 H. TOMENTÒSA (Poit. ann. mus. 7. p. 469.) suffruticose; branches clothed with floccose tomentum; leaves on short petioles, ovate-oblong, obtuse, crenated, rounded at the base, wrinkled, tomentose on both surfaces; cymes axillary, many-flowered; calyx clothed with white wool, with equal acuminated teeth. ♄. S. Native of Mexico, near Actopan and Acapulco. Tomentum whitish or yellowish. Leaves 1 to 1½ inch long. Corolla pubescent outside.

Tomentose Hyptis. Shrub 1½ to 2 feet.

SECT. XVIII. SIAGONA'RRHEN (from *σιαγων, siagon*, the cheek-bone; and *αρρην, arrhen*, a male; application not evident.) Mart. ex Benth. lab. p. 133. Cymes regularly dichotomous, many-flowered, racemose, rarely difformed, disposed in an elongated, contracted panicle. Bracteas setaceous. Calyxes nearly sessile, tubularly-campanulate, incurved, with an oblique mouth, lanceolate, acute, rarely obtuse teeth, and the throat naked inside. Corollas blue: tube for the most part a little exserted. Filaments very villous.—Shrubs, rarely tall herbs, generally clothed more or less with white tomentum, having the habit of species of *Anisómelis*.

184 H. LEUCOPHY'LLA (Pohl, icon. ined. ex Benth. lab. p. 134.) branches glabrous at the base, and floccosely tomentose at top; leaves on short petioles, ovate-oblong, obtuse, crenulated, rounded at the base; cymes pedunculate; bracteas 3 times shorter than the calyx; calyx clothed with white wool, with lanceolate, acute teeth. ♄. S. Native of Brazil, in the province of Minas Geraes. Branches bluntly tetragonal. Corolla red, villous outside: tube a little exserted. Leaves 1-2 inches long.

White-leaved Hyptis. Shrub.

185 H. LAURIFÒLIA (St. Hil. mss. ex Benth. lab. p. 134.) shrubby; branches erect, rather tomentose; leaves petiolate, oblong-lanceolate, acute, crenulated, cuneated at the base, green on both surfaces, or the upper ones are rather tomentose beneath; cymes pedunculate; calyx clothed with white wool, with lanceolate, acute teeth. ♄. S. Native of Brazil, in sandy places near Penha, in the province of Minas Geraes. Habit of *H. leucophýlla*; but the racemes are more loose; the whorls remote, and the flowers smaller and fewer. Corollas pale blue.

Laurel-leaved Hyptis. Shrub.

186 H. SCA'BRA (Benth. lab. p. 134.) shrubby; branches tomentose; leaves on short petioles, ovate or elliptic, roundly cordate at the base, wrinkled, very scabrous above, and clothed with white tomentum beneath, and the floral ones on both surfaces; cymes pedunculate; calyx clothed with white tomentum: teeth equal, lanceolate, acute. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Rio Janeiro, &c., on the margins of woods. Branches bluntly tetragonal. Leaves 3-4 inches long. Corollas downy outside, pale blue. Habit of *Gomphostémma*.

Scabrous Hyptis. Shrub 5 to 6 feet.

187 H. CA'NA (Pohl, icon. ined. ex Benth. lab. p. 135.) branches floccosely tomentose; leaves on short petioles, oval-roundish, very blunt or emarginate, mucronulate, scarcely crenulated, rounded at the base, clothed with scabrous tomentum above, and hoary tomentum beneath, but the floral ones are clothed with hoary tomentum on both surfaces; cymes loose, few-flowered; calyx clothed with white wool: teeth lanceolate, acute. ♄. S. Native of Brazil, in the province of Minas Geraes, at Rio Abaite. Lower leaves 4 inches long. Corolla deeply lobed.

Hoary Hyptis. Shrub.

188 H. SÓRDIDA (Pohl, icon. ined. ex Benth. l. c. p. 135.) branches clothed with floccose tomentum; leaves on short petioles, oval-roundish, very blunt, mucronate, scarcely crenated, rounded at the base or cordate, tomentose on both surfaces, whitish beneath; calyx clothed with white wool: teeth lanceolate, acute. ♄. S. Native of Brazil, in the province of Minas Geraes. Allied to *H. càna*, but the flowers are more dense, and the calyxes longer.

Sordid Hyptis. Shrub.

189 H. ALTÍSSIMA (St. Hil. mss. ex Benth. lab. p. 135.) shrubby, tall; branches somewhat floccosely tomentose; leaves petiolate, oblong, bluntish, finely crenulated, rounded at the base, wrinkled, clothed with hoary tomentum; raceme ample; calyx clothed with clammy pubescence: teeth lanceolate, acute. ♄. S. Native of Brazil, in the province of Goyaz, in fields near Meiaponte, and elsewhere. Shrub much branched; branches twisted. Corolla purplish blue.

Very-tall Hyptis. Shrub 15 feet.

190 H. LATIFÒLIA (Mart. mss. ex Benth. lab. p. 135.) shrubby; branches clothed with soft velvety pubescence; leaves petiolate, broad-ovate, obtuse, crenated, rounded at the base, somewhat complicate, very thick, stiff, velvety above, and clothed with white tomentum beneath; panicle coarctate, dense-flowered; flowers sessile; bracteas lanceolate, deciduous; calyx clothed with white villi: teeth short, bluntish. ♄. S. Native of Brazil, in the province of Minas Geraes, at Serro Frio. Leaves 3-4 inches long. Corolla downy outside.

Broad-leaved Hyptis. Shrub.

191 H.? SALVIÆFÒLIA (Pohl, icon. ined. ex Benth. lab. p. 136.) shrubby; branches clothed with soft adpressed pubescence; leaves petiolate, oblong-elliptic, obtuse, crenated, rounded at the base, wrinkled, clothed with soft villi on both surfaces, whitish beneath; panicle contracted, raceme-formed, secund, with a pubescent axis; flowers solitary, approximate, nearly sessile; calyx clothed with white villi, with an oblique mouth, and short, very blunt, truncate teeth. ♄. S. Native of Brazil, in the province of Minas Geraes, at Calumbis. Leaves 3 inches long. Calyx bilabiate, as in *Erìope*, and the corolla is almost the same. This species is apparently intermediate between the sections *Hypènia*, *Siagonarrhén*, and the genus *Erìope*.

Sage-leaved Hyptis. Shrub tall.

SECT. XIX. HYPE'NIA (from *ὑπηνη, hypene*, a beard; in reference to the filaments being very villous.) Mart. mss. ex Benth. lab. p. 136. Flowers almost solitary, nearly sessile, or

often pedicellate, disposed along the branches of the panicle, which is sometimes very wide and divaricate, and sometimes coarctate and raceme-formed, with cyme-formed or spike-formed branches. Bracteas twin under the calyx, minute, rarely setaceous, loose, about equal in length to the calyx. Calyx tubularly campanulate, equal, rarely incurved, increased in the fructiferous state: teeth lanceolate, acute, rarely obtuse. Tube of corolla inclosed, or much exserted, usually scarlet. Filaments very villous.—Herbs or subshrubs, for the most part tomentose or pilose at the base, panicled, nearly naked, and quite glabrous and glaucous at top, with subcoriaceous leaves. Hardly distinct from the last section.

192 H. densiflòra (Pohl, icon. ined. ex Benth. lab. p. 137.) stem tall, scarcely pilose at the base; leaves petiolate, ovate-lanceolate, acutish, crenated, rounded at the base, thick, rather scabrous above, reticulately wrinkled, and clothed with tomentose pubescence beneath; panicle raceme-formed, coarctate, quite glabrous, glaucous; branches spike-formed; flowers nearly sessile, densely approximate; calyx tubular, incurved, with lanceolate, acute teeth; tube of corolla inclosed. ♄. S. Native of Brazil, in the province of Goyaz, at Caretao, &c. Leaves 1-2 inches long. Calyx nearly glabrous. Corolla glabrous.

Dense-flowered Hyptis. Shrub.

193 H. brachy'stachys (Pohl, icon. ined. ex Benth. lab. p. 137.) stem pilosely hispid at the base; leaves small, nearly sessile, ovate-obtuse, crenated, cordate at the base, wrinkled, rather tomentose or villous; floral leaves and bracteas minute, ovate, or setaceous, acute; panicle coarctate, quite glabrous, glaucous, with spike-formed branches; flowers nearly sessile, approximate; calyx pubescent, tubular, incurved, reticulated, with short obtuse teeth; tube of corolla hardly exserted. ♃. ? S. Native of Brazil, in the province of Goyaz, on the road from Rio Crixas to Rio Maranhao, &c. Corollas pale violet, downy outside.

Short-spiked Hyptis. Pl. 3 feet.

194 H. melochioi'des (St. Hil. mss. ex Benth. lab. p. 137.) stem pilose at the base; leaves petiolate, ovate-oblong or lanceolate, acutish, serrate-crenated, rounded, cuneated at the base, thick, wrinkled, pubescent above, and clothed with hoary tomentum beneath: floral ones and bracteas small, lanceolate-subulate; panicle coarctate, raceme-formed, quite glabrous, glaucous; flowers nearly sessile, approximate; calyx pubescent, tubularly campanulate, with lanceolate-subulate increased teeth; tube of corolla hardly exserted. ♄. ? S. Native of Brazil. Habit of the preceding.

Melochia-like Hyptis. Pl. tall.

195 H. pruinòsa (Pohl, icon. ined. ex Benth. lab. p. 137.) stem tall; branches pilosely hispid at the base, and clothed with rusty tomentum; leaves sessile, roundish, obtuse, crenated, cordate at the base, thick, scabrous above, and lacunosely wrinkled beneath; panicle much branched, quite glabrous, glaucous; flowers pedicellate, approximate towards the tops of the branches; bracteas minute, subulate; calyx tubular, incurved, with an oblique mouth, and lanceolate, acuminated teeth: increasing in the fructiferous state, veined, and transversely wrinkled; tube of corolla hardly exserted. ♃. ? S. Native of Brazil, in the province of Goyaz, on Serra San Felix. Corolla downy outside.

Pruinose Hyptis. Pl. tall.

196 H. Blanche'ti (Benth. lab. p. 712.) stem pilose at the base?; leaves petiolate, oblong-elliptic, obtuse, crenated, coriaceous, glabrous on both surfaces; panicle loose, branched, quite glabrous, glaucous; flowers approximate towards the tops of the branches; bracteas minute, subulate; calyx tubularly campanulate, incurved, with an oblique mouth, and broad, acuminated teeth, much increased in the fructiferous state; tube of corolla hardly exserted. ♃. ? S. Native of Brazil, near Bahia, Blanchet. Habit of *H. pruinòsa*, but differs in the form of the leaves.

Blanchet's Hyptis. Pl. tall.

197 H. si'mplex (St. Hil. mss. ex Benth. lab. p. 138.) stem tall, tomentosely villous at the base; leaves nearly sessile, ovate, obtuse, crenated, rounded or subcordate at the base, thick, wrinkled, tomentose on both surfaces, or villous above; panicle loose, much branched, glabrous, rather glaucous; peduncles filiform, 1-flowered; bracteas minute, setaceous; calyx campanulate, erectish, with short acute teeth; tube of corolla almost inclosed. ♃. ? S. Native of Brazil, in the province of Goyaz, among rocks on Serra Dourada. Leaves 1 inch long.

Simple Hyptis. Pl. tall.

198 H. Salzma'nni (Benth. lab. p. 138.) shrubby; branches leafy, spreadingly pilose; leaves petiolate, ovate, obtuse, erosely crenated, wrinkled, pubescent, pale beneath; panicle very loose, nearly naked, quite glabrous, glaucous, with elongated branches; peduncles filiform, 1-3-flowered; calyx campanulate, veiny, with equal acute teeth; tube of corolla hardly exserted. ♄. S. Native of tropical Brazil, in sandy places near Bahia, and in many other places in the same province, as well as of Minas Geraes. Corolla pale blue.

Var. β, tomentòsa (Benth. lab. p. 138.) leaves tomentose on both surfaces, white beneath.

Salzmann's Hyptis. Shrub 3 feet.

199 H. calophy'lla (St. Hil. mss. ex Benth. lab. p. 138.) plant tall; branches panicled above, quite glabrous, scarcely glaucous; leaves petiolate, large, ovate, acuminated, sinuately lobed, crenated, deeply cordate at the base, scabrous above, and clothed with white wool beneath; panicle very loose, with filiform branches; peduncles very short, 1-flowered; bracteas minute, setaceous; fructiferous calyx much increased, glabrous, membranous, rather glaucous, obliquely campanulate, with a very short 5-toothed mouth; tube of corolla scarcely exserted. ♃. ? S. Native of Brazil, on a mountain called Morro d'Andaia, in Minas Novas. Leaves 4-6 inches long. Corollas very small.

Beautiful-leaved Hyptis. Pl. 5 feet.

200 H. vitifòlia (Pohl, icon. ined. ex Benth. lab. p. 138.) branches pilosely hispid at the base, panicled, quite glabrous and glaucous at top; leaves petiolate, broad-ovate, acuminated, irregularly crenated, and sinuately lobed, deeply cordate at the base, scabrous above, and clothed with white tomentum beneath; panicle loosely divaricate, with filiform, 1-flowered peduncles; calyx glabrous, membranous, much increased in the fructiferous state, obliquely campanulate, with a very short, 5-toothed mouth; tube of corolla much exserted. ♄. ? S. Native of Brazil, in the province of Goyaz, at Santa Cruz. Floral leaves and bracteas minute. Corollas scarlet.

Vine-leaved Hyptis. Shrub tall.

201 H. crispa'ta (Pohl, icon. ined. ex Benth. lab. p. 139.) stem tall, scarcely pilose at the base; leaves petiolate, oblong, with undulately crenated margins, rounded at the base, very thick, stiff, hairy above, and clothed with soft villi beneath; upper leaves lanceolate—linear: floral leaves and bracteas small, lanceolate; panicle quite glabrous and glaucous; flowers solitary, opposite, along the branches, on short peduncles; calyx tubularly campanulate, clothed with soft villi: teeth broad-lanceolate. ♄. ? S. Native of Brazil, in the province of Goyaz, on Serra Dourada. Allied to *H. calycìna*. Corolla villous, twice as long as the calyx.

Curled-leaved Hyptis. Shrub tall.

202 H. cocci'nea (Mart. mss. ex Benth. lab. p. 139.) stem tall, pubescent at the base, and ciliated with a few hairs; leaves petiolate, ovate-lanceolate or oblong, irregularly toothed, rounded or subcordate at the base, thick, villous above, and clothed with tomentose pubescence beneath; panicle very loose, almost naked, quite glabrous, glaucous; branches and peduncles generally 1-flowered, elongated; bracteas elongated; fructiferous calyx elongated, a little inflated, with lanceolate, acute teeth. ♃. S. Native of Brazil, in the provinces of Minas Geraes and Bahia, in stony fields. Leaves 2-3 inches long. Corolla scarlet, a little shorter than that of *H. laxiflòra*.

Scarlet-flowered Hyptis. Pl. 5 to 6 feet.

203 H. panicula'ta (Benth. lab. p. 139.) branches villous at the base; leaves on short petioles, ovate, obtuse, crenated, rounded at the base, thick, wrinkled, densely clothed with villous tomentum on both surfaces; panicle very loose, nearly naked, quite glabrous, glaucous, with elongated branches; peduncles filiform, 1-flowered, rather shorter than the calyxes, which are pubescent. ♄. S. Native of the south of Brazil, Sello. Shrub clothed with rusty tomentum and spreading villi. Corolla scarlet, downy outside.

Panicled Hyptis. Shrub.

204 H. laxiflòra (Mart. mss. ex Benth. lab. p. 139.) branches villous at the base; leaves petiolate, roundish, obtuse, crenated, rounded at the base, thick, wrinkled, clothed with tomentose pubescence on both surfaces, reticulated and whitish beneath; panicle very loose, nearly naked, quite glabrous, glaucous; bracteas small, ovate; branches elongated; peduncles filiform, 1-flowered, more than twice as long as the calyxes; tube of corolla twice as long as the calyx. ♄. S. Native of Brazil, in the province of Minas Geraes, in fields at Villa Rica, and elsewhere in the same province. Habit of *H. paniculàta*, but the leaves are much smaller. Corolla showy scarlet, downy outside.

Loose-flowered Hyptis. Shrub.

205 H. calyci'na (Pohl, icon. ined. ex Benth. lab. p. 140.) stem tall, scarcely pilose at the base; leaves petiolate, oblong-elliptic, obtuse, crenated, rounded at the base, very thick, tomentosely villous on both surfaces; superior leaves narrower; panicle very loose, nearly naked, quite glabrous, glaucous, with the branches and 1-flowered peduncles elongated; bracteas cordate, stem-clasping; fructiferous calyx long-campanulate, glabrous, with lanceolate, acute teeth. ♄.? S. Native of Brazil, in the province of Goyaz, on Serra do Chrystais and Trahiras. Fructiferous calyx 7-8 lines long. Corolla more than an inch, glabrous, scarlet.

Large-calyxed Hyptis. Shrub.?

206 H. macra'ntha (St. Hil. mss. ex Benth. lab. p. 140.) stem tall, furnished with spreading hairs at the base; leaves petiolate: lower ones oval: superior ones oblong-elliptic or lanceolate, serrately crenated, cuneated at the base, coriaceous, green on both surfaces, and rather scabrous, glabrous or spreadingly pilose; panicle loose, nearly naked, quite glabrous, rather glaucous; branches elongated; peduncles a little longer than the calyxes; bracteas small, ovate-lanceolate; fructiferous calyxes elongated: teeth lanceolate, acute; corolla 4 times as long as the calyx. ♄.? S. Native of Brazil, in the province of Minas Geraes, near Paracatu. Intermediate between *H. calycìna* and *H. longiflòra*. Corolla 1½ inch long.

Large-flowered Hyptis. Shrub 2 to 4 feet.

207 H. longiflòra (Pohl, icon. ined. ex Benth. lab. p. 140.) branches pilose at the base; leaves petiolate, ovate-oblong or rounded, obtuse, crenated, rounded at the base, thick, scabrous above, and reticulated, wrinkled beneath, and clothed with rufous pubescence; panicle very loose, nearly naked, quite glabrous, glaucous; branches elongated; peduncles filiform, elongated, 1-flowered; bracteas small, subulate; calyxes campanulate, increased in the fructiferous state, membranous, reticulated, with lanceolate, acute teeth. ♄.? S. Native of Brazil, in the province of Goyaz, in fields from Barbacena to Paracatu. Calyx very villous inside, and pubescent outside, at length glabrous. Corolla villous outside, 3 times longer than the calyx.

Long-flowered Hyptis. Shrub.?

208 H. reticula'ta (Mart. mss. ex Benth. lab. p. 141.) stems pubescent at the base, rather pilose; leaves petiolate, ovate, oblong, or lanceolate, doubly serrated, cuneated at the base, or rounded, coriaceous, glabrous and rather scabrous above, reticulately much veined beneath, and tomentosely pubescent on the veins; panicle very loose, nearly naked, quite glabrous, glaucous; branches and 1-flowered peduncles elongated; bracteas subulate; fructiferous calyx campanulate: teeth lanceolate, acutish. ♃.? S. Native of Brazil, in the province of Minas Geraes, in several places. Stem sub-tetragonal at the base, and terete at top. Leaves 2-3 inches long. Corollas of *H. coccìnea*, but a little shorter.

Reticulated-leaved Hyptis. Pl. 1 to 2½ feet.

209 H. glau'ca (St. Hil. mss. ex Benth. lab. p. 141.) stem tall, scarcely pilose at the base; leaves petiolate, ovate, undulately crenated, cuneated at the base, thick, coriaceous, green on both surfaces, scabrous and nearly glabrous above, reticulated, and loosely tomentose beneath; panicle large; flowers on short pedicels along the elongated, strict branches; bracteas small, lanceolate; calyxes campanulate, nearly glabrous, with broad-lanceolate, obtuse teeth; tube of corolla much exserted. ♃.? S. Native of Brazil, in the provinces of Minas Geraes and St. Paul, near habitations. Intermediate between *H. crispàta* and *H. reticulàta*.

Glaucous Hyptis. Pl.?

N.B. H. menthodòra, Schranck. in syll. pl. soc. ratisb. 2. p. 56. H. Nepalénsis, Lehm. sem. hort. hamb. 1830. H. obtusifòlia, R. Br. in salt. abyss. app. H. Pohliàna, Jacq., and H. marathrósma, Spreng. are very little known, or not described.

Cult. Very few of the species of *Hyptis* are worth cultivating for ornament, they are, therefore, seldom seen in gardens. The shrubby and perennial herbaceous kinds should be treated like other common stove plants, and they are readily increased from cuttings. The annual kinds should be treated like other tender annual plants, by being reared on a hot-bed, &c.

XVI. ERI'OPE (probably derived from *εριον, erion*, wool; and *οπη, ope*, a hole; because the throat of the calyx is closed with wool.) Humb. et Bonpl. mss. ex Benth. lab. p. 142.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx turbinate, spreading, and equally 5-toothed in the floriferous state, but increased and nutant in the fructiferous state, having the 3 superior teeth membranously dilated into a lip; the 2 lower teeth hardly increased, dejected into a lower lip; throat closed with dense white wool inside. Corolla declinate; tube a little exserted, much dilated at the throat; the 4 upper lobes of the limb oblong, nearly equal; the 2 uppermost of these erect, and the 2 lateral ones spreading: lower one abruptly dejected, saccate, acuminated, and somewhat bidentate at apex. Stamens 4, didynamous, declinate: lower ones the longest; filaments densely villous at the base; anthers ovate-reniform, with confluent cells. Style almost equally bifid at apex; stigmas almost confluent. Achenia oblong, somewhat compressed, smooth.—Shrubs, or sub-shrubs, rarely perennial herbs. Flowers solitary, opposite, along the axils of a simple or paniculately-branched raceme. Floral leaves minute, bractea-formed, soon

falling off. Bracteas 2, very minute under the calyx. Nearly allied to *Hyptis*, section *Hypènia*, but the habit is peculiar.

1 E. HYPENOÌDES (Mart. mss. ex Benth. lab. p. 142.) shrubby; stem pilose at the base, quite glabrous above, and glaucous; leaves on short petioles, ovate, or oblong, acute, rounded at the base, or cuneated, white beneath; panicle ample, branched. ♄. S. Native of Brazil, in the province of Bahia, in elevated fields at Rio da Contas. Branches terete. Leaves serrulated, or crenulated. Peduncles tomentose. Calyx villous. Corollas pale, bluish red.

Hypenia-like Eriope. Shrub 6 feet.

2 E. MONTÍCOLA (Mart. mss. ex Benth. lab. p. 143.) suffruticose; stem clothed with hoary tomentum at the base, glabrous, and bluish above; leaves on short petioles, ovate-roundish, coriaceous, glabrous above and shining, but rather scabrous and canescent beneath, with ciliated edges; panicle branched. ♄. S. Native of Brazil, in the province of Bahia, in elevated fields at Sincora. Branches terete, or scarcely tetragonal at the base. Leaves toothed, ½ inch long. Corolla pale blue, downy outside. Young branches, peduncles, and calyxes tomentose.

Mountain Eriope. Shrub 3 feet.

3 E. OBTUSA`TA (Benth. lab. p. 143.) suffruticose; stem tomentosely pubescent; leaves nearly sessile, oval, obtuse, crenated a little, coriaceous, rather wrinkled above, and tomentose beneath, with ciliated margins; racemes branched. ♄. S. Native of Brazil, in the province of Bahia. Racemes more villous than the preceding.

Blunt-leaved Eriope. Shrub 1 to 2 feet.

4 E. POLYPHY´LLA (Mart. mss. ex Benth. lab. p. 143.) suffruticose; stem tomentosely pubescent; leaves on short petioles, ovate, or lanceolate, acute, serrated, coriaceous, shining above, rather tomentose beneath, with ciliated edges; racemes elongated, nearly simple. ♄. S. Native of Brazil, in the province of Bahia, at Rio da Contas, and Cayes. An humble shrub.

Many-leaved Eriope. Shrub.

5 E. CRASSIFÒLIA (Mart mss. ex Benth. lab. p. 143.) shrubby; branches pubescent; leaves sessile, sub-imbricate, broad-ovate, acute, serrated, thick, coriaceous, glabrous on both surfaces, with naked margins; racemes simple. ♄. S. Native of Brazil, in the province of Bahia, in Serra das Lages, and at Sincora. Habit of *E. polyphýlla*. Corolla pale violet, as in the preceding.

Thick-leaved Eriope. Shrub 1 to 2 feet.

6 E. PARVIFÒLIA (Mart. mss. ex Benth. lab. p. 144.) suffruticose; branches tomentosely pubescent; leaves nearly sessile, ovate, acute, complicate, green on both surfaces, clothed with soft tomentum, with naked edges; racemes numerous, a little branched. ♄. S. Native of Brazil, in the province of Bahia, in the woods of Catingas, at Sincora. Shrub much branched. Peduncles and calyxes clothed with short, velvety tomentum. Corollas as in *E. crassifòlia*.

Small-leaved Eriope. Shrub.

7 E. NUDIFLÒRA (H. B. et Kunth, mss. ex Benth. lab. p. 144.) suffruticose; branches very hairy; leaves on short petioles, oblong, acutish, callously serrated, cuneated at the base, glabrous, coriaceous, wrinkled, with rather ciliated margins; racemes simple. ♄. S. Native of Guiana, at Maypure. Humb. et Bonpl. Leaves 1½ inch long. Corolla violet. Whorls 4-flowered. Pedicels glabrous.

Naked-flowered Eriope. Shrub.

8 C. CRA´SSIPES (Benth. lab. p. 144.) suffruticose; branches erect, nearly simple, pubescent; leaves nearly sessile, ovate, obtuse, crenated, or lanceolate, acute, serrated, nearly glabrous; racemes elongated, simple. ♄. S. Native of Brazil, in the province of Goyaz, in pastures near San Jose.

Var. β, acutifòlia (Benth. lab. p. 144.) leaves lanceolate, roughish, for the most part glabrous, or furnished with a few hairs. ♄. S. Native of Rio Janeiro.

Thick-peduncled Eriope. Shrub.

9 E. TEUCRIOÌDES (St. Hil. mss. ex Benth. lab. p. 144.) herbaceous, ? procumbent; branches spreadingly pilose at the base, pubescent at top; leaves on short petioles, ovate, bluntish, subcrenated, glabrous, somewhat ciliated; racemes elongated, nearly simple. ♃. ? S. Native of Brazil, in the province of Minas Novas, in woods. Racemes like those of *E. nudicaúlis*. Corollas blue.

Germander-like Eriope. Pl.

10 E. COMPLICA`TA (Mart. mss. ex Benth. lab. p. 144.) shrubby; branches elongated, tomentose, and spreadingly pilose; leaves petiolate, broad-ovate, obtuse, crenated, rounded at the base, wrinkled, villous on both surfaces, rather hoary beneath; racemes simple, clothed with white tomentum. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Bahia, in several places. Racemes 1-3-flowered, terminal. Leaves ½ an inch long. Corolla small, bluish-violet.

Complicate Eriope. Shrub 5 to 6 feet.

11 E. FŒ`TIDA (St. Hil. mss. ex Benth. lab. p. 145.) shrubby; branches divaricate, beset with spreading hairs at the base, and tomentose pubescence at top; leaves petiolate, ovate, acutish, serrately crenated, almost glabrous, coriaceous; racemes paniculately branched. ♄. S. Native of Brazil, in the provinces of Minas Geraes and Goyaz. Leaves 1½ to 3 inches long, often clammy. Corolla purplish. Odour fetid.

Fetid Eriope. Shrub 2 to 3 feet.

12 E. ALPE´STRIS (Mart. mss. ex Benth. lab. p. 145.) shrubby; branches and petioles clothed with spreading pili; leaves petiolate, oval, obtuse, crenated, cuneately rounded at the base, wrinkled, villous on both surfaces, hardly canescent beneath; racemes paniculately branched. ♄. S. Native of Brazil, in the province of Bahia, on the top of Mount Itambe.

Alp Eriope. Shrub 3 to 4 feet.

13 E. MACROSTA`CHYA (Mart. mss. ex Benth. lab. p. 145.) shrubby; branches pubescent, or villous; leaves petiolate, ovate-lanceolate, acute, denticulated, rounded at the base, or subcordate, wrinkled, villous on both surfaces; panicle ample, branched. ♄. S. Native of Brazil, in the provinces of Minas Geraes, Rio Janeiro, &c., in elevated fields, and on the banks of rivers. Leaves 1½ to 3 inches long. Corolla bluish purple, pubescent outside.

Var. β, villòsa (Benth. lab. p. 145.) stem clothed with rufous tomentum, and spreading pili. Leaves clothed with rufous villi beneath, and more wrinkled than in the species.

Long-spiked Eriope. Shrub tall.

Cult. Plants of easy culture. A light, rich soil will suit them, and cuttings will strike root readily in the same kind of earth.

XVII. LAVA´NDULA (from *lavo*, to wash; from its use in fomentations and baths.) Tourn. inst. 93. Lin. gen. no. 711. Schreb. gen. no. 965. Gært. fruct. 1. p. 320. t. 66. Juss. gen. 113. ed. Usteri, p. 127. Benth. lab. p. 146. Stœ`chas, Tourn. inst. 95. Fabrícia, Adans, fam. 188. Chætóstachys, Benth. in Wall. pl. rar. asiat. 2. p. 19.

LIN. SYST. *Didynàmia*, *Gymnospérmia*. Calyx ovate-tubular, nearly equal, 1-3, or rarely 15-nerved, shortly 5-toothed; the 4 lower teeth nearly equal, or the two lowest ones are narrower: the upper one, (and sometimes the lateral ones are broader,) sometimes drawn out at the apex into a dilated appendage. Corolla with an exserted tube, a somewhat dilated throat, and an oblique, bilabiate limb: upper lip 2-lobed: lower one 3-lobed:

lobes all nearly equal, spreading. Stamens 4, didynamous: lower ones the longest, inclosed, declinate; filaments glabrous, free, toothless; anthers ovate-reniform, confluent, 1-celled. Style shortly bifid at apex: lobes flattened, rather connate, with stigmatiferous margins. Disk concave, furnished with 4 fleshy scales on the margin in front of the achenia. Achenia glabrous, smooth, adnate behind to the scales of the disk.—Under shrubs, shrubs, or perennial, herbaceous plants. Stems leafy at the base, and usually naked under the spikes. Floral leaves bractea-formed, with 1-5 flowers on both sides, opposite, rarely alternate. Flowers approximate into terminal, simple spikes, which are sometimes branched at the base. Bracteas small, setaceous, or wanting.

SECT. I. STŒ'CHAS (the Latin name of *French Lavender;* because it grows wild in the Stoechade Islands.) Benth. lab. p. 147. Floral leaves 3-5-flowered, disposed in an imbricated, dense spike: the upper floral leaves sterile, and comose. Upper tooth of calyx dilately appendiculate. Small trees, with quite entire, or pinnately toothed leaves.

1 L. STŒ'CHAS (Lin. spec. p. 800.) leaves oblong-linear, quite entire, with revolute edges, clothed with hoary tomentum on both surfaces; spikes dense, comose; whorls 6-10-flowered; calyxes ovate, hoary, shorter than the tube of the corolla. ♄. H. Native of the South of Europe and North of Africa, in many places; also of Teneriffe. Sibth. et Smith, fl. græc. 6. t. 549. Stœ'chas officinàrum, Mill. dict. no. 1. Stœ'chas purpùrea, Tourn. inst. 201. t. 95.—Blackw. icon. t. 241. Stœ'chas vulgàris, Park. theatr. 67. Leaves about ½ an inch long. Corolla dark purple; tube a little exserted. Spike tetragonal, with a tuft of purple leaves at top. The whole plant has a strong aromatic, agreeable flavour.

Var. β, macrostàchya (Ging. hist. lav. p. 130.) spikes thicker, octagonal, with a tuft of coloured leaves at top; leaves broader. ♂. F. Native of Corsica, Sicily, Naples, and Teneriffe. Floral leaves 4 in a whorl.

French Lavender. Fl. May, July. Clt. 1568. Shrub 2 to 3 feet.

2 L. PEDUNCULA'TA (Cav. præl. p. 70.) leaves lanceolate, quite entire, with revolute edges, clothed with hoary tomentum on both surfaces; spikes dense, comose; whorls 6-10-flowered; calyxes elongated, pubescent, equalling the tube of the corolla. ♄. F. Native of Spain, Portugal, among heath on the banks of the Tagus, but rare; but more common between Lamego and Viseu; also of Madeira, Masson. L. Stœ'chas, β, Lin. spec. p. 800. Stœ'chas pedunculàta, Mill. dict. no. 2. —Ger. emac. p. 568. f. 4. Spikes thicker, more loose, and on longer peduncles than *L. Stœ'chas*, &c., and the odour weaker.

Long-peduncled Lavender. Fl. May, July. Clt.? Shrub 2 to 3 feet.

3 L. VI'RIDIS (Ait. hort. kew. 2. p. 288.) leaves oblong-linear, quite entire, with revolute edges, green on both surfaces, villous; spikes rather loose, and somewhat comose at top; whorls 6-10-flowered; calyx tubular, rather villous, equalling the tube of the corolla. ♄. F. Native of Portugal, and Madeira. Lher. sert. angl. 19. t. 21. Hoffm. et Link, fl. port. 1. p. 91. t. 4. Stœ'chas víridis, Ray. hist. 1. p. 514. Lavándula Massònii, Cels, ex Ging. hist. lav. p. 137. This species differs from *L. Stœ'chas*, in the leaves being villous, and in the spike and coma being green; the spikes are looser, and the upper tooth of calyx is furnished with a longer appendage.

Green Lavender. Fl. May, July. Clt. 1777. Shrub 2 to 3 feet.

4 L. DENTA'TA (Lin. spec. p. 800.) leaves oblong, linear, or lanceolate, bluntly and pinnately toothed, pubescent, hoary beneath, with revolute edges; spikes loose, rather tufted at apex; calyx oblong, pubescent, about equal in length to the tube of the corolla. ♄. F. Native of the South of Europe, and Africa, in the region of the Mediterranean; Spain, Balearic Islands, Naples, Sicily, Zante; Island of Madeira. Curt. bot. mag. t. 400. Stœ'chas dentàta, Mill. dict. no. 3.—Barrel. icon. 797. Bauh. hist. 3. p. 279. f. 2. Branches ascending, tetragonal, tomentosely pubescent. Leaves 1 to 1½ inch long. Spike interrupted at the base. Whorls 6-10-flowered. Corollas like those of *L. Stœ'chas*. Spike terminated by a few purplish leaves.

N.B. L. heterophýlla, Poir. suppl. 2. p. 308. includes 2 garden varieties, the one probably a hybrid between *L. dentàta* and *L. vèra;* the other between *L. dentàta* and *L. spìca*.

Toothed-leaved Lavender. Fl. June, Sept. Clt. 1597. Shrub 1 to 2 feet.

SECT. II. SPI'CA (from *spica*, an ear of corn; from the similarity of a spike of lavender to an ear of wheat.) Benth. lab. p. 148. Floral leaves 3-5-flowered, approximate into a loose spike: superior ones shorter than the calyxes, fertile. Upper tooth of calyx dilately appendiculate.—Shrubs. Branches naked at top. Leaves quite entire.

5 L. VE'RA (D. C. fl. fr. 5. p. 398.) leaves oblong-linear, or lanceolate, quite entire, hoary in the young state, with revolute edges; spikes interrupted; whorls 6-10-flowered; floral leaves rhombeo-ovate, acuminated, membranous, all fertile: upper ones shorter than the calyxes; bracteas almost wanting. ♄. H. Native of the South of Europe, and North of Africa, in the region of the Mediterranean, on sterile hills and declivities. L. spìca, var. α, Lin. spec. p. 800. L. spìca, Lin. spec. 800. Schkuhr, handb. 2. t. 157. Lois. fl. gall. 2. p. 346. Woodv. med. bot. p. 150. t. 55. Sabb. hort. rom. 3. t. 72.—Berg. 2. p. 233. L. spìca, α, angustifòlia, Mill. dict. no. 2. Garid. aix. t. 60. L. officinàlis, Clairv. in Vill. dauph. 2. p. 363. L. vulgàris, α, Lam. fl. fr. 2. p. 403. L. angustifòlia, Mœnch. meth. 389. Shrub much branched; branches tetragonal, rather tomentose, leafy at bottom, and naked at top. Calyxes bluish. Corollas blue, seldom white. Lavender is a plant which has long been celebrated for its virtues in nervous disorders. According to Dr. Cullen it is, "whether used externally or internally, a powerful stimulant to the nervous system, and amongst others of this order, named cephalics, the lavender has the best title to it, and it appears to me probable that it will seldom go farther than exciting the energy of the brain to a fuller impulse of the nervous power into the nerves of the animal function, and seldom into the vital." The officinal preparations of Lavender are the essential oil, a simple spirit, and a compound tincture. The essential oil has been used for stimulating paralytic limbs, and for several external purposes, but it is only now used as a perfume. Imitation scent-bottles are made of the fragrant spikes of Lavender. They are also put in paper bags, and placed among linen to perfume it. Lavender water, a well-known perfume, is distilled from the flowers, for which purpose the plant is cultivated extensively in different places, but more especially at Mitcham in Surrey, and Maidenhead in Berkshire.

Lavender is propagated by slips and cuttings, like rosemary; it likes a dry soil, and may be planted either in distinct plants two feet asunder, or to form a sort of hedge-row, in one or more lines, especially where large supplies of flowers are required for distilling. The plants will advance in a close, branchy growth, and when established will produce plenty of flowers in July and August. Gather them while in perfection, cutting the spikes off close to the stem; then give the plants occasional trimmings, taking off the gross and rampant shoots of

the year, and the decayed flower spikes. In dry gravelly, or poor soil its flowers have a more powerful odour, and the severity of our winters has little effect on it; while in rich garden soil, although it grows strongly, it is apt to be killed, and the flowers have less perfume.

True Lavender. Fl. July, Sept. Clt. 1568. Shrub 1 to 2 feet.

6 L. spìca (D. C. fl. fr. 5. p. 397.) leaves oblong-lanceolate, somewhat spatulate, quite entire, narrowed a long way at the base, with somewhat revolute margins, hoary on both surfaces; spikes somewhat interrupted; whorls 6-10-flowered; floral leaves lanceolate, or linear, all fertile: upper ones shorter than the calyxes; bracteas linear-subulate, shorter than the calyxes. ♄. H. Native of the South of Europe, and North of Africa, in the region of the Mediterranean. L. spìca, β, Lin. spec. 800. L. vulgàris, β, Lam. fl. fr. 2. p. 403. L. latifòlia, Vill. dauph. 2. p. 363. L. spìca, Mill. dict. no. 1.—Ger. emac. p. 583. f. 1, 2.—Park. theatr. p. 73. f. 1. Calyxes bluish. Corollas blue, rarely white. Habit of *L. vèra*, but more humble, and the aspect more hoary; the leaves at the base of the branches more crowded; the spikes more dense and shorter: the floral leaves different in form, and the bracteas present. The flowers of both this and the preceding have a fragrant, agreeable smell, and a warm, pungent, bitterish taste; and this species yields by distillation thrice as much essential oil as the preceding; hence in the southern parts of France, where both kinds grow wild, this only is used for the distillation of what is called oil of spike.

Spica, or Broad-leaved Lavender. Fl. July, Sept. Clt. 1568. Shrub 1 to 2 feet.

Sect. III. Pterόstachys (from πτερον, *pteron*, a wing; and σταχυς, *stachys*, a spike.) Ging. hist. lav. p. 158. Benth. lab. p. 149. Floral leaves 1-flowered, opposite, disposed in a loose spike: the upper ones not comose. Calyx 13-nerved, sub-bilabiate; upper lip tridentate: middle tooth broader, not appendiculate: lower lip bidentate.—Perennial herbs rather woody at the base. Leaves toothed, or deeply multifid.

7 L. rotundifòlia (Benth. lab. p. 150.) leaves petiolate, broad-ovate, deeply toothed, rounded at the base, glabrous on both surfaces; spikes elongated, slender; flowers solitary, opposite. ♄. G. Native of the Island of St. Nicolas, one of the Cape Verds. Habit and spike of *L. abrotanoìdes*. Branches pubescent, or glabrous. Leaves 1 to 1½ inch long. Calycine teeth lanceolate, acute.

Round-leaved Lavender. Shrub.

8 L. pinna'ta (Lin. fil. diss. lav. p. 55.) plant clothed with very short, hoary tomentum; leaves pinnate, or bipinnate, or pinnatifid: lobes quite entire, obtuse, very blunt; floral leaves ovate, acutish; spikes elongated, slender, usually by threes, hoary; flowers solitary, opposite. ♄. G. Native of the Canary Islands, on rocks by the sea-side. Jacq. icon. rar. 1. t. 106. Curt. bot. mag. t. 401. Spike tetragonal, 2-3 inches long, loose. Floral leaves rather longer than the calyxes. Corollas purple; tube about twice as long as the calyx.

Var. β, *pubéscens* (Benth. lab. p. 150.) plant less hoary; spike more loose. ♄. G. L. formòsa, Dietr. lex. naschtr. 4. Link. enum. 1. p. 103. Ging. hist. lav. p. 153.

Pinnate-leaved Lavender. Fl. April, Aug. Clt. 1777. Shrub 1 to 2 feet.

9 L. abrotanoìdes (Lam. dict. 3. p. 429.) green, rather pilose; leaves bipinnate: lobes entire, bluntish; floral leaves ovate-lanceolate, very acute; spikes elongated, slender, branched; flowers solitary, opposite. ♄. G. Native of the Canary Islands. L. Canariénsis, Mill. dict. no. 4. L. élegans, Desf. hort. par. p. 71. Mirb. ann. mus. 15. t. 5. f. 5.—Comm. rar. t. 27. This differs from *L. pinnàta* in its superfices being green, not hoary, in the stem being pubescent at the base, in the leaves being more deeply cut, in the segments being narrower, in the spikes being usually 5 together, longer, and more loose, and in the floral leaves being more acute. Corollas purple, rarely white.

Southernwood-like Lavender. Fl. June, Sept. Clt. 1699. Shrub 1 to 2 feet.

10 L. multífida (Lin. spec. p. 800.) green, pilose; stems leafy; leaves bipinnatifid: lobes rather cuneated, acute: floral leaves cordately dilated, acuminated, about equal in length to the calyxes; spike rather dense; calyxes tomentose. ♂. G. Native of the South of Europe, and North of Africa, in the region of the Mediterranean.—Barrel. icon. 795.—Bauh. hist. 3. p. 281. f. 2.—Lob. icon. 432. Very nearly allied to the preceding, but differs in the spikes being shorter, and usually simple, in the floral leaves being broad, and villous outside, and in the calyxes being tomentose, and in the peduncles being one-half shorter. Corollas purple, rarely white.

Multifid-leaved Lavender. Fl. July, Sept. Clt. 1597. Shrub 1½ foot.

11 L. pube'scens (Decaisne, in ann. sc. nat. par. 1834. 2. p. 246.) hairy; stems strict; leaves pinnate: segments linear, entire, or a little cut; floral leaves membranous, about equal in length to the calyxes; spikes slender; flowers solitary, opposite. ♄.? G. Native on Mount Sinai, N. Bovè. This species appears intermediate between *L. multífida* and *L. coronopifòlia*, but differs in hairiness, in the stems being more leafy, in the spikes being more dense, and in the floral leaves being larger.

Downy Lavender. Shrub 1 to 2 feet.

12 L. coronopifòlia (Poir. dict. 2. p. 308.) glabrous; stems nearly naked; leaves pinnate: segments linear, entire; floral leaves very short, ovate, very acute; spikes slender; flowers solitary, opposite, remote. ♄.? G. Native of the East of Africa, and West of Asia; in Egypt, near Val de L' Egarement, in the desert of Suez, Delile; Persia, Burmann. Leaves 1-2 inches long, rather fleshy. Calyx rather cinereous. Corolla bluish; tube about twice as long as the calyx.

Buckhorn-leaved Lavender. Shrub.

Sect. IV. Chætόstachys (from χαιτη, *chaite*, a head of hair; and σταχυς, *stachys*, a spike.) Benth. in Wall. pl. asiat. rar. 2. p. 19. Lab. p. 151. Floral leaves 1-flowered, alternate, disposed in a rather loose branched spike: the upper ones not comose. Calyx 15-nerved, almost equally 5-toothed. Leaves deeply multifid.

13 L. Burma'nni (Benth. lab. p. 151.) clothed with fine pubescence; stems leafy; leaves bipinnate: segments linear, quite entire; floral leaves membranous, dilated at the base, setaceously acuminated; spikes rather dense; flowers solitary, alternate, approximate. ♃.? S. Native of the East Indies, Burmann, Klein, &c.; in the North of India, about Indor, Aurungabad, Drolulabad, and Ellora, Jacquemont. L. mutàbile, Burm. ind. 126. icon. t. 38. f. 1. but not of Lin. Bysteròpogon bipinnàtus, Roth. nov. spec. p. 225. Chætóstachys multífida, Benth. in Wall. pl. rar. asiat. 2. p. 19. Stem herbaceous, tetragonal. Margins of the segments of the leaves revolute. Spike generally branched. Corolla slender, exceeding the calyx.

Burmann's Lavender. Pl.?

Cult. All the species of Lavender are of easy culture and propagation, increasing readily either by seeds or cuttings. *L. vèra* and *L. spìca* are the only truly hardy species, all the rest requiring the protection of a greenhouse, or frame during winter. The *L. vèra* and *L. spìca* abide longer in a dry, gravelly, or poor soil, than in a rich earth, although in such

a soil they grow stronger; nor are the plants so strong scented, or fit for medicinal uses, as those which grow in barren, rocky places.

Tribe II.

MENTHOI'DEÆ (from *mentha*, mint; and *idea*, similar; so called from the plants contained in this tribe agreeing with the genus *Méntha* in the characters given below.) Benth. lab. p. 152. Corolla somewhat campanulate, or funnel-shaped; tube shorter than the calyx, or scarcely longer; limb 4-5-cleft; lobes nearly equal. Stamens distant, straight, or diverging, not approximate by pairs, nearly equal, or the lower ones are longest; the superior ones sometimes abortive; anthers confluently 1-celled, or somewhat parallelly 2-celled.

XVIII. POGOSTE'MON (from *πωγων*, *pogon*, a beard; and *στημων*, *stemon*, a stamen; in allusion to the filaments being generally bearded in the middle.) Desf. mem. mus. 2. p. 154. Benth. lab. p. 152. Méntha species, Roxb.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx ovate-tubular, equal, 5-toothed; throat naked inside. Corolla with an inclosed tube, and a quadrifid, somewhat bilabiate limb: upper lip trifid: lower one entire: lobes all entire, nearly equal, spreading. Stamens 4, exserted, straight, or a little declinate; filaments bearded in the middle, or naked; anthers terminal, 1-celled, dehiscing by a transverse chink. Style almost equally bifid: lobes subulate; stigmas minute, terminal.—Herbs. Leaves opposite, petiolate, entire, toothed, or cut. Whorls many-flowered, equal, or secund, sometimes propped by bracteas, glomerately spiked, the spikelets racemosely panicled: sometimes loosely approximate into simple, spike-formed racemes. This genus differs from *Dysophýlla* in the greater irregularity of the corolla; and from the other, *Menthoideæ*, in the unilocular anthers, and slight declination of the stamens.

§ 1. Panicula'tæ. *Flowers paniculately branched,* ex Benth.

1 P. panicula'tum (Benth. in Wall. pl. rar. asiat. 1. p. 30. lab. p. 153.) stem erect, downy, with erect pili; leaves unequally ovate, deeply serrated, narrowed at the base; whorls globose, secund, remote, racemose; racemes terminal; bracteas broad-ovate, membranous, exceeding the calyxes; calyx membranous, pubescent, with lanceolate teeth; filaments bearded. ♃. S. Native of the East Indies; as of Malabar and Tavoy, in humid places. Elshóltzia paniculàta, Willd. spec. 3. p. 59. Hyssòpus cristàtus, Lam. dict. 3. p. 187. Manam podam, Rheed. mal. 10. p. 129. t. 65. Leaves 3 inches long. Whorls distinct. Corollas slender.

Panicled Pogostemon. Pl. 2 to 3 feet.

2 P. plectranthoìdes (Desf. ann. mus. 2. p. 154. t. 6. Benth. lab. p. 153.) clothed with hoary pubescence; stem erect; leaves ovate, cuneated, or rounded at the base, doubly serrated; flowers sub-secund, glomerately spicate; spikes ovate-cylindrical, pedunculate, panicled; bracteas broad-ovate, striated, glandularly dotted, exceeding the calyxes; calyx membranous, hairy, glandularly dotted, with broad-lanceolate, acute teeth; filaments bearded. ♃. S. Native of the East Indies, in humid places; as of Hindostan, Nipaul, and Kamaon, Wall.; towards Deyra Dhoon, Roxb.; Kheeree pass, Royle; Java, at the foot of Mount Gede, Blume; and of the Mauritius, Herb. D. C. Sims, bot. mag. t. 3238. Oríganum Bengalénse, Burm. fl. ind. p. 128. t. 38. f. 1. bad. Méntha secúnda, Roxb. hort. beng. p. 44. Wénsea pyramidàta, Wendl. coll. 2. p. 26. t. 84. Branches bluntly tetragonal. Leaves 2-3 inches long. Whorls densely glomerate. Bracteas and calyxes coloured at top, villous. Genitals twice as long as the corolla. Corolla white. ?

Plectranthus-like Pogostemon. Fl. July. Clt. ? Pl. 2 to 3 feet.

3 P. villòsum (Benth. lab. p. 153.) villous; stem erectish; leaves ovate, rounded at the base, narrowed into the petioles, crenated; flowers sub-secund, glomerately spicate; spikelets cylindrical, nearly sessile, panicled; bracteas ovate, striated, pubescent, equalling the calyxes; calyx villous, with lanceolate, acute teeth; filaments bearded. ♃. S. Native of Silhet, Wall. Leaves about half the size of those of the preceding. Panicle denser, and narrower, raceme-formed. Corolla smaller.

Var. β, *macrophýllum* (Benth. lab. p. 154.) leaves twice as large as those of the species, less deeply and bluntly toothed. ♃. S.

Villous Pogostemon. Pl. 2 to 3 feet.

4 P. parviflòrum (Benth. in Wall. pl. rar. asiat. 1. p. 31. lab. p. 154.) stem ascending, finely pubescent; leaves smoothish, ovate-oblong, narrowed at the base, doubly crenated; flowers sub-secund, glomerately spicate; spikelets nearly sessile, racemose; racemes axillary, and terminal; bracteas ovate, striated, pubescent, exceeding the flowers; calyx villous, membranous, with narrow-lanceolate teeth; filaments bearded. ♃. S. Native of Silhet, Wall. Stem procumbent at the base, at length glabrous. Leaves 3-4 inches long, on short petioles. Panicle raceme-formed, more slender than in *P. plectranthoìdes*. Whorls, calyxes, and flowers one-half smaller. A variety of this was gathered by Jacquemont, at Saharumpur, with glabrous leaves, and villous panicles.

Small-flowered Pogostemon. Pl. 2 to 3 feet. ?

5 P. gla'brum (Benth. in Wall. pl. rar. asiat. 1. p. 31. lab. p. 154.) quite glabrous; stem erect; leaves ovate, narrowed at the base, crenated; whorls nearly equal, globose, spicate; spikes panicled; bracteas ovate, 3 times shorter than the calyx; calyx glabrous, with ovate-lanceolate teeth; filaments bearded. ⊙. S. Native of Nipaul, Wall. Perílla polystàchya, D. Don, prod. fl. nep. p. 115. Habit of *P. plectranthoìdes*, but differs in being glabrous in all its parts, &c. Stem tetragonal.

Glabrous Pogostemon. Pl. 2 to 3 feet.

6 P. tuberculòsum (Benth. l. c.) pubescent from short, stellate pili, which rise from tubercles; stem erect; leaves ovate, narrowed at the base, doubly serrated, tuberculately wrinkled on both surfaces; whorls equal, globose, remote, racemose; racemes panicled; bracteas minute; calyx tubercular, with subulate teeth; filaments bearded. ⊙. ? S. Native of Nipaul, Wall. Differs from *P. glàbrum* in being tubercular. Flowers nearly sessile.

Tubercled Pogostemon. Pl. 2 to 3 feet. ?

7 P. Heynea'num (Benth. l. c.) stem ascending, pubescent; leaves nearly glabrous, ovate, narrowed at the base, irregularly crenated; whorls sub-secund, interruptedly spiked; spikes panicled; bracteas ovate, almost nerveless, about equal in length to the calyxes; calyx pubescent, with ovate teeth; filaments bearded. ⊙. ? S. Native of the Peninsula of India, Java, Ceylon, in boggy places. Oríganum I'ndicum, Roth. nov. spec. p. 265. Cottam, Rheed. mal. 10. p. 153. t. 77. Differs from the preceding in the whorls being nearly all distinct. Corollas like those of *P. parviflòrum*.

Heyne's Pogostemon. Pl. 2 to 3 feet. ?

§ 2. Racemòsæ. *Racemes simple, somewhat spicate,* ex Benth.

8 P. vesti'tum (Benth. l. c.) clothed with tomentose wool; stem ascending; leaves ovate, crenated, subcordate at the base, wrinkled, clothed with soft tomentum: upper floral leaves shorter than the calyxes; racemes simple; whorls secund, approximate; bracteas linear-subulate; calyx villous, with lanceolate teeth; filaments bearded. ♄. ? S. Native of the Peninsula

of India, Heyne. Stems woody at the base. Raceme 2-3 inches long.

Clothed Pogostemon. Pl. ascending.

9 P. rotunda'tum (Benth. l. c.) villous; stem ascending; leaves roundish, doubly crenated, truncate at the base or cordate; upper floral leaves shorter than the calyxes; racemes simple; whorls equal, rather remote; bracteas linear-subulate; calyx villous, with lanceolate teeth; filaments bearded. ⊙.? S. Native of the peninsula of India, Heyne. Stem procumbent at the base. Raceme 2-3 inches long. Corolla small.

Roundish-leaved Pogostemon. Pl. 1 foot.

10 P. mólle (Benth. lab. p. 155.) clothed with soft villous tomentum; stem ascending; leaves broad-ovate, crenated, roundedly cuneated at the base: floral ones rather longer than the calyxes; racemes simple; whorls equal: lower ones remote: upper ones approximate; bracteas linear-subulate; calyx villous, with lanceolate-subulate teeth; filaments bearded. ⊙.? S. Native of the peninsula of India, among the mountains of Madura, Wight. Stem more branched than that of *P. rotundifòlium;* and the leaves more numerous, and not half the size, &c.

Soft Pogostemon. Pl. 1 to 2 feet.?

11 P. hirsu'tum (Benth. lab. p. 155.) hairy from adpressed pili; stem ascending; leaves petiolate, ovate, acuminated, serrated, rounded at the base; upper floral leaves shorter than the calyxes; racemes simple; whorls equal, distinct; bracteas linear-subulate; calyx hispid, with lanceolate, acute teeth; filaments shortly exserted, bearded. ⊙.? S. Native of Ceylon, Macrae. Racemes 2-3 inches long. Corollas small. Filaments densely bearded with purplish hairs.

Hairy Pogostemon. Pl. 1 to 2 feet.?

12 P. rupe'stre (Benth. lab. p. 156.) glabrous; stem creeping; branches ascending; leaves petiolate, ovate-lanceolate, coarsely-toothed, narrowed at the base: floral ones and bracteas minute; racemes simple; whorls remote, few-flowered; calyx glabrous, with ovate, short teeth; filaments bearded. ♃. S. Native of Ceylon, among rocks at Nuera Ellia, Macrae. Leaves 1 to 1½ inch long. Corollas minute.

Rock Pogostemon. Pl. creeping, 1 foot.?

13 P. speciòsum (Benth. l. c.) plant pilosely hispid; stem erect; leaves broad-ovate, cordate at the base, doubly crenated; racemes simple; whorls terete, loose, approximate; bracteas minute; calyx nearly glabrous, tubular, with subulate teeth; filaments naked. ⊙.? S. Native of the peninsula of India, among the mountains of Madura, Wight. This differs from the following, in the leaves being larger and broader, and cordate at the base; also in the spikes being dense, and in the genitals being much exserted.

Showy Pogostemon. Pl. 1 to 3 feet.?

14 P. Wi'ghtii (Benth. lab. p. 156.) plant pilosely hispid; stem erect?; leaves petiolate, ovate, acute, doubly toothed or cut, roundly cuneated at the base; racemes simple; whorls equal, approximate, or the lower ones are remote; bracteas linear-subulate; calyx glabrous, with lanceolate-setaceous, hispid teeth; filaments naked. ⊙.? S. Native of the peninsula of India, among the mountains of Madura. Leaves like those of *Làmium*. Corollas minute. Filaments glabrous, or finely pubescent.

Wight's Pogostemon. Pl.?

15 P. menthoi'des (Blum. bijdr. p. 825.) stem herbaceous; leaves ovate, acutish at both ends, doubly toothed above the base, pubescent; spike terminal, elongated, simple: whorls approximate; filaments naked. ⊙.? S. Native of Java, in humid woods on Mount Gede.

Mint-like Pogostemon. Pl.?

Cult. For culture and propagation see *Elshóltzia*, p. 714.

XIX. DYSOPHY'LLA (from δυσοδης, *dysodes*, fetid; and φυλλον, *phyllon*, a leaf; probably in reference to the offensive smell of the leaves.) Blum. bijdr. p. 826. Benth. lab. p. 156. —Chotèkia, Opiz. et Corda, in bot. zeit. 1830. 1. p. 33.—Méntha species of Lin.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, equal, 5-toothed; throat naked inside. Corolla with an inclosed tube, and a nearly equal, quadrifid limb: upper lobe entire or emarginate: lower one spreading a little. Stamens 4, exserted, straight or hardly declinate; filaments bearded in the middle; anthers terminal, 1-celled, dehiscing by a transverse chink. Style somewhat equally bifid at top: lobes subulate; stigmas minute, terminal.—Herbs, with opposite or verticillate leaves. Whorls many-flowered, densely approximate, or imbricate into terminal spikes. This genus differs principally from *Pogostèmon* in the more regular corolla.

§ I. Oppositifòliæ. *Leaves opposite.*

1 D. strigòsa (Benth. in Wall. pl. rar. asiat. 1. p. 30. lab. p. 157.) clothed with strigose, adpressed hairs; stem erect; leaves opposite, nearly sessile, lanceolate-ovate, coarsely serrated: floral ones lanceolate, shorter than the flowers; spikes thick, rather loose; calyx ovate, hairy, with subulate, erect teeth. ♃.? S. Native of Silhet, Wall. Leaves 1½ inch long. Spikes somewhat interrupted, 3-4 inches long. Corolla somewhat irregular. Intermediate between *Pogostèmon* and *Dysso-phylla.*

Strigose Dysophylla. Pl. 1½ foot.

2 D. myosuroi'des (Benth. l. c.) clothed with silky tomentum; stem erect; leaves opposite, on short petioles: floral ones ovate, minute; spikes dense; calyx tomentose, with short straight teeth. ♃.? S. Native of the peninsula of India. Méntha myosuroìdes, Roth, nov. spec. p. 257. Leaves irregularly subcrenated. Corollas very minute.

Mouse-tail-like Dysophylla. Pl. ½ to 1 foot.

3 D. auricula'ria (Blum. bijdr. p. 826.) clothed with soft spreading hairs; stems procumbent; leaves opposite, nearly sessile, ovate-oblong, coarsely serrated: floral ones ovate-lanceolate, about equal in length to the flowers; spikes very dense; calyx villous, with ovate teeth, which connive after florescence. ♃. S. Native of the East Indies, in the peninsula and islands of the Indian Archipelago, in ditches and bogs; Ceylon, Bengal, Penang, Bournou, Amboyna, and Moluccas. Méntha auriculària, Lin. mant. p. 81. Méntha fœ'tida, Burm. ind. p. 126. Majàna fœ'tida, Rumph. amb. 6. p. 41. t. 16. f. 2.

Auricled Dysophylla. Pl. procumbent.

§ 2. Verticilla'tæ. *Leaves verticillate.*

4 D. crucia'ta (Benth. l. c.) clothed with soft spreading hairs; stems elongated, procumbent, nearly simple; leaves 4 in a whorl, rarely 5 or 6, lanceolate, obtuse, quite entire, with revolute margins: floral ones lanceolate, about equal in length to the flowers; spikes dense; lower whorl distinct; calyx villous, with bluntish erectish teeth. ♃. S. Native of Nipaul. Méntha quadrifòlia, D. Don, prod. fl. nep. p. 113. but not of Roxb. Corollas purple.

Cruciate-leaved Dysophylla. Fl. July, Aug. Clt. 1820. Pl. procumbent.

5 D. quadrifòlia (Benth. l. c.) clothed with tomentose villi; stem erect; leaves 4 in a whorl, elliptic-linear, quite entire, or remotely serrated, narrowed at both ends: floral ones linear, shorter than the whorls; spikes elongated, rather interrupted at the base; calyx ovate, with narrow-lanceolate, acute, erect teeth. ♃. S. Native of the East Indies, in stagnant water

about Calcutta, Circars, Tavoy, &c. Méntha quadrifòlia, Roxb. hort. beng. p. 44. but not of D. Don. Chotèkia serícea, Opiz. et Corda, in bot. zeit. 1830. 1. p. 35.

Var. β, velutìna (Benth. lab. p. 158.) leaves nerved, narrowed into the petioles at the base. ♃. S. Native of the Pundua mountains. Leaves 1-3 inches long.

Four-leaved Dysophylla. Pl. 2 feet.

6 D. verticilla'ta (Benth. l. c.) glabrous; stem erect or ascending; branches and leaves 6-10 in a whorl; leaves long-linear, narrowed at both ends; spikes very dense; teeth of fructiferous calyx ovate, spreading in a stellate manner. ♃. S. Native of Bengal, Silhet, Cochinchina, in water; frequent in bogs in Goulburn Island, and on the north coast of New Holland. Méntha stellàta, Lour. coch. p. 361. Méntha verticillàta, Roxb. hort. beng. p. 44. Leaves 2-3 inches long, remotely serrated. Corollas minute, purple.

Verticillate Dysophylla. Pl. 1 to 1½ foot.

7 D. crassicau'lis (Benth. l. c.) glabrous; stem ascending, branched; leaves 4 in a whorl, sometimes 5 or 6, lanceolate-linear, dilated at the base, almost quite entire: floral ones lanceolate, exceeding the flowers; spikes elongated; calyx pubescent, with oblong, erectish teeth. ♃. S. Native of Silhet and Bengal. This species is intermediate between *D. verticillàta* and *D. mèdia*. Leaves 2 inches long, and more.

Thick-stemmed Dysophylla. Pl. 1 to 1½ foot.

8 D. pu'mila (Benth. l. c.) glabrous; stem ascending, branched; leaves 4 in a whorl: lower ones usually 6, elliptic-linear, narrowed at both ends, remotely serrated: floral ones ovate; calyx villous, campanulate, inflated in the fructiferous state, with bluntish, erectish teeth. ♃. S. Native of Nipaul, Wall.; Cashmere, Jacquemont. Méntha pùmila, Graham, in edinb. phil. journ. 1828. p. 393. Méntha verticillàta, D. Don, prod. fl. nep. p. 114. Hook. in bot. mag. 2907. but not of Roxb. Herb aquatic, like the rest. Corollas purple.

Dwarf Dysophylla. Fl. July, Sept. Clt. 1826. Pl. ½ foot.

9 D. stella'ta (Benth. l. c.) glabrous or pubescent at top; stem creeping; branches erect, nearly simple; leaves 6-8 in a whorl, narrow-linear, about equal in length to the internodes, quite entire: floral ones subulate; calyx villous, ovate, with erect, acutish teeth. ♃. S. Native of Malabar and Mysore. Méntha stellàta, Hamilt. mss. but not of Lour. Méntha quaternifòlia, Roth, nov. spec. p. 256. ?—A small plant, with the habit of *Gàlium vèrum*. Spikes dense, villous, 1-3 inches long. Corollas small, purple: upper tooth emarginate.

Starry-leaved Dysophylla. Pl. ¼ to ½ foot.

Cult. Most of the species would grow well in the open air in summer, if planted in a cistern or pond; but in winter, they will require the protection of a greenhouse or stove; they are readily increased by separating the shoots.

XX. ELSHO'LTZIA (named after J. S. Elsholtz, a Prussian botanist.) Willd. in Uster. mag. 2. p. 5. t. 1. spec. 3. p. 29. Benth. lab. p. 160. Méntha species, Roxb. and other authors. Perílla species, D. Don. Aphanochìlus, Benth. in bot. reg. 15. Cyclostègia, Benth. l. c.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx ovate or campanulate, nearly equal, 5-toothed; throat naked inside, often elongated in the fructiferous state. Corolla having the tube equal in length to the calyx, rarely longer: limb mostly 4-lobed: upper lobe erectish, somewhat concave, emarginate: lower ones spreading. Stamens 4, usually exserted, distant: lower ones rather the longest; filaments naked; cells of anthers diverging or divaricate, at length confluent. Style almost equally bifid at top: lobes subulate; stigmas nearly terminal. Achenia ovoid, small, smoothish.—Herbs or subshrubs. Flowers minute. Whorls many-flowered, disposed into spikes, which are sometimes loose, slender, terete or secund, and sometimes densely imbricated. Spikes usually numerous, panicled.

Sect. I. Aphanochi'lus (from αφανης, *aphanes*, obscure; and χειλος, *cheilos*, a lip.) Benth. in Wall. pl. rar. asiat. 1. p. 28. t. 24. lab. p. 161. Spikes usually loose and panicled, equal, with ovate or lanceolate floral leaves; or somewhat secund, densely imbricated by lanceolate or subulate floral leaves. Cells of anthers diverging or divaricate, at length confluent.

1 E. fla'va (Benth. lab. p. 161.) suffruticose, erect; leaves petiolate, ample, broad-ovate, acuminated, nerved: floral ones bractea-formed, ovate-lanceolate, acuminated, about equal in length to the calyxes; spikes loose, terete, axillary and terminal; corolla about twice as long as the calyx. ♄. G. Native of Nipaul, on Sheopore, and towards Gosainsthan, Wall.; at Kidarkonta, Royle. Aphanochìlus flàvus, Benth. in Wall. pl. rar. asiat. 1. p. 28. t. 34. Plant clothed with canescent pubescence. Leaves a hand long. Corollas yellow.

Yellow-flowered Elsholtzia. Shrub 2 feet.

2 E. polysta'chya (Benth. lab. p. 161.) suffruticose, erect; branches pubescent; leaves petiolate, oblong, narrowed at both ends, nerved: floral ones bractea-formed, minute; spikes loose, terete, panicled; corolla about 3 times longer than the calyx. ♄. G. Native of Nipaul, on the high mountains of Sheopore and Chandaghiri, Wall.; Mussooree, Royle. Perílla fruticòsa, D. Don, prod. fl. nep. p. 115. Aphanochìlus polystàchya, Benth. in Wall. pl. asiat. rar. 1. p. 28. t. 33. Méntha fruticòsa, Roxb. Plant pubescent, but not canescent. Leaves crenated in the upper part, 3-4 inches long, and 1½ broad.

Many-spiked Elsholtzia. Shrub 3 to 6 feet.

3 E. Stauntònii (Benth. lab. p. 161.) suffruticose, erect; branches glabrous; leaves petiolate, oblong-lanceolate, acuminated, serrately crenated, narrowed a long way at the base, quite glabrous on both surfaces; floral leaves bractea-formed, minute; spikes elongated, canescent, somewhat panicled; whorls rather loose, secund; corollas about twice as long as the hoary calyx. ♄. G. Native of China, between Pekin and Jehol, Sir G. Staunton. This species differs from *E. polystàchya*, in the branches being quite glabrous, in the leaves being narrower, &c. Stamens much exserted.

Staunton's Elsholtzia. Shrub.

4 E. leptosta'chya (Benth. lab. p. 718.) suffruticose, erect; leaves nearly sessile, ovate, narrowed at both ends: floral ones bractea-formed, membranous, oblong, equalling the calyxes; spikes slender, elongated, interrupted; flowers minute; corollas twice as long as the calyx. ♄. G. Native of Cashmere, Jacquemont. This differs from *E. polystàchya*, in the leaves being one half shorter, and in the flowers. Whorls all distinct, small, dense. Spikes canescent, 2-3 inches long.

Slender-spiked Elsholtzia. Shrub.

5 E. bla'nda (Benth. lab. p. 162.) plant herbaceous, canescent; leaves oblong, narrowed at both ends: floral ones lanceolate-subulate; whorls loose, secund; spikes panicled; corolla hardly exceeding the calyx. ♃. G. Native of Nipaul, Silhet, and Ava, Wall.; and of Arabia, on Mount Horeb. Méntha blánda, Wall. mss. Perílla elàta, D. Don, prod. fl. nep. p. 115. Aphanochìlus blándus, Benth. in Wall. pl. rar. asiat. 1. p. 29. Hook. bot. mag. 3091. Leaves about 2 inches, remotely serrated, canescent beneath. Corollas whitish. Odour of plant weak, but aromatic.

Blush Elsholtzia. Fl. Sept. Clt. 1824. Pl. 1 to 2 feet.

6 E. inci'sa (Benth. lab. p. 162.) herbaceous, nearly glabrous; leaves petiolate, rhomboid-ovate, deeply serrated; whorls equal, loose; spikes panicled; corollas hardly exceeding the calyxes. ♃. G. Native of the East Indies, in Deyra

Dhoon, Royle; Nipaul, and of Ava, at Taong-Dong, Wall. Méntha incìsa, and M. fœ'tens, Wall. mss. Méntha blánda, D. C. pl. rar. hort. gen. p. 23. t. 8. Perílla leptostàchya, D. Don, prod. fl. nep. p. 115. Hýptis stachyoìdes, Link, enum. 2. p. 106. Aphanochìlus, fœ'tens, Benth. in Wall. pl. rar. asiat. 1. p. 30. Allied to *E. blánda*, but more humble. Leaves 1 to $1\frac{1}{4}$ inch long. Calyx pubescent. Corollas minute, white.

Cut-leaved Elsholtzia. Fl. Sept. Clt.? Pl. $\frac{1}{2}$ to 1 foot.?

7 E. pube'scens (Benth. lab. p. 162.) herbaceous; stem tomentosely pubescent; leaves on short petioles, ovate-oblong, acute, crenately serrated, quite entire at the base, nearly glabrous above, and clothed with fine tomentum beneath; whorls equal, dense; corolla scarcely exceeding the calyx. ♃. S. Native of Java, Commerson. Leaves glandularly dotted beneath. Lower whorls distinct. Axis of spike hispid. Calyx villous. Two of the stamens exserted.

Downy Elsholtzia. Pl.?

8 E. molli'ssima (Benth. lab. p. 163.) herbaceous, clothed with tomentose villi; leaves on short petioles, ovate-oblong, acute, crenated, roundish at the base or narrowed; whorls equal, dense; corolla hardly exceeding the calyx. ♃. S. Native of Java, Leschenault. Calyx villous. Corollas and stamens as in *E. pubéscens*.

Very-soft Elsholtzia. Pl.

9 E. integrifòlia (Benth. lab. p. 714.) herbaceous, pubescent; leaves on short petioles, oblong-linear or lanceolate, obtuse, quite entire: floral ones bractea-formed, ovate, shorter than the flowers; whorls interruptedly spicate. ♃. G. Native of China, Sir G. Staunton. Habit of *E. pubéscens* and *E. mollissima*. Lower whorls distant. Calyx pubescent. Corollas small.

Entire-leaved Elsholtzia. Pl.

10 E. pilòsa (Benth. lab. p. 163.) herbaceous, pilosely hispid; leaves petiolate, ovate or ovate-lanceolate: floral ones bractea-formed, subulate, imbricate, exceeding the flowers; whorls densely imbricate; spikes hispid, panicled. ⊙. H. Native of Nipaul. Aphanochìlus pilòsus, Benth. in Wall. pl. rar. asiat. 1. p. 30.—An annual procumbent herb. Leaves obtuse, crenated. Corollas minute.

Pilose Elsholtzia. Pl. procumbent.

11 E. eriosta'chya (Benth. lab. p. 163.) herbaceous, pubescent; leaves on short petioles, ovate-lanceolate: floral ones bractea-formed, ovate, shorter than the flowers; whorls densely imbricate; spikes tomentose, panicled. ♃.? G. Native of Nipaul and Buddrinath, Wall. Habit almost of *E. strobilífera*. Leaves serrately crenated, villous above and tomentose beneath. Calyx clothed with woolly tomentum. Corolla exceeding the calyx, yellow.

Woolly-spiked Elsholtzia. Pl. 1 foot.

12 E. de'nsa (Benth. lab. p. 714.) herbaceous, pubescent; leaves petiolate, oblong-lanceolate: floral ones bractea-formed, ovate-roundish, shorter than the flowers; whorls dense, imbricate; spikes tomentosely villous; fructiferous calyx inflated, globose. ♃.? G. Native of the north of India, in gravelly places at Ovelia, Rici, and Yonnedeh-Seursing, Jacquemont.—Very nearly allied to *E. eriostàchya*, but less villous; leaves narrower and longer; spikes densely woolly, and the fructiferous calyxes double the size. Corollas purple.

Dense-flowered Elsholtzia. Pl.

13 E. pusi'lla (Benth. lab. p. 714.) small, nearly simple, and almost glabrous; stem filiform; leaves ovate, quite entire; flowers few, subcapitate. ♃.? G. Native of Cashmere, in high grassy places beyond the Kioubrong, Jacquemont. Calyx pubescent. Corolla yellow, about twice as long as the calyx. Stamens inclosed, the two superior ones small or abortive.

Least Elsholtzia. Pl. $\frac{1}{4}$ foot.

Sect. II. Cycloste'gia (from κυκλος, *cyklos*, a circle; and στεγος, *stegos*, a covering; in reference to the cup-shaped floral leaves.) Benth. lab. p. 163. Cyclostègia, Benth. in. bot. reg. vol. 15. Spikes densely imbricate. Floral leaves connate, membranous, veiny, imbricate, cup-shaped, with ciliated margins. Anthers ovate, with confluent cells.

14 E. strobili'fera (Benth. lab. p. 163.) herbaceous; leaves petiolate, ovate: floral ones connate, cup-shaped, membranous, veiny, with ciliated edges; spikes imbricate, terminal, somewhat panicled. ♃.? S. Native of the mountains of Nipaul, and at Gosainsthan, Wall.; Kidarkonta, Royle. Cyclostègia strobilífera, Benth. in Wall. pl. rar. asiat. 1. p. 30. exclusive of the syn. of Rumph.—Herb glabrous or hairy at the base and at the axils. Spikes cylindrical. Flowers inclosed in the floral leaves. Odour gratefully aromatic.

Strobile-bearing Elsholtzia. Pl. $\frac{1}{2}$ to 1 foot.

Sect. III. Elshóltzia (see genus for derivation.) Benth. lab. p. 164. Elshóltzia, Willd. spec. 3. p. 29. Spikes dense, and are, as well as the floral leaves, secund. Anthers linear, with divaricate cells.

15 E. crista'ta (Willd. spec. 3. p. 29. and in Uster. mag. 2. p. 5. t. 1.) herbaceous, nearly glabrous; leaves petiolate, ovate or oblong, narrowed at both ends: floral ones broad-ovate, acute, ciliated, secund; whorls approximate, secund; spikes panicled. ⊙. H. Native throughout Asia, and also the south of Europe, but probably migrated from Asia; of Siberia, about Lake Baical, and the Altaian mountains. Sims, bot. mag. 2560. Lam. ill. t. 502. f. 1. Méntha ovàta, Cav. icon. 4. p. 36. t. 360. f. 1. Méntha Patrìnii, Lepech. in nov. act. petrop. 1. p. 336. t. 8. Hyssòpus ocymifòlius, Lam. dict. 3. p. 187. Hyssòpus bracteàtus, Gmel. An erect branched herb. Floral leaves exceeding the flowers. Calyxes ciliately hairy. Bracteas minute, linear. Corollas pale purple, minute. Odour of plant aromatic.

Crested-flowered Elsholtzia. Fl. May, July. Clt. 1789. Pl. 1 to $1\frac{1}{2}$ foot.

Cult. All the species are of easy culture, and will grow well in any rich light soil. The shrubby kinds are readily increased by cuttings: the perennial herbaceous species by division or by cuttings; and in summer they will all thrive in the open border; but in winter they require protection. The seeds of annual kinds only require to be sown in open borders, like those of other hardy annuals.

XXI. TETRADE'NIA (from τετρα, *tetra*, four; and αδην, *aden*, a gland; there are 4 glands on the disk or receptacle of the achenia.) Benth. in bot. reg. vol. 15. lab. p. 164. but not of Nees in Wall. pl. rar. asiat. 2. p. 57.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, 5-toothed: upper tooth the broadest: throat naked inside. Corolla with an inclosed tube, and a campanulate 5-cleft limb: lobes ovate, nearly equal. Stamens 4, equal, erect, distant; cells of anthers confluent, with reflexed valvules. Style shortly bifid at apex. Lobes of ovarium hidden by the 4 glands of the disk.—A shrub, with tetragonal branches, clothed with hoary or rufous tomentum. Leaves petiolate, oblong, crenated, rounded at the base, green above. Whorls 6-10-flowered, spicate. Spikelets numerous, racemosely panicled; panicle much branched, dense. Flowers minute, sessile. Glands red, 3 times as long as the ovaria.

1 T. fruticòsa (Benth. l. c.) ♄. S. Native of Madagascar, Hels. et Bojer. Méntha fruticòsa, Helsing and Bojer. mss.

Shrubby Tetradenia. Shrub.
Cult. For culture and propagation see *Erìope*, p. 708.

XXII. COLEBROO'KIA (named in honour of Henry Thomas Colebrooke, F.R.S., F.L.S., &c., an accomplished botanist.) Smith, exot. bot. 2. p. 111. Benth. lab. p. 165.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, equal, 5-parted, plumose, pappous at maturity, adhering to the achenia. Corolla with the tube equalling the calyx: the limb very short, nearly equal, 4-cleft: upper lobe emarginate. Stamens 4, equal, distant; filaments very short; anthers nearly sessile, 2-celled: cells parallel. Disc of ovarium equal, glandless. Style deeply bifid: lobes subulate, stigmatiferous in the upper part.—Shrubs, densely clothed with whitish or subrufous woolly tomentum. Leaves petiolate, 4-6 inches long, oblong-elliptic, crenulated; lower floral leaves similar, but smaller: upper ones bractea-formed, imbricate before florescence. Spikelets 1-3 inches long, pedunculate, panicled. Cymes of whorls distinct, head-formed, dense, sessile, involucrated by bracteas which are connate at the base. Flowers small, white. Corolla tubular, contracted in the middle.

1 C. oppositifòlia (Smith, exot. bot. 2. p. 111. t. 115.) branches, leaves, and spikes opposite. ♄. S. Native of Nipaul and Kamaon. Elshóltzia oppositifòlia, Poir. suppl. 5. p. 663. (fig. 75.)

Opposite-leaved Colebrookia. Fl.? Clt. 1820. Shrub 3 to 4 feet.

2 C. ternifòlia (Roxb. corom. 3. p. 40. t. 245.) branches, leaves, and spikes, 3 in a whorl. ♄. S. Native of the East Indies, among the Carnatic mountains, Roxb. Leaves more tomentose, and on shorter petioles than the first species, and the spikelets are more dense.

FIG. 75.

Tern-leaved Colebrookia. Clt. 1823. Shrub 3 to 4 feet.
Cult. For culture and propagation see *Erìope*, p. 708.

XXIII. PERI'LLA (meaning unknown to us.) Lin. gen. 578. Benth. lab. p. 166.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, nearly equal at the time of florescence, 5-cleft, nutant after florescence, and bilabiate: upper lip dilated, trifid: middle tooth the smallest: lower lip bifid; throat naked inside. Corolla almost equalling the calyx, nearly equal; limb shortly 5-cleft. Stamens 4, nearly equal, distant, erect, equalling the corolla; anthers 2-celled: cells parallel, at length diverging, or sub-divaricate. Style deeply bifid; stigmas terminal. Achenia dry, smooth.—An herb, with the inflorescence almost of the genus *Moschósma*, and with the flowers disposed in axillary and terminal secund spikes.

1 P. ocymoìdes (Lin. gen. 578. Sims, bot. mag. 2395.) ⊙. H. Native of Silhet, Kamaon, Nipaul, and Ava. O'cymum frutéscens, Lin. spec. p. 832. Melìssa máxima, Arduin. spec. 2. p. 28. t. 13. Méntha perilloìdes, Lam. dict. 4. p. 112. but not of Lin. Stem pilose, bluntly tetragonal. Leaves petiolate, 2-4 inches long, ovate, acuminated, coarsely serrated, cuneated at the base, or narrowed into the petioles, green on both surfaces, pilose on the veins. Racemes shorter than the leaves. Corolla minute, white.

Basil-like Perilla. Fl. July, Aug. Clt. 1770. Pl. 1 to 3 feet.
Cult. Sow the seeds in the open ground, where the plant will thrive without any further care.

XXIV. ISA'NTHUS (from ισος, *isos*, equal; and ανθος, *anthos*, a flower; in allusion to the corolla being regular, not bilabiate.) Michx. fl. bor. amer. 2. p. 3. Benth. lab. p. 166.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, equal, 10-nerved, deeply 5-toothed; throat naked inside. Corolla hardly exceeding the calyx, with a short, straight tube, and a campanulate limb: lobes 5, equal, roundish, spreading. Stamens 4, nearly equal, distant, erect, about equal in length to the corolla; anthers 2-celled: cells parallel, or at length diverging. Style shortly bifid at apex: lobes subulate; stigmas terminal. Achenia dry, obovate, reticulated, lacunosely wrinkled.—A herb with the habit and inflorescence of *Saturèia horténsis.*

1 I. cæru'leus (Michx. fl. bor. amer. 2. p. 4. t. 30.) ⊙. H. Native of North America, in Pennsylvania, Maryland, and Virginia, Nutt.; Carolina and Kentucky, Michx.; at St. Louis, Drummond. Trichostèma brachiàta, Lin. spec. 834. Plant erect, branched, rather viscid; branches pubescent, or pilose. Leaves on short petioles, oblong-elliptic, narrowed at both ends, with quite entire, or sub-sinuated edges, 3-nerved, green on both surfaces, glabrous, but usually pubescent, or pilose. Peduncles solitary, axillary, 1-flowered, shorter than the leaves, usually bibracteate under the calyx. Corollas like those of *Méntha*, pale blue.

Blue-flowered Isanthus. Fl. July, Aug. Clt. 1818. Pl. ½ to 1 foot.
Cult. The seeds should be sown in spring in a peat border, where the plants will flower and produce seed if the summer prove warm.

XXV. PRE'SLIA (named in honour of C. B. and J. S. Presl. of Prague, brothers; authors of "Flora Sicula, Diliciæ Pragensis, &c.") Opiz. in bot. zeit. 1824. 1. p. 322. Benth. lab. p. 167. but not of Mart.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, equal, 4-toothed; teeth awned; throat rather villous inside. Corolla equal, with an inclosed tube, and a 4-parted limb; lobes equal, entire. Stamens 4, equal, distant, erect; filaments glabrous; anthers 2-celled: cells parallel. Style bifid at top; lobes nearly equal, bearing the stigmas at apex. Achenia oblong, smooth, dry.—A bog herb, with the habit of *Saturèia*, and the inflorescence of *Méntha verticillàta.*

1 P. Cervi'na (Fresen. in syll. pl. soc. ratisb. 2. p. 238.) ♃. H. Native of Middle and South Europe, in bogs and ditches; as of the South of France, Spain, and Portugal. Méntha cervìna, Lin. spec. 807. Méntha punctàta, Mœnch. Pulègium cervìnum, Mill. dict. no. 3. Pulègium angustifòlium, Riv. mon. irr. t. 23. f. 2. Préslia glabriflòra, Opiz, in bot. zeit. 1824. 1. p. 323. Préslia villiflòra, Opiz, l. c. Herb prostrate, glabrous. Leaves sessile, linear, or linear-lanceolate, obtuse, quite entire, green on both surfaces, dotted, somewhat fascicled in the axils. Whorls many-flowered, dense, distant, rather shorter than the floral leaves. Corollas pale purplish, about twice as long as the calyxes.

Stag Preslia. Fl. June, Aug. Clt. 1684. Pl. prostrate.
Cult. This plant will grow freely in most soils, and is readily increased by division. It requires a little protection in severe frost.

XXVI. ME'NTHA (Mentha of Pliny. Μινθη, *Minthe*, of Theophrastus. From a nymph of that name, daughter of Cocytus, fabled to have been changed into mint by Proserpine in a fit of jealousy.) Lin. gen. no. 713. Schreb. gen. no. 967. Juss. gen. p. 113. ed. Usteri, p. 127. Tourn. inst. t. 89. Benth. lab. p. 168.

LIN. SYST. *Didynàmia, Gymnospérmia.* Calyx campanulate, or tubular, 5-toothed, equal, or sub-bilabiate; throat naked, or villous inside. Corolla with an inclosed tube, and a campanulate, nearly equal, 4-cleft limb: upper segment broader, and nearly entire, or emarginate. Stamens 4, equal, erect, distant; filaments glabrous, naked; anthers 2-celled: cells parallel. Style shortly bifid; segments bearing the stigmas at apex. Achenia dry, smooth.—Herbs. Whorls usually many-flowered, sometimes all remote in the axils of the leaves, sometimes approximate into terminal spikes, with the superior floral leaves bractea-formed.—The European mints, as is generally the case with plants which are very common in highly civilized and long cultivated countries, especially aquatic plants, vary much in appearance; and the repeated attempts by different authors in different countries to reduce these inconstant and ephemeral variations to so many species, have thrown so much confusion into this difficult genus that it is now almost impossible to clear up the chaos thus produced, ex Benth.

* *Throat of corolla naked inside.*

1 M. LAVANDULA'CEA (Willd. enum. p. 609.) canescent; leaves sessile, lanceolate-linear, quite entire, clothed with hoary tomentum on both surfaces; spike dense; calyxes clothed with white tomentum. ♃. H. Native of Spain; on Mount Sinai, Bovè; and of the Cape of Good Hope. M. lavandulæfòlia, Pers. ench. 2. p. 119. Stem erect, branched. Leaves 1½ to 2 inches long. Spikes solitary, conical at first, but at length somewhat interrupted at the base. Bracteas subulate. Corollas purple. ? Whorls many-flowered.

Lavender-like Mint. Fl. July, Aug. Clt. 1823. Pl. 1 to 2 feet.

2 M. INCA'NA (Willd. enum. p. 609.) stem humble, panicled; leaves nearly sessile, ovate-cordate, a little toothed, clothed with hoary tomentum on both surfaces; spikes numerous, short; calyxes clothed with villous tomentum. ♃. H. Native of Greece, and probably of Persia and Arabia. M. spicàta, Forsk. in herb. Vahl. M. Crética, and M. Pérsica, Hortul. Stems ascending. Spikes hardly an inch long, panicled. Whorls 8-flowered. Corolla twice as long as the calyx, downy outside, purple. ?

Hoary Mint. Fl. July, Aug. Clt. 1790. Pl. ½ foot.

3 M. TOMENTÒSA (D' Urv. mem. soc. Lin. par. 1. p. 323. but not of Borkh.) canescent; stem erect, or ascending, tall; leaves sessile, lanceolate, or ovate-lanceolate, irregularly serrated, somewhat reflexed, plicate, undulately curled, clothed with white tomentum on both surfaces; spikes elongated, cylindrical, interrupted at the base, somewhat panicled; calyx clothed with tomentose pubescence. ♃. H. Native of Crete, Syria; Greece, at fountains in the Island of Scyra, D'Urville; Persia, near Teheran. Stems erect, rarely procumbent at the base, or ascending. Leaves roundish, or cordate at the base. Spikes numerous, 3-4 inches long, or more. Whorls distinct, many-flowered. Bracteas subulate. Corolla purple, ? downy outside. Fertile stamens exserted.

Tomentose Mint. Pl. 2 to 3 feet.

4 M. SALI'CINA (Burch. cat. geo. pl. afr. austr. 1372. Benth. lab. p. 170.) canescent; stem erect; leaves petiolate, lanceolate-linear, almost entire, nearly glabrous above, and hoary beneath; spikes cylindrical. ♃. G. Native of the Cape of Good Hope. M. Capénsis, Thunb. prod. p. 95. ? Leaves size and form of those of *M. lavandulàcea*, but are nearly glabrous above.

Willowy-leaved Mentha. Pl.

5 M. ROYLEA'NA (Benth. in Wall. pl. rar. asiat. 1. p. 29.) plant clothed with white tomentum; leaves petiolate, ovate-oblong, unequally serrated; spikes elongated, slender, interrupted at the base. ♃. H. Native of Deyra Dhoon, Royle; and at Simlah. Habit of M. sylvéstris, var. híspida. Whorls distinct, numerous, small, globose: lower ones remote. Flowers minute, nearly sessile. Corollas small, whitish. Fertile stamens about equal in length to the corolla.

Royle's Mint. Pl. 1 to 2 feet.

6 M. SYLVE'STRIS (Lin. spec. 804.) stem erect; leaves nearly sessile, ovate-lanceolate, or oblong, pubescent above, or tomentose, but clothed with white tomentum beneath; spikes dense, or interrupted at the base, conically cylindrical; calyx clothed with villous tomentum. ♃. H. Native throughout Europe, North of Asia, and Canary Islands, in ditches and boggy places common. Spikes usually dense, obtuse, but in some of the varieties interrupted at the base. Corolla purplish, pubescent outside. Fertile stamens exserted.

Var. α, mollíssima (Benth. lab. p. 171.) leaves clothed with soft white tomentum on both surfaces. ♄. H. Native of Greece, Dalmatia, Spain, Canary Island, Cashmere; also of England, and Germany, but rare. M. mollíssima, Borkh. M. incàna, Sole herb. Smith, in Rees' cycl. vol. 23. M. canéscens, Roth, catalect. 2. p. 46. M. Chalepénsis, Mill. dict. no. 10.

Var. β, cándicans (Benth. lab. p. 171.) leaves clothed with short, hoary tomentum on both surfaces. ♃. H. Native in the same countries and places with var. α. M. cándicans, Crantz. austr. p. 330. M. pállida, Nees. M. sylvestris cándicans, Rchb. icon. bot. 10. p. 28. t. 982. M. sylvéstris álbida, Rchb. icon. bot. 10. p. 28. t. 983.

Var. γ, glabràta (Benth. lab. p. 171.) leaves almost glabrous above, pubescent and rather hoary beneath. ♃. H. Native of Britain, South of Sweden, Denmark, throughout Germany, France, Portugal, Italy, Spain, Sicily, Greece, European Russia, Tauria, Caucasus, Siberia, Cape of Good Hope, Teneriffe, &c. M. Rosàni, Tenore, fl. nap. append. 5. p. 18. syll. p. 281. M. Eisenstadtiàna, Nees.

Var. δ, vulgàris (Benth. l. c.) leaves pubescent above, rather wrinkled, clothed with soft white tomentum beneath. ♃. H. Native in the same countries and places with var. γ. M. cándicans, Mill. dict. M. villòsa, Sole, menth. brit. t. 1. & 2. M. sylvéstris, α, Smith, in Lin. trans. 5. p. 179. engl. bot. t. 686. bad. M. gratíssima, Willd. spec. 3. p. 75. M. M. suavèolens, Ehrh. beitr. 7. p. 149. ex Fresen. l. c. Stem panicled by a few branches at top. Leaves usually obtuse, roundish cordate at the base. Corollas whitish. Sterile stamens exserted.

Round-leaved Mint. Fl. July, Sept. Britain. Pl. 1 to 2 feet.

8 M. PRATE'NSIS (Sole, menth. brit. t. 17.) leaves nearly sessile, ovate-lanceolate, or oblong, serrated, glabrous, or finely pubescent, as well as the erect stem: floral leaves similar, but smaller: superior ones broad-lanceolate, about twice as long as the whorls; whorls all remote, globose; pedicels glabrous; calyx campanulate, with hairy teeth. ♃. H. Native of the North of Europe?; in England in ditches and watery places, but hardly spontaneous, Sole; Sweden, in cultivated places, apparently wild. M. rùbra, Huds. angl. ex Fries, nov. fl. suec. ed. 2d. p. 179. but not of Smith. M. gentìlis, Sole, menth. brit. t. 15. Smith, engl. bòt. 7. t. 449. M. grácilis, γ, Smith, in Lin. trans. 5. p. 210. Stem purplish red, with short, erect branches, glabrous, or furnished with a few spreading hairs. Cauline leaves deep green, or reddish, glabrous above, but paler beneath, with a few hairs on the veins. Whorls dense. Corolla purplish, glabrous, or pubescent outside. Stamens all inclosed. Style exserted.

Meadow Mint. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

9 M. SUA'VIS (Guss. pl. rar. p. 387. t. 66.) clothed with soft pubescence, or villi; leaves petiolate, ovate, acute, serrated, rounded at the base, pale beneath, or hoary: floral leaves small, lanceolate, or conforming to the lower cauline ones; whorls distinct: lower ones remote: upper ones disposed in a cylindrical spike. ♃. H. Native of the South of France, Italy, and Sicily. M. pubéscens, Willd. enum. p. 608.? M. divaricàta, Lag.? M. balsàmea, Willd. enum. p. 608.? M. hírta, Willd. enum. l. c. Link, enum. 2. p. 105. M. pubéscens, Rchb. icon. bot. 10. p. 27. t. 978. M. glomerulàta, Jan. M. Lángii, Geiger, pharm. bot. 1832. and Nees, pl. med. with a figure. Leaves more or less canescent beneath. Stem usually decumbent at the base, branched; branches ascending, rarely erectish. Leaves like those of *M. Piperìta*, but soft: upper ones exceeding the whorls. Corolla red, hardly exceeding the calyx. Stamens inclosed. Style exserted.

Sweet Mint. Fl. July, Aug. Clt. 1804. Pl. 1 to 2 feet.

10 M. VÍRIDIS (Lin. spec. 804.) stem erect; leaves nearly sessile, ovate-lanceolate, unequally serrated, and are, as well as the stems, glabrous: floral ones all bractea-formed, rather longer than the whorls, and are, as well as the calyxes, hairy, or glabrous; spikes cylindrical, loose; whorls approximate, or the lower ones or all are distant. ♃. H. Native of the temperate parts of Europe, among rubbish; in England and Scotland, France, &c.; also at the Cape of Good Hope, and North and South America, but probably has been carried thither from Europe. Sole, menth. brit. t. 5. Nees, pl. med. with a figure. Smith, engl. bot. t. 2424. Fl. dan. 1876. M. verticillàta, Feuill. chil. p. 42. t. 28. M. spicàta, Crantz, austr. 328. M. ocimiodòra, Opiz. M. brevispicàta, Lehm. sem. hort. hamb. 1828. M. balsàmea, Rchb. fl. germ. exc. p. 309.? but not of Willd. M. lævigàta, Willd. enum. p. 609. N. Nilìaca, Vahl, symb. 3. p. 75. M. Pudìna, Hamilt. ex Benth. in Wall. pl. rar. 1. p. 29. M. tènuis, Michx. fl. bor. amer. 2. p. 2. Stature, habit, and form of leaves that of *M. sylvéstris*, but is easily distinguished from that species by the stems and leaves being constantly quite glabrous. Spikes usually hairy, but sometimes also glabrous. Corollas purplish. There are several species of Mint cultivated in gardens for culinary purposes, but principally spearmint. The young leaves and tops of it are used in spring salads, and form an ingredient in soups. They are also employed to give flavour to certain dishes, as peas, &c., being boiled for a time, and then withdrawn, in the manner of garlic. The leaves have a warm, roughish, bitter taste, and a strong, not unpleasant smell. Their virtues are stomachic and carminitive. The culture of spearmint is the same as that for peppermint, which see. In order to have young leaves and tops all the summer, cut down some advanced stalks every month, when young shoots will be produced; and to have dried balm for winter, permit others to complete their growth, and come into blossom. Dry the crop thus gathered in the shade, and afterwards keep it in small bundles. (fig. 76.)

FIG. 76.

Var. β, *angustifòlia* (Lag. ex Benth. lab. p. 174.) leaves narrow. ♃. H. M. tenuifòlia, Opiz, ex Rchb. fl. germ. exc. p. 309. M. Lejeùnii, Opiz, ex Rchb. l. c. M. Michèlii, Rchb. icon. bot. 10. p. 27. t. 981.

Green Mint, or Spearmint. Fl. July, Aug. Britain. Pl. 2 feet.

11 M. PIPERÌTA (Lin. spec. 805.) leaves petiolate, ovate-oblong, acute, serrated, roundly crenated at the base, and are, as well as the stems, glabrous; spikes loose, obtuse, short, interrupted at the base; pedicels and calyxes glabrous at the base, with hispid teeth. 4. H. Native of the North of Europe, spontaneous; and cultivated throughout Europe, Egypt, Asia, North and South America. Smith, engl. bot. t. 687. Nees. pl. off. with a figure. Woodv. med. bot. 169.—Zorn. icon. t. 56.—Petiv. brit. t. 31. t. 10.—Ray. syn. t. 10. f. 2. M. piperìta officinàlis, Sole, menth. brit. t. 7. M. piperìta vulgàris, Sole, herb. but hardly of menth. brit. t. 8. M. glabràta, Vahl. symb. 3. p. 75. M. Kahirìna, Forsk. fl. ægypt. M. balsàmea, Willd. enum. p. 608.? Stem branched, reddish, quite glabrous, or with a few spreading hairs. Petioles usually ciliated. Spikes reddish. Calyxes purplish. Corolla purple, or red. This species, the peppermint, is almost entirely for distillation, for which it is extensively cultivated in low, rich, soft, marshy lands, especially such as can be irrigated or flooded. It is sometimes also cultivated in gardens for its young green tops and leaves, for the purposes of spearmint. The leaves have a strong, rather agreeable smell, and a pungent, aromatic taste, somewhat resembling that of pepper, and accompanied with a peculiar sensation of coldness. Its predominant constituents are essential oil and camphor, both of which rise in distillation, and are combined in what is called oil of peppermint. Peppermint is principally used as a carminitive and antispasmodic. The distilled water is a domestic remedy for flatulent colic, and the essential oil is often given with advantage in doses of a few drops in cramps of the stomach.

Culture. All the species of *Méntha*, as well as the present, are raised by the same methods, viz. by parting the roots, by offset young plants, and by cuttings of the stalks. By the roots—This is performed in spring and autumn. Having some full roots from any established beds, divide them as expedient, and drawing drills, with a hoe about 2 inches deep and 6 inches asunder, place the roots in the drills moderately close, and earth them over to an equal depth. By offsets—In the spring procure these from established plants, and dibble them in rows 6 inches asunder. By cuttings of the young stalks—In May, June, or advanced summer, taking the opportunities of showery weather, cut these into lengths of 5 or 6 inches, and plant the cuttings by dibble, 6 inches apart, inserted half way into the earth.

Subsequent Culture. Propagated in any of the above methods the plants set in spring or summer will come into use the same year. Water new plants till they take root. Keep them clean from weeds. At the end of autumn cut away any remaining stems, at which season, or in the spring, spread a little loose earth thinly over the beds.

Taking the crop. "For culinary use or salads, gather both when the young green tops are from one inch to 6 inches in length, and in their advanced growth throughout the summer. When nearly full grown in June, July, or August, or beginning to flower, gather a store for winter, spread the heads thinly in some dry place, shaded from the sun, to be well dried, then, tied in bunches, house the store. When desired for distillation let them attain full growth coming into flower, then cut and use the heads immediately. Peppermint being principally used for distillation, should stand in the ground until they begin to flower, being then in the highest perfection. Cut in dry weather, and tie the bundles, and carry under cover ready for immediate use. Cut full grown stalks close to the bottom. It is best to cut as soon as the dew is off in the morning, for in the afternoon, and especially during bright sunshine, the odour of the plant is found to be much diminished."

New Plantation. All the species continue by the roots many years, but when the plants grow weakly make a fresh plantation in time.

Forcing spearmint. Mint in a young green state may be obtained all winter, and early in spring, by planting some roots in a gentle hot-bed, or in pits, or shallow pans, to be plunged therein. Plant the roots pretty thickly, and earth over an inch and a half deep; or some roots thus planted in pots or boxes may be placed in a stove. Plant for succession every 3 weeks, as forced roots soon decay.

Var. β, ? subhirsùta (Benth. lab. p. 176.) leaves hairy on the nerves beneath, and on the petioles. 4. H. Native of England, in Norfolk, at a lake called Saha, Smith; and near Bath, Sole. M. hirsùta, δ, Smith, herb. M. piperìta sylvéstris, Sole, menth. brit. t. 24. M. hírta, Willd. enum. 608.? M. piméntum, Nees, ex Rchb. fl. germ. exc. p. 309.

Pepper Mint. Fl. Aug. Sept. Britain. Pl. 1 to 2 feet.

12 M. CITRÀTA (Ehrh. beitr. 7. p. 150.) leaves petiolate, ovate, broadly rounded at the base, or subcordate, and are, as well as the stem, glabrous, or the petioles are ciliated; whorls few, approximate into an oblong head, or the lower one is loose and remote; pedicels and calyxes glabrous. 4. H. Native of England, in watery places in Cheshire, North Wales, and near Bedford, Smith, probably spontaneous. M. nígricans, Mill. dict. no. 12. M. odoràta, Sole, menth. brit. t. 9. Smith, in Lin. trans. 5. p. 192. engl. bot. t. 1025. M. adspérsa, Mœnch. menth. 379. ex Willd. spec. 3. p. 79. This is intermediate between *M. piperìta* and *M. aquàtica*. Corollas reddish purple.

Bergamot Mint. Fl. July. Aug. Britain. Pl. 1 foot.

13 M. AQUÀTICA (Lin. spec. p. 805.) stem beset with reflexed hairs; leaves petiolate, ovate-serrated, rounded at the base, or sub-cordate, rather hispid on both surfaces, or villous; lower floral leaves like the others: upper ones bractea-formed; whorls few, all, or only 2 or 3 of the upper ones, disposed into globose or oblong heads: upper terminal one often remote from the lower ones; calyxes tubular, and are, as well as the pedicels, villous. 4. H. Native of Europe, and Asiatic Russia, very common in watery places and ditches; and now occurs almost in every part of the globe, but has probably migrated from Europe. Sole, menth. brit. t. 10, 11. M. palústris, Mill. dict. no. 11. M. hirsùta, Smith, in Lin. trans. 5. p. 193. engl. bot. 7. p. 447. M. pedunculàta, Pers. ench. 2. p. 119. Poir. dict. suppl. 3. p. 663. Water Mint. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

14 M. arve'nsis (Lin. spec. 806.) stem beset with retrograde pili or villi, or nearly glabrous; leaves petiolate, ovate or oblong, rounded at the base, cuneated or narrowed: floral ones all conforming to the cauline ones, exceeding the flowers: uppermost ones almost sterile; whorls all globose, many-flowered, remote; bracteas lanceolate-subulate, about equal in length to the tubular or campanulate calyxes. ♃. H. Native of Europe, and North and Middle Asia, very common; but very rare in the region of the Mediterranean; in shady places by the sides of ditches, in bogs and all moist soils; plentiful in Britain. M. gentìlis, Lin. spec. p. 805. This is a very polymorphous plant. Corollas red or purplish. Stamens sometimes exserted, but usually inclosed.

Var. α, satìva (Benth. lab. p. 178.) calyxes subcylindrical, and are, as well as the pedicels, hairy; leaves more or less villous. ♃. H. M. rivàlis, Sole. menth. brit. t. 20. M. satìva, Smith, in Lin. trans. 5. p. 199. engl. bot. t. 448. M. hirsùta? verticillàta, Smith, engl. fl. 3. p. 79. M. aquàtica, III. satìva, Fresen, in syll. bot. ratisb. 2. p. 235. M. parviflòra, Schultes, ex Rchb. fl. germ. exc. p. 307.

Var. θ, glàbra (Benth. lab. p. 179.) calyx campanulate; pedicels, stem, and leaves quite glabrous. ♃. H. M. glàbra, Sole, herb. M. præ'cox, Sole, menth. brit. t. 13. M. rùbra, Smith, herb. M. gentìlis, Host, fl. austr. 2. p. 241. and of many other authors.

Var. ι, críspa (Benth. lab. p. 180.) leaves undulately curled, and lacerately toothed; calyxes and leaves glabrous. ♃. H. M. satìva, Nees, pl. med. with a figure. M. críspa of many authors.

Corn-field, or Wild Mint. Fl. July, Sept. Britain. Pl. ½ to 2-3 feet.

15 M. Canade'nsis (Lin. spec. 806.) prostrate or ascending, nearly glabrous, or densely clothed with spreading hairs; leaves petiolate, oblong-elliptic, narrowed a long way at both ends: floral ones similar to the rest: upper ones lanceolate-linear, almost sterile; whorls all globose, many-flowered, remote; bracteas lanceolate-subulate, about equal in length to the calyxes,

which is tubularly campanulate. ♃. H. Native of North America, on the mountains, and on the banks of rivulets; North-west coast, Canada, near New York, Pennsylvania; also of China, Sir G. Staunton.

Var. α, villòsa (Benth. lab. p. 181.) plant densely hairy. ♃. H. M. Canadénsis of authors.

Var. β, glabràta (Benth. lab. p. 181.) plant nearly glabrous. ♃. H. M. boreàlis, Michx. fl. bor. amer. 2. p. 2.

Canadian Mint. Fl. July, Aug. Clt. 1800. Pl. 1 foot.

16 M. LAPPÓNICA (Wahl. fl. lapp. p. 161. t. 10.) stem beset with retrograde asperities; leaves petiolate, oblong, serrated, narrowed at the base, glabrous: floral ones similar to the others; whorls all remote, few-flowered; pedicels glabrous; calyxes rough, with obtuse teeth. ♃. H. Native of Lapland, in humid sandy places at the river Kemen; also of Kamtschatka. Very nearly allied to *M. Canadénsis, β, glabràta.* Corollas rose-coloured. Stamens exserted.

Lapland Mint. Pl. 1 to 1½ foot.

17 M. LANCEOLA'TA (Benth. lab. p. 181.) stem clothed with adpressed, reflexed hairs; leaves lanceolate, acute, serrated, narrowed at the base into the petioles, roughish above and glabrous beneath: floral ones similar to the rest: upper ones twice as long as the whorls; whorls all remote, many-flowered; calyx tubular, clothed with adpressed villi, with acute teeth. ♃. S. Native of Ceylon, Macrae. Stem a little branched, tetragonal. Nearly allied to *M. Canadénsis.*

Lanceolate-leaved Mint. Pl. 1 to 2 feet.

18 M. DAHU'RICA (Fisch. mss. ex Benth. lab. p. 181.) stem erect, nearly simple; leaves on short petioles, ovate-lanceolate, quite glabrous: floral ones similar to the others; whorls few, remote, loosely globose; calyx tubular, nearly glabrous, with obtuse teeth. ♃. H. Native of Dahuria. Lepechínia clinopodifòlia, Willd. hort. berol. under no. 21. Hormìnum clinopodifòlia, Pers. ench. 2. p. 132. Stem tetragonal. Leaves quite entire, or remotely serrated. Calyx villous inside. This differs from all the European tubular-calyxed species, in the calycine teeth being obtuse.

Dahurian Mint. Fl. July. Aug. Clt. 1818. Pl. ½ to 1 foot.?

* * *Throat of calyx villous inside.*

19 M. MÓLLIS (Benth. lab. p. 182.) stem much branched, twining? pilosely woolly; leaves petiolate, ovate-roundish, acute, somewhat serrated, pubescent above, and clothed with white tomentum beneath: floral ones similar; whorls all remote, globose, many-flowered; calyx clothed with white hairs; throat villous inside. ♃. S. Native of tropical America; frequent on elevated plains near Quito, Riobamba, Nuevo, and Cuenca; Peru, and near Santa Fe de Bogota. Bysteropògon mólle, H. B. et Kunth, nov. gen. amer. 2. p. 317. Leaves about an inch long. Corolla scarcely longer than the calyx. Stamens inclosed. Style exserted.

Soft Mint. Pl. twining.?

20 M. PULE'GIUM (Lin. spec. p. 807.) stem much branched, prostrate; leaves petiolate, ovate; whorls all remote, globose, many-flowered; calyx hispid, bilabiate: throat villous inside. ♃. H. Native throughout Europe, in ditches and bogs, and other humid places; as in England, Sweden, France, Germany, Spain, Portugal, Italy, Greece; also of Caucasus, near Lenkoran, and about Valparaiso; also of North America. Sole, menth. brit. t. 23. Smith, engl. bot. t. 1026. Nees, pl. med. with a figure. Woodv. med. bot. t. 171. M. exígua, Lin. spec. 806. Smith, icon. ined. t. 38. Pulègium latifòlium, Bauh. pin. 222. Pulègium eréctum, Mill. dict. no. 2. Pulègium vulgàre, Mill. dict. no. 1.—Sabb. hort. rom. 3. t. 49.—Riv. mon. t. 23. f. 1. Stems and leaves glabrous, or finely pubescent. Corollas pale purple. The name is derived from *pulex*, a flea, because the plant is supposed to drive away fleas by its smell.

Var. β, tomentòsa; stem and leaves densely villous. ♃. H. Native of Portugal, Spain, about Montpelier, Sicily, Naples, Algiers, South of Tauria, Teneriffe. M. tomentòsa, Smith, in Rees' cycl. M. tomentélla, Hoffm. et Link, fl. port. 1. p. 73. M. Gibraltárica, Willd. enum. 611. M. pulegioìdes, Rchb. Pulègium tomentéllum, Presl. fl. sic. 36. Pennyroyal is indigenous to places subject to inundations. It is used in different branches of cookery, also for distilling Pennyroyal-water. In its sensible qualities it is warm, pungent, and aromatic, somewhat similar to *Spearmint*, but less agreeable, and is seldom used. The plant is said to thrive best in a strong clayey moist soil.

Flea Mint, or Pennyroyal. Fl. Aug. Sept. Britain. Pl. prostrate.

21 M. REQUIE'NI (Benth. lab. p. 182.) small, creeping, quite glabrous; branches filiform, ascending; leaves petiolate, orbicular; whorls loosely few-flowered; calyx globosely campanulate, quite glabrous, somewhat bilabiate: throat villous inside. ♃. H. Native of Corsica, Requien. Thymus parviflòrus, Req. in ann. sc. nat. Audibértia, Benth. Stem diffuse at the base, much branched. Leaves almost quite entire. Flowers 2-6 in each whorl; pedicels longer than the calyx. Corollas and odour that of *M. Pulègium.*

Requien's Pennyroyal. Pl. creeping.

† *Species hardly known.*

22 M. GRAVE'OLENS (Presl, fl. sic. p. 36.) spikes panicled, cylindrical; flowers sessile; calyx pubescent; bracteas linear-setaceous, twice as long as the calyxes; stem erect, branched, tomentose; leaves cordate-oblong, mucronate, remotely serrated, pubescent, clothed with greyish tomentum beneath. ♃. H. Native of Sicily. Perhaps referrible to *M. pyramidàlis.*

Strong-scented Mint. Pl. 2 to 3 feet.?

23 M. ANGUSTIFÒLIA (Host, fl. austr. 2. p. 148.) whorls of flowers approximate; leaves linear-lanceolate, flat, hairy; pedicels hispid; stamens shorter than the corolla. ♃. H. Native of Austria, about Vienna, in humid parts of woods. Stem humble, purplish, roughish from bristles, simple or branched. Leaves denticulated above the middle. Bracteas ciliated. Pedicels hispid. Calyx campanulate, hairy. Corolla purplish, hairy outside.

Narrow-leaved Mint. Pl. humble.

24 M. NUMI'DICA (Poir. suppl. 3. p. 662.) leaves lanceolate, somewhat serrated, glabrous, nerved, dotted beneath; stem erect, much branched; whorls pedunculate, subcorymbose. ♃. H. Native of the north of Africa, near the ruins of the town of Tabrarca. Plant glabrous. Leaves petiolate. Corolla rather hairy. Stamens exserted. Perhaps a species of *Micromèria.*

Numidian Mint. Pl.

25 M. JAVA'NICA (Blum. bijdr. p. 826.) flowers capitate; leaves lanceolate, distantly serrated from the middle to the apex, puberulous on both surfaces; stem obversely hairy; stamens exserted. ♃. S. Native of Java, in humid places about Buitenzorg, and in bogs near Tugu. Said by Blume to be nearly allied to *M. acutifòlia.* Perhaps the same as *M. lanceolàta*, or a var. of *M. arvénsis.*

Java Mint. Pl.

Cult. Most of the species delight in a moist soil; but they will also grow in a dry soil. Being all creeping rooted plants, they are readily increased by slips of the roots.

XXVII. LYCO'PUS (from λυκος, *lukos*, a wolf; and πους, *pous*, a foot; so called probably from the form of the leaves.)

Tourn. inst. t. 89. Lin. gen. no. 36. Schreb. gen. no. 44. Juss. gen. p. 111. ed. Usteri, p. 124. Benth. lab. p. 185.

Lin. syst. *Diándria, Monogýnia.* Calyx campanulate, equal, 4-5-toothed: throat naked inside. Corolla hardly exceeding the calyx, campanulate, equal, 4-cleft. Superior stamens wanting, or sterile, filiform, capitellate, shorter than the corolla: lower 2 a little exserted, fertile, distant; anthers 2-celled: cells parallel, rather distinct. Style somewhat equally bifid at top; stigmas minute, terminal. Achenia dry, smooth, with thickened callous edges, trigonal, truncate at apex, attenuated at the base. —Coarse marsh or bog herbs. Leaves acutely toothed or pinnatifid: floral ones similar to the rest, much exceeding the flowers. Whorls dense, usually many-flowered, axillary. Interior bracteas minute: outer ones sometimes exceeding the calyxes in the inferior whorls. Flowers small, sessile. This genus is nearly allied to *Méntha*, but differs from it in the superior stamens being sterile or wanting, and in the achenia being callously thickened on the margin.

1 L. Virgi'nicus (Lin. spec. p. 30.) nearly glabrous; stem stoloniferous at the base; leaves oblong-elliptic, narrowed at both ends, remotely toothed; calyx 4-toothed: teeth ovate, obtuse; rudiments of sterile stamens wanting. ♃. H. Native of North America, in humid places from New England to Carolina, Michx.; near St. Louis, and at the river Saskatchawan, near Cumberland House Fort, Drummond. Root often tuberous, creeping. Leaves 1-2 inches long, on short petioles, usually purplish beneath. Whorls small. Corolla a little longer than the calyx, white.

Var. β, pauciflòrus (Benth. lab. p. 185.) ♃. H. Native at Lake Mistassins, &c., Michx. L. uniflòrus, Michx. fl. bor. amer. 1. p. 14. L. pùmilus, Vahl, enum. 1. p. 211.

Virginian Water-Horehound. Fl. Aug. Sept. Clt. 1760. Pl. 3 feet.

2 L. macrophy'llus (Benth. lab. p. 185.) stem erect, firm, bluntly tetragonal; leaves large, petiolate, ovate, long-acuminated, coarsely and sinuately toothed, narrowed at the base, glabrous; whorls many-flowered; calyx irregularly 4-5-toothed: teeth ovate, obtuse; rudiments of sterile stamens wanting? achenia equalling the calyx. ♃. H. Native of North-west America, at the straits of Juan de Fuca, Scouler. L. Virgínicus, β, quercifòlius, Pursh, fl. amer. sept. 1. p. 16.? Stem pubescent. Leaves glabrous, 3-4 inches long. Corollas white.

Long-leaved Water-Horehound. Fl. Aug. Sept. Clt. 1700.? Pl. 1 to 3 feet.

3 L. obtusifòlius (Michx. ex Vahl, enum. 1. p. 212.? Benth. lab. p. 185.) stem erect, firm, almost simple; leaves sessile, oblong-elliptic, deeply serrated, roundly narrowed at the base; whorls many-flowered; calyx irregularly 5-toothed; achenia hardly shorter than the calyx; rudiments of sterile stamens almost wanting. ♃. H. Native of North-west America, in flats along the Red River, Douglas; at the river Saskatchawan, near Carlton House Fort, Drummond, Hudson's Bay, Michx. Habit of *L. Virgînicus.* Teeth of leaves acute or bluntish. Corolla rather longer than the calyx, white.?

Blunt-leaved Water-Horehound. Pl. 1 to 2 feet.

4 L. Europæ'us (Lin. spec. p. 30.) stolons none; stem erect, branched; leaves petiolate, ovate-oblong, sinuately toothed or pinnatifid; whorls many-flowered; calyx acutely 5-toothed; rudiments of sterile stamens wanting; achenia rather shorter than the tube of the calyx. ♃. H. Native throughout Europe and the north of Asia, in humid watery places by the sides of ditches and rivers; plentiful in Britain. Smith, engl. bot. t. 1105. Fl. dan. 1081. Svensk, bot. t. 262. Curt. lond. vol. 3. with a figure. L. vulgàris, Pers. ench. 1. p. 24. L. palústris, Lam. fl. fr. 2. p. 430. ill. t. 18. L. aquàticus, Mœnch. —Petiv. brit. t. 32. f. 5. Root creeping. Stem acutely tetragonal, glabrous, as well as the leaves. Corolla white, equalling the calycine teeth, with a tinge of red. Cattle appear not to touch this herb. It dyes black, and gives a permanent colour to linen, wool, and silk. Gypsies are said to stain their skin with it.

Var. β, pubéscens (Benth. lab. p. 186.) stem bluntly tetragonal; and are, as well as the more nerved leaves, pubescent, and the calycine teeth are a little longer. ♃. H. Native of England.

European Water-Horehound. Fl. July, Aug. Britain. Pl. 1 to 4 feet.

5 L. rube'llus (Mœnch. suppl. p. 446. ex Wenderoth, in syll. pl. soc. ratisb. 1. p. 88.) stolons creeping; stem erectish, humble, pubescent; leaves petiolate, ovate, narrowed at the base, deeply toothed, pubescent; calyx 5-toothed: teeth lanceolate, acute; rudiments of sterile stamens wanting. ♃. H. Native of Virginia, Wenderoth. This species differs from *L. Europæ'us* in the stolons being long and leafy, and in the stem being hardly half a foot high.

Reddish Water-Horehound. Pl. ½ to 1 foot.

6 L. sinua'tus (Elliott, car. 1. p. 187.) stem erect, acutely tetragonal, nearly glabrous; leaves petiolate, oblong-lanceolate, narrowed at both ends: lower ones pinnatifid: middle ones sinuately toothed: upper ones linear, almost quite entire; whorls many-flowered; calyx 5-toothed, acute; rudiments of sterile stamens capitate; achenia shorter than the tube. ♃. H. Native of North America, in watery places common, from the river Saskatchawan to Canada, Virginia, &c. L. Europæ'us, Pursh, fl. amer. sept. 1. p. 16. Michx. fl. bor. amer. 1. p. 14. but not of Lin. L. bracteàtus, Muhl. ex Link, jahrb. 1-3. p. 55. L. Americànus, Muhl. ex Bart. fl. phil. 1. p. 12. Stolons not seen. Stem glabrous, acutely tetragonal. Leaves very variable, glabrous. Corollas white.

Var. α, disséctus (Benth. lab. p. 187.) leaves usually pinnatifid. ♃. H. Native principally of the northern region of North America. L. exaltàtus, Elliott, bot. car. 1. p. 187. but not of Lin. L. heterophýllus, Rafin, med. fl. 2. p. 28.

Var. β, vulgàris (Benth. lab. p. 187.) leaves generally sinuated. ♃. H. Native of the middle region of North America, L. sinuàtus, Elliott, bot. car. 1. p. 187. L. vulgàris, Nutt. gen. amer. 1. p. 15.

Var. γ, angustifòlius (Benth. lab. p. 187.) leaves for the most part linear, and almost quite entire. ♃. H. Native of the southern region of North America. L. angustifòlius, Nutt. gen. amer. 1. p. 15. L. longifòlius, Rafin. med. fl. 2. p. 28. L. Pennsylvánicus, Muhl. ex Rafin. l. c. L. pauciflòrus, Rafin. l. c.?

Sinuated-leaved Water-Horehound. Pl. 1 to 2 feet.

7 L. Austra'lis (R. Br. prod. p. 500. Benth. lab. p. 716.) stem erect, quite glabrous, or hispid from a few pili; leaves almost sessile, oblong-lanceolate, narrowed at both ends, sharply toothed, quite glabrous above or on both surfaces, shining or pubescent beneath; whorls many-flowered; calyx 5-toothed: teeth, as well as the bracteas, very acute; rudiments of sterile stamens capitate; achenia shorter than the tube of the calyx. ♃. H. Native of Eastern Siberia; China; New South Wales, at Port Jackson; and on the south coast of New Holland; also of Van Diemen's Land. L. Europæ'us, γ, argùtus, Benth. lab. p. 186. L. lùcidus, Turcz. mss. This species differs from *L. Europæ'us* besides habit, in the rudiments of sterile stamens being present; and it is also very nearly allied to *L. sinuàtus*; but differs in habit, almost sessile leaves, and in the calyxes and bracteas being very acute.

Southern Water-Horehound. Fl. July, Aug. Clt. 1823. Pl. 1 to 3 feet.

8 L. exalta'tus (Lin. fil. suppl. p. 87.) stem erect, branched, tall; leaves petiolate, ovate-oblong, pinnatifid; whorls many-flowered; calyx acutely 5-toothed; rudiments of sterile stamens capitate; achenia about equal in length to the calycine teeth. ♃. H. Native of the east of Europe, and Middle Asia; as of Hungary, Siberia, Himalaya, Bithynia, Italy, France, &c., in humid or watery places. Sibth. et Smith. fl. græc. t. 12.—Sabb. hort. rom. 3. t. 64. but not of the more recent authors. L. pinnatífidus, Pall. fl. ross. 2. t. 1. Stem acutely tetragonal, glabrous or pubescent. Leaves glabrous or pubescent. Corollas white, smaller than those of *L. Europæ'us*.

Exalted Water-Horehound. Fl. July, Aug. Clt. 1739. Pl. 4 to 6 feet.

N.B.—What is *L. intermèdius*, Schrad.?

Cult. Coarse marsh plants of easy culture, but of no beauty. They will grow in any kind of soil, but prefer one moist; and are readily propagated by dividing at the root.

XXVIII. MERIA'NDRA (from μερις, *meris*, a part; and ανηρ ανδρος, *aner andros*, a male; in allusion to the superior stamens being abortive, rarely one of them fertile.) Benth. in bot. reg. vol. 15. lab. p. 188. Sálvia species, Roth. and Roxb.

Lin. syst. *Diándria, Monogýnia.* Calyx ovate, bilabiate: upper lip concave, entire, or with 3 very short teeth: lower lip bifid; throat naked inside. Corolla having the tube equal in length to the calyx; and the limb equally 4-cleft; lobes flat: upper lobe entire or emarginate. The 2 lower stamens fertile, erect, distant: the two superior ones usually abortive, rarely with one or the other fertile, conforming to the lower ones; anthers 2-celled: cells separate, stipitate, equal, pendulous; with a short linear connective, which is articulated with the filament at the middle, and erect on both sides. Style nearly equally bifid at top.—Shrubs with racemose or spicately panicled flowers. Habit of *Sálvia*, but the form of the corolla and direction of the stamens are that of *Menthoídeæ*; and *M. strobilífera* is not unlike *Elshóltzia* in habit.

1 M. strobili'fera (Benth. in Wall. pl. asiat. rar. 1. p. 29. lab. p. 188.) branches densely clothed with floccose tomentum; whorls spicate: lower ones rather remote; floral leaves bracteaformed, ovate-lanceolate, disposed in 4 rows. ♄. F. Native of the East Indies, among the mountains, in the province of Sirmore, Wall.; Himalaya, at Syen, and below Simlah, Royle. Leaves on short petioles, oblong-lanceolate, 2-4 inches long, obtuse, crenulated, rather villous above, and woolly beneath: floral ones entire. Flowers about the size of those of *Elshóltzia*. Odour ungrateful.

Strobile-bearing Meriandra. Shrub 2 to 3 feet.

2 M. Bengale'nsis (Benth. l. c.) stem nearly glabrous; branches canescent; whorls remote, racemosely panicled. ♄. S. Native of Bengal and Coromandel. It is cultivated in the gardens of India, and used for the purposes of sage. It has also been found in Abyssinia, where it is also probably a native. Sálvia Bengalénsis, Roxb. fl. ind. 1. p. 146. Sálvia dianthèra, Roth. nov. spec. p. 18. Sálvia Abyssínica, R. Br. append. to Salt. abyss. Leaves very like those of *Sálvia officinàlis*, 2-3 inches long, petiolate, oblong-lanceolate, obtuse, crenulated, rounded or truncate at the base, green above and canescent beneath: floral ones small. Flowers about the size of those of *Thymus serpýllum*. Taste and odour of leaves stronger than that of sage, Roxb. The whole plant exhales an odour like that of camphor when rubbed, Wall.

Bengal Meriandra. Shrub 4 to 6 feet.

Cult. For culture and propagation see shrubby species of *Sálvia*, p. 723.

Tribe III.

MONA'RDEÆ (the plants contained in this tribe agree with the genus *Monárda* in the characters given below.) Benth. lab. p. 190. Corolla bilabiate. The 2 superior stamens abortive, or if fertile, bearing linear connate anthers. The 2 lower stamens fertile, ascending; anthers linear, sometimes with opposite, confluent, contiguous cells, therefore apparently 1-celled, sometimes dimidiate, free or connate behind; connective linear, articulated in the filament, bearing a fertile cell at top, truncate behind, or usually drawn out, filiform and clavate, or bearing another cell, which is sometimes difformed and empty, and sometimes fertile.

XXIX. SA'LVIA (from *salvo*, to save; so called on account of the healing qualities of sage.) Lin. gen. no. 39. Schreb. gen. no. 50. Gærtn. fruct. t. 66. Tourn. inst. t. 83. Juss. gen. p. 111. ed. Usteri, p. 125. Benth. lab. p. 190. Hormìnum, Sclàrea, and Æthìopis, Tourn. inst. and other authors. Schradèria and Júngia, Mœnch.—Stenarrhèna, D. Don, prod. fl. nep.—Leònia, Llave and Lexarza, pl. mex.

Lin. syst. *Diándria, Monogýnia.* Calyx ovate, tubular, or campanulate, bilabiate: upper lip entire or tridentate: lower one bifid: throat naked inside. Corolla with an inclosed or exserted tube, which is equal, ventricose, or widened, sometimes furnished with a ring of hairs inside, sometimes naked, or sometimes furnished with 2 teeth or processes on the lower side at the base: limb bilabiate: upper lip erect, rarely spreading, straight or falcate, entire or emarginate: lower lip spreading, shorter or longer, with the lateral lobes oblong or roundish, spreading, reflexed, or twisted erectly, the middle lobe usually the broadest, entire or emarginate. Rudiments of superior stamens wanting, or small and club-shaped: lower 2 always fertile, inserted near the throat of the tube; filaments short, horizontal, rarely erect, articulated with the anther at top, and usually drawn out beneath the articulation, rarely almost continuous. Anthers dimidiate; connective elongated, linear, articulated transversely with the filament, ascending under the upper lip of the corolla, and bearing at the top a linear, adnate, or versatile fertile cell, and deflexed or erect behind, and sometimes bearing another smaller cell, which is either fertile or difformed, and empty; free, but usually combined together, or connate in various ways. Disk of ovarium glanduliferous in front. Style ascending, bifid at top: lobes sometimes subulate, equal, or the superior one is longest, and sometimes the lower one or both are rounded, dilated, and flattened. Stigmas for the most part minute, terminal, or in the larger part running along the lobes of the style. Achenia ovoid-triquetrous, dry, glabrous, usually very smooth.—This very extensive genus is very variable in habit.

Sect. I. Eu'space (from ευ, *eu*, well; and σφακος, *sphakos*, sage; this section is supposed to contain the true species of the genus.) Benth. in Hook. bot. misc. 3. p. 372. lab. p. 207. Calyx campanulate: upper lip tridentate: lower one bifid: teeth all acute, and hardly increasing at maturity. Tube of corolla wide, a little exserted, furnished with a ring of hairs inside: upper lip erect; lateral lobes of lower lip reflexedly spreading: middle lobe broad, emarginately bifid, with the segments a little reflexed. Connective stretched out behind, bearing a difformed, empty, rarely somewhat polliniferous cell, almost connected at the extremities.—Herbs, rarely shrubs, natives of the region of the Mediterranean. Leaves entire or pinnate.

1 S. Cre'tica (Lin. spec. p. 33.) shrubby; stem clothed with white wool; floriferous branches clothed with white pubescence; leaves petiolate, entire, oblong-linear, narrowed at the base, wrinkled: lower ones clothed with white wool beneath: floral leaves sessile: uppermost ones deciduous; racemes a little branched; whorls many-flowered; calyx membranaceous, coloured, striated, pubescent, with subulately acuminate teeth; tube of corolla exserted; connective very short behind, and bearing an empty cell. ♄. H. Native of Candia. Schreb. nov. act. nat. cur. 479. t. 3. D. C. pl. rar. hort. gen. not. 4. 9. t. 3. S. tenuifòlia, Riv. mon. irr. 59. t. 128. S. officinàlis, var. angustifòlia, Link. Corollas violet. Very nearly allied to *S. officinàlis;* and differs principally in the very narrow leaves and long petioles.

Cretan Sage. Fl. June, Aug. Clt. 1760. Shrub 1 foot.

2 S. lavandulæfòlia (Vahl, enum. 1. p. 222.) shrubby, clothed with white tomentum; leaves petiolate, entire, oblong-lanceolate, narrowed at the base, wrinkled, clothed with white tomentum on both surfaces; floral leaves sessile: uppermost ones deciduous; calyx tubularly campanulate, membranaceously coloured at apex, striated, pubescent: teeth all nearly equal, subulately acuminated; tube of corolla exserted; connective stretched out behind, bearing anthers at both ends, the hind cells empty and connate. ♄. S. Native of Spain, on arid hills. S. rosmarinifòlia, Hortul. ex Rœm. et Schultes, syst. 1. p. 200. S. tenùior, Desf. ex Rœm. et Schultes, mant. 1. p. 200. S. Hispanòrum, Lag. gen. et spec. nov. diagn. 1. Very nearly allied to *S. officinàlis;* and differs principally in being canescent; in the leaves being narrower; in the racemes being slender; in the whorls being loose and fewer-flowered; and in the calyxes being smaller, and hardly bilabiate. Corollas violet.

Lavender-leaved Sage. Shrub.

3 S. officina'lis (Lin. spec. p. 34.) stem shrubby, clothed with white tomentum; floriferous branches clothed with tomentose pubescence; leaves petiolate, entire, oblong, narrowed or roundish at the base, wrinkled: lower ones clothed with white wool beneath: floral leaves sessile, ovate, acuminated, membranous at the base, striated; racemes almost simple; whorls many-flowered, distinct; calyx membranaceously coloured, striated, pubescent: teeth all subulately acuminated; tube of corolla exserted; connective stretched out behind, bearing anthers at both ends: hind cells empty, connate. ♄. H. Native of the south of Europe, in dry places; as of Spain, south of France, Piedmont, Naples, Dalmatia. Woodv. med. bot. t. 38.? S. grandiflòra, Tenore, fl. nap. prod. append. 5. p. 3. syll. p. 16. but not of Ettling. S. chromática, Hoffm. naschtr.? S. papillòsa, Hoffm. naschtr. 1. p. 58.? S. Hispánica, &c., Besl. eyst. ord. 8. fol. 1. f. 19. 2. Leaves 1 to 1½ inch long: upper floral ones coloured. Corolla downy outside, larger or smaller, purple, blue, or white. There are several varieties of this species; one with variegated leaves, another with narrow leaves, and a third with small leaves, &c. The leaves of this and some other species are used in stuffing and sauces for many kinds of luscious and strong meats, as well as to improve the flavour of various articles of cookery. The decoction called sage-tea is usually made from one variety, the *Small-leaved green*, or *Sage of virtue;* but any of the other varieties are equally fit for this purpose. Sage has a peculiar aromatic smell, and a warm aromatic taste, with some degree of bitterness and astringency. In its effects, sage agrees with other aromatics. It is stimulant, carminitive, and tonic. The best preparation for these purposes is an infusion of the dried leaves, drunk as tea. With the addition of a little lemon-juice, it proves a useful diluting drink in febrile disorders, being sufficiently agreeable to the palate.

Varieties are as follow: 1. The common or red. 2. The green. 3. The small-leaved green, or Sage of Virtue. 4. The broad-leaved, or balsamic. The red is the principal sort in culinary use, having the most agreeable and fullest flavour: the green is the next in estimation with the cook; but the small-leaved is generally preferred to those to eat as a raw herb, and for decoctions; while the broad-leaved or balsamic kind is most efficacious in a medical way, and is also a tea herb. However, any of the sorts may be occasionally used for those alternate purposes.

Cult. All the varieties may be propagated by slips or cuttings of the young shoots taken from March to June; but most successfully in May and June, by detaching the young shoots of the same year. The outward shoots are to be preferred: slip or cut them off 5 or 6 inches long, slipping off the under leaves, and preserving the top leaves, and water them. They will soon take root freely, especially the young shoots planted in May and June. In the advancing growth, if they spindle up into flower-stalks, pinch or cut that part down; that the plants may shoot out full and stocky from the bottom in close bushy growth for use the same year. In gathering sage for use, cut or slip off the young side and top shoots neatly; and be careful not to strip too close, especially towards winter, and during that season. In July, and the rest of the summer, it is usual to gather some of the young top growth to dry for winter. Keep the plants in regular bushy heads, by cutting away disorderly growths, and the decayed flower-stalks in autumn. Keep them clear from weeds; and sometimes loosen the earth about the plants with a hoe, garden trowel, or small spade, in spring and autumn. Make a fresh plantation once in two, or three, or four years, or as may be necessary by the plants becoming naked, stubby, and dwindling.—Abercrombie.

Officinal or Common Sage. Fl. June, July. Clt. 1597. Shrub 1 to 2 feet.

4 S. crassifòlia (Desf. arb. 1. p. 134. but not of Smith.) stem shrubby, clothed with white wool; floriferous branches clothed with tomentose pubescence; leaves petiolate, ovate, obtuse, somewhat cordate at the base, erosely crenated, wrinkled, pubescent: those of the sterile branches undulately curled, and clothed with white wool on both surfaces: lower floral leaves green: upper ones membranous, deciduous; racemes simple; whorls many-flowered, distant; calyx membranous, coloured, striated, pubescent: teeth all lanceolate, acute; tube of corolla a little exserted; connective stretched out behind, antheriferous at both ends: hind cells empty, connate. ♄. H. Native of the South of Europe. This is probably only a variety of *S. officinàlis*, differing in the shape and larger size of the leaves, &c.

Thick-leaved Sage. Fl. June, July. Clt. 1804. Shrub 1 to 2 feet.

5 S. grandiflòra (Ettling, salv. no. 2.) stem shrubby, clothed with white wool; floriferous branches clothed with tomentose pubescence; leaves entire, petiolate, ovate, acute, broadly rounded at the base, or cordate, wrinkled, pubescent: lower ones woolly beneath: floral leaves herbaceous, or the upper ones are membranaceous at the base, ovate, acute; racemes nearly simple; whorls 6-10-flowered, distinct; calyx membranaceous, coloured, striated, hispid: teeth all acute; tube of corolla exserted; connective stretched out behind, antheriferous at both ends: hind cells empty, connate. ♄. H. Native of Tauria, in stony, exposed places on the mountains, and of the Levant. Jacq. fil. ecl. fasc. 4. p. 55. t. 36. S. tomentòsa, Mill. dict. no. 2. S. officinàlis, Pall. ind. taur. p. 134. but not of Lin. S. màjor, &c. Besl. eyst. ord. 8. fol. 1. f. 11. Leaves 3-4 inches long, and 1½ to 2 broad, green above, and canescent beneath, pubescent on both surfaces, but not woolly. Corollas large, blue.

Var. β, mìnor (Benth. lab. p. 210.) plant more humble; leaves smaller, and more hoary, and always broadly rounded, or cordate at the base.

Great-flowered Sage. Fl. June, Sept. Clt. 1816. Shrub 2 to 3 feet.

6 S. confu'sa (Benth. lab. p. 210.) stem shrubby, rather woolly at the base; floriferous branches clothed with tomentose pubescence; leaves petiolate, usually interruptedly pinnate, wrinkled, clothed with white wool beneath: terminal segment large, oblong-lanceolate, narrowed at the base, with 1-2 lateral segments on each side, which are oblong-lanceolate, and rounded at the base; floral leaves bractea-formed, deciduous; racemes elongated; whorls many-flowered, remote; calyx rather membranous, coloured, striated, pubescent: teeth all subulately acuminated; tube of corolla exserted; connective stretched out behind, antheriferous at both ends: hind cells empty, connate. ♄. H. Native of the South of Europe; ? and occurs in French gardens under the names of *S. tríloba*, *S. interrúpta*, and *S. officinàlis foliis pinnatis*. S. aurìta, Schultes, obs. bot. p. 10. ? but not of Thunb. Corollas blue, or purple.

Confused Sage. Fl. June, July. Clt. ? Shrub 1 to 2 feet.

7 S. tríloba (Lin. fil. suppl. 88.) stem shrubby, and is, as well as the branches, clothed with white wool; leaves petiolate, ovate, obtuse, wrinkled, thick, clothed with white wool beneath, cordate at the base, auriculated, or with 1 or 2 additional, roundish-ovate, small, distinct segments; floral leaves membranous, deciduous; racemes short, somewhat panicled, clammy; whorls 6-10-flowered, distinct; calyx tubularly campanulate, striated, villous, clammy: teeth all ovate, acutish; tube of corolla exserted; connective stretched out behind, antheriferous at both ends, the hind cells empty, approximate, free. ♄. H. Native of the region of the Mediterranean, on dry, exposed hills; as of Sicily, Calabria, Grecian Archipelago, Syria, &c. Sibth. et Smith, fl. græc. 1. p. 13. t. 17. S. subtríloba, Schranck, in syll. pl. soc. ratisb. 2. p. 58.? S. Clùsii, Jacq. hort. schœnbr. 2. p. 37. t. 195.? S. marrubioìdes, Vahl, enum. 1. p. 223. a garden monstrosity, having the whorls axillary. S. baccífera, Ettling. salv. p. 4. S. Sipỳlea, Lam. ill. gen. 1. p. 68. S. fruticòsa, Mill. dict. no. 5. S. auriculàta, Mill. dict. no. 3. S. quinquéloba, Riv. mon. irr. t. 131. Leaves 1 to 1½ inches long, seldom entire, but usually furnished with 1-2 segments at the base. Calyx purplish. Corolla reddish violet, glabrous outside.

Three-lobed-leaved Sage. Fl. June, Aug. Clt. 1596. Shrub 2 to 3 feet.

8 S. interru'pta (Schousb. beob. mar. 7. t. 1.) stem shrubby; branches clothed with clammy villi; leaves petiolate, irregularly pinnate, wrinkled, clothed with white tomentum beneath: terminal segment large: the lateral ones 1-2 pairs, ovate-oblong, rounded at the base, with other small, rounded segments between these; floral leaves membranous, deciduous; racemes simple; whorls about 6-flowered, remote; calyx tubularly campanulate, striated, clothed with clammy villi: teeth all acute; tube of corolla exserted; connectives stretched out behind, antheriferous at both ends, the hind cells empty, and rather connate. ♄. H. Native of the North of Africa, in the southern provinces of Morocco. Jacq. fragm. 61. t. 90.? Sweet, fl. gard. 2. t. 169. Hairs on the plant glanduliferous. Leaves 4-6 inches long, with the petioles; segments crenulated. Raceme 1-2 feet long. Corolla showy, white, with a tinge of blue: upper lip downy outside. This species occurs in gardens under the names of *S. rosæfòlia* and *S. pinnàta*.

Interrupted-leaved Sage. Fl. April, Sept. Clt. 1798. Shrub 3 to 4 feet.

9 S. rí'ngens (Sibth. et Smith, fl. græc. 1. p. 14. t. 18.) branches clothed with clammy villi; leaves petiolate, irregularly pinnate; segments unequal, ovate-oblong, rounded at the base, villous on both surfaces, hardly canescent beneath: floral leaves membranous, deciduous; racemes simple; whorls about 6-flowered, loose, remote; calyxes drooping, tubularly campanulate, striated, clothed with clammy villi: teeth all acutish; tube of corolla exserted, recurvedly ascending, connective stretched out behind, antheriferous at both ends, the hind cells empty, and rather connate. ♄. H. Native of Greece, on the declivities of mountains frequent. Petioles ciliated. Leaves almost like those of *S. interrúpta*. Corollas blue.

Ringent-flowered Sage. Shrub 1 to 2 feet.

10 S. pinna'ta (Lin. spec. p. 39.) stem herbaceous, erect, pilose; leaves pinnate, with 3-4 pairs of petiolate, ovate, or deeply crenated, wrinkled, villous leaflets; racemes simple; whorls about 6-flowered, remote; floral leaves and bracteas membranous, ovate, acuminated, shorter than the calyxes, deciduous; calyx urceolate, truncate, pilosely woolly: teeth all short, acute; tube of corolla much exserted; connective stretched out behind, antheriferous at both ends, the hind cells empty, approximate, free. ♂. H. Native of the South and East of Europe; as of Spain, and the Levant; also of Arabia. The whole plant is clothed with long, white hairs, and short, clammy villi. Leaves smaller than those of *S. interrúpta*, and the segments more numerous. Corolla above an inch long, purple, showy.

Pinnate-leaved Sage. Fl. July. Clt. 1731. Shrub 1 to 2 feet.

11 S. incarna'ta (Vahl, enum. 1. p. 226. but not of Cav., but probably of Ettling, salv. no. 15.) stem herbaceous, erect, pilose; leaves pinnate, with 2-3 pairs of almost sessile, ovate, crenated, wrinkled, villous leaflets; racemes simple; whorls 2-6-flowered, remote; floral leaves membranaceous, ovate, acuminated, shorter than the calyx, deciduous; calyx campanulate, pilosely woolly: teeth all ovate, acute; tube of corolla deflexed, equalling the calyx; connective stretched out behind, antheriferous at both ends, the hind cells empty, free. ♃. H. Native of the Levant. Habit of *S. pinnàta*, but the flowers are different. It differs from *S. rosæfòlia* in the erect stem and bracteas. Corollas large, flesh-coloured.

Flesh-coloured-flowered Sage. Pl. 1 to 2 feet.?

12 S. rosæfòlia (Smith, icon. ined. 1. p. 5. t. 5.) stem procumbent at the base; branches ascending, pubescent; leaves pinnate, with 2-3 pairs of petiolate, oblong leaflets, which are narrowed at both ends, villous above, and pubescent beneath; floral leaves ovate-lanceolate, coloured, about equal in length to the calyxes; racemes short; whorls 2-3-flowered, distinct; calyx coloured: teeth all acute. ♃.? ♄.? H. Native of Armenia, Levant, Persia. S. orientàlis, Mill. dict. no. 8.? Petioles ciliated. Leaves 3 inches long. Calyx almost like that of *S. officinàlis*. Corollas, calyxes, and bracteas purple. There is a variety of this having lanceolate leaflets, the ultimate ones confluent, ex Vahl.

Rose-leaved Sage. Shrub procumbent.

13 S. bractea'ta (Russ. nat. hist. Alep. 2.) stem herbaceous, erect, pubescent; leaves pinnate, with 2-3 pairs of sessile, oblong, acute, crenately serrated leaflets, which are narrowed at the base, and tomentosely villous on both surfaces: floral leaves very broad, ovate, acuminated, quite entire, permanent, clasping the flowers, longer than the calyxes; racemes simple; whorls usually 10-flowered, remote; calyx sessile, with villous lips: teeth all lanceolate; tube of corolla inclosed. ♃. H. Native of Syria, near Aleppo, Russel.—Plukn. alm. p. 185. t. 194. f. 6. Leaves 2-4 inches long. Floral leaves membranaceous, whitish, like those of *S. Sclàrea*. Whorls dense. Corolla purplish.

Bracteate-flowered Sage. Pl. 1 to 1½ foot.

14 S. scabiosæfòlia (Lam. journ. hist. nat. no. 14. p. 44. t. 27.) stem shrubby; branches diffuse, pilosely woolly; leaves pinnate: leaflets usually twin, entire, bifid, or pinnate, oblong, or linear, acute, quite entire; racemes simple; whorls 6-10-flowered, distinct: floral leaves permanent, lanceolate, ovate, or ovate-roundish, acuminated; calyx ample, striated, villous: teeth all ovate, acute; tube of corolla a little exserted; connective stretched out behind, dilated, antheriferous at both ends, the hind cells empty, and connate. ♄. H. Native of Tauria, Caucasus, and Armenia. Mirb. ann. mus. 15. t. 15. f. 2. S. vulnerariæfòlia, Willd. spec. 1. p. 149. S. Habliziàna, Willd. in Schrad. journ. bot. 1. p. 289. t. 2. Jacq. fil. eclog. 1. p. 9. t. 1. Sims, bot. mag. t. 1429. S. scabiòsa, Pers. ench. 1. p. 29. S. Taûrica, Habl. phys. beschr. taur. p. 207. S. pinifòlia, Pall. ind. taur. Stem pilose, or woolly, almost glabrous above, and often purplish. Leaves numerous, sometimes almost glabrous, but usually canescent and pilose, with 3-4 pairs of segments, which are usually twin, or by threes, but opposite, and therefore apparently somewhat verticillate. Corolla beautiful, large, white. There is a variety of this with usually very narrow, almost glabrous leaves, and with the whorls all 6-flowered, and sometimes 10-flowered and more. There are also varieties differing in the size and form of the floral leaves. The *S. Habliziàna* is a more hairy plant, with broader leaflets than that called *S. scabiosæfòlia* in the gardens, whose leaflets are narrower and nearly glabrous.

Scabious-leaved Sage. Fl. Aug. Clt. 1795. Shrub diffuse.

Sect. II. Hymenósphace (from ὑμην, *hymen*, a membrane; and σφακος, *sphakos*, sage; in reference to the dilated, membranaceous lobes of the lower lip of calyx.) Benth. in Hook. bot. misc. 3. p. 373. lab. p. 214. Calyx campanulate: upper lip 2-3-cleft: lower one bifid; lobes all nearly equal, and becoming dilated, membranaceous, and veiny after florescence. Tube of corolla ample, furnished with a ring of hairs inside; upper lip rather falcate, compressed, and the lateral lobes of the lower lip spreading. Connective drawn out behind, and bearing a difformed, empty cell, somewhat connected at the extremities.—Shrubs, rarely herbs, usually hoary. Habit of the last section, especially those species natives of the region of the Mediterranean and the Canary Islands. The Cape species are more woody.

15 S. Linkia'na (Rœm. et Schultes, syst. mant. 1. p. 182.) herbaceous; ? branches ascending, tomentose; leaves pinnate, with 2-3 pairs of sessile, oblong-lanceolate, bluntish, crenated leaflets, which are narrowed at the base, wrinkled, pubescent above, and clothed with soft villi beneath; floral leaves broad-ovate, obtuse, entire, equal in length to the calyxes; racemes simple; whorls many-flowered; calyxes on short pedicels, villous, with coloured lips: lobes all ovate, roundish; tube of corolla a little exserted; hind cells of anthers connate. ♃. ? H. Native of the Levant. S. pilántha, Link, enum. 1. p. 10. Corolla blue: upper lip pilose.

Link's Sage. Fl. July, Aug. Clt. 1823. Pl. 2 to 3 feet.

16 S. acetabulòsa (Vahl, enum. 1. p. 227.) stem suffruticose, ascending, pilose; lower leaves pinnate, with 1-2 pairs of leaflets; upper leaves entire, oblong, obtuse, very much wrinkled, villous on both surfaces, canescent beneath: lower floral ones like the rest, but the upper ones are membranous, and about equal in length to the calyxes; racemes simple; whorls about 10-flowered; calyx ample, hispid, with coloured lips: upper lip entire. ♄. H. Native of the Levant. Very nearly allied to *S. Molucéllæ*, but differs in the leaves being pinnate, and the calyxes hispid. Corolla glabrous.

Acetabulose Sage. Shrub ascending.

17 S. Hydra'ngea (D. C. herb. ex Benth. lab. p. 717.) canescent; leaves pinnate, with 3-4 pairs of oblong, obtuse, quite entire, pubescent leaflets; floral leaves small, deciduous; whorls 6-10-flowered; calyx large, glabrous, coloured: upper lip sinuated: lobes of lower lip ovate-roundish; corollas hardly exserted. ♄. ? H. Native of Persia, Olivier. Flowers similar to those of the last. Leaves not wrinkled.

Hydrangea Sage. Shrub. ?

18 S. pomi'fera (Lin. spec. p. 34.) shrubby: branches clothed with hoary tomentum; leaves petiolate, ovate-oblong, obtuse, rounded at the base, or somewhat cordate, with crenulated, undulately curled margins, wrinkled, hoary; floral leaves shorter than the calyxes: upper ones and bracteas membranous, deciduous; racemes a little branched; whorls about 6-flowered, distinct; calyx ample, pubescent at the base, a little striated, with coloured lips: upper lip very broad, almost entire, or sinuated: lobes of the lower lip obovate-roundish, obtuse, mucronulate; tube of corolla ample, a little exserted; hind cells of anthers difformed, rather connate. ♄. H. Native of the Levant, Grecian Islands, Palestine, and Syria. Sibth. et Smith, fl. græc. 1. p. 12. t. 15.—Tourn. itin. t. 92. S. frugífera, Ettling, salv. no. 5. S. crísp a, Riv. mon. irr. t. 125. Calyxes nearly sessile. Corollas bluish-violet, 1½ inch long, glabrous, or downy outside, with sometimes a white spot on the lower lip. Sterile stamens clavate at top.

Apple-bearing Sage. Fl. July, Aug. Clt. 1699. Shrub 2 to 3 feet.

19 S. calyci'na (Sibth. et Smith, fl. græc. 1. p. 13. t. 16.) shrubby; branches erect, clothed with hoary tomentum; leaves petiolate, ovate, obtuse, cuneated, rounded, or subcordate at the base, crenulated, flattish, wrinkled, hoary; floral leaves shorter than the calyxes: upper ones and bracteas membranous, deciduous; racemes short, branched a little; whorls 2-6-flowered, remote; calyx ample, striated at the base, pubescent: upper lip entire, sinuated, or ending in 3 small points: lobes of the lower lip obovate, cuneated; tube of corolla ample, hardly exserted; hind cells of anthers difformed, sub-connate. ♄. H. Native of Greece, in several parts. S. peregrìna, Rauw. gesn. ed. Schmidel, 1. t. 12. f. 103. Very nearly allied to *S. pomífera*, but differs in the shorter, broader leaves, and larger flowers, &c. Corollas reddish violet.

Large-calyxed Sage. Fl. July, Aug. Clt. 1823. Shrub.

20 S. multicau'lis (Vahl, enum. 1. p. 225.) tomentose; leaves subcordate-oblong, very blunt, crenated; calyx hairy; bracteas lanceolate; stem herbaceous. ♃. H. Native of the Levant. Stems many, leafy at the base, and, like the whole plant, clothed with hoary tomentum, but pilose above among the whorls. Leaves petiolate, wrinkled. Whorls distant, 6-flowered. Bracteas shorter than the calyxes. Calyx large, campanulate, veiny, membranaceous, with rounded segments. It appears to differ from *S. calycìna* in the stems being humble and herbaceous, in the cauline leaves being smaller, and the floral ones lanceolate.

Many-stemmed Sage. Pl. ½ foot.

21 S. Molucce'llæ (Benth. lab. p. 216.) stem herbaceous, erect, pubescent; leaves on long petioles, ovate, obtuse, crenated, cordate at the base, much wrinkled, pubescent on both surfaces, canescent while young: floral ones shorter than the calyxes: upper ones and bracteas membranous, deciduous; racemes elongated, simple; whorls remote, 6-10-flowered; calyxes almost sessile, striated at the base, pubescent, ample; upper lip minute, tridentate; lobes of the lower lip very blunt. ♃. H. Native of Syria, near Aleppo. This species differs from *S. calycìna* in the leaves being more wrinkled, hardly

tomentose, in the racemes being nearly a foot long, and in the fructiferous calyxes being as large as those of *S. Molucélla lævis*. Stems creeping at the base.

Molucella-like Sage. Pl.?

22 S. aurea (Lin. spec. p. 38.) stem shrubby; branches clothed with hoary tomentum; leaves petiolate, ovate-roundish, obtuse, quite entire, or sinuated, coriaceous, hoary; floral leaves sessile, villous, permanent; racemes short, a little branched; whorls 2-flowered, approximate; calyx ample, villous, with coloured lobes: upper lip almost quite entire, broad-rounded: lobes of the lower lip ovate-roundish; tube of corolla hardly exceeding the calyx; connective short, somewhat deflexed and dilated behind, bearing a small, empty cell. ♄. G. Native of the Cape of Good Hope, and Algoa Bay. Curt. bot. mag. t. 186. Mirb. ann. mus. 15. t. 15. f. 7. Walth. hort. t. 15. S. coloràta, Lin. syst. p. 71.? but not of Vahl. S. Africàna, &c. Commel. hort. 2. p. 183. t. 92. The whole plant clothed with white tomentum. Corolla beautiful, golden yellow. Leaves $\frac{1}{2}$ an inch long, or hardly an inch.

Golden-flowered Sage. Fl. April, Nov. Clt. 1731. Shrub 3 to 4 feet.

23 S. Africana (Lin. spec. p. 38.) stem shrubby, panicled at top; branches canescent; leaves nearly sessile, ovate-oblong, obovate, or cuneated, acute, quite entire, or sinuately toothed, narrowed at the base, nearly glabrous above, and white beneath, coriaceous, stiff; floral leaves and bracteas broad-ovate, almost permanent; racemes a little branched; whorls 2-6-flowered, distant; calyx hispid: upper lip nearly entire, broad-roundish: lobes of the lower lip ovate, acute; tube of corolla hardly exceeding the calyx; connective short, and dilated behind, bearing an empty cell. ♄. G. Native of the Cape of Good Hope. Commel. hort. 2. p. 181. t. 91. Mill. fig. t. 225. f. 1. S. coloràta, Vahl, enum. 1. p. 230. S. integérrima, Mill. fig. t. 225. f. 2. dict. no. 12. S. barbàta, Lam. ill. 1. p. 72. Branches purplish. Leaves variable, often green above, but constantly white beneath. Corolla violaceous. There are several slight varieties of the species.

African Sage. Fl. April, July. Clt. 1731. Shrub 2 to 3 feet.

24 S. paniculata (Lin. mant. p. 25. and p. 511.) stem shrubby; branches scabrous, nearly glabrous; leaves petiolate, obovate, acute, a little toothed, coriaceous, green on both surfaces, scabrous beneath; floral leaves ovate, membranous, deciduous; racemes paniculately branched; whorls 2-flowered, distant; calyx scabrous: upper lip entire, rounded; lobes of the lower lip ovate, acuminated; tube of corolla hardly equalling the calyx in length; connective short, and dilated behind, bearing an empty cell. ♄. G. Native of the Cape of Good Hope. S. chamæelæágnea, Berg. cap. 1. p. 3. S. mìnor, &c. Breyn. cent. 1. p. 169. t. 85. Shrub purplish. Leaves $\frac{1}{2}$ an inch long. Corolla purplish violet, a little larger than those of *S. Africàna*.

Panicled-flowered Sage. Fl. June, Aug. Clt. 1758. Shrub 2 to 4 feet.

25 S. dentata (Ait. hort. kew. 1. p. 37.) stem shrubby, glabrous; leaves linear, fascicled, remotely-toothed, nearly glabrous; floral leaves and bracteas ovate, much shorter than the calyxes, permanent; racemes short, simple; whorls 2-6-flowered; calyx ample, pubescent: upper lip sinuate, somewhat 3-toothed: lobes of the lower lip ovate, bluntish; tube of corolla equalling the calyx; connective short, and dilated behind, bearing an empty cell. ♄. G. Native of the Cape of Good Hope. S. rígida, Thunb. prod. fl. cap. 1. p. 96. Corollas purplish violet, smaller than those of *S. Africàna*.

Toothed-leaved Sage. Fl. Dec. Jan. Clt. 1774. Shrub $\frac{1}{2}$ to 1 foot.

26 S. nivea (Thunb. prod. p. 96.) leaves lanceolate, quite entire, clothed with white tomentum; branches divaricate. ♄.? G. Native of the Cape of Good Hope. S. lanceolàta, Lam. ill. 1. p. 72. Branches and branchlets decussate, tetragonal, tomentose at top. Leaves petiolate, acute, a little wrinkled, an inch long, bearing other leaves in the axils. Flowers opposite, or somewhat panicled at the top of the branchlets. Calyxes hairy. Corolla purple. Distinguished from *S. aúrea* by the lanceolate, white leaves.

Snowy Sage. Shrub 2 to 3 feet.

27 S. Canariensis (Lin. spec. p. 38.) stem shrubby, clothed with white tomentum; leaves petiolate, lanceolate, hastately-triangular, wrinkled, almost glabrous: floral leaves ovate-lanceolate, exceeding the calyxes, membranous, coloured; calyx incurvedly campanulate: upper lip sinuated, somewhat 3-lobed: lobes of lower lip obtuse, mucronate; tube of corolla wide, inclosed; connective somewhat dilated behind, bearing an empty cell. ♄. G. Native of the Canary Islands; also of Sicily. Sclàrea tomentòsa, Mill. dict. no. 13. Schradèria hastàta, Mœnch. meth.—Trew. pl. rar. 2. p. 17. t. 19. Corollas purple.

Canary Island Sage. Fl. June, Sept. Clt. 1697. Shrub 3 to 6 feet.

Sect. III. Drymosphace (from δρυμος, *drymos*, a forest; and σφακος, *sphakos*, sage; probably in reference to the species inhabiting woods.) Benth. in Hook. misc. 3. p. 373. lab. p. 218. Calyx tubular, or campanulate; upper lip almost entire, truncate, or with 3 very short teeth. Tube of corolla exserted, furnished with a ring of hairs inside; upper lip falcately compressed; lateral lobes of the lower lip spreading. Connective drawn out behind, bearing an empty, difformed cell, somewhat connected at the extremities.—European, or Asiatic green, rather clammy herbs. Leaves usually large, hastately cordate. Corollas yellow, rarely blue.

28 S. glutinòsa (Lin. spec. p. 37.) stems herbaceous, erect, clammy, pilose; leaves petiolate, ovate-oblong, acuminated, cordately sagittate at the base: floral ones ovate, acuminated, shorter than the calyxes; racemes simple; whorls distant, loose, 6-flowered; calyx tubular: upper lip truncate, entire, somewhat recurved; corollas gaping, 3 times as long as the calyx. 4. H. Native of Europe, and middle Asia, in woods and other shady places; as of Spain, South of France, Switzerland, Italy, South of Germany, South of Russia, Tauria, Caucasus, &c.—Sabb. hort. rom. t. 3. Mirb. ann. mus. 15. t. 15. f. 11. Riv. mon. irr. t. 35. Sclàrea glutinòsa, Mill. dict. no. 11. Còlus jòvis, Besl. eyst. ord. 8. fol. 4. f. 1. Plant clammy. Lower leaves large, glabrous, or clothed with clammy pubescence. Corollas pale yellow.

Clammy Sage. Fl. June, Sept. Clt. 1769. Pl. 2 to 3 feet.

29 S. nubícola (Wall. ex Benth. in Wall. pl. rar. asiat. 1. p. 68. lab. p. 219.) stem herbaceous, erect, villous; leaves petiolate, ovate-lanceolate, crenated, pubescent on both surfaces: lower ones hastately cordate at the base: upper ones rounded, or narrowed at the base: uppermost and floral ones sessile, ovate, acute, quite entire; racemes a little branched; whorls loose, few-flowered, remote; calyx campanulate, villous: upper lip entire, and toothed: the lower lip acute; corolla 3 times as long as the calyx: hind cells of anthers empty, connected. 4. H. Native of Kamaon and Sirinaghur, Wall.; in the valley of Cashmere, and at Kidarkonta, Royle; Simlah, Jacquemont. Sweet, fl. gard. 2. t. 140. Corollas yellow, smaller than those of *S. glutinòsa*.

Cloud Sage. Fl. Oct. Clt. 1823. Pl. 3 feet.

30 S. hi'ans (Royle, ex Benth. in Hook. bot. misc. 3. p. 373. lab. p. 219.) stem herbaceous, erect, villous; leaves on long petioles, broad ovate, broadly and cordately sagittate at the base: floral leaves ovate, acuminated, shorter than the calyxes; racemes branched a little; whorls 6-flowered; calyx campanulate, striated, coloured, clammy: upper lip entire, truncate: lower lip longer, with ovate, acute teeth; corolla gaping, 3 times as long as the calyx; hind cells of anthers somewhat connected, empty. ♃. H. Native of the valley of Cashmere, Royle. Allied to *S. glutinòsa.* Corolla showy, blue. Connective short behind.

Gaping-flowered Sage. Pl. 2 to 3 feet.?

31 S. campanula'ta (Wall. ex Benth. in Wall. pl. rar. asiat. 1. p. 67. lab. p. 220.) stem herbaceous, ascending, hairy; leaves large, on long petioles, ovate, acute, deeply crenated, cordate at the base, rather hispid on both surfaces: floral leaves ovate, acute, shorter than the calyxes; racemes a little branched; whorls about 6-flowered, remote; calyxes on short pedicels, amply campanulate, truncate, villous: upper lip very short, nearly entire, and toothed: lobes of the lower lip broad ovate, acute; corolla one-half longer than the calyx; tube of corolla inclosed; connective free behind, and bearing an empty cell. ♃. H. Native of Nipaul, on Gosainsthan. Leaves 4 to 6 inches long, and about the same in breadth. Racemes short. Corollas, according to Wallich, similar to those of *S. nubícola.*

Campanulate-calyxed Sage. Pl. 1 to 2 feet.

• Sect. IV. Hormi'num (from ὁρμαω, *hormao,* to excite; in reference to the stimulating qualities of the plant.) Benth. in Hook. bot. misc. 3. p. 373. lab. p. 220. Calyx tubular: upper lip truncate, somewhat 3-toothed. Tube of corolla widened under the throat, or ventricose, without any ring of hairs inside: upper lip straight, concave, or falcate, compressed: lateral lobes of the lower lip oblong, erect, a little twisted; middle lobe spreading, roundish. Connective deflexed behind, abruptly dilated, connected, and callous at the extremity.—Herbs natives of the region of the Mediterranean.

32 S. vi'ridis (Lin. spec. p. 34.) stem herbaceous, erect, villous; leaves petiolate, ovate-oblong, rounded at the base, obtuse, crenated, villous: superior ones ovate-cordate: floral leaves very broad, acute, permanent, rather longer than the calyxes, becoming gradually smaller as they ascend; racemes simple; whorls distant, usually 6-flowered; calyx villous, reflexed in the fructiferous state, and plicately striated: teeth of the lower lip lanceolate, acute; corolla hardly a third part longer than the calyx, with an almost inclosed tube. ⊙. H. Native of Europe, Africa, and Asia, in the region of the Mediterranean, in dry, stony, or gravelly places; Barbary, Spain, Italy, Dalmatia, Greece, Tauria, Caucasus, &c. Jacq. icon. rar. 1. p. 2. t. 4. Desf. fl. atl. 1. p. 20. t. 1. Sibth. et Smith, fl. græc. 1. p. 15. t. 19. Rchb. icon. bot. c. 6. p. 23. t. 531. S. Spielmánni, Scop. del. ins. 3. p. 31. t. 15. Jacq. fil. ecl. 1. p. 25. t. 15. Rchb. icon. bot. c. 6. p. 23. t. 532. but not of Willd. S. truncàta, Willd. enum. 1. p. 34. Hormìnum víride, Mœnch. meth. p. 377. Hormìnum comâ víridi, Tourn. inst. 178. Stem sparingly branched. Leaves 1-2 inches long. Corollas small, blue. Bracteas green.

Var. β, *violàcea;* flowers violaceous, or bluish. ⊙. H. Plant more robust than the species.

Green-topped Clary. Fl. July, Aug. Clt. 1759. Pl. ¼ to 1 foot.

33 S. Hormìnum (Lin. spec. p. 34.) stem herbaceous, erect, villous; leaves petiolate, oval-oblong, rounded at the base, or cuneated, obtuse, crenated, villous: superior ones ovate-cordate: floral leaves very broad, acute, permanent, rather longer than the calyxes: uppermost ones membranaceously dilated, coloured, comose; racemes simple; whorls distant, about 6-flowered; calyx pubescent, reflexed in the mature state, and plicately striated: teeth of the lower lip lanceolate, acute; corolla one-half longer than the calyx, with an inclosed tube. ⊙. H. Native of Europe, Africa, and Asia, in the region of the Mediterranean, at the edges of fields, and in bushy places; as of Barbary, Greece, Italy, Dalmatia, Syria, Tauria. Sibth. et Smith, fl. græc. 1. p. 15. t. 20. S. coloràta, Thore, chl. land. p. 17. Hormìnum satìvum, Mill. dict. no. 5. Hormìnum coloràtum, Mœnch. meth. p. 376.—Plenck. icon. 20.—Lob. icon. t. 555. —Gesn. fasc. 17. t. 11. f. 21.—Buxb. cent. t. 39. f. 2. There are two varieties of this, the *Purple-topped Clary,* and the *Red-topped Clary,* the bracteas in the one being purple, and in the other red, for which they are cultivated in gardens.

Clary, Purple, and Red-topped. Fl. June, July. Clt. 1596. Pl. 1 to 1½ foot.

34 S. Forskòelei (Lin. mant. p. 26.) stem herbaceous, clothed with rather clammy villi; lower leaves petiolate, large, ovate, repandly crenated, auricled at the base, or lobed, villous; cauline leaves few, nearly sessile: floral leaves broadly ovate, acuminated, permanent, much shorter than the calyxes; racemes elongated, nearly simple; whorls 2-6-flowered, distant; teeth of lower lip of calyx lanceolate, acute; corolla twice as long as the calyx, with an exserted tube: upper lip emarginately bifid. ♃.? H. Native of the Levant, Forsk.; in woods on Mount Olympus in Bithynia; and about Belgrad, near Constantinople, Sibthorp. Sims, bot. mag. t. 988. Willd. hort. berol. t. 20. Sibth. et Smith, fl. græc. 1. p. 16. t. 21. S. bífida, Forsk, fl. arab. p. 202. Stem leafy at base, and nearly naked at top. Lower leaves 3-4 inches long, subcordate at the base. Calyx usually coloured at top, clothed with clammy pubescence. Corollas violaceous, similar to Sect. I. *Eusphàce:* lower lip variegated; middle lobe deflexed, emarginately bifid.

Forskœl's Sage. Fl. June, Aug. Clt. 1800. Pl. 1½ foot.

35 S. miltiorhi'za (Bunge. enum. pl. chin. p. 50.) stem herbaceous, erect, pilose; leaves petiolate, pinnate, with 3-7 petiolate, ovate, crenated leaflets: the ultimate leaflet larger or bifid; floral leaves bractea-formed; racemes simple; whorls many-flowered, loose; calyx campanulate: upper lip acute, entire: lower one shortly bidentate; corolla about 3 times as long as the calyx: tube a little exserted, obliquely annulate inside: upper lip falcate, compressed: middle lobe of lower lip fringed; connective rather dilated behind. ⊙.? ♃.? G. Native of the north of China, in shady mountains at Zui-wey-schin and Ssi-jui-ssy, Bunge. Habit of *S. Forskœ'lei.* Root vermilion-coloured. Leaves large, hispid, green above and paler beneath. Calyxes coloured, rather clammy. Corollas blue, clothed with clammy pubescence outside. This species differs from the present section in the upper lip of corolla being entire; and in the inside of the tube of the corolla being annulate from both the present section and sect. *Æthìopis.*

Red-rooted Sage. Pl. 2 to 3 feet.

• Sect. V. Æthi'opis (so called from *S. Æthìopis* being a native of Ethiopia.) Benth. in Hook. bot. misc. 3. p. 373. lab. p. 222. Calyx campanulate or tubular; upper lip tridentate: teeth erect: middle tooth very small. Tube of corolla widened under the throat or ventricose, without any ring of hairs inside: upper lip falcate, compressed; lateral lobes of lower lip oblong, erectish, and a little twisted: middle lobe spreading, roundish, usually concave, emarginate, crenulated. Connective deflexed behind, abruptly dilated, callous and connected at the extremity.—Herbs, natives of the region of the Mediterranean, and the mountains of Middle Asia. Leaves and lower parts of stem usually clothed with white wool. Floral leaves permanent, erect, clasping the whorls, rarely rather

longer than the peduncles. Panicle divaricately branched, rarely almost simple.

36 S. I'ndica (Lin. spec. p. 37.) stem erect, rather hairy; leaves petiolate, ovate or oblong, acute, a little toothed, broadly cordate at the base, glabrous; floral leaves ovate-cordate, reflexed; racemes simple; whorls 6-flowered, remote; calyxes sessile, campanulate, inflated after florescence; corolla 3 times as long as the calyx. ♃. H. Native of India, Lin., but probably of the mountains of Persia or Arabia. Jacq. hort. vind. 1. p. 33. t. 78. Curt. bot. mag. t. 395. Sclàrea I'ndica, Mill. dict. no. 9.—Mor. hist. 3. sect. 11. t. 13. f. 16. Stem angular, glabrous, or beset with clammy hairs. Lower leaves 3-5 inches long: floral ones shorter than the calyxes. Corollas variegated: lower lip yellow and blue; the upper lip purple, size of those of *S. argéntea*. Calyx clothed with clammy pubescence.

Indian Clary. Fl. May, July. Clt. 1731. Pl. 3 to 4 feet.

37 S. commuta'ta (Benth. lab. p. 222.) stem erect, hispidly pilose; leaves petiolate, ovate, obtuse, erosely crenated, cordate at the base, thick, tubercularly wrinkled, hispid and green on both surfaces; floral leaves hardly longer than the peduncles; raceme dense, spike-formed; calyx campanulate, hispid; corolla about twice as long as the calyx. ♃.? H. Native of Syria or Italy. S. Domínica, Lin. spec. p. 35. but not of Swartz. and other authors. S. Syrìaca, Gouan. herb. but not of Lin. Cauline leaves very numerous, and smaller than in other species of the present section, hardly 1½ inch long.

Changed Clary. Pl.?

38 S. Syri'aca (Lin. spec. p. 36.) stem nearly glabrous, panicled at top, and clothed with tomentose pubescence; leaves petiolate, ovate, obtuse, erosely crenated or deeply toothed, cordate at the base, green on both surfaces, much wrinkled, pubescent; floral leaves broad-ovate, concave, permanent, one half shorter than the calyxes; racemes panicled; whorls distant, 2-6-flowered; calyx campanulate, tomentose; corolla one half longer than the calyx, with an inclosed tube. ♃. H. Native of the Levant, Persia, and Palestine; Syria, near Aleppo. Sclàrea Syrìaca, Mill. dict. no. 5. Hormìnum Syrìacum, Bauh. pin. p. 238. Allied to *S. odoràta;* but differs in the leaves being green on both surfaces, and the form of the leaves is that of *S. praténsis*. Corollas white.

Syrian Clary. Fl. July. Clt. 1759. Pl. 2 to 3 feet.

39 S. odora'ta (Willd. enum. p. 43.) stem suffruticose, clothed with white wool at the base, but panicled and glabrous at top; leaves petiolate, ovate-lanceolate, acuminated, irregularly crenate-toothed, cordate at the base, wrinkled, clothed with white tomentum on both surfaces: upper ones sessile; floral leaves shorter than the pedicels, permanent; racemes panicled, loose; whorls remote, 2-flowered; calyx campanulate, striated, pubescently hairy; corolla about 3 times as long as the calyx. ♄. F. Native near Bagdad. Jacq. fil. ecl. fasc. 2. p. 26. t. 16. S. álbida, Jacq. obs. 10. no. 73. S. argéntea, Hortul. but not of Lin. Branches tetragonal. Leaves 3 inches long, and 1 to 1½ broad. Flowers on short pedicels, about the size of those of *S. sclàrea*. Corollas white: lower lip yellowish in the middle.

Sweet-scented Clary. Fl. July. Clt. 1804. Shrub 2 to 3 feet.

40 S. candidi'ssima (Vahl, enum. 1. p. 278.) stem erect, clothed with white tomentum; leaves petiolate, ovate, obtuse, sinuately toothed, cordate at the base, thick, wrinkled, densely clothed with white tomentum on both surfaces; floral leaves broad, acuminated, concave, permanent, rather shorter than the calyxes; racemes branched; whorls 6-10-flowered: upper whorls abortive; calyx campanulate, villous; tube of corolla equal in length to the calyx. ♃. S. Native of Armenia, and the Island of Cyprus. S. crassifòlia, Sibth. et Smith, fl. græc. 1. p. 19. t. 26. Corollas white, with a yellow lip, size of those of *S. sclàrea*. Leaves smaller than those of *S. argéntea*. Root creeping.?

Very-white Clary. Fl. June, Aug. Clt. 1820. Pl. 1 to 2 feet.?

41 S. scla'rea (Lin. spec. p. 38.) stem erect, villous; leaves petiolate, ample, ovate, erosely crenated, cordate at the base, wrinkled, hoary: upper ones stem-clasping: floral leaves very broad, acuminated, concave, membranous, coloured, exceeding the flowers, permanent; racemes panicled; whorls distant, about 10-flowered; calyx campanulate, striated, pubescently hispid: teeth somewhat spinosely acuminated; corolla twice as long as the calyx: tube inclosed. ♂. H. Native of the south of Europe, in the region of the Mediterranean; as of the south of France, north of Italy, Naples, Sicily, Dalmatia, Grecian Islands, Tauria, Caucasus, &c. Sibth. et Smith, fl. græc. 1. p. 18. t. 25. St. Hil. pl. fr. t. 2. 47. Mirb. ann. mus. 15. t. 15. f. 2. S. Simsiàna, Rœm. et Schultes, syst. mant. 1. p. 210. Lindl. bot. reg. 1003. S. bracteàta, Sims, bot. mag. t. 2320. Sclàrea vulgàris, Mill. dict. no. 1.—Ludw. ect. t. 171.—Plenck. icon. 21.—Blackw. t. 122. Lob. icon. 556.—Mor. hist. 3. sect. 11. t. 16. f. 1. Stem clammy. Leaves 8-9 inches long, and 4-5 broad: floral leaves membranous, white at the base, and red at top, comose. Corolla white, tinged with purple. In the cultivated specimens the leaves are more glabrous than in the wild specimens.

This plant is called *Orvale* by the French; *Scharlach-kraut* by the Germans; *Schlarea* by the Italians; and *Clary* by the English. The leaves are sometimes used in soups, though many dislike its scent. Its flowers are used for a fermented wine; and the whole plant is, like sage, esteemed medicinal. *Clary* is reared from seed, and sometimes from cuttings and slips. A small bed will supply most families; and if raised from seed, a quarter of an ounce will suffice for a seed-bed to be transplanted from 2 feet by 2. Sow in the last fortnight of March or the course of April, in any bed or border thinly, and rake in the seed. In summer, when the plants are advanced 2 or 3 inches, transplant a portion of the strongest from 12 to 18 inches apart, to allow competent room for the leaves to spread, when they will be fit for use the same year, and in continuation through winter until the following spring and summer. In the spring allot some old plants to run up into stalks, these will yield ripe seed in autumn.

Common *Clary*. Fl. July, Sept. Clt. 1562. Pl. 3 to 4 feet.

42 S. spinòsa (Lin. mant. p. 511.) stem beset with glandular villi; leaves petiolate, ample, ovate, deeply crenated, rounded at the base, wrinkled, pubescent: superior ones sessile, cordately stem-clasping: floral ones very broad, acuminated, concave, permanent, exceeding the calyxes; racemes panicled; whorls distant, 6-10-flowered; calyx tubular, cylindrical, striated: teeth all erect and spiny; corolla hardly one half longer than the calyx: tube inclosed. ♂. H. Native of Egypt, Persia; and of Syria, near Aleppo. Jacq. icon. rar. 1. p. 2. t. 7. S. Ægyptìaca, Lin. mant. p. 26. S. Abyssínica, Lin. fil. suppl. p. 88. ex Steud. Màrum Ægyptìacum, Vesling, fl. ægypt. p. 75. t. 76. Hormìnum suavèolens, Mœnch. meth.—Mor. hist. 3. sect. 11. t. 16. f. 2. Plant hispid from spreading glandular hairs in all parts, rarely glabrous. Lower leaves 4-5 inches long. Floral leaves green or white at the base, ciliated. Calyx glabrous, or ciliated with long glandular hairs. Corollas white, glabrous outside.

Spiny-calyxed Clary. Fl. June, July. Clt. 1789. Pl. 1 to 2 feet.

43 S. Palæsti'na (Benth. lab. p. 718.) stem clothed with glandular hairs; leaves petiolate, oblong, somewhat pinnate or

pinnatifid, wrinkled, villous: lobes erosely toothed, very blunt; floral leaves bractea-formed, very broad, acuminated, concave, permanent, shorter than the calyxes; racemes panicled; whorls distant, about 6-flowered; calyx tubular, striated: teeth all erect and spiny; corolla about twice as long as the calyx. ♂. H. Native of Palestine, in corn-fields, Bove. S. Sinàica, Delile, mss. Habit, inflorescence, and flowers, like that of *S. spinòsa;* but differs from that species in the form of the leaves.

Palestine Clary. Pl. 1 to 2 feet.

44 S. Tingita'na (Ettling, salv. p. 30.) stem herbaceous, beset with glandular hairs; leaves petiolate, ample, ovate, deeply crenated, somewhat cordate at the base, much wrinkled, villous: superior ones stem-clasping; floral leaves very broad, acuminated, concave, permanent, rather shorter than the calyxes; racemes panicled; whorls distant, 6-10-flowered; calyx campanulate, plicately striated, hispidly ciliated: teeth all somewhat spiny: the middle tooth of the lower lip obsolete; corolla twice as long as the calyx. ♂. H. Native of the north of Africa, about Tunis; and of Spain, near Cadiz. S. coarctàta, Vahl, enum. 1. p. 277. S. fœ'tida, Lam. ill. 1. p. 69. Hormìnum Tingitànum, Riv. mon. irr. 1. t. 62. Allied to *S. spinòsa;* but differs in the broader leaves, cordate at the base, and more wrinkled, &c. The whole plant is beset with long spreading, and short glandular hairs. Corolla dirty white: lower lip yellowish, crenulated: upper lip tinged with blue.

Tangier Clary. Fl. July. Clt. 1796. Pl. 1 to 3 feet.

45 S. præ'cox (Vahl, enum. 1. p. 274.) leaves ovate-oblong, rather repand, smooth, rather pilose; bracteas cordate, veiny, acuminated, length of calyx. ♃. ? H. Native of the north of Africa. Nearly allied to *S. Tingitàna.* Stem erect, pilose. Lower leaves 3 inches long, petiolate: superior ones sessile, ovate, acute. Teeth of calyx cuspidate, but not spiny. Corolla size of that of *S. Sclàrea:* upper lip villous: lower lip concave.

Early Clary. Pl. 2 to 3 feet.

46 S. Æthìopis (Lin. spec. p. 39.) stem erect, clothed with white wool; lower leaves petiolate, narrowed at the base: cauline leaves cordate, stem-clasping, all deeply toothed, and much wrinkled, densely clothed with white wool on both surfaces: floral leaves very broad, acuminated, permanent, concave, equalling the calyxes, woolly; racemes panicled; whorls 6-10-flowered, distinct; calyx campanulate, woolly: teeth all subulately spinose, spreading; corolla twice as long as the calyx, with an inclosed tube. ♂. H. Native of Europe, Africa, and Asia, in the region of the Mediterranean, in arid fields and dry sterile places; south of France, Piedmont, Naples, Sicily, Austria, Hungary, Podolia, Greece and Syria, Tauria and Caucasus.—Herb panicled at top. Corollas white: upper lip pubescent, often reddish. This plant in a wild state is from ½ to 1 foot in height, but in the cultivated state it grows from 3-5 feet in height. Jacq. fl. austr. 3. p. 7. t. 211. Sclàrea lanàta, Mœnch. meth. p. 374. Sclàrea Æthìopis, Mill. dict. no. 2. Æthìopis, Besl. eyst. 2. ord. 8. fol. 3. f. 1.

Var. β, laciniàta; leaves jagged.—Barrel. icon. p. 24. t. 188.

Var. γ, papillòsa; leaves woolly beneath, and papillosely wrinkled above.—Sabb. hort. rom. p. 5. t. 3.

Ethiopian Clary. Fl. May, June. Clt. 1570. Pl. 1 to 4 feet.

47 S. compre'ssa (Vahl, enum. 1. p. 275.) stem erect, villous; lower leaves petiolate, rounded at the base: superior ones cordately stem-clasping, all ovate, and erosely toothed, wrinkled, rather woolly on both surfaces; floral leaves very broad, obtuse, permanent, concave, coloured, ciliated, equalling the calyxes; racemes panicled; whorls 6-10-flowered: the upper whorls abortive; calyx campanulate, membranous coloured, pubescent: teeth of lower lip of calyx obtuse; corolla one half longer than the calyx. ♂. ? H. Native of the Levant. Vent. cels. t. 59. Very nearly allied to the preceding; but differs principally in the floral leaves and blunt mutic calycine teeth, and in the upper whorls being abortive. Bracteas and floral leaves purplish at top. Corollas white.

Compressed Clary. Fl. May, June. Clt. 1822. Pl. 2 feet. ?

48 S. arge'ntea (Lin. spec. 38.) stem erect, villous; radical leaves petiolate, and the lower cauline leaves sessile, ample, ovate, cuneated at the base, sinuately lobed, erose, woolly, wrinkled: floral leaves very broad, acuminated, concave, permanent, pilose, equalling the calyxes; racemes panicled; whorls 6-10-flowered, remote: the upper ones abortive; calyx campanulate, striated, villous; calycine teeth all rather spiny; corolla about 3 times as long as the calyx, with an inclosed tube. ♂. H. Native of Europe and Africa, in the region of the Mediterranean, in corn-fields; as of Barbary, Portugal, Algarves, Sicily, Naples, Greece, &c. Jacq. hort. schœnbr. 1. p. 4. t. 6. Sibth. et Smith, fl. græc. 1. p. 20. t. 27. S. pyramidàlis, Petagna, inst. bot. 2. p. 54. S. candidíssima, Guss. prod. fl. sic. 1. p. 16. and of other Sicilian authors. Hoffm. et Link. fl. port. 1. p. 151. t. 20. but not of Vahl. S. Atlántica, Pers. ench. 1. p. 29. S. pátula, Desf. fl. atl. 1. p. 25. S. Æthìopis, Brot. fl. lus. 1. p. 18. but not of Lin. Sclàrea argéntea, Mill. dict. no. 15.—Mirb. ann. mus. 15. t. 15. f. 4. Allied to *S. spinòsa* and *S. Tingitàna.* Radical and lower cauline leaves 6-8 inches long, and 4-6 broad, clothed with loose white wool on both surfaces. Panicle ample. Corollas showy, bluish-white: lower lip yellowish.

Silvery Clary. Fl. May, July. Clt. 1759. Pl. 2 to 3 feet.

49 S. verbascifòlia (Bieb. fl. cauc. 3. p. 24.) stem erect, clothed with clammy villi; lower leaves petiolate, ample, ovate, cordate at the base, sinuately lobed, erose, thick, much wrinkled, hardly woolly above, but clothed with white tomentose wool beneath; floral leaves very broad, acuminated, concave, permanent, villous, about equalling the calyxes; racemes subpanicled; whorls 2-6-flowered, approximate, distinct: the upper ones abortive; calyx campanulate, striated, clothed with clammy villi; calycine teeth all acute, but scarcely spiny; corolla twice as long as the calyx. ♃. H. Native of Caucasus and Iberia, on sterile parts of mountains; Persia, in the province of Azarbaudgan. S. candidíssimum, Bieb. fl. cauc. 1. p. 21. but not of Vahl. Very nearly allied to *S. argéntea,* but differs in the more humble stature, in the leaves being cordate at the base, not narrowed, &c. Corollas white.

Mullien-leaved Clary. Fl. May, July. Clt. 1823. Pl. 1 to 2 feet. ?

50 S. Broussone'tii (Benth. lab. p. 227.) stem erect, clothed with rather clammy villi; leaves petiolate, ample, ovate, obtuse, sinuately crenated, cordate at the base, thick, much wrinkled, green, and nearly glabrous above, clothed with white tomentum beneath, and the veins with clammy pubescence; floral leaves ovate-lanceolate, acuminated, concave, green, hispid, permanent, rather longer than the calyxes; racemes panicled; whorls usually 6-flowered, distinct; calyx campanulate, hispid: teeth of upper lip ovate, acute; corolla scarcely twice the length of the calyx. ♃. ? H. Native of Teneriffe, or the north of Africa, Broussonet. This is a very distinct species from *S. verbascifòlia;* the leaves are larger, and destitute of wool on the upper surface; the panicle is more dense and more branched, and very villous; the floral leaves narrower, and the flowers smaller.

Broussonet's Clary. Pl. ?

51 S. Moorcroftia'na (Wall. ex Benth. in Wall. pl. rar. asiat. 1. p. 67. Benth. lab. p. 228.) stem erect, woolly at the base, but clothed with clammy villi at top; lower leaves on long petioles, ample, ovate, erosely crenated, narrowed at the base,

wrinkled, villous above, and clothed with white wool beneath; floral leaves very broad, acuminated, concave, permanent, equalling the calyxes; racemes panicled; whorls remote, about 6-flowered; calyx campanulate, striated, clothed with rough villi; calycine teeth all subulately mucronate; corollas 3 times as long as the calyx, with an exserted tube. ♂. ? H. Native of the Himalaya; in Luddak, Moorcroft; in the valley of Cashmere; and in Kinaour and Kidarkonta, Royle. Allied to *S. argéntea;* but differs in the leaves being on long petioles, less cut, hardly woolly above, but densely clothed with subfloccose wool beneath, &c. Corolla violaceous. ?

Moorcroft's Clary. Pl.

52 S. lana'ta (Roxb. fl. ind. 1. p. 147.) stems tufted, woolly at the base; leaves oblong-lanceolate, obtuse, entire, minutely crenulated, narrowed a long way at the base, much wrinkled, loosely clothed above, but densely beneath with white wool; floral leaves very broad, acuminated, concave, permanent, equalling the calyxes; racemes almost simple, clothed with clammy villi; whorls remote, about 10-flowered; calyx campanulate, with acute teeth; corolla twice as long as the calyx, with the tube rather exserted. ♃. ? S. Native of Himalaya; on the tops of the alps of Kamaon and Sirmore, and Mussooree; and common throughout the whole of the range. Wall. pl. rar. asiat. 2. p. 11. t. 116. S. càna, Wall. cat. no. 2145. S. integrifòlia, Hardw. in asiat. res. 6. p. 349. Stenarhèna lanàta, D. Don, prod. fl. nep. p. 111. Stems woody at the base, numerous. Leaves 3-4 inches long. Flowers size of those of *S. Æthìopis*. Corolla downy outside, purple.

Woolly Clary. Pl. 1 to 2 feet.

53 S. phlomoi'des (Asso, arrag. p. 158. t. 4.) stems tufted, clothed with white wool at the base; leaves oblong-linear or lanceolate, acute, entire, or the lower ones are sinuately lobed, narrowed a long way at the base, much wrinkled, clothed with white wool on both surfaces; floral leaves very broad, acuminated, concave, permanent, longer than the calyx; racemes nearly simple, clothed with clammy villi; whorls remote; calyx campanulate: teeth of lower lip lanceolate, acuminated; corolla about 3 times as long as the calyx: the tube a little exserted. ♂. H. Native of Spain, plentiful among the mountains of Arragon, about Siguenza. Rœm. script. pl. hisp. et lus. 10. t. 1. f. 1. Stems clothed with clammy hairs at top. Corollas almost glabrous outside, size of those of *S. Sclàrea*.

Phlomis-like Clary. Fl. May, June. Clt. 1805. Pl. 1 to 2 feet.

54 S. cane'scens (Meyer, verz. pflanz. p. 86.) stems woolly at the base; leaves lanceolate-oblong, entire or sinuately-lobed, narrowed a long way at the base, wrinkled, loosely clothed above, but densely beneath with white wool; floral leaves very broad, acuminated, concave, permanent, rather shorter than the calyxes; racemes branched, clothed with clammy villi; whorls remote; calyx tubularly campanulate; teeth of lower lip lanceolate, acuminated; corolla about 3 times longer than the calyx, the tube a little exserted. ♂. ? H. Native of Caucasus, among rocks towards the river Anticeta; and near Natzana, Meyer. This is very nearly allied to *S. phlomoìdes;* but differs in being taller and more slender; in the racemes being branched; in the flowers being fewer and smaller, &c.

Canescent Clary. Pl. 2 to 3 feet. ?

55 S. ceratophy'lla (Lin. spec. p. 39.) stem clothed with white wool at the base; lower leaves deeply pinnatifid, with linear, obtuse, sinuately subpinnatifid lobes, much wrinkled, clothed with loose wool on both surfaces; superior leaves nearly entire: floral leaves very broad, acuminated, concave, permanent, longer than the calyxes; racemes panicled; whorls about 6-flowered, distant, the upper ones abortive; calyx campanulate, with lanceolate-setaceous, rather spiny teeth; corolla twice as long as the calyx, the tube inclosed. ♂. H. Native of the Levant; Syria, near Aleppo, Persia, &c. S. exasperàta, Cav. ann. hist. nat. 3. p. 113. t. 17. icon. 6. p. 38. t. 558. Sclàrea ceratophýlla, Mill. dict. no. 8.—Kniph. cent. 4. t. 78.—Mor. hist. 3. p. 393. sect. 11. t. 13. f. 6. The lower part of the stem and leaves are clothed with loose wool. Lower leaves 7-8 inches long: floral leaves green, clammy. Corolla yellowish-white or cream-coloured.

Buckhorn-leaved Clary. Fl. July, Aug. Clt. 1699. Pl. 2 to 3 feet.

† *Doubtful species, probably belonging to the present section.*

56 S. grave'olens (Vahl, enum. 1 p. 273.) stem shrubby; branches tetragonal, very villous; leaves petiolate, cordate, wrinkled, crenated, villous, hoary beneath: lower ones somewhat sinuated; floral leaves cordate; spikes branchy; whorls approximate, 6-flowered; calyx campanulate. ♄. F. Native of Egypt. Bracteas attenuated, shorter than the calyxes, glabrous above. Galea of corolla linear-falcate, pilose.

Strong-scented Clary. Shrub.

57 S. va'ria (Vahl, enum. 1. p. 273.) herbaceous; leaves petiolate, cordate, unequally crenated, obtuse, wrinkled, clothed with hoary tomentum beneath, as well as the stems, but rather villous above; whorls 6-flowered; bracteas cordate, acuminated, length of calyxes; calyx, bracteas, and peduncles hoary: calycine teeth subulate. ♃. H. Native of Armenia. Leaves 3-4 inches long. Corolla small, a little longer than the calyx.

Various Clary. Pl.

• Sect. VI. PlethiósPace (from πληθος, *plethos*, multitude; and σφακος, *sphakos*, sage; so called from the section containing the *S. sylvéstris*, or common wild sage.) Benth. lab. p. 230. in Hook. bot. misc. 3. p. 373. Calyx ovate: upper lip concave above, bisulcate, with 3 very short conniving teeth: lower lip bifid, with acute teeth. Tube of corolla widened or ventricose under the throat, without any ring of hairs inside: upper lip concave, or falcately compressed; lateral lobes of lower lip oblong, erectish, a little twisted: middle lobe spreading, roundish, usually concave, emarginate, and crenulated. Connective deflexed behind, abruptly dilated, callous and connate at the extremity.—European, African, and North Asiatic herbs. Leaves usually erosely toothed or cut. Racemes elongated, simple, or virgately panicled.

58 S. bi'color (Desf. in Fourcr. journ. de decouv. 1792.) stem erect, a little branched, clothed with clammy pubescence; lower leaves petiolate, ample, ovate, deeply toothed, pinnatifid or palmately lobed; middle leaves petiolate, ovate-lanceolate, acuminated, deeply toothed: superior leaves sessile, lanceolate, all cordate at the base, and clothed with clammy pubescence: floral leaves ovate-lanceolate, acuminated, reflexed; racemes a little branched, elongated; whorls distant, 6-flowered; calyxes pedicellate, campanulate, striated, clothed with clammy hispid hairs: teeth all subulate; corolla 3 times longer than the calyx; the tube equalling the calyx; stamens exserted. ♃. H. Native of the north of Africa; and of Spain, in Andalusia. Sims. bot mag. t. 1774. Desf. fl. atl. 1. p. 22. t. 2. Jacq. hort. schœnbr. 1. p. 4. t. 7. S. crassifòlia, Cav. hort. matr. descr. p. 16. Jacq. fragm. p. 47. t. 60. This is a very beautiful and distinct species, allied to *S. Austrìaca*. Stems tetragonal. Radical leaves usually palmately pinnatifid. Racemes 1 to 2 feet long, many-flowered. Corollas larger than those of *S. Austrìaca:* upper lip bluish-violet, spotted with white: lower lip yellow.

Two-coloured-flowered Sage. Fl. June, July. Clt. 1793. Pl. 2 to 3 feet.

59 S. Algerie'nsis (Desf. fl. atl. 1. p. 23. t. 3.) stem branched, hairy; lower leaves ovate-oblong, crenated, running into the petioles: middle and upper leaves few, sessile, usually quite entire; whorls 2-6-flowered, distinct; calycine teeth setaceous, spiny; bracteas reflexed. ♃. H. Native of Algiers, near Maiane. Calyxes nutant. Corollas blue, size of those of *S. praténsis*. This species is said to differ from *S. bícolor*, in the stem being hairy; in the leaves being ovate-oblong, crenated, not erose, and sinuately toothed, ex Desf.

Algiers Sage. Pl. 2 to 3 feet.?

60 S. latifòlia (Vahl, enum. 1. p. 271.) stem rather pilose, branched at top; lower leaves petiolate, oblong, attenuated at the base: upper ones sessile, cordate; racemes clothed with clammy villi; whorls remote, 4-flowered; calyx campanulate, striated, villous, with setaceous teeth; bracteas cordate, acuminated, glabrous inside, one half shorter than the calyxes. ♃. H. Native of Tangiers. Stems purplish. Upper leaves sessile, 2-3 inches long, very blunt, attenuated at the base, veiny, villous. Pedicels very short. Corolla much larger than the calyx. Very nearly allied to *S. Algeriénsis;* but differs in the leaves being remotely toothed, and the seeds larger, &c.

Broad-leaved Sage. Pl.

61 S. inamœ'na (Vahl, enum. 1. p. 269.) stem erect, branched, clammy and hispid; leaves petiolate, ample, ovate, deeply toothed, cordate at the base, hispid: upper leaves lanceolate-linear: floral leaves ovate, acuminated, reflexed; racemes elongated, a little branched; whorls 6-flowered, distant; calyxes shorter than the pedicels, amply campanulate, striated, hispid: teeth all short and stiff; genitals hardly exserted. ♃. H. Native of Spain, Schousboe. Leaves a hand long. Corollas size of those of *S. Sclàrea*, pubescent outside. Pedicels clothed with clammy villi.

Unpleasant Sage. Pl. 2 to 3 feet.?

62 S. Austri'aca (Lin. syst. veg. p. 69.) stem erect, nearly naked, pubescent; radical leaves petiolate, broad-ovate, erosely toothed, cordate, rounded or cuneated at the base, wrinkled, glabrous above and pubescent beneath: cauline leaves few: floral leaves ovate, acuminated, ciliated, about equal in length to the calyxes; racemes a little branched; whorls about 6-flowered: lower ones distant: upper ones approximate; calyxes nearly sessile, campanulate, very pilose; corolla 3 times as long as the calyx, the tube a little exserted. ♃. H. Native of Lower Austria, Hungary, Transylvania, Moldavia; frequent in Tauria, and Caucasus. Jacq. fl. austr. 2. p. 8. t. 112. Lindl. bot. reg. t. 1019. S. Sclàrea, Crantz, austr. p. 236. but not of Lin. Sálvia dístans, Pohl, ex Steud. nom. 725. Sclàrea dístans, Mœnch. meth. Stems bluntly tetragonal. Radical leaves 3-4 inches long: cauline ones 2 inches long, pinnatifid. Corolla cream-coloured, beset with clammy pili outside, size of that of *S. praténsis*.

Austrian Sage. Fl. June, Jul. Clt. 1776. Pl. 2 to 3 feet.

63 S. limba'ta (Meyer, verz. pflanz. p. 86.) stems erect, almost naked, pubescent; radical leaves petiolate, broad-ovate, entire, erosely toothed, cordate at the base, very much wrinkled, green, and rather hairy on both surfaces; cauline leaves few, sessile: floral leaves ovate, acuminated, shorter than the calyx; racemes branched; whorls 2-6-flowered, distant; calyxes nearly sessile, broadly campanulate, rather hispid; corolla about thrice as long as the calyx, the tube a little exserted; genitals exserted. ♃. H. Native of Caucasus, in dry stony places on the Talusch mountains. Very nearly allied to *S. Austrìaca;* but differs in the leaves being shorter, more wrinkled; in the racemes being fewer-flowered; in the calyx being more broadly campanulate, and hardly hairy.

Limbate Sage. Pl. 2 to 3 feet.?

64 S. ceratophylloi'des (Lin. mant. p. 26.) stem ascending? villous; leaves oblong, deeply pinnatifid, with oblong-lanceolate, deeply toothed lobes, much wrinkled, glabrous: superior leaves nearly sessile: floral leaves ovate, acute, one half shorter than the calyxes; racemes elongated, branched a little; whorls remote, 2-6-flowered; calyxes pedicellate, campanulate, hispid; teeth of lower lip lanceolate, acute; corolla twice as long as the calyx: the tube exserted a little. ♃.? H. Native of the region of the Mediterranean; on arid hills of Calabria; and south of Sicily. Corollas of *S. praténsis*, but smaller, larger than those of *S. verbenàca*, violaceous or blue.

Stag-horn-like-leaved Sage. Fl. June, May. Clt. 1771. Pl. 1 to 2 feet.

65 S. prate'nsis (Lin. spec. p. 35.) stems erect, almost simple, pubescent; radical leaves petiolate, oblong-ovate, obtuse, crenated, or cut, cordate at the base, bullately wrinkled, glabrous above, with the petioles and nerves pubescent beneath; cauline leaves few, sessile: uppermost ones lanceolate, acuminated: floral leaves cordate-ovate, shorter than the calyxes, rather reflexed; racemes clammy, nearly simple; whorls 6-flowered, distant; calyxes nearly sessile, campanulate, clothed with clammy villi; corolla 3 times longer than the calyx, the tube equal in length to the calyx; genitals exserted. ♃. H. Native of Middle and South Europe, in dry, grassy fields, and by waysides; as of Britain, France, Spain, Portugal, Germany, Italy, Greece, Caucasus, Sweden, Russia. Smith, engl. bot. t. 153. S. agréstis, Lin. amœn. acad. 3. p. 399.? S. hæmatòdes, Lin. spec. p. 35. S. Barrelièri, Tenor. fl. nap. 1. p. 9. t. 2. Schranck, hort. mon. 1. t. 5. S. Tenòrii, Spreng. syst. 2. p. 65. Sweet. brit. fl. gard. 1. t. 26. S. rubicúnda, Wenderoth. S. virgàta, Sav. bot. etrusc. 2. p. 4. ex Tenore, syll. p. 17. but not of Jacq. S. variegàta, Waldst. et Kit. ex Willd. enum. 1. p. 36. S. trícolor, Hortul.—Berg. phyt. 2. t. 95.—Blackw. t. 258.—Plenck, icon. t. 22. This species is variable in height and pubescence, but the flowers are always large, usually blue, rarely reddish, or white. Racemes simple, or furnished with a few small branches. Root thick. Leaves in the more southern varieties more or less spotted with red.

Meadow Sage. Fl. May, June. Britain. Pl. 2 to 4 feet.

66 S. dumetòrum (Andrz. in Bess. enum. fl. volh. 3. & 40.) stem erect, almost simple, pubescent; radical and lower cauline leaves petiolate, ovate, doubly crenated, deeply crenated at the base, wrinkled, glabrous on both surfaces, or pubescent on the nerves and petioles beneath; cauline leaves few, sessile, broadly ovate-cordate, acute; floral leaves roundish-cordate, shorter than the calyxes, at length reflexed; racemes almost simple, clammy; whorls 6-flowered, remote; calyxes almost sessile, campanulate, striated, clothed with clammy villi; corolla about 3 times longer than the calyx: tube equal in length to the calyx; genitals almost inclosed. ♃. H. Native of Altaia, in fields at the river Tscharysch; and in the Kirghisean Steppe at the river Nura Ledeb; and in the valley of Cashmere, Royle. Corollas blue. This species differs from *S. praténsis* in the leaves being smaller, less wrinkled, and more entire, the lower ones on longer petioles, the whorls more remote, and the flowers about half the size.

Bush Sage. Pl. 1 to 3 feet.

67 S. Lusita'nica (Jacq. fil. eclog. 1. p. 57. t. 38. exclusive of the syn. of Vahl and Poir.) stem erect, pilose, clammy; radical leaves petiolate; cauline leaves few, stem-clasping, all triangularly ovate, truncate at the base, somewhat cordate, acute, deeply toothed, much wrinkled, glabrous above, and villous beneath; floral leaves ovate, acuminated, equalling the calyxes; racemes branched; whorls 6-flowered, distant; calyxes nearly sessile, campanulate, striated, hispid, rather veiny; corolla about twice as long as the calyx, with an inclosed tube. ♃. H. Native of Spain and Portugal. Sclàrea Lusitánica, Mill. dict. no.

3.? This species is very nearly allied to *S. praténsis*, *S. dumetòrum*, and *S. virgàta*. It has the small flowers of the two latter species, and the branching panicle of *S. virgàta*. Corollas blue.

Portugal Sage. Fl. June, July. Clt. 1819. Pl. 1 to 2 feet.

68 S. virga'ta (Ait. hort. kew. ed. 1st. vol. 1. p. 39.) stem erect, branched, pubescently villous; radical leaves petiolate, amply ovate, cordate at the base: lower cauline leaves on short petioles, ample, ovate-oblong, rounded or cordate at the base: upper cauline ones more sessile, and smaller: uppermost ones cordately stem-clasping, acuminated, all erosely crenated, wrinkled, almost glabrous above, and pubescent on the nerves beneath, or hispid; floral leaves ovate, acuminated, somewhat reflexed, shorter than the calyxes; racemes branched, elongated; whorls 6-flowered, distant; calyxes pedicellate, campanulate, striated, clothed with clammy villi; corolla twice as long as the calyx, with an inclosed tube. ♃. H. Native of Italy, about Rome, and in fields on Mount St. Angelo. Jacq. hort. vind. 1. p. 14. t. 37. S. Tiberìna, Mauri, ex Requien. S. Gargánica, Tenore, ind. sem. hort. neap. 1829. syll. p. 18. S. cadùca, Horn. hort. hafn. 1. p. 30. S. gigantèa, Desf. cat. hort. par. 2. p. 68. S. Pyrenàica, Lin. spec. p. 36. S. grandidentàta, Lehm. ind. sem. hort. hamb. 1. p. 29.? S. amplexicaúlis, Lam. ill. 1. p. 68.? S. rùbra, Spreng. cur. post. 17. S. Caucásica, Schranck, in syll. pl. soc. ratisb. 2. p. 58. S. affìnis, Spreng, ex Steud. nom. S. Bauhìni, S. Barrelièri, S. quercifòlia, S. Taúrica, and S. Taurìna, Hortul.—Riv. mon. irr. t. 63. Corollas white, pale red, or pale blue. This species differs from *S. praténsis* in the large panicle, in the elongated, few-flowered racemes, in the larger leaves, and smaller flowers. The calyxes and floral leaves are clammy, and hardly coloured.

Twiggy Sage. Fl. June, Nov. Clt. 1758. Pl. 2 to 4 feet.

69 S. rugòsa (Thunb. prod. fl. cap. p. 97.) stem ascending, very villous; leaves petiolate, ovate, or oblong-lanceolate, obtuse, erosely toothed, cordate at the base, bullately wrinkled, pubescent on both surfaces; floral leaves ovate-cordate, acute, rather shorter than the calyxes; racemes a little branched; whorls 6-10-flowered, remote; calyx campanulate, striated, clothed with clammy villi; corolla twice as long as the calyx, the tube equalling the calyx. ♃. G. Native of the Cape of Good Hope. Corollas white, tinged with red. This species differs from *S. disérmas* in the form of the leaves, large and widely campanulate calyxes, and in the corollas being white.

Wrinkled-leaved Sage. Fl. July, Aug. Clt. 1775. Pl. 1 to 2 feet.

70 S. viscòsa (Jacq. misc. 2. p. 328. icon. rar. 1. p. 2. t. 5.) stem erect, clothed with clammy pubescence; leaves petiolate, broad-ovate, crenulated, sub-sinuated, cordate at the base, wrinkled, rather villous on both surfaces, clammy: superior leaves sessile: floral leaves rounded, half the length of the calyxes; racemes elongated, branched; whorls remote, usually 6-flowered; calyx campanulate, clothed with clammy villi; corolla 3 times as long as the calyx, the tube exserted. ♃. H. Native of Spain, Italy, &c. All parts of the plant are clothed with clammy pubescence. Stems with few leaves at top. Radical leaves 8 inches long, and 4-5 broad: cauline ones becoming gradually smaller as they ascend. Corolla 8-9 lines long, violaceous, glabrous outside. Allied to *S. virgàta*.

Clammy Sage. Fl. June, July. Clt. 1773. Pl. 2 to 4 feet.

71 S. dise'rmas (Lin. spec. p. 36.) stems procumbent at the base; branches ascending, and clothed with clammy villi; lower leaves petiolate: superior ones nearly sessile, all oblong-lanceolate, erose, rounded at the base, or cordate, clothed with clammy villi on both surfaces: floral leaves broad-ovate, acute, about equal in length to the calyxes; racemes a little branched; whorls 6-10-flowered, remote; calyx ovate-tubular, clothed with clammy villi, striated; lower calycine teeth lanceolate, acute; corolla exceeding the calyx but little, the tube equalling the calyx. ♃. H. Native of the Cape of Good Hope. Hormìnum disérmas, Mœnch. meth. Allied to *S. verbenàca* and *S. clandestìna*. Corollas white.

Two-glumed Sage. Fl. July. Clt. 1773. Pl. 1 foot.?

72 S. Sibthórpii (Smith, fl. græc. 1. p. 17. t. 22.) stem erect, rather panicled at top, villous; radical leaves petiolate, ample: superior leaves sessile, all ovate, coarsely and doubly crenated, a little cut, glabrous above, wrinkled, villous beneath: floral leaves roundish, acuminated, rather coloured, shorter than the calyxes; racemes elongated, brachiate, branched, rather canescent; whorls numerous, distinct, 6-10-flowered; calyx tubularly campanulate, villous; lower calycine teeth lanceolate, very acute; corolla hardly twice as long as the calyx, the tube exserted. ♃. H. Native of Europe, in the region of the Mediterranean, in grassy places, and by way-sides; as of Greece, South of Podolia, Bulgaria, about Smyrna, Tauria, &c.; also in the valley of Cashmere, Royle. S. campéstris, Bieb. fl. cauc. 1. p. 20. and 3. p. 22. Rchb. icon. bot. 6. p. 21. t. 529. S. Hypánica, Andrz. in Bess. enum. pl. pod. 3. S. móllis, Jacq. fil. ecl. 1. p. 56. t. 37.? exclusive of the syn. of Donn. S. amplexicaúlis, S. Barrelièri, S. Caucásica, S. Taurica, and S. virgàta, &c. Hortul. Very nearly allied to *S. sylvéstris* and *S. virgàta*; it differs from the first in the less leafy, more villous stem, and more ample leaves, which are 6-9 inches long, and 3-4 broad; and from the latter in the whorls being more numerous and more approximate, in the calyx being larger, and in the floral leaves being membranous and coloured.

Sibthorp's Sage. Pl. 1 to 3 feet.

73 S. sylve'stris (Lin. spec. p. 34.) stem erect, panicled at top; lower leaves petiolate: superior ones sessile, all oblong-lanceolate, crenated, rounded, or usually cordate at the base, wrinkled, glabrous above, and paler and pubescent beneath, or canescent; floral leaves orbicular, acuminated, coloured, about equal in length to the calyxes, imbricated before florescence, but afterwards a little reflexed; racemes elongated, a little branched; whorls 6-10-flowered, distinct; calyx ovate-tubular; corolla twice as long as the calyx, the tube equalling the calyx. ♃. H. Native of East and middle Europe, and middle Asia, in grassy fields; Spain, South of France, Sicily, Naples, Germany, Austria, Hungary, Bohemia, Greece, Persia, Tauria, and Caucasus, Siberia, &c. Jacq. fl. austr. 3. p. 7. t. 212. Rchb. icon. bot. 6. p. 20. t. 527. S. nemoròsa, Lin. spec. p. 35. Poit. et Turp. fl. par. t. 35.? Rchb. icon. bot. 6. p. 19. t. 526. S. desérta, Schangin, in Led. cat. hort. dorp. 1824. p. 6. Rchb. icon. bot. 6. p. 21. t. 528. S. Valentìna, Vahl, enum. 1. p. 268. S. elàta, Host, fl. austr. 1. p. 24. and probably of Tenore, syll. p. 18. S. amplexicaúlis, Lam. ill. 1. p. 68.? S. alpéstris, S. aspérula, and S. Taurìna, Hortul. Sclàrea punctàta, Mœnch. meth. Sclàrea sylvéstris, Mill. dict. no. 7. Sclàrea nemoròsa, Mill. dict. no. 6. Sclàrea Syrìaca, Mill. dict. no. 5. This species is very variable in height and villosity, but with a very distinct habit. Leaves 2-4 inches long. Corollas purplish violet.

Wild Sage. Fl. June, Oct. Clt. 1759. Pl. 1 to 3 feet.

74 S. pe'ndula (Vahl, enum. 1. p. 281.) stem erect, villous; lower leaves petiolate: upper ones sessile, all oblong-lanceolate, obtuse, doubly crenated, rather cordate at the base, wrinkled, pubescent; floral leaves orbicular, acuminated, about half as long as the calyxes, permanent, reflexed; racemes a little branched, rather nutant at apex; whorls 6-10-flowered, distinct; calyx tubular, pubescent; corolla twice as long as the calyx, the tube a little exserted. ♃. H. Native of Transylvania, and

Podolia. S. betonicæfòlia, Ettling, salv. 49. S. Cremenecénsis, Bess. enum. pl. volh. p. 40. This species differs from *S. nùtans* in the stem being leafy, in the leaves being narrower, and on shorter petioles, the racemes few, elongated, and loose, and the flowers larger, &c. Corollas violaceous, larger than those of *S. sylvéstris*.

Pendulous-racemed Sage. Pl. 1 to 2 feet. ?

75 S. NU'TANS (Lin. spec. p. 39.) stem pubescent, nearly naked; leaves all radical, or nearly so, on long petioles, ovate-oblong, doubly crenated, sub-cordate at the base, wrinkled; floral leaves orbicular; racemes short, on long peduncles, panicled, drooping at the time of flowering; whorls about 6-flowered, approximate; calyxes reflexed, pubescent; corolla twice as long as the calyx, the tube equalling the calyx. 4. H. Native of the East of Europe, Podolia, and Galicia, Hungary, and Transylvania, Siberia, Tauria, and Caucasus, &c. Waldst. et Kit. pl. hung. 1. p. 63. t. 62. Sims, bot. mag. 2436. S. acutifòlia, Lam. ill. 1. p. 683. S. péndula, Besser. fl. galic. but not of Vahl. S. hastàta, Ettling, salv. 46. Vahl, enum. 1. p. 280. S. betonicæfòlia, Ettling, salv. p. 49. Bieb. fl. cauc. 1. p. 23.—Kniph. cent. 7. t. 79.—Nov. act. petrop. 1. p. 378. t. 14. Stems nearly simple. Lower leaves 3-4 inches long, glabrous above, and pubescent beneath. Racemes spike-formed, 1-2 inches long. Corolla violaceous, 4-5 lines long. Stamens inclosed.

Drooping-racemed Sage. Fl. June, Aug. Clt. 1780. Pl. 1 to 3 feet.

76 S. SCLAREOI'DES (Brot. fl. lus. 1. p. 17. phyt. 3. t. 2.) stems erect, almost simple, pilose; radical leaves petiolate, oblong-ovate, obtuse, crenated, or a little cut, cordate at the base, bullately wrinkled, glabrous above, but the petioles and nerves are pilose beneath; cauline leaves few, sessile: upper ones lanceolate, acuminated: floral leaves cordate-ovate, shorter than the calyxes, a little reflexed; racemes clammy, nearly simple; calyxes nearly sessile, campanulate, clothed with clammy villi; corolla hardly twice as long as the calyx, the tube equalling the calyx. 4. H. Native of the South of Europe, as of Portugal, and Italy. S. Lusitánica, Poir. dict. 6. p. 606. but not of Jacq. S. elongàta, Spreng. pug. pl. min. cogn. 1. p. 43. S. bullàta, Schousb. ex Vahl. enum. 1. p. 265. This species differs from *S. praténsis* in the flowers being smaller. Habit of *S. clandestìna*, but the leaves are very distinct. Corollas violaceous.

Clary-like Sage. Fl. July, Aug. Clt. 1804. Pl. 1 to 2 feet.

77 S. NUDICAU'LIS (Vahl, enum. 1. p. 266.) stems erect, nearly naked, clothed with hoary villi; leaves all radical, or nearly so, petiolate, oblong-linear, or lanceolate, acute, erosely toothed, somewhat cordate at the base, bullately wrinkled, glabrous above, canescent and sub-villous beneath; floral leaves ovate-roundish, shorter than the calyxes, a little reflexed, permanent; racemes simple, or branched: whorls 6-flowered, distant; calyxes nearly sessile, campanulate, striated, clothed with clammy villi; corolla about twice as long as the calyx. 4. H. Native of Arabia. S. Abyssínica, Lin. fil. suppl. p. 88. ? but not of other authors. S. Merjàmie, Forsk. fl. arab. p. 10. Nearly allied to *S. bullàta*, but differs in the narrower, more wrinkled, erosely toothed leaves.

Naked-stemmed Sage. Pl. 1 to 2 feet. ?

78 S. VERBENA'CA (Lin. spec. p. 35.) stem erect, pubescent, or villous; leaves broad-ovate, or oblong, crenated, wrinkled, glabrous: lower ones on long petioles, narrowed at the base: superior ones broader, sessile, cordate at the base; floral leaves ovate-roundish, acuminated, villous, permanent, rather shorter than the calyxes, reflexed after florescence; racemes elongated, simple, or a little branched; whorls remote, about 6-flowered; calyx ovate, hairy; corolla one-half longer than the calyx, the tube equalling the calyx. 4. H. Native of North and middle Europe; as of Britain, North of France, Sweden, Denmark, Germany, Italy, European Russia, about Constantinople, Tauria, and Caucasus, &c. Smith, engl. bot. t. 154. Curt. lond. 6. t. 1. S. Spielmánni, Willd. enum. p. 38. but not of Scop. S. Spielmanniàna, Bieb. fl. cauc. 1. p. 21. S. Illýrica, Schultes, obs. bot. 8. S. micrántha, Desf. cat. hort. par. but not of Vahl. S. horminòides, Pourr. act. toul. 3. p. 327. S. Bysantìna, and S. heterophýlla, Hortul. Hormìnum verbenàceum, Mill. dict. no. 1. Mor. hist. sect. 11. t. 14. f. 33. Leaves 3-4 inches long, 1-2 broad. Corollas blue, rarely white, size of those of *S. Hormìnum*. The herb and flowers prove very aromatic when rubbed. The seeds produce a great quantity of mucilage when moistened, whence they become serviceable for removing extraneous matter from the eyes. If put under the eye-lashes for a few moments the tears dissolve their mucilage, which envelopes any sand or dust, and brings it out. Hence some old authors has called the plant *Oculus christi*, and others of our own country have derived our English name *Clary* from the same circumstance.

Var. β, oblongifòlia (Benth. lab. p. 240.) leaves oblong, crenated, hardly cut. 4. H. Cultivated in gardens. S. oblongàta, Vahl, enum. 1. p. 256. S. betonicæfòlia, Lam. ill. 1. p. 70. but not of Ettling.

Var. γ, ? incìsa (Benth. l. c.) leaves broad-ovate, cut: lobes ovate, acute, approximate. 4. H. Native of France, about Toulouse. This is probably a variety of *S. clandestìna*.

Vervain Sage, or Clary. Fl. June, Oct. Britain. Pl. 1 to 2 feet.

79 S. CLANDESTI'NA (Lin. spec. p. 36. but not of his herb.) stem herbaceous, erect, pubescent, or villous; leaves ovate-oblong, deeply toothed, or pinnatifid, wrinkled, glabrous: lower ones petiolate, narrowed at the base, truncate, or sub-cordate; floral leaves ovate-roundish, acuminated, villous, permanent; racemes simple, or a little branched; lower whorls remote: upper ones approximate, about 6-flowered; calyx ovate, hairy; corolla twice as long as the calyx. 4. H. Native of the South of Europe, and North of Africa; and Madeira, in dry places, and by way sides; Spain, Portugal, South of France, Sardinia, Dalmatia, Syria, Caucasus, &c. S. verbenàca, Vahl, enum. 1. p. 255. Rchb. icon. bot. 6. p. 17. t. 523. S. verbenacioìdes, Brot. fl. lus. 1. p. 17. S. polymórpha, Hoffm. et Link, fl. port. 1. p. 149. t. 19. Rchb. icon. bot. 6. p. 18. t. 524. f. 719. S. acutàta, Link, et Brot. phyt. lus. p. 116. S. obtusàta, Link, et Brot. l. c. S. parviflòra, Link, et Brot. l. c. but not of Vahl. S. clandestinoìdes, Link, jahrb. 3. p. 169. S. præ'cox, Savi, fl. pis. 1. p. 22. Lois. not. 6. but not of Vahl. S. pallidiflòra, St. Aman. fl. agen. 10. S. collìna, Lowe, prim. fl. mad. p. 19. S. variàbilis, var. Lois. fl. gall. ed. 2d. vol. 1. p. 16. S. oblongàta, Rchb. icon. bot. 6. p. 16. t. 521. but not of Vahl. S. micrántha, Desf. cat. hort. par. ex Rchb. l. c. but not of Vahl. S. Viviàni, Spreng. in Sieb. pl. apul. et calab. ex Rchb. l. c. Corollas pale blue or pale purple. This is a very variable plant, very nearly allied to *S. verbenàca*, but is always much smaller, with the leaves crowded at the bottom of the stem, narrower, and more deeply cut.

Var. β, multífida (Benth. lab. p. 241.) leaves deeply pinnatifid, with ovate-oblong lobes. 4. H. S. multífida, Sibth. et Smith, fl. græc. 1. p. 17. t. 23. Rchb. icon. bot. 6. p. 18. t. 524. f. 720. S. clandestìna, Vahl, enum. 1. p. 256. Rchb. icon. bot. 6. p. 18. t. 525. S. laciniàta, Willd. enum. suppl. p. 2. S. eròsa, Desf. cat. hort. par. p. 68. Poir. suppl. 5. p. 49. S. ceratophylloìdes, Willd. enum. 1. p. 297. ex Rchb. l. c. but not of Lin.—Hormìnum, &c. Barrel. icon. 24. t. 200.

Clandestine Sage. Fl. May, Aug. Clt. 1739. Pl. ½ to 1 foot.

80 S. contrave'rsa (Tenore, syll. fl. nap. p. 18.) stem pubescent, or villous; leaves oblong, deeply pinnatifid, with oblong-linear, very blunt, deeply crenated lobes, bullately wrinkled, rather pilose on both surfaces, with revolute margins; lower leaves petiolate: superior ones sessile: floral leaves roundish, acuminated, villous, scarcely shorter than the calyxes; racemes branched; whorls 6-10-flowered: lower ones remote: superior ones approximate; calyx ovate, clothed with long hairs; corolla shorter than the calyx, or a half longer. ♃. H. Native of the region of the Mediterranean; as of Spain, Calabria, Cyprus, Syria; Egypt, in the Great Syrtus; also of the Cape of Good Hope. S. clandestìna, Lin herb. but not of his spec. p. 36. Sibth. et Smith, fl. græc. 1. p. 18. t. 24. S. lanígera, Poir. suppl. 5. p. 48. Habit of *S. clandestìna*, but more humble and more branched; the leaves more deeply cut, lobed almost to the midrib. Corolla pale purple.

Var. β, grandiflòra (Benth. lab. p. 719.) corolla more than twice as long as the calyx. ♃. H. Native near Jaffa, in the sand by the sea-side, Bovè.

Twisted Sage. Pl. ½ to ¾ foot.

81 S.? dese'rti (Decaisne, in ann. sc. nat. par. 1834. 2. p. 248.) plant suffruticose, hoary; branches divaricate, pubescent; leaves small, few, oblong, petiolate, crenated, bullately wrinkled, with reflexed margins, clothed with hoary pubescence; floral leaves small: uppermost ones very small; whorls 2-6-flowered, distant; calyx ovate-campanulate, beset with very long hairs: teeth all nearly equal, or the upper one is smaller. ♄. G. Native of the desert of Sinai, Bovè. Habit of *S. contravérsa* and *S. Ægyptìaca*.

Desert Sage. Shrub.

82 S. Nu'bia (Ait. hort. kew. ed. 1st. vol. 1. p. 42. but not of other authors.) stem erect, villous, canescent; lower leaves on long petioles: superior ones sessile, or cordately stem-clasping, all oblong-ovate, or lanceolate, obtuse, or acuminated, irregularly crenated, or erose, cordate at the base, much wrinkled, clothed with fine pubescence above, and hoary tomentum beneath, or rather woolly; racemes very villous, dense, branched; whorls 6-flowered, approximate; calyx ovate, clothed with soft, hair-like wool; corolla about twice as long as the calyx. ♃. H. Native of Abyssinia. Habit of *S. verbenàca*. Leaves almost like those of *S. sylvéstris*. Racemes like those of *S. contravérsa*, but more branched, and more dense, and the stem is taller.

Nubian Sage. Fl. June, July. Clt. 1784. Pl. 2 to 3 feet.?

† *Doubtful species, probably belonging to the present section.*

83 S. Barrelie'ri (Ettling, salv. p. 46. ex Vahl, enum. 1. p. 269.) stem erect, leafy; leaves petiolate, hairy, hastately 7-lobed: middle lobe lanceolate, acute, all unequally serrated; bracteas small, ovate, ciliated, acute; whorls 6-flowered; calyx villous, 5-toothed. ♃. H. Native of Spain.

Barrelier's Sage. Pl. 1 to 2 feet.

84 S. parviflòra (Vahl, enum. 1. p. 268. Labill. pl. syr. rar. dec. 4. p. 13. t. 7.) stems erect, hoary; leaves cordate, oblong, veiny, wrinkled, greenish grey, crenated, villous beneath: upper ones sessile; flowers pedicellate; whorls 2-6-flowered; bracteas cordate, ovate, acute, hardly the length of the calyxes; calyx tomentose, rather hoary, one-half shorter than the corolla; stamens inclosed. ♃. H. Native of Syria, near Damascus, and on the mount called Dgebel-cher. Corollas rather tomentose, yellowish. Nearly allied to *S. Nùbia*.

Small-flowered Sage. Pl. 1½ foot.

● Sect. VII. Micro'sphace (from μικρος, *micros*, small; and σφακος, *sphakos*, sage; in allusion to the small corollas.) Benth. lab. p. 244. Calyx ovate: upper lip entire. Corolla small; tube inclosed, without any ring of hairs inside; lips very short; upper lip erect: lateral lobes of lower lip spreading. Connective deflexed behind, linear, combined longitudinally. Lower lobe of style flattened, dilated, rounded.—Procumbent, American herbs.

85 S. occidenta'lis (Swartz, fl. ind. occ. 1. p. 23.) diffuse, procumbent, glabrous, or pubescent; leaves petiolate, broad-ovate, acute, serrated, rounded at the base, or cuneated, glabrous or hispid; floral leaves sessile, hardly longer than the pedicels, ovate-lanceolate, acute, permanent; racemes elongated, branched a little at the base; whorls 2-6-flowered, remote; flowers minute; calyx tubular, clothed with glandular villi: teeth of lower lip obtuse; corolla a half longer than the calyx. ♃. S. Native of Tropical America, in waste fields; Mexico, Jamaica, St. Domingo, Cuba, Martinico, Trinidad, Antigua, Peru, in the valley of Lima, and elsewhere on the same coast. S. procúmbens, Ruiz. et Pav. fl. per. 1. p. 27. t. 39. f. a. S. radìcans, Poir. suppl. 6. p. 621. Hyptis glandulòsa, Sieb. fl. mart. exsic. no. 151. Verbena minima chamædryos folio, Sloane, jam. 1. p. 172. t. 107. Stems numerous, tetragonal. Leaves 1 to 1½ inches long. Racemes like those of *Verbèna officinàlis*. Corolla blue, glabrous.

Western Sage. Pl. procumbent.

86 S. mise'lla (H. B. et Kunth, nov. gen. amer. 2. p. 290.) herbaceous; stems pilose; leaves roundish rhomboid, acute, rather cuneated at the base, crenated, glabrous; whorls generally 6-flowered, remote; calyx beset with glandular hairs. ♃. S. Native of New Spain, in most places between Acapulco and La Venta del Exido. Stem branched, diffuse; branches ascending. Leaves on short petioles, 2-4 lines long. Racemes filiform. Bracteas roundish-ovate, hairy, acuminated, deciduous, shorter than the calyxes. Corolla violet.? This species hardly differs from *S. occidentàlis*.

Pityful Sage. Pl. ½ to 1 foot.

● Sect. VIII. Calo'sphace (from καλος, *kalos*, beautiful; and σφακος, *spakos*, sage; many of the species contained in this section are showy.) Benth. in Hook. bot. misc. 3. p. 374. lab. p. 245. Calyx ovate, tubular, or campanulate: upper lip entire, or shortly tridentate. Tube of corolla exserted, or inclosed, without any ring of hairs inside, but sometimes furnished near the base with two teeth: upper lip of corolla straight, concave, entire, or usually a little emarginate; lobes of lower lip spreading. Connective deflexed behind, linear, longitudinally connate. Lower lobe of style subulate.—Herbs, undershrubs, or shrubs, variable in habit, but readily distinguished from the other sections. Leaves entire, serrated, crenated, rarely quite entire.

— § 1. Micra'nthæ (μικρος, *mikros*, small; and ανθος, *anthos*, a flower; flowers small.) Benth. lab. p. 245. *Corolla hardly 3 lines long, half as long again, rarely almost twice as long as the calyx, with an inclosed tube: lower lip almost twice as long as the upper, which is erect.—Herbs, with blue inconspicuous corollas.*

87 S. obscu'ra (Benth. lab. p. 245.) herbaceous, diffuse; leaves petiolate, ovate, acute, serrated, narrowly cuneated at the base, glabrous or hispid above, green on both surfaces: floral leaves permanent, sessile, ovate, acuminated, shorter than the calyxes; racemes elongated, simple; whorls 2-6-flowered, remote; flowers minute; calyx tubular, clothed with rather glandular villi, increasing in the fructiferous state: upper lip entire, and the teeth of the lower lip shortly and subulately acuminated; corolla a half longer than the calyx; lobes of style subulate. ♃.? S. Native of Jamaica. Very nearly allied to *S.*

occidentàlis; but differs in the lobes of the calyx being subulately-acuminated; in the lobes of the style being acute and subulate, not roundish and flattened.

Obscure Sage. Pl ½ to 1 foot. ?

88 S. ripa'ria (H. B. et Kunth, nov. gen. amer. 2. p. 300.) stem herbaceous, erect, branched, pubescent; leaves ovate-oblong, acute, cordate, serrated, pilosely pubescent on both surfaces; whorls many-flowered, rather remote; calyx subcampanulate, striated, beset with glandular hairs, having the upper lip tricuspidate, and the lower one bifid, the segments acuminately subulate; corolla a little longer than the calyx. ♃. ? S. Native of Peru, between Guancabamba and Paramo de Guamani, Humb. et Bonpl.; on the banks of the river Chulucana. Herb canescent, sweet-scented. Leaves on short petioles, an inch long. Racemes 3-4 inches long. Bracteas roundish-ovate, acute, hardly longer than the pedicels, which are pilose. Corollas bluish.

River-side Sage. Pl. ?

89 S. tene'lla (Swartz, fl. ind. 1. p. 45. t. 2.) stems herbaceous, small, procumbent; branches ascending, pubescent, leaves petiolate, broad-ovate, roundish, obtuse, crenated, cordate at the base, clothed with adpressed pubescence above, but glabrous beneath; floral leaves lanceolate, minute, permanent; racemes short; whorls about 6-flowered; flowers minute; calyx tubular, clothed with glandular villi, having the upper lip entire, and the teeth of the lower lip very short and bluntish; corolla exceeding the calyx a very little: upper lip short, truncate; lobes of style subulate. ♃. ? S. Native of Jamaica. Habit of *Verónica agréstis.* Corollas blue.

Slender Sage. Pl. procumbent.

90 S. micra'ntha (Vahl, enum. 1. p. 235.) stems herbaceous, erect, glabrous or pubescent; leaves petiolate, broad-ovate, obtuse, irregularly crenated, a little curled, truncate at the base or cordate, nearly glabrous; floral leaves lanceolate, shorter than the pedicels; racemes simple; whorls 6-10-flowered; flowers minute; calyx tubular, clothed with glandular villi, having the upper lip quite entire, and the teeth of the lower lip obtuse; corolla a half longer than the calyx: upper lip short, truncate; lobes of style subulate. ☉. S. Native of Mexico, and near the Havana, in Cuba. S. bullàta, Ort. dec. 9. p. 109. Jacq. hort. schœnbr. 4. p. 41. t. 481. S. serótina, Vahl, enum. 1. p. 232. but not of Lin. S. foliis cordato-ovatis, &c. Ard. spec. 1. p. 10. t. 2. Leaves small. Corollas blue.

Small-flowered Sage. Fl. May, June. Clt. 1823. Pl. ½ foot.

91 S. serótina (Lin. mant. p. 25.) stems herbaceous, pubescent or villous; leaves petiolate, ovate, obtuse, crenated, truncate at the base, somewhat cordate, wrinkled, villous above, and clothed with soft woolly pubescence beneath; floral leaves lanceolate, shorter than the pedicels; racemes simple; whorls about 6-flowered; flowers minute; calyx tubular, clothed with glandular villi, having the upper lip almost entire, and the teeth of lower lip acutish; corolla exceeding the calyx a little: upper lip short, truncate; lobes of style subulate. ♃. ? S. Native of the Bahama Islands, Trinidad, Santa Cruz, Jamaica, &c. Jacq. icon. rar. 1. p. 1. t. 3. S. Domínica, Vahl, enum. 1. p. 233. Swartz, obs. p. 18. t. 1. f. 1. but not of Lin. Allied to *S. micrántha*, but smaller. Racemes loose, more branched and more villous. Leaves villous. Corollas smaller, dirty white or bluish.

Late Sage. Fl. Aug. Clt. 1803. Pl. 1½ foot.

92 S. hu'milis (Benth. lab. p. 246.) stem herbaceous, erect, branched, beset with spreading hairs; leaves petiolate, broad-ovate, acutish, crenated, rounded at the base or cordate, green on both sides, and finely pubescent; upper floral leaves membranous, lanceolate, deciduous; racemes simple; whorls 2-4-flowered, loose, remote; lower flowers in the axils of the cauline leaves; calyx tubularly campanulate, villous, with the upper lip entire, and the teeth of the lower one acute, increased very much in the fructiferous state. ♃. ? S. Native of Mexico, Karwinski. Habit and leaves of *S. serótina;* but differs in the whorls being usually 2-flowered, and in the lower whorls being axillary, but particularly in the increased fructiferous calyx.

Humble Sage. Pl. ½ foot. ?

93 S. inconspi'cua (Benth. lab. p. 247.) stems procumbent? villous; leaves on short petioles, ovate-lanceolate, obtuse, crenated, cordate at the base, wrinkled, clothed with rufous tomentum beneath; floral leaves deciduous; racemes a little branched; whorls 4-6-flowered, loose; flowers small; calyx tubular, striated, clothed with rather glandular villi, with the upper lip entire, and the teeth of the lower lip obtuse. ♃. ? S. Native of Mexico, Hænke. This species differs from *S. micrántha*, in the leaves being wrinkled and tomentose beneath. Stems elongated, branched. Leaves 1 to 1½ inch long: superior ones sessile. Calyx of *S. serótina*, but stiffer, and the teeth more obtuse.

Inconspicuous Sage. Pl. procumbent. ?

94 S. tiliæfòlia (Vahl, symb. 3. p. 7.) stem herbaceous, erect, almost glabrous or finely pubescent; leaves broad-ovate, crenated, truncate or nearly cordate at the base, softly wrinkled and pubescent from a few hairs on both surfaces: floral leaves membranous, lanceolate, deciduous; racemes simple; whorls loose, approximate, 6-10-flowered; calyx tubular, with ciliated nerves, having the upper lip entire, and the teeth of the lower lip ovate-lanceolate, acute; corolla hardly exceeding the calyx, with short erectish lips: lobes of style nearly equal, subulate. ♃. S. Native of Caraccas, and the Andes of New Spain, near the town of Pazcuara; Mexico, at Jalapa, &c. Jacq. hort. schœnbr. 3. p. 2. t. 254. S. fimbriàta, H. B. et Kunth, nov. gen. amer. 2. p. 299. t. 149. ? Leaves with the petioles 1 to 1½ inch long. Corollas blue, variegated with white.

Lime-tree-leaved Sage. Fl. June, Aug. Clt. 1793. Pl. 3 to 4 feet.

95 S. paleæfòlia (H. B. et Kunth, l. c. p. 303. t. 157.) stem suffruticose, erect, and is, as well as the branches, pilose; leaves cordate-sagittate, rounded at top, crenated, hairy on both surfaces, canescent beneath; spikes panicled; whorls 2-flowered, crowded; calyx clothed with glandular hairs, campanulate, striated, having the upper lip bluntish, and the teeth of the lower lip acuminated; tube of corolla exceeding the calyx a little: upper lip pubescent: middle segment of the lower lip emarginately 2-lobed; genitals exserted. ♄. S. Native of New Granada, between Popayan and Palace. Leaves petiolate, 2 inches long. Pedicels clothed with glandular pili. Flowers size of those of *Thymus serpyllum*. Corollas blue.

Chaff-leaved Sage. Shrub.

96 S. flexuòsa (Presl, mss. ex Benth. lab. p. 248.) stem diffuse, twisted, glabrous; leaves petiolate, ovate, acute, serrately crenated, roundly cuneated at the base, glabrous; floral leaves membranous, lanceolate, deciduous; racemes simple; whorls 6-10-flowered; flowers minute; calyx tubular, glabrous or ciliated on the nerves, with an entire upper lip, and the teeth of the lower lip acutish; corolla hardly exceeding the calyx. ♃. S. Native of Mexico, Hænke. Allied to *S. tiliæfòlia*, but differs in the diffuse, twisted, glabrous stem. Leaves glabrous or minutely ciliated on the nerves and margins, not truncate nor cordate at the base. Racemes 2-6 inches long.

Twisted-stemmed Sage. Pl. diffuse.

97 S. lanceola'ta (Willd. enum. 1. p. 37.) stem herbaceous, ascending, branched, glabrous; leavēs petiolate, lanceolate-linear, bluntish or acuminated, narrowed at the base, pubescent, hoary while young; floral leaves lanceolate-subulate, shorter than the

calyxes; racemes simple; whorls generally 2-flowered, all remote; calyx tubular, striated, glabrous, having the upper lip entire, and the teeth of the lower lip lanceolate, acute; corolla exceeding the calyx a little: upper lip straight. ⊙. H. Native of Mexico, Moçino et Sesse; in the valley of Guanaxuato, Humb. et Bonpl.; at the river Missouri, Clarke and Lewis. Jacq. fil. eclog. 1. p. 13. t. 13. S. lanceæfòlia, Poir. suppl. 5. p. 49. S. refléxa, Horn. hort. hafn. 1. p. 34. S. aspidophýlla, Rœm. et Schultes, syst. mant. 1. p. 206. S. trichostemmoìdes, Pursh, fl. amer. sept. 1. p. 19. Stem glabrous, or clothed with hoary pubescence at top. Leaves 1½ to 2 inches long, obscurely and bluntly serrated. Whorls 2-4-flowered. Corollas blue.

Lanceolate-leaved Sage. Fl. June, Sept. Clt. 1813. Pl. 1 foot.

98 S. leptophy'lla (Benth. lab. p. 249.) stem herbaceous, ascending, branched, glabrous; leaves nearly sessile, narrow-linear, acute, quite entire, glabrous: floral leaves deciduous; racemes simple; whorls remote, generally 2-flowered; calyx tubular, striated, glabrous, with the upper lip entire, and the teeth of the lower lip acute; corolla about twice as long as the calyx: tube inclosed; style bifariously bearded. ⊙.? H. Native of Mexico. Nearly allied to *S. lanceolàta;* but differs in the leaves being narrower, quite glabrous, and in the flowers being larger; and from *S. angustifòlia*, in the stem being glabrous, and in the flowers being much smaller.

Slender-leaved Sage. Pl. 1 foot.

§ 2. Brachya'ntha (from βραχυς, *brachys*, short; and ανθος, *anthos*, a flower; in allusion to the shortness of the flowers.) Benth. lab. p. 249. *Floral leaves bractea-formed, deciduous. Calyx glabrous, villous, or clothed with hoary tomentum. Corolla 4 lines long, or longer: tube inclosed, or hardly a half again as long as the calyx: lower lip generally longer than the upper one, flat, with rounded lobes: the middle lobe very large. Flowers blue, rarely white or pale red, never scarlet nor yellow.*

* Angustifòliæ. *Leaves linear or lanceolate, very narrow at the base, or cuneated, usually petiolate.*

99 S. angustifòlia (Cav. icon. 4. p. 9. t. 317.) stems herbaceous, erect, glabrous, or beset with spreading hairs; leaves nearly sessile, oblong-linear, narrowed at both ends, quite entire or serrated, glabrous; floral leaves bractea-formed, linear-lanceolate, deciduous; racemes elongated, simple; whorls all distant, 2-6-flowered; calyx tubular, striated, hispid, with the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx: tube equalling the calyx: middle lobe of lower lip emarginately bifid; style bifariously bearded. ♃. S. Native of Mexico, in bushy places near Totonilco el Grande and Tlalpuxahua. Lindl. bot. reg. t. 1554. S. réptans, Jacq. hort. schœnbr. 3. p. 38. t. 319. S. virgàta, Ort. dec. 3. Stems numerous, twiggy, a little branched, leafy at the base, bluntly tetragonal. Leaves 1½ inch long. Calyx usually bluish. Corolla azure blue. Upper lobe of style very long, subulate.

Narrow-leaved Sage. Fl. June, July. Clt. 1806. Pl. 1 to 1½ foot.

100 S. pa'llida (Benth. lab. p. 250.) stem herbaceous, procumbent, glabrous; branches ascending, canescent; leaves petiolate, ovate-lanceolate or linear, acuminated, narrowed at the base, clothed with hoary tomentum while young, but at length glabrous; floral leaves ovate at the base, but with a long linear acumen at apex, deciduous; racemes simple, elongated; whorls remote, about 6-flowered; calyx nearly sessile, tubular, striated, clothed with hoary tomentum, with the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx, downy outside; tube ventricose, equalling the calyx; style pubescent beneath. ♃.? S. Native of the south of Brazil, Sello; at Buenos Ayres, Parker. S. canéscens, Benth. mss. but not of Meyer. Habit of *S. lanceolàta;* but the stems are more procumbent and elongated; the branches canescent; the leaves more acute. Flowers size of those of *Stàchys ánnua*.

Pale Sage. Pl. procumbent.

101 S. azu'rea (Lam. diar. hist. nat. 1. p. 409.) stem herbaceous, erect, glabrous; leaves petiolate, oblong-lanceolate or linear, bluntish, narrowed a long way at the base, subserrated, green on both surfaces, and glabrous; floral leaves lanceolate-linear, deciduous; racemes simple, elongated; whorls distant, generally 6-flowered; calyxes nearly sessile, tubular, striated, nearly glabrous, with the upper lip entire, and the teeth of the lower lip broad, acutish; corolla more than twice as long as the calyx, pubescent outside: tube ventricose, a half again as long as the calyx; style bifariously bearded. ♃.? H. Native of the southern states of North America, as of Carolina, Upper Georgia, Eastern Florida, Jacksonville, Alabama, Arkansas, &c. Sims, bot. mag. t. 1728. S. Mexicàna, Walt. fl. car. p. 65. but not of Lin. S. elàta, Poir. dict. 6. p. 625. S. angustifòlia, Michx. fl. bor. amer. 1. p. 13. but not of Cav. S. acuminàta, Vent. hort. cels. 50. t. 50. S. acuminàta, Pers. ench. 1. p. 24. S. longifòlia, Nutt. in amer. phil. trans. n. s. 5. p. 185. Herb tall, green or bluish. Leaves 2-3 inches long, stiffish, entire or few-toothed. Whorls subsecund. Calyx pubescent, green or bluish. Corolla blue, downy outside.

Azure-blue-flowered Sage. Fl. Aug. Clt. 1806. Pl. 4 to 6 feet.

102 S. Pitche'ri (Torrey, mss. ex Benth. lab. p. 251.) stem herbaceous, erect, tomentose, pubescent; leaves petiolate, oblong-lanceolate, or linear, acute, somewhat serrated, narrowed a long way at the base, clothed with soft tomentum on both surfaces; floral leaves lanceolate-linear, deciduous; racemes simple, elongated; whorls distant, 6-15-flowered; calyxes nearly sessile, tubular, striated, villous, with the upper lip entire, and the teeth of the lower lip broad, obtuse; corolla more than twice as long as the calyx, pubescent outside; tube ventricose, a half again as long as the calyx; style bearded. ♃. H. Native of North America, at the Red River, Pitcher. Habit of *S. azùrea*, but the whole plant is pubescent and canescent, the flowers more numerous, and the calyx larger, and the teeth blunter.

Pitcher's Sage. Pl. 3 to 4 feet.?

103 S. læ'vis (Benth. lab. p. 251.) stem herbaceous, erect, glabrous; leaves petiolate, oblong-lanceolate, narrowed a long way at the base, remotely serrated, glabrous; floral leaves membranous, broad roundish, ciliated, obtuse, deciduous; racemes simple, on long peduncles; whorls 6-10-flowered: lower ones remote: upper ones approximate; calyxes pedicellate, campanulate, ciliated, with the upper lip almost entire, and the teeth of the lower lip lanceolate, cuspidate; corolla thrice as long as the calyx: tube exserted, ventricose: upper lip glabrous. ♃.? G. Native of Mexico. Stem nearly terete, striated, with yellow and green lines. Corollas pale blue. Genitals inclosed. Allied to *S. uliginòsa*. Style furnished with a long beard at top.

Smooth Sage. Pl. ?

104 S. uliginòsa (Benth. lab. p. 251.) stem herbaceous, erect, glabrous, or villous; leaves petiolate, oblong-lanceolate, acute, serrated, narrowed at the base, glabrous, or pubescent; floral leaves membranous, broad-ovate, acuminated, deciduous; racemes dense, on long peduncles, a little branched; whorls many-flowered; calyx campanulate, with the upper lip almost

entire, and the teeth of the lower one acuminated; corolla twice as long as the calyx: tube almost inclosed, ventricose: upper lip pubescent; style shortly bearded at top. ♃. S. Native of Brazil, in the province of Rio Grande; and in bogs in the missions of the Uruquay, Buenos Ayres, &c. Stems glandular. Leaves 2-4 inches long. Whorls 10-20-flowered. Corollas blue, or white.

Var. β, *ruféscens* (Benth. lab. p. 252.) stem and lower surfaces of the leaves clothed with rufous pubescence. ♃. S. Native by way-sides from Rio Janeiro to the Mines.

Bog Sage. Pl. 2 to 4 feet.

105 S. lavandulòides (H. B. et Kunth, nov. gen. 2. p. 287.) stem herbaceous; branches erect, clothed with hoary pubescence; leaves on short petioles, oblong-lanceolate, acute, cuneated at the base, crenated, clothed with hoary pubescence, white beneath: floral leaves ovate, long, and subulately acuminated, deciduous; spikes simple; whorls approximate, equal, about 10-flowered; calyx tubularly-campanulate, clothed with hoary pubescence, having the upper lip entire, and the teeth of the lower lip ovate, and shortly mucronate; corolla half as long again as the calyx: tube inclosed, nearly equal; style inclosed, shortly bearded. ♃. S. Native of New Spain, Moçino et Sesse; near Pazcuaro, on the shores of lakes, Humb. et Bonpl. S. lavandulæfòlia, Spreng. syst. 1. p. 58. but not of Vahl. S. Humboldtiàna, Rœm. et Schultes, syst. mant. 1. p. 183. Stems many, branched at the base. Leaves $1\frac{1}{2}$ to 2 inches long. Calyx usually tipped with blue. Corollas small, pale blue.

Lavender-like Sage. Pl. 2 to 3 feet. ?

106 S. stachyòides (H. B. et Kunth, l. c. p. 287. t. 138.) stem herbaceous, almost simple, pubescent, as well as the leaves; leaves lanceolate, acute, crenately serrated; spikes oblong, on long peduncles; whorls approximate; calyx clothed with hoary villi, tubular, striated, having the upper lip entire and acute, and the teeth of the lower lip acuminated. ♃. H. Native of Mexico, in frigid places on the mountains near Los Joares and Santa Rosa de La Sierra. Leaves on short petioles, 2-3 inches long. Bracteas oblong, acuminately subulate, pubescent. Corolla probably blue. This hardly differs from *S. elongàta*.

Stachys-like Sage. Pl. 3 feet.

107 S. elonga'ta (H. B. et Kunth, l. c. p. 287. t. 139.) stem herbaceous, erect, almost simple, clothed with hoary pubescence; leaves on short petioles, oblong, acutish, narrowed at the base, crenately serrated, almost glabrous, or pubescent beneath: floral leaves ovate-lanceolate, hairy, equalling the calyxes; spikes oblong, on long peduncles; whorls many-flowered, closely approximate; calyx tubular, striated, pilose, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube hardly exserted, ventricose; style bearded. ♃. S. Native of New Spain, Moçino et Sesse; on the western declivities of the mountains between Ario and Aguasarco. S. símplex, Spreng. syst. 1. p. 58. S. betónica, Rœm. et Schultes, mant. 1. p. 188. Stems many, leafy at the base, and almost naked at top. Leaves $1\frac{1}{2}$ inch long, rather scabrous above, and glabrous beneath, or pubescent on the nerves. Spikes villous. Calyx coloured a little. Corolla violaceous, pubescent outside.

Elongated-peduncled Sage. Pl. 2 feet.

108 S. corruga'ta (Vahl, enum. 1. p. 252.) stem shrubby; branches clothed with rufous tomentum; leaves petiolate, oblong-lanceolate, obtuse, crenated, rounded at the base, much wrinkled, almost glabrous above, and clothed with rufous wool beneath: floral leaves deciduous; whorls usually 6-flowered, distant; calyx campanulate, almost glabrous, coloured, having the upper lip entire, and the teeth of the lower lip obtuse; corolla a little longer than the calyx: tube almost inclosed. ♄. S. Native of Peru. Leaves 2 inches long, approximate. Calyxes bluish. Corolla blue, hairy.

Wrinkled-leaved Sage. Shrub.

* * Ovatifòliæ. *Leaves petiolate, ovate-roundish, ovate, or ovate-lanceolate, rounded, truncate, or cuneated at the base, rarely almost sessile, and cuneated at the base.*

109 S. assu'rgens (H. B. et Kunth, nov. gen. amer. 2. p. 293.) stem herbaceous, a little branched, ascending, pubescent; leaves ovate-elliptic, acute at both ends, crenately serrated, nearly glabrous; whorls many-flowered: lower ones distant; calyx clothed with silky hairs, campanulate, having the upper lip ovate, obtuse, and mucronate, and the lower lip bifid, with obtuse, mucronate segments; tube of corolla ventricose, equalling the calyx. ♃. S. Native of Mexico, near Pazcuaro. Leaves almost glabrous on both surfaces, or pubescent on the veins beneath, 2 inches long. Calyx very pilose. Corolla pale violet. Stamens inclosed. Said to be nearly allied to *S prunelloìdes*.

Assurgent Sage. Pl. 1 foot.

110 S. helianthemifòlia (Benth. lab. p. 254.) stem herbaceous, erect; branches twiggy, pubescent; leaves on short petioles, oblong, acute, somewhat serrated, narrowed at the base, wrinkled, glabrous, or pubescent on both surfaces: floral leaves very minute; racemes simple; whorls 6-20-flowered, secund, remote, or the upper ones are approximate; calyx tubular, with pubescent nerves, having the upper lip entire, and the teeth of the lower lip acute; corolla about twice as long as the calyx: tube equal, inclosed: upper lip pubescent outside; style bearded. ♃. S. Native of Mexico, near Tlalpuxahua. Leaves $\frac{1}{2}$ to $1\frac{1}{2}$ inches long. Corollas blue.

Var. β; flowers white, smaller. ♃. S. Native of Mexico, near San Martin, Graham.

Sun-Rose-leaved Sage. Pl. 1 to $1\frac{1}{2}$ foot.

111 S. sideritoìdes (Presl, mss. ex Benth. lab. p. 255.) shrubby; branches erect, clothed with white tomentum; leaves on short petioles, oval, bluntish, serrately crenated, cuneated at the base, wrinkled, green above, and clothed with white tomentum beneath; racemes short; whorls about 6-flowered; calyx tubular, villous, having the upper lip entire, and the teeth of the lower lip acute. ♄. S. Native of Peru, at Huanuco, Hænke. This species differs from *S. spicàta* in the upper lip of calyx being entire, not tridentate.

Sideritis-like Sage. Shrub.

112 S. chamædryoìdes (Cav. icon. 2. p. 77. t. 197.) stem suffruticose, procumbent; branches clothed with hoary tomentum; leaves petiolate, ovate-oblong, obtuse, crenulated, narrowed or rounded at the base, wrinkled, clothed with hoary tomentum beneath: floral leaves broad-ovate, acuminated, longer than the calyxes, deciduous; racemes simple; whorls about 6-flowered; calyx tubular, striated, tomentose, the upper lip entire, and the teeth of the lower lip shortly cuspidate; corolla twice as long as the calyx, glabrous outside: tube hardly exserted, ventricose: middle lobe of lower lip large, bifid; style bearded at apex. ♄. S. Native of Mexico. Sims, bot. mag. t. 808. S. chamæ'drys, Willd. hort. berol. 1. p. 29. t. 29. S. chamædrifòlia, Andr. bot. rep. 6. p. 416. An humble branched, canescent shrub. Leaves wrinkled similar to those of *S. officinàlis*, but smaller. Corollas blue. Genitals equalling the corolla.

Germander-like Sage. Fl. June, Sept. Clt. 1795. Shrub $1\frac{1}{2}$ foot.

113 S. thymoìdes (Benth. lab. p. 255.) stem suffruticose, much-branched, canescent; leaves small, nearly sessile, oval, obtuse, quite entire, canescent, with sub-revolute edges: floral

leaves ovate, acuminated, deciduous; racemes short, few-flowered; whorls distinct, loosely 2-4-flowered; calyx ovate-tubular, striated, clothed with glandular pubescence, having the upper lip entire, and the teeth of the lower one bluntish; corolla twice as long as the calyx: tube ventricose, equal in length to the calyx: middle lobe of lower lip emarginate; style shortly bearded at apex. ♄. S. Native of New Spain, Moçino et Sesse. A much branched, humble, canescent shrub, with the habit of *Thymus*, or *Gardòquia*. Corollas bluish.

Thyme-like Sage. Shrub dwarf.

114 S. glechomæfòlia (H. B. et Kunth, nov. gen. amer. 2. p. 290. t. 141.) stems herbaceous, nearly simple, rather pilose at top; leaves ovate-triangular, obtuse, somewhat cordately truncate at the base, crenated, almost glabrous, rather pilose while young; whorls about 5-flowered, remote; calyx hairy, campanulate, striated, having the upper lip tricuspidate, and the segments of the lower lip cuspidate; tube of corolla ventricose, a little shorter than the calyx: middle lobe of lower lip emarginately 2-lobed. ♃. S. Native of New Spain, between the city of Guanaxuato and Santa Rosa. Stems many, procumbent. Leaves petiolate, 6-9 lines long. Floral leaves ovate, acuminated, ciliated, length of flowers deciduous. Corollas blue.

Ground-Ivy-leaved Sage. Pl. procumbent.

115 S. na'na (H. B. et Kunth, l. c. p. 289.) plant herbaceous, stemless; leaves ovate, obtuse, narrowed at the base, crenated, hispid above, and clothed with hairy tomentum beneath; spikes ovate, pedunculate; whorls usually 4-flowered; calyx clothed with glandular hairs, the upper lip tridentate, and the lower lip bifid: teeth all subulate. ♃. S. Native of New Spain, in dry places near the mine of Valentiana, in the valley of Guanaxuato. Leaves radical, nearly sessile, an inch long. Corolla blue, ex Bonpl. Spikes radical. Leaves more wrinkled than in *S. prunelloìdes*.

Dwarf Sage. Pl. small.

116 S. prunelloìdes (H. B. et Kunth, l. c. p. 289.? Benth. lab. p. 256.) stems herbaceous, nearly simple, erect, pilosely pubescent; leaves petiolate, ovate-oblong, obtuse, crenated, narrowed at the base, green on both surfaces, and nearly glabrous: floral leaves ovate, acuminated, deciduous; racemes simple, on long peduncles; whorls remote, sub-secund: upper whorls approximate, 6-10-flowered; calyx campanulate, striated, clothed with silky hairs, having the upper lip shortly tridentate, and the teeth of the lower lip lanceolate, acute; corolla about 3 times longer than the calyx, pubescent outside: tube ventricose, equalling the calyx: middle lobe of lower lip emarginate; style bearded. ♃. S. Native of Mexico, among rocks on the burning mount Jorullo. Stems many, ascending. Calyxes bluish. Corolla blue.

Prunella-like Sage. Pl. 1 to 1½ foot.

117 S. arena'ria (St. Hil. mss. ex Benth. lab. p. 257.) shrubby; branches glabrous; leaves petiolate, oblong, or lanceolate, acuminated, serrately crenated, cuneated, or narrowed at the base, green, and glabrous on both surfaces: floral leaves ovate, acuminated, deciduous; racemes short, simple; whorls 4-6-flowered, secund; calyx tubularly campanulate, striated, glabrous, smooth, with the upper lip entire, and the teeth of the lower lip ovate, acuminated; corolla about twice as long as the calyx, nearly glabrous outside: tube ventricose, a little exserted. ♄. S. Native of Brazil, in sandy places at the limits of the provinces of Minas Geraes and Rio Janeiro. Shrub much branched. Leaves 2-3 inches long. Style bifariously bearded.

Sand Sage. Shrub.

118 S. serra'ta (Benth. lab. p. 257.) stem herbaceous, erect, almost simple, and nearly glabrous; leaves petiolate, ovate, oblong, or lanceolate, acute, coarsely and irregularly serrated, cuneate at the base, or rounded, glabrous: floral leaves lanceolate-linear, shorter than the calyxes, reflexed, or deciduous; racemes elongated, simple; whorls all remote, 6-10-flowered; calyxes pedicellate, tubular, striated, pubescent, the upper lip entire, and the teeth of the lower lip acutish; corolla about 3 times as long as the calyx, pubescent outside: tube rather exserted, ventricose: middle lobe of lower lip large, emarginate; style bearded. ♃. S. Native of the South of Brazil. Habit of *S. uliginòsa*, but the inflorescence and flowers are very different. Corollas blue, almost an inch long.

Serrated-leaved Sage. Pl.?

119 S. Uruguaye'nsis (St. Hil. mss. ex Benth. lab. p. 257.) stem herbaceous, erect, nearly glabrous; leaves petiolate, ovate-lanceolate, or oblong, acute, serrately crenated, roundly cuneated at the base, nearly glabrous, green on both surfaces, or pale beneath; floral leaves ovate, acuminated, deciduous; racemes simple, elongated; whorls remote, 6-10-flowered; calyxes nearly sessile, tubular, striated, clothed with hoary villi, the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx, pubescent outside: tube ventricose, exceeding the calyx; style bearded below. ♃. S. Native of Brazil, on the banks of the Uruguay, in fields, at San Jozè; in the province of Rio Grande do Sul. Nearly allied to *S. pállida*, but the stems are erect, the leaves broader and less acuminated, and the flowers more numerous. It is probably only a variety of *S. pállida*.

Uruguay Sage. Pl. erect.

120 S. urticæfòlia (Lin. spec. p. 34.) plant herbaceous, erect, beset with rather glandular villi; leaves on short petioles, ovate-rhomboid, acutish, crenated, roundly subcordate at the base, cuneated at the petioles, nearly glabrous; floral leaves broad-ovate, deciduous; whorls many-flowered, remote; calyxes on short pedicels, campanulate, clothed with clammy villi, the upper lip entire, and the teeth of the lower lip ovate, acutish; corolla about twice as long as the calyx, pubescent outside: middle lobe of lower lip emarginately bifid; style bearded. ♃. H. Native of Carolina, Virginia, and Georgia. Pursh, fl. amer. sept. 1. p. 20.—Mor. hist. 3. p. 395. sect. 11. t. 13. f. 31.? Corollas blue, small.

Nettle-leaved Sage. Fl. June, July. Clt. 1799. Pl. 3 feet.

121 S. gra'cilis (Benth. lab. p. 258.) stem herbaceous? erect, almost glabrous; leaves on long petioles, ovate, acuminated, rounded at the base, serrated, pilosely pubescent on both surfaces; floral leaves ovate, acuminated, coloured, deciduous; racemes simple; whorls loose, 6-10-flowered: lower ones remote: upper ones approximate; calyxes on short pedicels, campanulate, striated, coloured, glabrous, having the upper lip entire, and the teeth of the lower lip setaceously acuminated; corolla twice as long as the calyx: tube ventricose, equalling the calyx: middle lobe of lower lip broad, emarginate; style bearded. ♃. S. Native of New Spain, Moçino and Sesse. Stems or branches simple, purplish. Leaves flaccid, 1½ inch long. Flowers small, flesh-coloured, size of those of *S. cárnea*. Allied to *S. cárnea;* but differs from it in the calyx being glabrous, and in the leaves not being cordate at the base.

Slender Sage. Pl.

122 S. leptóstachys (Benth. lab. p. 258.) stem herbaceous, erect, branched, clothed with hoary pubescence; leaves on long petioles, ovate-roundish, acute, truncate at the base, green, and finely pubescent on both surfaces; floral leaves ovate, subulately acuminated, deciduous; racemes simple, elongated; whorls at length all remote, about 6-flowered; calyx ovate-tubular, striated, hoary, having the upper lip entire, and the teeth of the lower lip acuminated; corolla twice as long as the calyx: tube rather ventricose, equalling the calyx: middle lobe of lower lip broad, emarginate; style glabrous. ♃. S. Na-

tive of New Spain, Moçino et Sesse. Leaves similar to those of *S. tiliæfòlia*, 1½ to 2 inches long: upper ones more sessile. Corollas blue.

Slender-spiked Sage. Pl. ?

123 S. membrana'cea (Benth. lab. p. 259.) stem herbaceous? erect, glabrous; leaves on long petioles, ample, broad-ovate, acute, crenated, rounded at the base or truncate, glabrous; floral leaves deciduous; racemes elongated, simple; whorls all remote, loose, about 10-flowered; calyxes pedicellate, nutant, campanulate, glabrous, the upper lip entire, and the teeth of the lower lip setaceoùsly acuminated; corolla twice as long as the calyx: tube ventricose, equalling the calyx: middle lobe of lower lip large, emarginate; style bearded. ♃. S. Native of Mexico, Moçino et Sesse. Herb glabrous. Leaves 3-6 inches long, membranous, often purplish beneath. Calyxes often purplish. Corollas blue, size of those of *S. angustifòlia*.

Var. β, acuminàta (Benth. l. c.) leaves long-acuminated at both ends; corollas shorter. ♃.? S. Native of Guayaquil, Tafalla.

Var. γ, villósula (Benth. lab. p. 720.) leaves smaller, and are, as well as the younger calyxes, villous. ♃. G. Native of Mexico, about Oaxaca.

Membranaceous-leaved Sage. Pl. 2 to 3 feet.

124 S. rhombifòlia (Ruiz, et Pav. fl. per. 1. p. 26. t. 36. f. b.) stem herbaceous, erect, branched, pubescent; leaves petiolate, broad-ovate or rhomboid, subcordate at the base, pubescent; floral leaves ovate-lanceolate, deciduous; racemes simple, few-flowered; whorls about 6-flowered, remote; calyx ovate, pubescent, the upper lip entire, and the teeth of the lower lip ovate, acute; corolla a half again as long as the calyx: tube inclosed, ventricose: middle lobe of lower lip emarginate; style glabrous. ⊙. S. Native of Peru, in the province of Camana, on the sandy hills of Lomas de Atiquipa and Pongo; plentiful about Chancay and near Lima; and also of Mexico. S. foliòsa, Benth. in bot. reg. t. 1429. S. pilòsa, Vahl, enum. 1. p. 240. Leaves 1½ to 2 inches long, coarsely crenated. Genitals exserted. Corollas blue.

Var. β, glàbrior (Benth. l. c.) calyxes more slender and glabrous. ⊙. H. Native near Lima.

Rhomb-leaved Sage. Fl. Year. Clt. 1827. Pl. 1½ foot.

125 S. herba'cea (Benth. lab. p. 720.) stem herbaceous, erect, a little branched, villous; leaves on long petioles, broad-ovate or rhomboid, rather cordate at the base, pubescent; floral leaves ovate, deciduous; racemes simple; whorls about 6-flowered, distinct; calyx ovate-tubular, hairy, green, the upper lip and the teeth of the lower one ovate-dilated; corolla half as long again as the calyx: tube inclosed. ⊙. H. Native of Mexico, at Tehuantepec, in Oaxaca. Nearly allied to the preceding, from which it differs in the stem and calyxes being more hairy, &c.

Herbaceous Sage. Pl. 1½ foot.?

126 S. Tafa'llæ (Benth. lab. p. 260.) stem herbaceous, erect, branched, villous; leaves petiolate, ovate, crenated, rounded at the base or cuneated, rather hispid; floral leaves ovate, acute, at length deciduous; racemes simple; whorls 6-10-flowered, remote; calyx ovate, nerved, villous, the upper lip entire, and the teeth of the lower lip ovate, acute; corolla a half as long again as the calyx: tube inclosed, ventricose: middle lobe of lower lip emarginate; style glabrous. ⊙. H. Native of Peru, at Tarma, Tafalla. Leaves hardly an inch long. Corollas small, blue.

Tafalla's Sage. Pl. 1½ foot.?

127 S. viola'cea (Ruiz, et Pav. fl. per. 1. p. 26. t. 43.) stem herbaceous, hairy; leaves ovate, acute, crenated, wrinkled; spikes short, terminal; whorls 6-flowered; upper lip of corolla dependent. ⊙. H. Native of Peru, in the province of Tarma. Flowers on short pedicels, propped by ovate, concave, opposite bracteas. Corolla bluish-violet, about 3 times as long as the calyx.

Violaceous-flowered Sage. Pl. 1 to 2 feet.

128 S. glanduli'fera (Cav. ann. hist. nat. 2. p. 3.) stem branched, beset with glanduliferous pili, as well as the branches, bracteas, and calyxes; leaves petiolate, serrated, villous; whorls 6-flowered; corolla hardly twice as long as the calyx. ⊙.? H. Native on Mount Chimboraco, Cav. Floral leaves short, acute. Calycine segments bluntish. Corolla purplish-violet. Stamens exserted.

Gland-bearing Sage. Pl. 1 to 3 feet.

129 S. Cruiksha'nksii (Benth. lab. p. 261.) stem herbaceous? erect, glabrous or pubescent; leaves on short petioles, ovate, obtuse, crenated, rounded at the base or subcordate, glabrous or pubescent beneath; floral leaves deciduous; racemes simple; whorls about 6-flowered, remote, somewhat secund; calyx tubularly campanulate, striated, pubescent, the upper lip entire, and the teeth of the lower lip ovate, acute; corolla thrice as long as the calyx: tube ventricose, inclosed: middle lobe of lower lip large, emarginate; style glabrous. ♃.?. S. Native of Peru, in the valley of Canta, near Obrajillo, Cruikshanks; and at Huamantanga, Mathews. S. rhombifòlia, β, Hook. bot. misc. Stem naked at the base, and leafy in the middle. Leaves 1 to 1½ inch long. Calyxes sessile. Corollas blue, nearly glabrous.

Cruikshanks's Sage. Pl. 1 to 1½ foot.

130 S. galea'ta (Ruiz, et Pav. fl. per. 1. p. 27. t. 42. f. a.) stem shrubby, much branched, naked at bottom; leaves nearly sessile, oval or ovate, serrated, wrinkled, pubescent; spikes terminal, by threes; whorls 6-10-flowered, propped by ovate deciduous bracteas; calyx ventricose at top, the upper lip concave; corolla twice as long as the calyx. ♄. S. Native of Peru, around Muna, in arid places. Flowers on short pedicels. Corollas pale violet. Genitals inclosed.

Galeate-calyxed Sage. Shrub 3 feet.

131 S. mi'tis (Ruiz, et Pav. fl. per. 1. p. 27.) stem shrubby, branched; branches pubescent; leaves petiolate, ovate, acute, serrated, tomentose, hoary beneath; spikes terminal: middle one longer, and leafless; whorls many-flowered, secund; calyx pubescent, subcampanulate: the upper lip bifid and acute. ♄. S. Native of Peru, in the valley of Canta, at Obrajillo. Flowers pedicellate. Whorls 6-12-flowered. Floral leaves oval, acuminated, pubescent, deciduous. Corolla whitish blue, a little longer than the calyx, pubescent outside. Stamens length of corolla. Stigma exserted.

Mild Sage. Shrub 2 feet.

132 S. incurva'ta (Ruiz, et Pav. fl. per. 1. p. 24. t. 42. f. b.) stem herbaceous, erect, clothed with fine hoary tomentum; leaves petiolate, ovate, acute, serrated, rounded at the base or cordate, clothed with soft white tomentum beneath; floral leaves deciduous; racemes simple; whorls 4-6-flowered, remote; calyx tubularly campanulate, pubescent, the upper lip entire, and the teeth of the lower lip ovate, acuminated; corolla twice as long as the calyx: tube inclosed, ventricose; style glabrous. ♃.? S. Native of Peru, around Muna. Leaves 2 inches long, approximate at the middle of the stem. Lips of fructiferous calyx incurved. Corolla purplish blue.

Incurved-calyxed Sage. Pl. 2 feet.

133 S. Hispa'nica (Lin. spec. 37.) stem herbaceous, erect, pubescent; leaves petiolate, ovate, acute, crenately serrated, narrowed or cuneated at the base, glabrous; floral leaves ovate, acuminated, ciliated, almost permanent; racemes dense, branched; whorls many-flowered, approximate; calyx inflately tubu-

lar, clothed with soft pubescence, the upper lip entire, and the teeth of the lower lip acute; corolla hardly exceeding the calyx: tube ventricose; style bearded. ⊙. H. Native of tropical America; Quito, near Chillo; Jamaica, among the mountains; Mexico; State of New York; and now apparently naturalized in the south of Europe, as in Spain, Portugal, Piedmont, Liguria, &c. Ker. bot. reg. t. 359. S. tetragòna, Mœnch, meth. p. 373. S. prismática, Cav. desc. 14.—Arduin. spec. 1. p. 10. t. 2.—Lam. ill. t. 20. f. 2. Leaves 2-3 inches long. Whorls usually 10-flowered. Corolla glabrous outside, pale blue. Genitals equalling the corolla.

Spanish Sage. Fl. June, Aug. Clt. 1739. Pl. 1 to 2 feet.

134 S. angula'ta (Benth. lab. p. 721.) stem herbaceous, erect, hardly pubescent; leaves petiolate, broad, ovate, acuminated, serrated, roundly cuneated at the base, clothed with fine pubescence, scarcely canescent beneath; floral leaves ovate, acuminated, deciduous; racemes many-flowered, elongated, branched; whorls loose, secund; calyx tubularly campanulate, scarcely pubescent, the upper lip entire, and the teeth of the lower lip acute; corolla exceeding the calyx a little, upper lip pubescent; style bearded. ⊙.? H. Native of Caraccas, Vargas. Habit of *S. polystàchya*. Calyx often coloured, angular. Corolla small, blue.?

Angular-calyxed Sage. Pl. 1 to 2 feet.

135 S. densiflòra (Benth. lab. p. 721.) stem herbaceous, erect, hardly pubescent; leaves petiolate, ovate, obtuse, crenated, roundly truncate at the base, or subcordate, much wrinkled, pubescent on both surfaces, green, or hardly canescent beneath; floral leaves deciduous; racemes almost simple, spike-formed; whorls many-flowered, approximate; calyx tubular, nearly glabrous, having the upper lip entire, and the teeth of the lower lip ovate, obtuse; corolla half as long again as the calyx; genitals exserted; style glabrous. ⊙. H. Native of the Island of Dominica. Allied to *S. polystàchya* and *S. Keèrlii*, but differs from both in the form of the calyx, small corolla, and exserted genitals.

Dense-flowered Sage. Pl. 1 to 2 feet.

136 S. polysta'chya (Ortega, dec. p. 55.) stem herbaceous, erect, clothed with hoary down; leaves petiolate, ovate, acuminated, serrated, rounded at the base or cordate, rather wrinkled above, and pubescent, nerved, and clothed with hoary pubescence beneath; floral leaves ovate, acuminated, deciduous; racemes dense, branched; whorls many-flowered, approximate, almost secund; calyx tubularly campanulate, pubescent or tomentosely villous, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube inclosed, ventricose; style bearded. ♃.? G. Native of Mexico, in many places; as among the mountains of Guanaxuato; shores of Lake Pazcuaro; near Tlalpuxahua, &c. Cav. icon. 1. p. 17. t. 27. bad. H. B. et Kunth, nov. gen. amer. 2. p. 296. S. cæ'sia, H. B. et Kunth. l. c. p. 295. S. lineatifòlia, Lag. gen. et spec. nov. 2. Stem nearly glabrous, but usually pubescent. Leaves 2-3 inches long. Whorls 15-20-flowered. Corolla blue. This species occurs in gardens, under the names of *S. spicàta*, *S. Breynítica*, *S. eremítica*, and *S. tetragòna*.

Many-spiked Sage. Fl. Oct. Dec. Clt. 1822. Pl. 1 to 2 feet.

137 S. Kee'rlii (Benth. lab. p. 263.) stem shrubby? erect, pubescent; leaves petiolate, ovate, obtuse, crenated, roundly truncate or cordate at the base, much wrinkled, clothed with hoary tomentum on both surfaces; floral leaves ovate, deciduous; racemes dense, paniculately branched; whorls many-flowered, approximate; calyx tubularly campanulate, pilosely hairy, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube inclosed, ventricose: upper lip pubescent; style glabrous or bearded above. ♄.? S. Native of Mexico, near Tlalpuxahua, Keerl. Nearly allied to *S. polystàchya*; but the leaves are smaller, obtuse, and much wrinkled, and more cordate at the base; the racemes shorter and more dense; the calyxes hairy, not clothed with hoary tomentum.

Keerl's Sage. Shrub 1 to 3 feet.?

* * * *Leaves petiolate, more or less cordate at the base.*

138 S. semiatra'ta (Zucc. acad. wiss. 1. p. 298.) stem shrubby; branches tomentosely pubescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, much wrinkled, clothed with white tomentum beneath; floral leaves ovate, small, deciduous; racemes simple; whorls 4-8-flowered, distant; calyxes pedicellate, tubular, striated, clothed with glandular villi, the upper lip entire, and the teeth of the lower lip obtuse; corolla twice as long as the calyx, pubescent outside: tube ventricose, a little exserted; style bearded beneath. ♄. S. Native of Mexico, Karwinski. Said to be nearly allied to *S. scorodònia*; but differs in the calyxes being twice the size; in the pedicels being elongated; and in the lower lip of the corolla being shorter and of a more intense colour.

Half-dark-flowered Sage. Shrub.

139 S. fruticulòsa (Benth. lab. p. 721.) stem shrubby, humble, much branched; branches clothed with white tomentum; leaves petiolate, ovate, obtuse, crenated, roundly truncate or subcordate at the base, much wrinkled, hardly pubescent above, and clothed with white tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes simple; whorls about 6-flowered, distant; calyxes nearly sessile, tubularly campanulate, clothed with white tomentum, having the upper lip entire, and the teeth of the lower lip obtuse and truncate; corolla about 3 times as long as the calyx: tube a little exserted; style shortly bearded. ♄. S. Native of Mexico, about Oaxaca, Andrieux. Allied to *S. scorodònia* and *S. breviflòra*, but differs from both in habit. Leaves ½ inch long.

Fruticulose Sage. Shrub ½ foot.

140 S. scorodònia (Poir. suppl. 5. p. 46.) stem shrubby; branches clothed with hoary tomentum; leaves petiolate, ovate or oblong, obtuse, crenulated, roundly cordate at the base, much wrinkled, pubescent above, pale, or clothed with white tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes simple; whorls 6-20-flowered, distant; calyxes nearly sessile, tubularly campanulate, striated, clothed with glandular villi, having the upper lip entire, and the teeth of the lower one bluntish; corolla twice as long as the calyx, pubescent outside: tube a little exserted, ventricose; style glabrous. ♄. S. Native of Mexico. S. melissodòra, Lag. nov. gen. et spec. 2. S. hírta, Schranck, in syll. pl. soc. ratisb. 2. p. 60.? Leaves 1-2 inches long. Corollas blue, white at the base; middle lobe of lower lip large, emarginate.

Garlick Sage. Shrub.

141 S. amarí'ssima (Ortega, dec. p. 4.) stem herbaceous, erect, branched, hispidly pilose; leaves petiolate, ovate-cordate, crenated, wrinkled, almost glabrous, canescent beneath; floral leaves ovate, acuminated, deciduous; racemes simple, dense-flowered; whorls distinct, rather remote, generally 10-flowered; calyx tubularly campanulate, striated, villous, having the upper lip entire, and the teeth of the lower lip acutish; corolla about 3 times as long as the calyx: tube ventricose, equalling the calyx: upper lip almost glabrous; style bearded above. ♃. G. Native of Mexico, in several places. Ker. bot. reg. t. 347. S. nepetoìdes, H. B. et Kunth, nov. gen. 2. p. 299. t. 150. S. amàra, Jacq. hort. schœnbr. 3. t. 255. S.

circinàta, Cav. icon. 4. p. 9. t. 318. Stem beset with long hairs, often glandularly hispid. Leaves $1\frac{1}{2}$ inch long. Corollas blue; middle lobe of lower lip broad, emarginate. Upper lobe of style twice as long as the lower one.

Very-bitter Sage. Fl. July, Aug. Clt. 1803. Pl. 3 to 6 feet.

142 S. cuspida'ta (Ruiz, et Pav. fl. per. 1. p. 23. t. 40. f. b.) suffruticose; branches pubescent; leaves petiolate, ovate, bluntish, crenated, cordate at the base, wrinkled, pale and pubescent beneath; floral leaves ovate, acuminated, deciduous; racemes elongated, almost simple; whorls usually 6-flowered, distant; calyx tubularly campanulate, villous, having the upper lip tricuspidate, and the teeth of the lower lip ovate, cuspidate; corolla about 3 times as long as the calyx: tube exserted a little, ventricose; style glabrous, or shortly pubescent. ♄. S. Native of Peru, on hills about Purrochuca and Cheuchin. Leaves an inch long, somewhat doubly crenated. Flowers almost like those of *S. scorodònia* and *S. amarissima*. Corollas blue.

Cuspidate-calyxed Sage. Shrub 4 to 6 feet.

143 S. cardiophy'lla (Benth. lab. p. 721.) herbaceous or suffruticose; branches pubescent; leaves petiolate, ovate, crenated, deeply cordate at the base, wrinkled, clothed with soft villi on both surfaces: floral ones deciduous; racemes elongated, simple; whorls about 6-flowered, distant; calyx tubularly campanulate, finely pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acutish; corolla twice as long as the calyx: tube almost inclosed, ventricose; style glabrous. ♄.? G. Native of South America, without the tropic, in Banda Oriental. Habit of *S. cuspidàta*, from which it differs in the soft villous leaves, and larger, somewhat coloured calyxes, mutic teeth, and entire upper lip.

Heart-leaved Sage. Pl. 2 feet.?

144 S. Gillie'sii (Benth. lab. p. 264.) stem shrubby; branches clothed with hoary tomentum; leaves petiolate, ovate or ovate-lanceolate, bluntish, crenately toothed, truncately cordate at the base, wrinkled, nearly glabrous above, and clothed with hoary tomentum beneath; floral leaves ovate, acute, deciduous; racemes simple; whorls remote, 2-6-flowered; flowers nearly sessile; calyx campanulate, clothed with hoary pubescence, having the upper lip entire, and the teeth of the lower lip ovate, obtuse, mucronate, recurved; corolla about twice as long as the calyx, downy outside; style pubescent. ♄. G. Native of Chili; plentiful on the Andes near Mendoza, at Uspaleta; and on Mount Cerro de las Achiras. Branches tomentose, and furnished with red scattered glands. Leaves 1 to $1\frac{1}{2}$ inch long. Calyxes usually coloured. Corollas blue, like those of *S. urticæfòlia*, but smaller.

Gillies's Sage. Shrub humble.

145 S. racemòsa (Ruiz, et Pav. fl. per. 1. p. 25.) plant shrubby, hairy, erect, branched; leaves cordate, acute, sublanceolate, serrated; racemes terminal, numerous, compound; floral leaves ovate, acuminated, concave, deciduous. ♄. S. Native of Peru, among rubbish, and in waste places of Huanuco. Leaves on long petioles, usually spotted with livid purple. Flowers verticillate, on short pedicels. Corolla pale blue.

Racemose-flowered Sage. Shrub.

146 S. ca'rnea (H. B. et Kunth, nov. gen. 2. p. 300. t. 151.) stem shrubby, erect, branched, glabrous; leaves roundish-ovate, cordate, crenately serrated, hairy; floral leaves oblong, acuminated, shorter than the calyxes, deciduous; spikes terminal; whorls many-flowered: lower ones remote; calyx tubular, striated, hairy: upper lip ovate, acuminated, and the teeth of the lower lip acuminated; tube of corolla exceeding the calyx a little, rather ventricose: upper lip pubescent: middle segment of the lower lip emarginately 2-lobed. ♄. S. Native of New Granada, on the Andes of Quindiu. Leaves on long petioles, 2 to $2\frac{1}{2}$ inches long. Corolla pale red. Genitals a little exserted. Stigma glabrous.

Flesh-coloured Sage. Shrub.

147 S. procu'rrens (Benth. lab. p. 266.) stems creeping, and rooting at the base; floriferous branches ascending, glabrous, or villous; leaves petiolate, roundish, or broad-ovate, cordate at the base, crenated, glabrous, or villous: floral leaves broad-ovate, acutish, deciduous; racemes simple, on long peduncles; whorls 6-10-flowered, remote; flowers on short pedicels; calyx campanulate, hispid, having the upper lip entire, or shortly tridentate, and the teeth of the lower lip acute; corolla glabrous, about twice as long as the calyx: tube ventricose, equalling the calyx; style almost glabrous. ♃. G. Native of South America, in humid pastures and woods; in the province of Rio Grande do Sul, and the more southern parts of Brazil, St. Hil. and Sello; in moist woods at Porana, Tweedie; in ditches near Buenos Ayres, Gillies. Stem glabrous, or hispid from hairs, which are often glandular, clammy, pubescent while young. Leaves similar to those of Ground Ivy. Corolla blue.

Running Sage. Pl. creeping.

148 S. propínqua (Benth. lab. p. 267.) stems creeping at the base?; branches ascending, elongated, villous; leaves petiolate, ovate, obtuse, crenated, cordate at the base, villous on both surfaces; floral leaves deciduous; racemes simple; whorls about 6-flowered, remote; calyxes equal in length to the pedicels, tubular, striated, clothed with rufous villi, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx: tube ventricose, equalling the calyx: lobes of lower lip roundish, emarginate; style glabrous. ♃. G. Native of the south of Brazil, Sello. Allied to *S. procúrrens*; but differs in the stem being firmer; in the leaves being more villous, on short petioles, and particularly in the flowers being larger; in the calyxes being on long pedicels, and tubular, not campanulate, clothed with rufous villi, not hispid.

Allied Sage. Pl. creeping.?

* * * * Sessilifòliæ. *Leaves sessile, or nearly so, rounded or truncate at the base. Species all natives of Brazil.*

149 S. ovalifòlia (St. Hil. mss. ex Benth. lab. p. 267.) stems creeping at the base; branches ascending, glabrous or villous; leaves on short petioles, oval, obtuse, crenated, rounded at the base, glabrous, rather coriaceous; floral leaves ovate-lanceolate, shorter than the calyxes, deciduous; racemes simple; whorls 6-10-flowered, remote; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx: tube ventricose, equalling the calyx: middle lobe of lower lip very broad, emarginate; style shortly bearded. ♃.? G. Native of Brazil, common in pastures in the missions of the Uruguay; and to the south of that, as well as in the province of Minas Geraes. S. rèpens, Benth. in herb. berol. Stems rather woody. Branches naked under the racemes. Leaves an inch and more long. Racemes on long peduncles.

Var. β, villòsa (Benth. lab. p. 267.) leaves deeply serrate-crenated, broadest at the base. ♃. G. Native near Salto Grande, on the banks of the Uruguay, in the province of Rio Grande do Sul.

Oval-leaved Sage. Pl. 1 to $1\frac{1}{2}$ foot.

150 S. lachnóstachys (Benth. lab. p. 267.) stem rooting at the base; branches ascending, simple, villous or spreadingly pilose; leaves nearly sessile, oval-oblong, obtuse, regularly crenulated, rounded or subcordate at the base, wrinkled, clothed with rufous tomentum above; floral leaves cordate-ovate, bluntish, rather shorter than the calyxes, almost permanent; racemes dense; whorls remotish, usually 10-flowered; calyx campanu-

late, pilosely hispid, having the upper lip entire, and the teeth of the lower lip acutish; corolla about twice as long as the calyx: tube about equal in length to the calyx, ventricose; style bifariously bearded. 2l. G. Native of Brazil, in the province of St. Paul, in fields near Registra de Curitiba, and the pastures near Fazenda da Fortaleza, St. Hil.; and in the south of Brazil, Sello. Stems clothed with rufous tomentum, or villous. Leaves 1 inch long, pubescent above. Corolla blue, a little smaller than those of *S. ovalifòlia*.

Woolly-spiked Sage. Pl. 1 to 2 feet.

151 S. vi'scida (St. Hil. mss. ex Benth. lab. p. 268.) suffruticose, clammy; branches clothed with glandular hairs; leaves nearly sessile, or the lower ones are ovate-lanceolate, acutish, serrately crenated or cordate at the base, green on both surfaces, soft, hispid; racemes elongated, almost simple; whorls generally 6-flowered, subsecund; calyx tubularly campanulate, villous, clammy, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx: tube a little exserted, ventricose; style bearded above. ♄. G. Native of Brazil, in the woods called Carrascos, in Serra Negro, at the limits of the provinces of Minas Geraes and Rio Janeiro, St. Hil. Shrub decumbent at the base. Racemes numerous, ½ foot. Corollas blue.

Viscid Sage. Shrub 3 to 4 feet.

152 S. corda'ta (Benth. lab. p. 268.) stem herbaceous, erect, tall, villous; leaves on short petioles, ovate-oblong, acute, crenated, cordate, wrinkled, pubescent above, clothed with soft white tomentum beneath; floral leaves ovate, acute? deciduous; racemes simple; whorls distant, many-flowered; calyx tubularly campanulate, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla thrice as long as the calyx: tube a little exserted, ventricose: upper lip pubescent: middle lobe of lower lip very broad, emarginate; style glabrous. 2l. G. Native of the south of Brazil, Sello. Stems almost simple. Leaves 3-4 inches long. Whorls often 20-flowered. Corolla blue, above an inch long. Upper lobe of style very long, subulate.

Cordate-leaved Sage. Pl. 3 to 4 feet.

153 S. nervòsa (Benth. lab. p. 268.) stem herbaceous? erect, almost simple, clothed with rufous tomentum, and long spreading hairs; leaves sessile, ovate-lanceolate, acute, crenately serrated, rounded or subcordate at the base, coriaceous, wrinkled above, and glabrous, nerved, and clothed with fine rufous tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes elongated; whorls numerous, 6-10-flowered; calyx ovate-tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip broad-ovate, obtuse, or shortly acuminated; corolla twice as long as the calyx, tomentose outside: tube exserted, widened at top; style bearded. 2l.? G. Native of the south of Brazil, Sello. Stems naked at the base. Leaves 1-2 inches long. Whorls distant. Corolla bluish. Stamens inclosed. Upper lobe of style longest.

Nerved-leaved Sage. Pl. 2 to 3 feet.

154 S. ri'gida (Benth. lab. p. 269.) stems herbaceous, erect, villous or nearly glabrous; leaves sessile, lanceolate or linear, cordate at the base, with crenulated margins, glabrous, rather coriaceous, stiff; floral leaves minute, linear, deciduous; racemes simple; whorls 6-10-flowered, remote; calyx tubular, striated, villous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx: tube ventricose, equalling the calyx; style shortly bearded beneath. 2l.? G. Native of Brazil, in the provinces of Minas Geraes, Rio Grande do Sul, and the south of Brazil, St. Hil. and Sello. Stems branched at the base. Branches almost simple. Leaves 1-2 inches long. Flowers almost sessile. Corolla blue, hardly half an inch long with the calyx.

Stiff Sage. Pl. 1 to 2 feet.

155 S. rosmarinoi'des (St. Hil. mss. ex Benth. lab. p. 269.) stem suffruticose; branches erect, twiggy, tomentosely villous; leaves sessile, linear or linear-lanceolate, acuminated, crenated, subcordate at the base, stiff, almost glabrous above, but clothed with hoary tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes elongated, simple; whorls about 6-flowered, distant; calyx tubular, clothed with clammy villi, having the upper lip entire, and the teeth of the lower lip acute; corolla about thrice as long as the calyx: tube a little exserted; style bifariously pubescent. ♄. G. Native of Brazil, in fields in the Missions of the Uruguay, near El Salto Grande. Plant scentless. Racemes nearly a foot long. Corollas blue, marked with white lines.

Rosmary-like Sage. Shrub 2 feet.

§ 3. Axillariflòræ. *Floral leaves conforming to the cauline ones. Flowers axillary. Tube of corolla equal in height to the calyx, or hardly half as long again.—Humble undershrubs, with bluish flowers.*

156 S. axilla'ris (Moc. et Sesse, mss. ex Benth. lab. p. 270.) leaves oblong-linear, acute, quite entire, narrowed at the base, scabrous from hairs; whorls axillary, 2-6-flowered; calyxes almost sessile, tubular, striated, pubescent, having the upper lip tridentate, and the lower lip bifid: teeth all acute, and subulately acuminated. ♄. S. Native of New Spain, Moçino et Sesse. Habit of *Thymus* or *Saturèia*. Leaves 3-4 lines long. Corollas not seen.

Axillary-flowered Sage. Shrub humble.

157 S. cuneifòlia (Benth. lab. p. 270.) branches decumbent, villous; leaves sessile, ovate-cuneated, a little toothed, narrowed at the base, green on both surfaces; whorls axillary, few-flowered; calyx tubular, villous, having the upper lip shortly tricuspidate, and the lower lip bifid: lobes acuminated; corolla more than twice as long as the calyx: tube exserted, equal; style glabrous. ♄. G. Native of Mexico, near Chapultepec? Karwinski. Stems many, rising from a thick woody base. Leaves 3-4 lines long, furnished with one or two teeth on both sides: the upper ones quite entire. Flowers size of those of *Calamintha Nepeta*.

Wedge-leaved Sage. Shrub ½ foot.

158 S. calaminthæfòlia (Vahl, enum. 1. p. 233.) stem shrubby; branches canescent; leaves petiolate, broad-ovate, obtuse, crenated, cordate at the base, clothed with fine tomentum on both surfaces; whorls axillary, remote, generally 6-flowered; calyxes pedicellate, tubularly campanulate, nearly glabrous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx, pubescent outside; style bearded above. ♄. S. Native of St. Domingo. Branches slender, purplish. Leaves hardly a nail in length. Corollas blue. Genitals a little exserted.

Calamint-leaved Sage. Shrub humble.

159 S. ballotæflòra (Benth. lab. 270.) leaves petiolate, ovate, roundish, obtuse, truncate or cordate at the base, nearly glabrous above, and clothed with white tomentum beneath; upper floral leaves bractea-formed; whorls few, axillary, 2-6-flowered, distant, or the 2 or 3 upper ones approximating into a short raceme; calyx pedicellate, tubularly campanulate, attenuated at the base, having the upper lip entire, and the teeth of the lower lip ovate, dilated after florescence; corolla about twice as long as the calyx: tube inclosed; style bifariously bearded. ♄. G. Native of Mexico, near Toliman, Karwinski. Shrub much branched. Leaves hardly ½ an inch long, when young clothed with mealy tomentum beneath, as well as the calyxes.

Ballota-flowered Sage. Shrub humble.

§ 4. Membrana'ceæ. *Floral leaves bractea-formed, dilately spreading, membranous. Tube of corolla inclosed, or hardly longer than the calyx.—Herbs or subshrubs, with bluish flowers.*

160 S. bupleuroi'des (Presl, mss. ex Benth. lab. p. 271.) herbaceous, nearly glabrous; leaves petiolate, ovate, acute, crenately-serrated, narrowed or cuneated at the base, green on both surfaces; axillary branches short; peduncles long, fascicled, with a solitary, terminal, many-flowered whorl on each peduncle; floral leaves exceeding the calyxes, permanent, broad, rounded, subcordate at the base, shortly acuminated at the apex, membranaceous, veiny, glabrous; calyxes sessile, membranous, having the upper lip entire, and the teeth of the lower lip acutish; corolla hardly longer than the calyx. ♃. G. Native of Mexico, Hænke. Flowers small. Very distinct from all other species in the inflorescence.

Bupleurum-like Sage. Pl.?

161 S. Moci'ni (Benth. lab. p. 271.) stem herbaceous, procumbent; branches ascending, clothed with short pubescence; leaves petiolate, ovate, acuminated, serrately-crenated, cuneated or truncate at the base, nearly glabrous; floral leaves large, orbicular, acuminated, membranous, veiny, spreading; racemes simple; whorls remote, 6-10-flowered; calyx almost sessile, ovate, tubular, canescent, having the upper lip entire, and the teeth of the lower lip acute, ciliated; corolla twice as long as the calyx: tube inclosed, ventricose: middle lobe of lower lip emarginate; style glabrous. ♃.? G. Native of New Spain, Moçino et Sesse. Leaves green on both surfaces, glabrous or downy: floral ones almost an inch broad. Corollas blue.

Moçino's Sage. Pl. procumbent.

§ 5. Bractea'tæ. *Floral leaves bractea-formed, permanent, green, broad-roundish, clasping the flowers. Tube of corolla inclosed, or hardly half as long again as the calyx.—Herbs and undershrubs, with bluish flowers.*

162 S. hirsu'ta (Jacq. schœnbr. 3. p. 1. t. 252.) stem herbaceous, ascending, branched, pubescent; leaves petiolate, oblong, acute, remotely serrated, narrowed at the base, villous; floral leaves sessile, broad-roundish, acuminated, ciliated, permanent, exceeding the whorls; racemes simple: whorls about 6-flowered, at length distant; calyxes sessile, tubularly campanulate, somewhat inflated, striated, pubescent or hispid, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla exceeding the calyx a little: tube inclosed, ventricose; style bearded beneath. ☉. G. Native of Mexico. S. nepetifòlia, Poir. suppl. 5. p. 48. S. cryptánthos, Schultes, obs. p. 12. S. siderítidis, Vahl, enum. 1. p. 250. S. bracteàta, Poir. dict. 6. p. 662.? S. ciliàta, Poir. dict. 6. p. 588. S. phlomoìdes, Cav. icon. 4. p. 10. t. 320. but not of Asso. Corollas blue.

Hairy Sage. Fl. May, July. Clt. 1801. Pl. 1 to 2 feet.

163 S. clinopodioi'des (H. B. et Kunth, nov. gen. amer. 2. p. 294. t. 145.) stem herbaceous, erect, clothed with white wool above; leaves ovate, bluntish, rounded at the base, crenated, pubescent beneath; floral leaves roundish-ovate, obtuse, pilose, permanent, exceeding the calyxes; whorls many-flowered, distant; calyx clothed with white hairs, tubularly campanulate, with an ovate-acuminated upper lip, and a reflexed lower bifid lip, with acuminated segments. ♃. S. Native of New Spain, between Pazcuaro and Aguasarco. Leaves petiolate, 2 inches long. Corollas pale blue: upper lip pubescent: tube a little longer than the calyx. Stamens equalling the upper lip of the corolla.

Clinopodium-like Sage. Pl.?

164 S. speciòsa (Presl, mss. ex Benth. l. c. p. 272.) shrubby; branches clothed with white villi; leaves petiolate, ovate, acute, serrated, rounded at the base or truncate, wrinkled, pubescent above, and clothed with white villi or tomentum beneath; floral leaves bractea-formed, broad-ovate, acuminated, longer than the calyxes, permanent, herbaceous, a little coloured; raceme dense, imbricate; whorls approximate, 6-10-flowered; calyx large, tubular, having the upper lip erect, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx: tube equalling the calyx; genitals much exserted. ♄. S. Native of Peru, about the town of Huanuco, and on the mountains in the vicinity, Hænke. Corolla dark purple.?

Showy Sage. Shrub.

165 S. Parquere'nsis (Moc. et Sesse, mss. ex Benth. lab. p. 273.) stem herbaceous, erect, clothed with white wool above; leaves on long petioles, ample, ovate, acute, pubescent on both surfaces, rounded or cuneated at the base, running into the winged petioles; floral leaves sessile, rounded, obtuse, permanent, clasping the flowers; racemes simple; whorls densely globose, many-flowered, approximate, distinct; calyx tubularly campanulate, clothed with white hairs, having the upper lip ovate, acuminated, entire, and the segments of the lower lip acuminated, reflexed; corolla about thrice as long as the calyx: tube exserted, widened at top: middle lobe of lower lip large, emarginate; style pubescent. ♃.? S. Native of New Spain. Corollas blue, an inch long.

Parquero Sage. Pl.?

166 S. Mathe'wsii (Benth. lab. p. 722.) herbaceous?; branches very villous at top; leaves ample, petiolate, ovate, deeply cordate at the base, flaccid, green on both surfaces, glabrous or hardly hairy on the nerves; floral leaves bractea-formed, broad-ovate, membranous, coloured, almost permanent, equalling the calyxes; racemes elongated, loose; whorls 6-10-flowered; calyxes pedicellate, large, tubular, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla hardly twice as long as the calyx: tube equalling the calyx; genitals much exserted. ♃.? S. Native of Peru, at Purrochuca and Obrajillo, Mathews. Leaves 6-8 inches long. Calyxes hispid at the base, glabrous at apex, and coloured. Flowers like those of *S. speciòsa*.

Mathews's Sage. Pl.?

167 S. macrosta'chya (H. B. et Kunth, nov. gen. 2. p. 298.) stem shrubby, erect, hairy; leaves petiolate, roundish-ovate, acute, deeply cordate at the base, with rounded imbricate auricles, pubescently villous on both surfaces; floral leaves broad-ovate, villous, permanent, equalling the calyxes; spikes dense, thick; whorls many-flowered, closely approximate; flowers sessile; calyx tubular, villous, having the upper lip entire, and the teeth of the lower lip acute; corolla hardly exceeding the calyx. ♄. S. Native of Peru, near Guayaquil; and near Quito, Llactacunga, and Cuença. Leaves 2-3 inches long. Corolla blue: upper lip arched, emarginate, as well as the middle segment of the lower lip.

Long-spiked Sage. Shrub 4 to 6 feet.

§ 6. Eria'nthæ. *Floral leaves bractea-formed, deciduous. Calyxes densely clothed with tomentose wool. Tube of corolla hardly a half as long again as the calyx.—Herbs or shrubs. Flowers whitish or yellowish, rarely reddish.*

168 S. leucoce'phala (H. B. et Kunth, nov. gen. 2. p. 301. t. 156.) stem shrubby, erect, and is, as well as the branches, clothed with hoary tomentum; leaves ovate, bluntish, cordate, crenately serrated, clothed with hoary tomentum beneath; spikes

ovate: whorls many-flowered, closely crowded; calyx tubular, having the upper lip ovate, acute, and the segments of the lower lip acute; tube of corolla equalling the calyx. ♄. S. Native of Peru, in the province of Quito, near Alausi. Floral leaves ovate, acute. Corolla violaceous. Stamens hardly exserted. This is a very showy species.

White-headed Sage. Shrub 3 to 4 feet.

169 S. breviflòra (Moc. et Sesse, mss. ex Benth. lab. p. 274.) stem shrubby; branches clothed with hoary tomentum; leaves on short petioles, ovate, acute, crenulated, rounded at the base or subcordate, clothed with soft hoary pubescence above, and white tomentum beneath; floral leaves ovate, acuminated, equalling the calyxes; racemes spike-formed, dense, a little branched; whorls about 6-flowered, approximate, secund; flowers almost sessile; calyx tubularly campanulate, having the upper lip entire, and the teeth of the lower lip short, obtuse; corolla about twice as long as the calyx, tomentose outside, with equal lips; genitals exserted a little; style glabrous. ♄. S. Native of New Spain. Leaves almost like those of a species of *Lantàna*, scarcely an inch long. Upper lip of corolla shortly emarginate, and the middle segment of the lower lip large, bifid.

Short-flowered Sage. Shrub.

170 S. colli'na (H. B. et Kunth, l. c. p. 288.) shrubby; branches and under sides of leaves clothed with white tomentum, but pubescent above; leaves oblong-lanceolate, bluntish, acute at the base, crenated; floral leaves lanceolate, tomentose, deciduous; spikes on long peduncles; whorls many-flowered, approximate; calyx clothed with white tomentum, campanulate, striated, having the upper lip entire, acute, and the lower one bipartite, with acuminated segments. ♄. S. Native of Quito, on dry hills about Riobamba Nuevo. Shrub sweet-scented. Leaves an inch long, green above. Lower whorls distant. Corollas blue: lower lip spotted with white, ex Bonpl. This species differs from *S. breviflòra*, in the leaves being green above, and in their form.

Hill Sage. Shrub.

171 S. spica'ta (Rœm. et Schultes, syst. mant. 1. p. 202.) shrubby; branches glabrous, clothed with hoary pubescence while young; leaves lanceolate-oblong, obsoletely crenated towards the apex, pubescent above, but clothed with white tomentum beneath; floral leaves ovate, acuminated, clothed with white tomentum, tipped with blue, deciduous; spikes terminal, solitary, pedunculate; whorls many-flowered, approximate; calyx clothed with white tomentum, campanulate, striated, having the upper lip obtuse and tridentate, and the lower one bidentate: teeth all acute. ♄. S. Native of New Spain. S. salígna, Willd. herb. ex Link, Schwæg. et Dietr. spec. pl. 1. p. 308. S. Humbóldtii, Spreng. syst. 1. p. 64. S. Humboldtiàna, Dietr. gart. lex. 7. p. 418. S. pulchélla, H. B. et Kunth, nov. gen. 2. p. 288. t. 140. Leaves about an inch long. Corolla blue: tube equalling the calyx: upper lip galeate, concave, emarginate, pubescent. Calyx reddish, more villous than that of *S. breviflòra*.

Spicate-flowered Sage. Shrub 3 feet.

172 S. farina'cea (Benth. lab. p. 274.) stem herbaceous, erect, nearly glabrous; leaves petiolate, ovate-oblong, or lanceolate, bluntish, irregularly serrate-crenated, narrowed a long way at the base, nearly glabrous, green on both surfaces or canescent beneath; floral leaves small, deciduous; raceme elongated, simple; whorls many-flowered, almost secund, remote, or the upper ones are approximate; flowers almost sessile; calyx tubular, having the upper lip entire, and the teeth of the lower lip short and obtuse; corolla twice as long as the calyx: tube hardly exserted, ventricose; style bearded. ♃.? S. Native of Texas, between Rio Guadaloupe and Rio Colorado. Leaves like those of *S. uliginòsa* or *S. serràta*.

Mealy Sage. Pl.?

173 S. revolu'ta (Ruiz, et Pav. fl. per. 1. p. 28. t. 41. f. b.) stem shrubby, erect, clothed with white tomentum; leaves on short petioles, linear-lanceolate, obtuse, crenated, with revolute edges, wrinkled, clothed with white tomentum on both surfaces; lower floral leaves similar to the cauline ones: upper ones ovate, acuminated, deciduous; racemes simple; whorls about 6-flowered, remote, secund; calyx tubular, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube exserted, ventricose: lips equal in length; style hairy. ♄. S. Native of Peru, in the province of Canta. Shrub much branched. Leaves on short petioles, $1\frac{1}{2}$ inch long. Corolla whitish-violet.

Revolute-leaved Sage. Shrub 2 to 3 feet.

174 S. leuca'ntha (Cav. icon. 1. p. 16. t. 24.) stem shrubby; branches nearly terete, clothed with white wool; leaves on short petioles, lanceolate-linear, acute, minutely crenated, rounded at the base, wrinkled above, and pubescent, but clothed with white wool beneath; floral leaves ovate, acuminated, deciduous; raceme elongated; whorls many-flowered: lower ones remote; flowers almost sessile; calyx ovate, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx, clothed with white tomentum outside: tube exserted, rather ventricose: lips short; style bearded. ♄. S. Native of Mexico. Leaves 2-6 inches long. Racemes usually purplish. Corolla white, rather contracted under the throat.

White-flowered Sage. Shrub 4 to 5 feet.

175 S. velati'na (Benth. lab. p. 275.) stem shrubby?; branches densely leafy, clothed with velvety wool; leaves almost sessile, oblong-lanceolate, obtuse, crenated, narrowed at the base, wrinkled, clothed with velvety wool beneath; floral leaves lanceolate, deciduous; racemes rather loose; whorls about 6-flowered; calyxes striated, tubular, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla half again as long as the calyx, clothed with white wool outside: tube wide: lips nearly equal; style glabrous. ♄.? S. Native of the South of Brazil, Sello. Nearly allied to *S. confertiflòra*. Corollas white.

Velvety Sage. Shrub.

176 S. erioca'lyx (Bertero, ex Rœm. et Schultes, syst. addit. to mant. 1. p. 246.) stem shrubby; branches divaricate, clothed with hoary pubescence; leaves oblong-lanceolate, acuminated, serrated, cuneated at the base, pubescent above, and densely clothed with hoary tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes short, simple; whorls 6-10-flowered, approximate; calyx campanulate, having the upper lip entire, and the teeth of the lower lip ovate, obtuse; corolla exceeding the calyx a little, woolly outside: tube inclosed: lips short; style bearded. ♄. S. Native of Jamaica. Branches divaricate or procumbent. Leaves 3-4 inches long. Flowers nearly sessile. Wool of calyx generally reddish. Corollas like those of *S. confertiflòra*.

Woolly-calyxed Sage. Shrub.

177 S. confertiflòra (Pohl, pl. bras. 2. p. 134. t. 190.) stem shrubby?; branches clothed with rufous tomentum; leaves petiolate, ovate-oblong, acutish, crenated, cuneated at the base, and running into the petioles, a little wrinkled above, and clothed with adpressed tomentum, and densely clothed with rufous tomentum beneath; floral leaves ovate, long-acuminated, reflexed or deciduous; racemes elongated; whorls numerous, many-flowered; calyx ovate-tubular, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla one half longer than the calyx, clothed with yellow wool outside: tube

exserted, ventricose: lips short; style glabrous. ♄. S. Native of Brazil, near Rio Janeiro, and on Serra d'Estrella, and Padre Correa. Leaves 3-4 inches long, and 1½ broad. Bracteas long-acuminated, comose at apex. Whorls 10-20-flowered. Calyx reddish. Corolla reddish, small.

Crowded-flowered Sage. Shrub. ?

178 S. lasia'ntha (Benth. lab. p. 276.) shrubby; branches densely woolly; leaves almost sessile, oval-oblong, obtuse, crenated, rounded at the base or cordate, much wrinkled above, hispid, clothed with soft white wool beneath: floral ones ovate, acuminated, shorter than the calyxes, deciduous; racemes elongated, simple; whorls distant, many-flowered; calyxes tubular, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla one half longer than the calyx: tube hardly exserted, ventricose, pubescent outside: lips nearly equal; style glabrous. ♄. S. Native of Mexico. Shape of leaves and habit of *S. scorodònia.* Racemes reddish or yellowish. Inflorescence of *S. eriocàlyx.*

Woolly-flowered Sage. Shrub.

§ 7. Longiflòræ. *Tube of corolla 2-3 times longer than the calyx: lower lip generally shorter, rarely longer than the upper one.—Herbs, undershrubs, or shrubs. Corollas white, yellowish, orange-coloured, bluish, scarlet, or purple.*

* A'lbidæ. *Corollas white or whitish.*

179 S. tomente'lla (Pohl, pl. bras. 2. p. 138. t. 194.) herbaceous? erect, clothed with rufous tomentum; leaves sessile, ovate-oblong, obtuse, crenated, narrowed at the base, wrinkled, and rather hispid above, and clothed with tomentose pubescence beneath; floral leaves deciduous; racemes elongated; whorls 6-10-flowered, remote; calyxes tubular, striated, tomentosely pubescent, having the upper lip entire, and the teeth of the lower one acute; corolla twice as long as the calyx, clothed with white wool outside: tube exserted: lips short; lateral lobes of lower lip reflexed: middle one concave; style shortly bearded. ♃.? S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Leaves 2-3 inches long, few. Corolla 15 lines long, white.

Woolly Sage. Pl. 2 to 3 feet.

* * Auranti'acæ. *Corollas yellowish or orange-coloured.*

180 S. lu'tea (H. B. et Kunth, nov. gen. 2. p. 297. t. 148.) stems shrubby, and are, as well as the branches, pilose; leaves oblong, acutish, cordate, crenated, glabrous above, and clothed with white tomentum beneath; whorls many-flowered: lower ones distant; floral leaves ovate, acute, shorter than the calyxes, deciduous; calyx subcampanulate, clothed with glandular hairs, the upper lip tridentate, the teeth acuminately mucronate, and the segments of the lower lip acuminately subulate. ♄. S. Native of Peru, between Loxa and Mount Saraguru, in the province of Quito. Leaves 1½ inch long. Corolla yellow, glandularly pilose on the back: tube ventricose, thrice as long as the calyx.

Yellow-flowered Sage. Shrub.

181 S. puncta'ta (Ruiz, et Pav. fl. per. 1. p. 27. t. 39.) stem suffruticose, erect, clothed with glandular pubescence; leaves petiolate, ovate, acute, serrated, rounded at the base, quite entire, coriaceous, veiny, clammy above, of the same colour beneath, pubescent or glabrous; floral leaves ovate, acuminated, deciduous; racemes simple; whorls 1-10-flowered, remote; calyx campanulate, hairy, having the upper lip entire, obtuse, or shortly tridentate, and the teeth of the lower lip ovate, acute; corolla pubescent, thrice as long as the calyx: tube exserted, rather ventricose: lips nearly equal; style bearded. ♄. S. Native of Peru, on hills of Huanuco.—A fetid ferruginous plant. Branches purplish. Leaves hardly an inch long. Corollas white, but usually yellowish or whitish-violet, size of those of *S. lamiifòlia.*

Dotted Sage. Shrub 2 to 3 feet.

182 S. Pavònii (Benth. lab. p. 278.) stem shrubby, bifariously pubescent; branches beset with glandular villi at top; leaves petiolate, ovate, obtuse, quite entire, cuneated at the base, glabrous; floral leaves ovate, acuminated, deciduous; racemes simple; whorls many-flowered, distant; calyx campanulate, clothed with glandular villi, having the upper lip entire, and the teeth of the lower lip broad-ovate, acute; corolla pubescent outside, about 4 times longer than the calyx: tube much exserted, inflated in the middle: lips short, erect; style bearded above. ♄. S. Native of Peru. Allied to *S. punctàta;* but differs in the quite entire obtuse leaves, and longer corollas. Corollas yellowish.

Pavon's Sage. Shrub.

183 S. integrifòlia (Ruiz, et Pav. fl. per. 1. p. 26. t. 36. f. b.) stem shrubby, glabrous; leaves petiolate, ovate, quite entire, rounded at the base, glabrous, clammy, rather fleshy; floral leaves lanceolate, acute, deciduous; racemes short, simple; whorls about 6-flowered, distant; calyx tubular, glabrous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla thrice as long as the calyx, pubescent: tube exserted, nearly equal; style glabrous. ♄. S. Native of Peru, at Caxatamba, near the hot baths of Cheuchin, and among rocks, where it is called *Succoncha* by the natives. Stem much branched. Branches clammy, purplish. Leaves scarcely half an inch long, obtuse or acute. Corolla more than an inch long, of a coppery-yellow colour. Genitals exserted.

Entire-leaved Sage. Shrub 2 to 3 feet.

184 S. oppositiflòra (Ruiz, et Pav. fl. per. 1. p. 26. t. 43. f. a.) stem suffruticose, procumbent at the base; branches erect, finely pubescent; leaves petiolate, ovate, obtuse, rounded at the base or cordate, wrinkled, pubescent; floral leaves deciduous; racemes simple; whorls 2-flowered, secund; calyx tubular, striated, the upper lip entire, and the teeth of the lower lip ovate, acute; corollas 4 times as long as the calyx, pubescent outside: tube much exserted: lips nearly equal; style glabrous.? ♄. S. Native of Peru, in elevated, exposed, arid places of Tarma. S. gràta, Vahl, enum. 1. p. 244. Plant with a grateful scent. Leaves 1 to 1½ inch long. Corollas a little smaller than those of *S. tubiflòra,* scarlet. The vernacular name of the plant is *Chenchelcoma.*

Opposite-flowered Sage. Shrub.

185 S. gluma'cea (H. B. et Kunth, nov. gen. 2. p. 298.) stem suffruticose, erect, and is, as well as the branches, pubescent; leaves ovate, obtuse, cordate, almost quite entire, coriaceous, nearly glabrous; whorls 2-flowered, distant; floral leaves oblong, acute, ciliated, glumaceous, about equal in length to the calyxes; calyx nearly glabrous, tubular: lips ciliately pilose: upper lip and segments of the lower lip acuminated. ♄. S. Native of New Spain, in temperate places. Corolla scarlet.?

Glumaceous-bractead Sage. Shrub.

186 S. strictiflòra (Hook. bot. misc. 2. p. 234.) stem shrubby; branches clothed with tomentose pubescence; leaves petiolate, ovate, acute, crenately serrated, cordate at the base, thickish, rather fleshy, nearly glabrous; floral leaves ovate, acute, membranous, deciduous; racemes elongated; whorls 2-flowered, secund; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla more than twice as long as the calyx: tube elongated, incurved, tomentose outside: lips nearly equal, hardly spreading: lateral lobes of lower lip very short; genitals exserted;

style glabrous. ♄. S. Native of Peru, between Yazo and Obrajillo, in the valley of Canta. Leaves 1½ to 2 inches long. Corolla of a yellowish scarlet colour.

Strict-flowered Sage. Shrub 4 to 6 feet.

187 S. tubiflòra (Smith, icon. ined. t. 26.) stem suffruticose, erect, villous; leaves petiolate, ovate, obtuse, crenately-serrated, cordate at the base, pubescent above, or villous, and clothed with white wool beneath, or the lower ones are nearly glabrous; floral leaves ovate, acute, membranous, deciduous; racemes simple; whorls 2-flowered, secund; calyx tubular, striated, woolly or villous, having the upper lip entire, and the teeth of the lower lip lanceolate, acute; corolla 3 times as long as the calyx: tube elongated, incurved, tomentose outside: lateral lobes of lower lip small: middle one concave; genitals exserted a little; style glabrous. ♄. S. Native of Peru, on the mountains. S. biflòra, Ruiz, et Pav. fl. per. et chil. 1. p. 24. t. 38. f. a. Stem and branches densely villous. Floral leaves and calyxes glumaceous, usually clothed with soft, silky, white tomentum. Corolla of a golden scarlet colour, 1½ inch long.

Var. β, *glabràta* (Benth. lab. p. 279.) lower leaves of the same colour on both surfaces, and nearly glabrous. ♄. S. Native of Peru, common in sandy places in the town of Atiquipa, in the province of Camana. S. excìsa, Ruiz, et Pav. fl. per. 1. p. 25. t. 36. f. a. Stem and racemes less villous; the younger leaves constantly tomentose beneath.

Tube-flowered Sage. Fl. June, July. Clt. 1820. Shrub 2 to 3 feet.

* * * Cocci'neæ. *Corollas scarlet or purple.*

188 S. leonuroi'des (Glox. obs. bot. 15. t. 2.) stem suffruticose, nearly glabrous; leaves petiolate, ovate, or rhomboid, obtuse, crenated a little, truncate or subcordate at the base, nearly glabrous above, veiny and canescent beneath; floral leaves similar to the others; whorls about 6-flowered; flowers about equal in length to the leaves; pedicels shorter than the petioles; calyx tubularly campanulate, glabrous: the upper lip entire, and the lobes of the lower lip broad-ovate, acute; corolla about twice as long as the calyx: tube ventricose: lips nearly equal: upper lip pubescent outside; stamens inclosed; style exserted, bearded, with subulate lobes. ♄. S. Native of Quito, in temperate places near Chillo, Ichubamba, and Huanuco. Lam. ill. t. 20. f. 3. S. comòsa, Lher. stirp. 1. p. 41. t. 21. Mirb. ann. mus. 15. t. 15. f. 6. S. nodòsa, Ruiz, et Pav. fl. per. 1. p. 25. t. 41. f. a. S. pyrifòlia, Dombey, ex Cav. Júngia formòsa, Mœnch. Branches furrowed, nodose, glabrous, or clothed with fine hoary tomentum. Leaves rarely quite entire, but usually sinuated or crenated. Corolla scarlet.

Lion's-tail-like Sage. Shrub 4 to 6 feet.

189 S. plumòsa (Ruiz, et Pav. fl. per. 1. p. 26. t. 37. f. a.) shrubby, clothed with rusty tomentum; branches woolly; leaves petiolate, subcordate, acute, crenated, veiny, wrinkled, very woolly beneath; peduncles 4-5, axillary, 6-flowered, propped by subulate bracteoles; calyx tubular, scabrous inside; corolla hairy outside, twice as long as the calyx: lips equal: upper one emarginate: lower one trifid; style plumose, purplish. ♄. S. Native of Peru, in the province of Tarma, among broken rocks at Huassahuassi. Corollas purple: tube not ventricose. Very nearly allied to the preceding.

Plumose-styled Sage. Shrub.

190 S. Balausti'na (Pohl, pl. bras. 2. p. 133. t. 189.) suffruticose, erect, pilose; leaves petiolate, oblong, acute, serrated, narrowed at the base, green on both surfaces, pilose; floral leaves conforming to the others; whorls axillary, remote, 6-flowered; calyx tubular, pilose, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla thrice as long as the calyx: tube much exserted; style bearded. ♄. S. Native of Brazil, among bushes, by way sides near Engenho da Varge, in the province of Rio Janeiro. Branches reddish-brown. Leaves 2 to 2½ inches long. Bracteas lanceolate, hardly longer than the pedicels. Corolla 2 inches long, scarlet. Stamens inclosed.

Pomegranate-flowered Sage. Shrub 3 feet.

191 S. asperifòlia (Benth. lab. 281.) stem suffruticose, erect, clothed with short pubescence; leaves sessile, oblong, crenated, narrowed at the base, tubercled and very rough above, but nearly glabrous beneath; floral leaves ovate, acuminated, membranous, ciliated, deciduous; racemes elongated; whorls about 6-flowered, somewhat secund: lower ones remote; calyx tubular, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla 3 times as long as the calyx, pubescent: tube elongated, widened above: lateral lobes of lower lip deflexed; style exserted, plumose. ♄. S. Native of Brazil, in the provinces of Goyaz and Minas Geraes. Stem nearly naked above. Leaves 3-4 inches long. Corolla 1½ inch long, scarlet.

Rough-leaved Sage. Shrub.

192 S. sca'brida (Pohl, pl. bras. 2. p. 140. t. 195.) stem suffruticose, erect, clothed with short pubescence; leaves almost sessile, oblong-lanceolate, obtuse, crenated, narrowly rounded at the base, rough from tubercles above, and nearly glabrous beneath; floral leaves ovate, acuminated, deciduous; racemes simple, elongated; whorls few-flowered; calyx tubular, pubescent, having the upper lip entire, and the segments of the lower lip ovate, acute; corolla thrice as long as the calyx, pubescent: tube elongated, hardly widened; style plumose. ♄. S. Native of Brazil, in grassy pastures at St. Lucia, in the province of Goyaz; and about Barbacena and Registo Velho, in the province of Minas Geraes. This differs from *S. asperifòlia*, in the narrower leaves; in the whorls being usually 2-4-flowered, and in the tube of the corolla being less widened. Corolla of a beautiful red colour.

Scabrous Sage. Shrub.

193 S. persicæfòlia (St. Hil. mss. ex Benth. lab. p. 281.) shrubby; branches villous above; leaves nearly sessile, oblong-lanceolate, acuminated, a little serrated, narrowed at the base, rather scabrous above, and of the same colour on both surfaces, nearly glabrous beneath; floral leaves bractea-formed, ovate, acuminated, deciduous; racemes simple; whorls about 6-flowered, distant; calyx campanulate, clothed with long purple wool outside, having the upper lip entire, and the teeth of the lower lip ovate, acutish; corolla more than twice as long as the calyx, villous: tube widened above; style plumose. ♄. S. Native of Brazil, in woods near Rio Vermelho, in the eastern part of the province of Minas Geraes. Leaves 2-3 inches long, villous on the veins beneath, the rest glabrous. Racemes and calyxes densely clothed with purple articulated hairs. Corolla scarlet, more than 2 inches long. Style exserted.

Peach-leaved Sage. Shrub 5 to 7 feet.

194 S. Maria'na (Mart. mss. ex Benth. lab. p. 282.) shrubby; branches clothed with tomentose villi; leaves on short petioles, oblong-lanceolate, narrowed a long way at both ends, pubescent on both surfaces, pale beneath; floral leaves bractea-formed, ovate, acuminated, deciduous; racemes simple; whorls about 6-flowered, distant; calyx tubularly campanulate, densely clothed with brownish-white, rather silky adpressed wool, having the upper lip entire, and with the teeth of the lower lip very short, ovate-acute; corolla twice as long as the calyx, villous: tube much exserted; style bearded. ♄. S. Native of Brazil, in the province of Minas Geraes, in humid parts of woods at Mariana, and elsewhere in the same province. This differs from *S. persicæfòlia*, in the leaves being narrower, and rather

tomentose beneath; in the woolly calyx and shorter corolla. Corolla 1½ inch long, scarlet.

Mariana Sage. Shrub.

195 S. Hila'rii (Benth. lab. p. 282.) shrubby; branches glabrous; leaves petiolate, oblong or ovate-lanceolate, acuminated, subserrated, narrowly cuneated at the base, green on both surfaces, smoothish, glabrous; floral leaves linear, almost deciduous; racemes simple, short; whorls few, 2-4-flowered, approximate; calyx tubularly campanulate, corrugated from short wool outside, having the upper lip entire, and the teeth of the lower lip very short, ovate, bluntish; corolla twice as long as the calyx, woolly: tube much exserted; style bearded. ♄. S. Native of Brazil, St. Hil. Leaves almost like those of *S. persicæfòlia*, but broader, and on longer petioles. Flowers size of those of *S. persicæfòlia*, or a little smaller, but differs in the wool of the corolla and calyx.

St. Hilaire's Sage. Shrub.

196 S. salicifòlia (Pohl, pl. bras. 2. p. 140. t. 196.) shrubby; branches glabrous, pubescent, or clothed with rufous villi; leaves on short petioles, oblong-lanceolate, somewhat crenately serrated, narrowed at both ends, glabrous or hispid above, and clothed with fine rufous tomentum beneath; floral leaves ovate, acute, deciduous; racemes elongated; whorls about 6-flowered; calyx tubularly campanulate, glabrous or pubescent, having the upper lip entire, and the teeth of the lower lip very short and acute; corolla more than twice as long as the calyx: tube much exserted; style bearded. ♄. S. Native of Brazil, among bushes about Queluz, in the province of Minas Geraes, and elsewhere in the same province. This species differs from *S. persicæfòlia*, in the glabrous or pubescent calyxes, &c.

Willow-leaved Sage. Shrub.

197 S. Hæ'nkei (Benth. lab. p. 283.) shrubby; branches clothed with hoary tomentum and clammy villi at top; leaves on short petioles, ovate-oblong or oblong-lanceolate, acute, serrated, rounded at the base, wrinkled, clothed with white tomentum beneath; floral leaves bractea-formed, lanceolate, deciduous; racemes elongated, simple, or the lower whorls are irregularly cymose, and a little branched; calyx tubularly campanulate, clothed with clammy villi, having the upper lip entire, and the teeth of the lower lip bluntish; corolla about 3 times as long as the calyx, clothed with clammy villi: tube much exserted; genitals exserted; style glabrous. ♄. S. Native of Peru, Hænke. Upper whorls 6-flowered, but sometimes 8-10-flowered: lower ones elongated, or the racemes are branched at the base. Corolla 15-16 lines long, scarlet: tube slender, hardly widened at top. This species is very distinct in the form of the leaves and inflorescence.

Hænke's Sage. Shrub.

198 S. hi'rta (H. B. et Kunth, nov. gen. amer. 2. p. 296.) stem shrubby, erect, bifariously pilose; leaves ovate-oblong, acuminated, crenately-serrated, clothed with hoary pubescence beneath; spikes panicled; whorls remote, few-flowered; floral leaves ovate, acuminated, hairy, shorter than the calyxes, deciduous; calyx clothed with rather glandular hairs, tubularly campanulate: upper lip acuminated, entire: segments of the lower lip acuminately mucronate; corolla thrice as long as the calyx. ♄. S. Native of the Andes of Peru, near Ayavaca, and elsewhere. Leaves petiolate, 2 inches long. Corolla purple.

Hairy Sage. Shrub.

199 S. tortuòsa (H. B. et Kunth, nov. gen. amer. 2. p. 292. t. 142.) stems shrubby, erect, clothed with fuscescent tomentum; leaves petiolate, ovate-oblong, acuminated, narrowed at the base, serrated, clothed with fuscescent tomentum beneath, and pubescence above; spikes secund; whorls about 6-flowered, approximate; calyx tubularly campanulate, clothed with villous tomentum, having the upper lip entire, ovate, acuminated, subulate, and the segments of the lower lip acuminately subulate; corollas 2-3 times longer than the calyx, pubescently villous; genitals a little exserted. ♄. S. Native of New Granada, on the Andes of Quindiu. Branches twisted, clothed with fuscescent tomentum. Flowers on long pedicels. Corolla an inch long: upper lip emarginate, villous outside, and middle segment of the lower lip obcordate: tube widened above.

Twisted-branched Sage. Shrub.

200 S. curviflòra (Benth. lab. p. 284.) shrubby; branches clothed with tomentose pubescence; leaves petiolate, ovate-oblong, acute, crenately serrated, rounded or narrowed at the base, pubescent above, but clothed with soft hoary tomentum beneath; floral leaves acuminated, deciduous; flowers secund, incurvedly reflexed, nearly sessile; whorls 6-10-flowered; calyx tubular, pubescent, having the upper lip as well as the teeth of the lower lip acuminated; corolla about 4 times longer than the calyx, pubescent outside: tube rather widened above; stamens inclosed; style exserted, quite glabrous. ♄. G. Native of Mexico, near Tlalpuxahua. Shrub divaricately branched. Leaves 1 to 1½ inch long. Corolla reddish scarlet, nearly 1½ inch long: tube bidentate inside at bottom.

Curved-flowered Sage. Shrub.

201 S. Neovide'nsis (Benth. lab. p. 284.) shrubby?; branches finely pubescent; leaves petiolate, ovate, acuminated, serrately crenated, rounded at the base, soft, pubescent above, and pale and clothed with hoary tomentum beneath; upper leaves sessile: floral leaves lanceolate-subulate, longer than the calyxes, at length deciduous; racemes elongated, simple; whorls loose, remote, secund, 2-6-flowered; calyxes tubularly-campanulate, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla 4-5 times longer than the calyx, nearly glabrous: tube slender at the base, and much widened at top: lower lip very short; genitals exserted; style glabrous. ♄. S. Native of Brazil, near Rio Janeiro, Prince Maximilian Neuwied. Nearly allied to *S. curviflòra*. Corolla 14-15 lines long, scarlet.

Neuwied Sage. Shrub.

202 S. fruticetòrum (Benth. lab. p. 284.) herbaceous, erect, tall, nearly glabrous; leaves petiolate, ovate, acuminated, serrated, cuneated at the base, green on both surfaces, glabrous, or clothed with fine pubescence; floral leaves deciduous; racemes elongated, simple; whorls about 6-flowered, distant; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, obtuse; corolla about 3 times as long as the calyx, villous outside: lower lip very short; stamens shorter than the corolla; style pubescent. ♃. S. Native of Brazil, among bushes at Arrayal, Prince Maximilian Neuwied. Leaves 3 inches long. Calyx green. Corollas deep red, form of those of *S. Neovidénsis*.

Bush Sage. Pl. 4 feet.

203 S. alti'ssimum (Pohl, pl. bras. 2. p. 136. t. 192.) suffruticose; branches erect, tall, nearly glabrous; leaves petiolate, ovate-oblong, acute, serrated, narrowly cuneated at the base, glabrous above, and clothed with fine pubescence beneath; floral leaves ovate, acuminated, deciduous; racemes elongated, simple; whorls distant, many-flowered; calyx tubular, villous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla more than twice as long as the calyx, glabrous: tube much exserted: lips equal; style pilose. ♄. S. Native of Brazil, among bushes at Arrayal Santa Rita, in the province of Goyaz. Branches, as well as the nerves of the leaves and calyxes, clothed with glandular villi. Corolla pure red, 14 lines long: tube scarcely widened at top. Leaves 4-5 inches long.

Tallest Sage. Shrub 6 to 7 feet.

204 S. moscha'ta (H. B. et Kunth, nov. 2. p. 293, t. 143.) shrubby, erect, glabrous; leaves petiolate, ovate, acute, cuneated at the base, serrated, glabrous or pilose; whorls 5-6 flowered, distant; calyx tubular, striated, glabrous or pilose, having the upper lip ovate, acuminated, entire, and the segments of the lower lip acuminated; corolla thrice as long as the calyx; tube widened at top: upper lip emarginate: middle segment of the lower lip short, retuse; style villous on the upper side. ♄. S. Native of New Granada, near Almaguer, among bushes. Plant exhaling a scent of musk. Leaves 2 inches long; pilose on the veins beneath. Spikes terminal, pedunculate. Corolla purple. Calyxes clothed with fuscescent hairs while young. Allied to *S. Neovidénsis* and *S. altíssima*.

Musky-scented Sage. Shrub, 4-6 feet.

205 S. squa'lens (H. B. et Kunth, nov. gen. amer. 2. p. 297.) stem shrubby, erect, and are, as well as the branches, pilose and clammy; leaves petiolate, ovate-oblong, obtuse, cordate, crenated, coriaceous, wrinkled above, and pilose but clothed with hoary tomentum beneath; whorls 2-flowered, distant; floral leaves ovate-oblong, shorter than the calyxes, deciduous; calyx tubular, hairy, striated, the upper lip, and segments of the lower lip, acuminated; corolla twice as long as the calyx, pubescent; stamens exserted. ♄. S. Native of Peru, on the Andes. Branches purple. Leaves 1½ to 2 inches long. Spikes terminal. Corolla purple.

Filthy Sage. Shrub.

206 S. rube'scens (H. B. et Kunth, nov. gen. amer. 2. p. 301. t. 154.) stem shrubby, erect, canescent, glabrous; leaves on long petioles, ovate, narrowly-acute, cordate, crenated, clothed with fine hoary tomentum beneath; spikes panicled; whorls 4-6 flowered, distant; calyx densely clothed with clammy hairs, tubular, purple, having the upper lip ovate, acute, entire, and the teeth of the lower lip acuminated; corolla glabrous, twice as long as the calyx. ♄. S. Native of Quito, in temperate places. Leaves 4 inches long. Leaves pubescent above. Corolla beautiful purple.

Reddish-flowered Sage. Shrub.

207 S. hirte'lla (Vahl. enum. 1. p. 249.) stem herbaceous? ascending, clothed with clammy villi; leaves petiolate, ovate-oblong, acute, crenated, roundly-cuneated at the base, green on both surfaces, and nearly glabrous; floral leaves ovate, acute, deciduous; racemes elongated, simple; whorls about 6-flowered, remote; calyx tubular, very hairy, having the upper lip entire, and the teeth of the lower lip ovate, obtuse; corolla more than twice as long as the calyx, villous outside: tube much exserted: lips nearly equal; genitals much exserted. ♄.? S. Native of Peru, Dombey. Corolla scarlet, an inch long; tube dilated a little at top.

Hairy Sage. Shrub.

208 S. secu'nda (Benth. lab. p. 285.) stem herbaceous, erect, glabrous; branches pubescent; leaves petiolate, oblong, narrowed at the base, acute, serrated, rather hispid above, and glabrous beneath: floral leaves ovate, acuminated, deciduous; whorls about 6-flowered, secund; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla one half longer than the calyx, pubescent outside: tube a little exserted, nearly equal, or hardly contracted at the throat: lips short, nearly equal; genitals inclosed; style glabrous. ♃.? G. Native of the South of Brazil, Sello. Leaves 2-3 inches long. Corolla scarcely half an inch long. Hairs of branches reflexed.

Var. β; leaves clothed with hoary tomentum beneath. ♄. G. Native of Brazil, in the province of Minas Geraes.

Secund-flowered Sage. Pl.?

209 S. cilia'ta (Benth. lab. p. 286.) stem herbaceous?; branches elongated, glabrous, or the angles and petioles are ciliated; leaves petiolate, ovate, acute, crenately serrated, roundish or subcordate at the base, nearly glabrous: floral leaves ovate, acuminated, ciliated at length, deciduous; whorls about 10-flowered; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla pubescent outside, 2-3 times longer than the calyx: tube widened at top: lips nearly equal; style glabrous, exserted. ♃.? S. Native of Mexico, among bushes, at Papantla. Leaves downy on the nerves. Corolla scarlet. Allied to S. *lamiifólia*, like the preceding.

Ciliated Sage. Shrub.?

210 S e'legans (Vahl. enum. 1. p. 238.) stem herbaceous, erect, glabrous, or furnished with scattered hairs; leaves petiolate, ovate, acuminated, serrated, rounded or narrow at the base, rather hispid above, and glabrous beneath; floral leaves sessile, ovate, acuminated, deciduous; whorls remote, about 6-flowered; flowers on short pedicels; calyx campanulate, clothed with glandular villi, having the upper lip almost entire, or with 1-3 short awns, lower lip shortly bidentate, 2-awned; corolla pubescent outside, six times as long as the calyx: tube slender, incurved: lips equal, oblong; stamens a little exserted, bearded. ♃? S. Native of Mexico, near Tlalpuxahua and Guanaxuato. S. incarnàta, Cav. ann. sc. 2. p. 112. H. B. and Kunth, nov. gen. amer. 2. p. 293. t. 144. S. microcaúlis, Poir. dict. 6. p. 614. Branches purplish at the base. Leaves 1 to 1½ inch long. Corolla blood-red, more than an inch long. Tube toothless inside.

Elegant Sage. Pl. 4 feet.

211 S. me'ntiens (Pohl, pl. bras. 2. p. 137. t. 193.) herbaceous, erect; stem glabrous at the base, but furnished with spreading hairs at apex; leaves petiolate, ovate, acuminated, serrated, rounded at the base, green and glabrous on both surfaces; floral leaves small, deciduous; racemes simple, elongated; whorls remote, few-flowered; calyx tubularly campanulate, green at the base, villous, membranous, and coloured at top, having the upper lip entire, and the teeth of the lower lip ovate, subulately acuminated; corolla 4-5 times longer than the calyx: tube much exserted: lips short, nearly equal, broad; genitals inclosed; style glabrous. ♃? S. Native of Brazil, at Serra d'Estrella, and about Fazenda de Padre Correa, in the province of Rio Janeiro, and about the town of Rio Janeiro. Herb nearly simple. Calyx scarlet at top. Corolla scarlet, nearly glabrous, 18-22 lines long. Tube widened a little at top.

Disguising Sage. Pl. 1½ foot.

212 S. sple'ndens (Sello ex Rœm. et Schultes, syst. mant. 2. p. 185. Benth. lab. p. 287.) shrubby; branched; branches glabrous; leaves petiolate, ovate, acuminated, crenately serrated, cuneate, rounded or subcordate at the base, glabrous on both surfaces; floral leaves ovate, acuminated, coloured, deciduous; whorls 2-flowered; calyx campanulate, membranous, coloured, glabrous, or the nerves and pedicels are villous, having the upper lip entire, and the teeth of the lower lip broad, ovate, acute; corolla glabrous outside, about three times as long as the calyx: tube exserted, widened a little: lower lip short; stamens exserted; style glabrous. ♄. G. Native of Brazil, in woods at Guaxindiba, near Rio Janeiro. Ker. bot. reg. t. 687. Rchb. hort. bot. 1. t. 51. Colla in acad. taur. 31. p. 331. t. 17. S. colòrans, Hortul. S. Brasiliénsis, Spreng. syst. 2. p. 56.—An elegant species, very common in gardens, having the floral leaves, calyxes, and corollas scarlet. Corolla 2 to 2½ inches long. This species is a very great ornament in the autumn, if planted out in the open ground against a south wall.

Shining Sage. Fl. Sept. Nov. Clt. 1822. Shrub 3 to 4 feet.

213 S. involucra'ta (Cav. icon. 2. p. 114. t. 105.) stem

shrubby; branches elongated, glabrous; leaves petiolate, ovate, acuminated, crenately serrated in the middle, roundly serrated at the base, glabrous; floral leaves bractea-formed, sessile, broad-ovate, acuminated, coloured, imbricated before florescence, deciduous; whorls about 6-flowered, approximate; calyx tubularly campanulate, striated, having the upper lip entire, and the teeth of the lower lip short, ovate, setaceously acuminated; corolla 2-5 times as long as the calyx: tube ventricose, glabrous: lips short, nearly equal; style bearded. ♄. G Native near to the city of Mexico and Tlalpuxahua. Bot. reg. 1205. Hook, bot. mag. t. 2872. S. lævigàta, H. B. et Kunth, nov. gen. amer. 2. p. 295. t. 147. Corolla rose-coloured.

Involucrated-flowered Sage. Fl. July, Aug. Clt. 1825. Shrub 2-4 feet.

214 S. Sesse'i (Benth. lab. p. 288.) stem shrubby; branches nearly glabrous: leaves petiolate, ovate-oblong, acuminated, rounded, cuneated, or narrowed at the base, glabrous on both surfaces, or pubescent beneath; floral leaves smaller: uppermost ones minute, deciduous; whorls few-flowered, panicled; calyx inflately-campanulate, membranous, coloured, glabrous, having the upper lip entire, and the teeth of the lower lip ovate, rounded; corolla about three times as long as the calyx, pubescent outside; tube much exserted, nearly equal; style glabrous. ♄. G. Native of New Spain, on the western declivity of Cordillera de Guchillaque. Leaves 2-3 inches long, rather coriaceous. Panicles short, loose. Fructiferous calyx large, scarlet. Corolla nearly 2 inches long, scarlet. Upper lobe of style very long.

Sessé Sage. Shrub.

215 S. agglutina'ta (Lag. gen. et spec. nov. p. 2. no. 120.) leaves cordate-ovate-lanceolate, acute, serrated, white beneath; corolla pubescent, four times longer than the calyx, which is inflated; stem hairy, clammy. ♄. S. Native of New Spain. S. fruticòsa, Cervantes. Leaves clothed with clammy villi, particularly while young. Whorls about 6-flowered, bracteate. Bracteas ovate, acuminated, concave, deciduous, shorter than the calyxes. Corolla scarlet. Style bearded. This species agrees with *S. Sessèi* in the calyx; but the leaves are very distinct.

Clammy Sage. Shrub.

216 S. pube'scens (Benth. lab. p. 723.) stem shrubby; branches tomentosely pubescent; leaves petiolate, ovate, bluntish, rounded at the base, wrinkled, pubescent above, and clothed with hoary villi beneath; floral leaves smaller: upper ones minute, deciduous; whorls few-flowered, rather panicled; flowers nearly sessile; calyx inflately tubular, rather incurved, coloured at top, having the upper lip entire, and the teeth of the lower lip broad-ovate, obtuse; corolla twice as long as the calyx, pubescent outside: tube much exserted, nearly equal: lips nearly equal; style shortly bearded. ♄. S. Native of Mexico at San Dionicio, in Oaxaca. Allied to *S. Sessèi* and *S. Règla*.

Pubescent Sage. Shrub.

217 S. Re'gla (Cav. icon. 5. p. 33. t. 455.) stem shrubby; branches glabrous or pubescent under the axils; leaves petiolate, rounded, obtuse, sinuately crenated, broadly subcordate at the base, coriaceous, wrinkled, rather hispid above, nerved and pubescent beneath; floral leaves conforming to the others; whorls terminal, few-flowered; flowers nearly sessile; calyx tubular, coloured, having the upper lip entire, and the teeth of the lower lip broad-ovate, acutish; corolla twice as long as the calyx, pubescent outside: tube ventricose; style glabrous, exserted. ♄. S. Native of Mexico at Vilalpando and Regla. Branches purplish. Leaves $1\frac{1}{2}$ inch long, fuscescent beneath. Flowers, crowded in the number of 3 to 6, at the tops of the branches. Calyx pubescent. Corolla scarlet.

Regla Sage. Shrub 5 to 6 feet.

218 S. Graha'mii (Benth. in bot. reg. t. 1370.) stem shrubby; branches glabrous or bifariously pubescent; leaves petiolate, oval, obtuse, rounded or cuneated at the base, irregularly crenated in the middle, nearly glabrous; floral leaves ovate, acuminated, ciliated, deciduous; racemes elongated; whorls 2-flowered; calyx tubular, striated, pubescent on the nerves, having the upper lip entire, and the teeth of the lower lip acute; corolla twice as long as the calyx, glabrous outside: tube much exserted, ventricose: middle lobe of lower lip very broad, emarginate; style shortly bearded. ♄. S. Native of Mexico, in several places. Calyxes usually coloured. Flowers smaller than those of *S. microphýlla;* but the leaves are larger.

Graham's Sage. Shrub.

219 S. microphy'lla (H. B. et Kunth, nov. gen. amer. 2. p. 294.) stem shrubby; branches finely pubescent: leaves petiolate, ovate, obtuse, minute, regularly crenated, rounded at the base, wrinkled, pubescent; floral leaves ovate, acuminated, deciduous; racemes short; whorls 2-flowered; calyx tubular, striated, with pubescent nerves, having the upper lip entire, and the teeth of the lower lip acuminated; corolla twice as long as the calyx, glabrous outside: tube ventricose, exceeding the calyx: throat contracted: middle lobe of lower lip broad; style shortly bearded. ♄. G. Native of New Spain, near Santa Rosa, Moran, and Pachucan. Leaves 3-4 lines long. Corolla reddish, purple, or scarlet.

Small-leaved Sage. Shrub 1 foot.

220 S. subrotu'nda (St. Hil. mss. ex. Benth. lab. p. 290.) herbaceous, erect; branches glabrous; leaves petiolate, broad-ovate, roundish, bluntish, crenately serrated, rounded or truncate at the base, green and glabrous on both surfaces; racemes elongated, simple; whorls loose, 2-6-flowered; flowers pedicellate; calyx tubularly campanulate, pubescent, coloured at top; corolla more than twice as long as the calyx: tube exserted, widened: middle segment of lower lip very broad; genitals exserted; style glabrous. ♃. ? S. Native of Brazil. Nearly allied to *S. coccínea*.

Roundish-leaved Sage. Pl. 1 to 2 feet?

221 S. coccínea (Lin. mant. p. 88.) stem herbaceous, erect, clothed with hoary pubescence; leaves petiolate, ovate, acute, crenated, cordate at the base, pubescent above, and clothed with hoary tomentum beneath; floral leaves ovate, acuminated, deciduous; racemes simple; whorls 6-10-flowered, remote; calyx tubularly campanulate, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla glabrous, twice as long as the calyx: tube exserted, widened at top: upper lip short: middle segment of the lower lip broad, emarginate. ♃. S. Native of Florida, Georgia, Mexico, Cuba, Jamaica, Brazil, in the province of Goyaz; East Indies, on the banks of the Ganges, and about Madras, but probably escaped from gardens. Murr. comm. gœtt. 1778. p. 86. t. 1. S. ròsea, Vahl. enum. 1. p. 244. S. glaucéscens, Pohl. pl. bras. 2. p. 136. t. 192. Hormìnum coccíneum, Mœnch. Stem branched, hoary, sometimes hispid at the base from pili. Leaves 1-2 inches long, very soft beneath: floral ones shorter than the calyxes. Calyx often purplish. Corolla scarlet.

Scarlet-flowered Sage. Fl. April, Oct. Clt. 1772. Pl. 1 to 3 feet.

222 S. pseu'do-cocci'nea (Jacq. coll. 2. p. 302. icon. rar. p. 22. t. 209.) stem herbaceous, erect, hispid from long spreading hairs; leaves petiolate, ovate, acute, crenated, rounded or subcuneated at the base, pubescent above, and clothed with hoary tomentose pubescence beneath; floral leaves ovate, acuminated, deciduous; racemes simple; whorls 6-10-flowered, remote; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower lip acute; corolla pubescent outside, twice as long as the calyx: tube exserted, equal: middle lobe of lower lip very broad, emarginate; style exserted, glabrous. ♃. S. Native of tropical America in New Andalusia, on the

declivity of Mount Tumiriquiri; also of Caraccas, and Trinidad. Bot. mag. 2864. This species differs from *S. coccínea*, in being taller, beset with long hairs, not with hoary tomentum; and in the leaves being rounded at the base, not cordate, &c. Corollas scarlet.

False-scarlet Sage. Fl. June, Aug. Clt. 1797. Pl. 2 to 3 feet.

223 S. phœnícea (H. B. et Kunth, nov. gen. amer. 291.) stems shrubby, erect, and are, as well as the branches, muricately hispid; leaves ovate, acute, subcordate, serrated, glabrous; racemes terminal; whorls many-flowered, distant; calyx tubular, hispidly glandular, having the upper lip entire and acute, and the segments of the lower lip acuminated; corolla downy outside, twice as long as the calyx: middle segment of lower lip large, emarginately 2-lobed; stamens much exserted. ♄. S. Native of Quito, at the roots of the mountains of Colopaxi and El Corazon, between Mulalo and Tambillo. Leaves pilose on the middle nerve, above $1\frac{1}{2}$ inch long, strong-scented. Peduncles purplish, glandularly pilose, as well as the floral leaves. Corolla blood-coloured. A plant intermediate between *S. pseùdo-coccínea* and *S. pulchélla*. Leaves quite glabrous. Allied to *S. glumàcea*, yet the flowers are very different.

Crimson-flowered Sage. Shrub 3 to 4 feet.

224 S. linea'ta (Benth. lab. p. 724.) branches bifariously pubescent; leaves petiolate, ovate, obtuse, crenated, truncate at the base, green on both surfaces, and clothed with fine pubescence; floral leaves broad-ovate, deciduous; racemes simple; whorls 4-6-flowered; calyx tubularly-campanulate, green, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, scarcely acuminated; corolla twice as long as the calyx: tube exserted, ventricose: throat contracted: upper lip villous; stamens enclosed; style plumose. ♄.? S. Native of Mexico, Karwinski. Leaves almost like those of *S. Grahàmi*. Corollas form of those of *S. fúlgens*, but smaller. Floral leaves imbricate before florescence, pubescent, ciliated. Leaves crenated.

Lined-leaved Sage. Shrub.

225 S. pulche'lla (D. C. cat. hort. monsp. p. 142. Benth. lab. p. 291.) stem shrubby; branches pubescent; leaves petiolate, ovate, narrowed at apex, bluntish, crenated, broad and cordate at the base, membranous, wrinkled a little, nearly glabrous; floral leaves membranaceous, acuminated, deciduous; racemes simple; whorls about 10-flowered; calyx tubular, striated, finely-pubescent, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice or thrice as long as the calyx, glabrous outside: tube much exserted, bidentate inside at the base: middle segment of the lower lip broad-roundish, shortly-emarginate; style shortly-bearded above. ♄. G. Native of Mexico. S. dolióstachys *Lag.* Colla, hort. rip. p. 125. t. 16. Allied to *S. fúlgens*, but differs in the thinner nearly glabrous leaves, and more glabrous stem, and shorter glabrous corollas, &c. Corollas scarlet.

Pretty Sage. Fl. Oct. Feb. Clt. 1821. Shrub 2 feet.

226 S. fu'lgens (Cav. icon. 1. p. 15. t. 23.) stem shrubby; branches pilosely-hairy; leaves petiolate, ovate, acute, crenately-serrated, cordate at the base, pubescent above, clothed with white tomentum or wool beneath; floral leaves sessile, ovate, acuminated, deciduous; whorls 6-flowered; calyxes longer than their pedicels, tubularly-campanulate, pubescent, having the upper lip entire, and the teeth of the lower lip ovate, shortly and bluntly-acuminated; corolla twice as long as the calyx: tube exserted, ventricose, bidentate inside at the base: throat contracted: upper lip villous outside; stamens enclosed; style plumose, hardly exserted. ♄. G. Native of Mexico, on the mountains. Sweet, fl. gard. n. s. 1. t. 59. Bot. reg. t. 1356. S. cardinàlis. H. B. et Kunth, nov. gen. amer. 2. p. 301. t. 151. S. spléndens Nova, Loud. gard. mag. 5. p. 577. f. 116. Leaves variable in hairiness, and size from 1 to 3 inches long: floral leaves usually coloured, deciduous. Corollas showy, scarlet, 2 inches long: upper lip a little longer than the lower one.

Fulgent Sage. Fl. May, Oct. Clt. 1829. Shrub 2 to 5 feet.

227 S. Ayavace'nsis (H. B. et Kunth, nov. gen. amer. 2. p. 298.) stem shrubby, erect, and is, as well as the branches, beset with yellow hairs; leaves petiolate, ovate, acute, cordate, crenated, pilose beneath; spikes terminal, sessile; whorls 6-8 flowered, distant; calyx tubular, striated, glandularly pilose, having the upper lip, and the teeth of the lower lip, subulately acuminated. ♄. S. Native of Peru, in temperate places between Ayavaca and the river Cutaco. Leaves 2 to $2\frac{1}{2}$ inches long. Rachis and pedicels hairy. Corolla purple, ex Bonpl. Allied to *S. rubéscens* and *S. squàlens*, but differs in the corolla being blue.

Ayavaca Sage. Shrub 4 to 6 feet.

228 S. acumina'ta (Ruiz, et Pav. fl. per. 1. p. 24. t. 37. f. b.) stem suffruticose, erect, villous; leaves petiolate, ovate, acuminated, crenately-serrated, cordate at the base, wrinkled, rather hispid above, and of the same colour beneath, pubescent on the nerves: floral leaves about equal in length to the calyxes, ovate-oblong, obtuse, membranous, ciliated, deciduous; racemes almost simple; whorls about 6-flowered, remote; flowers pedicellate; calyx tubular, striated, pubescent, having the upper lip entire, and the teeth of the lower one lanceolate and a little incurved; corolla twice as long as the calyx: tube exserted, a little incurved: lips nearly equal. ♄. S. Native of Peru, in Pillao and Canta. Floral leaves glumaceous, flesh coloured. Calyx almost an inch long. Corolla flesh coloured.

Acuminated-leaved Sage. Shrub 5 to 6 feet.

229. S. longiflo'ra (Ruiz, et Pav. fl. per. 1. p. 23. t. 10. f. a.) stem shrubby, erect, villous, clammy; leaves petiolate, ovate, acuminated, serrated, cordate at the base, pubescently-hairy, clothed with white tomentum beneath; floral leaves ovate, acute, coloured, deciduous; raceme simple; whorls few-flowered, distant; calyx ovate, inflated, coloured, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla very long, five times longer than the calyx, hairy outside: tube ample, much exserted: lips nearly equal; style glabrous. ♄. S. Native of Peru in Tarma at Huichay. Shrub much branched. Leaves ample. Racemes elongated, nutant. Corolla 5 inches long, showy, colour of wool.

Long-flowered Sage. Shrub 10 to 15 feet.

* * * * Cæru'leæ. *Corollas blue, or bluish-violet.*

230 S. rumicifòlia (H. B. et Kunth, nov. gen. amer. 2. p. 305.) stem shrubby, erect, and is, as well as the branches, pubescently-hairy; leaves petiolate, oblong, hastate, bluntish, crenated, clothed with hoary tomentose wool beneath; panicles terminal; whorls 2-flowered, remote; calyx clothed with glandular hairs, campanulate, striated, having the upper lip entire and acute, and the teeth of the lower lip acutish. ♄. S. Native near the city of Quito, at the foot of Mount Javirac. Leaves wrinkled and pilose above, 4 inches long and $2\frac{1}{2}$ broad. Peduncles, and branches of panicle beset with glandular hairs. Corolla unknown. A beautiful species, intermediate between sections *Brachyánthæ* and *Longiflòræ*.

Dock-leaved Sage. Shrub 4 to 5 feet.

231 S. petiola'ris (H. B. et Kunth, nov. gen. amer. 2. p. 304.) stems herbaceous, erect, branched, pubescent; leaves on very long petioles, deltoid, cordately-hastate, bluntish, irregularly crenate-serrated, hairy; spikes terminal, on long peduncles, usually by threes; whorls 2-flowered, distant; calyx clothed with glandular hairs, campanulate, having the upper lip tridentate, and the lower one bifid, with acuminated segments.

♃. S. Native of tropical America, on the banks of the river Magdalena. Leaves 3 inches long. Corolla blue, pubescent.

Petiolate-leaved Sage. Pl. 1½ foot.

232 S. sagitta'ta (Ruiz, et Pav. fl. per. 1. p. 23. t. 35. f. a.) stem herbaceous, erect, villous; leaves petiolate, triangularly sagittate, acute, crenately serrated, much wrinkled, clothed with soft villi; floral leaves ovate, acuminated, deciduous; racemes elongated, branched; whorls remote, 2-6-flowered; flowers pedicellate; calyx ovate, villous, having the upper lip broad-ovate, obtuse, or tridentate, and the teeth of the lower lip acutish; corolla 4 times longer than the calyx: tube exserted, rather inflated beneath: middle lobe of lower lip emarginate; style glabrous. ♃. S. Native of Peru, plentiful in gardens, and in waste places of Tarma and Huanuco, and at Obrajillo; and of New Granada, on Mount Quindiu. Stem much branched at bottom. Branches villous, and glandularly pubescent. Leaves 2-3 inches long. Calyx purplish-violet. Corolla pale blue, downy outside. The vernacular name of this species in Peru is *Salvia Real*, where the plant is used as a substitute for common sage.

Sagittate-leaved Sage. Pl. 4 to 6 feet.

233 S. vitifòlia (Benth. lab. p. 724.) stem herbaceous, erect, villous; leaves petiolate, broadly deltoid, angularly lobed, truncate at the base, or broadly and sagittately cordate, thick, villously hairy, and green on both surfaces, or rufescent beneath; floral leaves ovate-lanceolate, acuminated, deciduous; racemes elongated, branched; whorls remote, 2-6-flowered; flowers pedicellate; calyx ovate-campanulate, villous, having the upper lip somewhat tridentate, and the teeth of the lower lip acuminated; corolla 3-4 times longer than the calyx: tube a little exserted, ventricose: limb gaping: upper lip falcate; style glabrous. ♃. S. Native of Mexico, on Mount San Felipe, near Oaxaca. Habit of *S. petiolàris*, *S. sagittàta*, and *S. macrophýlla*, but differs in the form of the leaves. Corollas blue, almost like those of *S. petiolàris*.

Vine-leaved Sage. Pl.?

234 S. macrophy'lla (Benth. lab. p. 725.) stem herbaceous, erect, pilosely hispid; leaves on long petioles, ample, ovate, cordate: upper ones hastate, a little wrinkled, green on both surfaces, hispid; floral leaves ovate, deciduous; racemes elongated, branched, clammy; whorls remote, 2-6-flowered; flowers pedicellate; calyx campanulate, at length elongated, villous, having the upper lip very shortly tridentate, and the lower one bifid: the teeth all ovate, acute; corolla about 4 times as long as the calyx: tube exserted, widened: lips nearly equal; style glabrous. ♃. S. Native of Peru, in the valley of Huanuco. Allied to *S. sagittàta*; but differs in the taller stature, in the larger broader leaves, with the auricles rounded at the base.

Long-leaved Sage. Pl. 5 to 6 feet.

235 S. scutellarioi'des (H. B. et Kunth, nov. gen. amer. 2. p. 303. t. 158.) plant herbaceous; branches pilosely pubescent, or nearly glabrous; leaves petiolate, ovate, deltoid, acutish, crenately-serrated, cordately hastate at the base, hairy on both surfaces; floral leaves ovate, deciduous; racemes nearly simple, elongated; whorls distant, generally 2-flowered; calyx campanulate, clothed with clammy villi, having the upper lip shortly tridentate, and the lower lip bifid: teeth all acute; corolla 3 times longer than the calyx: tube much exserted, ventricose: middle segment of the lower lip emarginate; genitals much exserted. ♃. S. Native of tropical America, as of the province of Quito, near Chillo; and in humid sandy places near Santa Fe de Bogota. Stems procumbent at the base. Branches a foot long, nearly naked in the upper part. Leaves 1½ inch long, and nearly the same in breadth. Corolla an inch long, blue, pubescent outside. Form of calyx and lower lip of corolla almost as in section *Brachyánthæ*.

Skullcap-like Sage. Pl. 1 foot.

236 S. pa'tens (Cav. icon. 5. p. 33. t. 454.) stem herbaceous, erect, pilose; leaves petiolate, ovate-deltoid, crenated, hastate at the base, or the upper ones are rounded, hispid on both surfaces; floral leaves lanceolate-linear; whorls few, remote; flowers large; calyx campanulate, villous, having the upper lip very shortly tricuspidate, and the lower lip bifid: teeth acuminated; corolla about 3 times as long as the calyx: throat widened; stamens much exserted; style very long, glabrous. ♃.? G. Native of Mexico, near Tlalpuxahua, Guanaxuato, and Santa Rosa, and near Real del Monte. S. grandiflòra, Nee, ex Cav. S. spectàbilis, H. B. et Kunth, nov. gen. amer. 2. p. 304. Stems nearly simple. Lower leaves petiolate: upper ones nearly sessile, paler beneath: floral leaves quite entire, clothed with glandular villi. Corolla blue, more than 2 inches long, pubescent outside; middle lobe of lower lip very broad, emarginate.

Spreading Sage. Pl. 1 to 2 feet.

237 S. longi'styla (Benth. lab. p. 295.) stem herbaceous? erect, clothed with tomentose villi; leaves petiolate, broad, ovate, acuminated, crenated, amply cordate at the base, wrinkled, clothed with soft pubescent villi on both surfaces: superior ones sessile; floral leaves ovate, long-acuminated, ciliated, deciduous: uppermost ones rather comose; whorls 6-10-flowered; calyx elongated, tubular, striated at the base, clothed with soft pubescence, having the upper lip entire, and the teeth of the lower lip very short, and setaceously acuminated; corolla hardly twice as long as the calyx: tube equal: middle lobe of lower lip bifid; genitals exserted; style glabrous, the upper lobe very long and subulate. ♃.? G. Native of Mexico, near Zinepecuaro, Graham. Corolla blue, a little incurved.

Long-styled Sage. Pl.?

238 S. amethy'stina (Smith, icon. ined. 2. p. 27. t. 27.) shrubby; branches clothed with white villi; leaves petiolate, ovate, acute, deeply cordate at the base, with rounded auricles, wrinkled, pubescent above, but clothed with hoary or white tomentum beneath; floral leaves lanceolate, deciduous; racemes elongated, simple; whorls loose, 6-flowered, remote; calyx tubularly campanulate, villous outside, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about twice as long as the calyx: tube exserted, ventricose: lips nearly equal: middle lobe of lower lip almost entire; genitals inclosed; style bearded. ♄. S. Native of tropical America, on the Andes of Quindiu, &c. Leaves 2 to 3½ inches long, serrated. Corollas form of those of *S. fúlgens*, or *S. Mexicàna*, but blue, and 1 inch long. Leaves similar to those of *S. fúlgens*.

Amethyst-flowered Sage. Fl. Aug. Sept. Clt. 1817. Shrub 2 to 4 feet.

239 S. Karwi'nskii (Benth. lab. p. 725.) stem shrubby?; branches clothed with rufous wool; leaves petiolate, ovate, acuminated, crenated, rounded at the base, rather wrinkled above, and roughish, and clothed with rufous wool beneath; floral leaves deciduous; whorls many-flowered; calyx ample, tubular, clothed with glandular villi, having the upper lip entire, and the teeth of the lower lip very short, long-acuminated; corolla twice as long as the calyx; genitals equalling the corolla; style glabrous. ♄.? G. Native of Mexico, Karwinski. Allied to *S. longistyla* and *S. amethýstina*. Habit of *S. Hæ'nkei*, but the corolla is blue.

Karwinski's Sage. Shrub.

240 S. cya'nea (Benth. lab. p. 296. but not of Fisch.) stem shrubby; branches clothed with hoary pubescence; leaves petiolate, ovate, acuminated, serrately crenated, cordate at the base, pubescent on both surfaces; floral leaves ovate, acuminated, membranous, deciduous; racemes simple; whorls loosely

6-10-flowered, rather secund; calyx tubular, clothed with rufous villi: upper lip very short, tricuspidate, and the teeth of the lower lip lanceolate-acute; corolla about 3 times as long as the calyx: tube exserted, ventricose above: lips nearly equal; style bearded. ♄. G. Native of New Spain, Moçino et Sessé. Allied to *S. amethýstina;* but differs in the more acuminated leaves, and particularly in the slenderer calyxes being clothed with rufous villi, and in the tricuspidate upper lip.

Azure-flowered Sage. Shrub.

241 S. Mexica'na (Lin. spec. p. 37.) stem shrubby, erect, tomentose; leaves petiolate, ovate or oblong, narrowed at both ends, crenately serrated, pubescently tomentose; floral leaves ovate, acute, deciduous, scarcely longer than the pedicels; whorls 6-20-flowered; calyx tubular, with ciliated nerves, having the upper lip entire, and the teeth of the lower lip ovate, acute, and mutic; corolla twice as long as the calyx: tube inflated at the middle, contracted under the throat: lips nearly equal: upper lip pubescent: middle lobe of lower lip smaller than the lateral ones, roundish, emarginate; style bearded, with subulate unequal lobes. ♄. S. Native of Mexico, near Pazcuaro, and near the city of Mexico. Cav. icon. 1. p. 16. t. 26. S. melissæfòlia, Desf. cat. hort. par. Sclàrea Mexicàna, Dill. hort. elth. 339. t. 254. f. 330. Mill. dict. no. 14. Júngia altíssima, Mœnch. meth. Leaves 2-3 inches long. Corolla blue; tube oblong, bidentate inside.

Var. β, màjor (Benth. lab. p. 297.) younger leaves more densely and velvety tomentose. ♄. S. S. papilionàcea, Cav. icon. 4. p. 9. t. 319. S. nitidifòlia, Ortega, dec. p. 9. This is a large handsome plant. The wings of the corolla figured by Cavanilles, must be the side lobes of the lower lip split up by accident, ex Benth.

Mexican Sage. Fl. May, July. Clt. 1724. Shrub 4 to 6 feet.

242 S. glabra'ta (H. B. et Kunth, nov. gen. amer. 2. p. 299.) shrubby? glabrous; leaves petiolate, ovate, acuminated, serrately crenated, cordate at the base, green on both surfaces, glabrous; floral leaves small, deciduous; racemes elongated, simple; whorls loose, 6-10-flowered; flowers on long pedicels; calyx tubularly campanulate, nearly glabrous, having the upper lip entire, and the teeth of the lower lip subulately acuminated; corolla more than twice as long as the calyx: tube much exserted, ventricose: lips rather short: upper lip villous: middle lobe of lower lip very broad; style bearded. ♄. S. Native of Mexico, Karwinski; and of New Spain, at the monastery of Caripe, and the village of Coccollar. Larger leaves 2-4 inches long. Corolla violaceous, an inch long. Stamens inclosed. Style a little exserted.

Glabrous Sage. Shrub.

243 S. cóncolor (Lamb. herb. ex Benth. lab. p. 297.) stem shrubby?; branches glabrous; leaves petiolate, ovate, acuminated, serrated, truncate at the base, glabrous; floral leaves deciduous; racemes elongated, simple; whorls remote, many-flowered; flowers on long pedicels; calyx tubular, striated, villous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla twice as long as the calyx, pubescent outside: tube slender, exserted, ventricose at top: lips nearly equal; style glabrous. ♄. S. Native of Mexico. This differs from *S. amethýstina*, in the leaves being glabrous, truncate at the base, not cordate; in the long pedicels. Calyx bluish, villous; hairs usually glanduliferous. Corolla blue. Leaves same colour on both surfaces, sometimes pubescent in the young state.

Self-coloured-leaved Sage. Shrub. ?

244 S. cæru'lea (Benth. lab. p. 298.) stem herbaceous? erect; branches glabrous, or spreadingly pilose; leaves petiolate, ovate, long-acuminated, truncate, rounded or subcordate at the base, glabrous; floral leaves deciduous; whorls 2-6-flowered, somewhat secund; calyx tubular, having the upper lip entire, and the teeth of the lower lip very short and bluntish; corolla about 3 times as long as the calyx: tube exserted, widened at top: lips nearly equal: upper lip pubescent outside; connective minutely toothed behind; style glabrous. ♃.? G. Native of the south of Brazil, Sello. Upper part of branches generally hispid from glanduliferous hairs. Leaves usually hispid from a few scattered hairs above, 4 inches long. Flowers on short pedicels. Calyxes green or bluish, pubescent. Corolla blue, $1\frac{1}{2}$ to 4 inches long. Stamens equalling the lower lip.

Blue-flowered Sage. Pl. ?

245 S. tubiflòra (Cav. icon. 1. p. 16. t. 25.) stem herbaceous, nearly glabrous; leaves petiolate, broad-ovate, serrately-crenated, roundedly truncate or subcuneated at the base, nearly glabrous above, or clothed with hoary pubescence beneath; floral leaves deciduous; racemes simple; whorls about 6-flowered, secund; flowers nearly sessile; calyx tubular, striated, nearly glabrous, having the upper lip entire, and the teeth of the lower lip ovate, acuminated; corolla 3-4 times as long as the calyx, glabrous outside, or pubescent: tube exserted, equal, a little incurved: lips short; style bearded. ♃.? S. Native of Mexico, Moçino et Sessé. S. longiflòra, Willd. spec. 1. p. 141. Stems purplish, glabrous or pubescent on the angles. Corolla violaceous, 12-15 lines long. Stamens a little exserted.

Tube-flowered Sage. Fl. June, July. Clt. 1820. Pl. 2 to 3 feet.

246 S. Guarani'tica (St. Hil. mss. ex Benth. lab. p. 298.) shrubby; branches beset with spreading hairs; leaves petiolate, ovate, acute, serrated, truncately cordate at the base, much wrinkled, hispid, clothed with rather hoary tomentum beneath; racemes numerous, simple, secund; whorls few-flowered, loose, approximate; calyx tubular, nearly glabrous, having the upper lip entire, and the teeth of the lower lip ovate, acute; corolla about 3 times as long as the calyx: tube much exserted: lips elongated, equal; stamens shorter than the corolla; style bearded beneath. ♄. S. Native of Brazil, among bushes near Santa Anjo, in the Missions of the Uruguay, St. Hilaire. This is a showy species. Leaves 1 to $1\frac{1}{2}$ inch long. Corolla 15-16 lines long, deep blue. Calyx usually glabrous, sometimes hispid from glanduliferous hairs.

Guaranitic Sage. Shrub.

247 S. lamiifòlia (Jacq. schœnbr. 3. p. 37. t. 318.) stem shrubby, erect, nearly glabrous; leaves petiolate, ovate, acuminated, serrately crenated, rounded or cuneated at the base, glabrous; floral leaves membranous, ovate-lanceolate, deciduous; racemes elongated; whorls 6-10-flowered; flowers almost sessile; calyx tubular, having the upper lip entire, and the teeth of the lower lip acute; corolla scarcely twice as long as the calyx: tube nearly equal: upper lip villous outside; stamens equalling the corolla in length; style bearded. ♄. S. Native of the Islands of St. Vincent and Trinidad. S. Boosiàna, Jacq. fil. ecl. 1. p. 69. t. 47. S. Boòsii, Tratt. obs. bot. fasc. 2. p. 59. t. 92. S. hyemàlis, Boose, ex Jacq. fil. l. c. S. cyánea, Fisch, cat. hort. gorenki. p. 21. S. thymiflòra, Willd. enum. suppl. p. 2. S. amœ'na, Sims, bot. mag. t. 1294. Andr. bot. rep. 6. t. 446. S. violàcea, Donn, hort. cantabr. ed. 4. S. latifòlia, Anders. in trans. soc. arts et man. vol. 25. p. 210. S. azùrea, and S. cærùlea, Hortul. Branches often pubescent while young. Leaves 3-4 inches long. Corolla blue.

Dead-nettle-leaved Sage. Fl. March, April. Clt. 1821. Shrub 2 to 4 feet.

248 S. affi'nis (Cham. et Schlecht, in Linnæa, 5. p. 99.) stem shrubby; branches glabrous; leaves petiolate, ovate, acuminated, serrately crenated, rounded at the base, glabrous or

finely pubescent; floral leaves ovate, membranaceous, deciduous; racemes elongated, nearly simple, many-flowered; whorls somewhat approximate, 6-10-flowered, secund; flowers pedicellate; calyx tubular, pubescent, having the upper lip entire, and the teeth of the lower lip subulately acuminated; corolla about 3 times as long as the calyx: tube exserted, equal, slender: lips nearly equal; genitals exserted; style glabrous. ♄. S. Native of Mexico, near Jalapa, Schiede et Deppe; and of the Cordillera de Guchilapa, Berlandier. Corollas pale violet.

Allied Sage. Shrub.

249 S. purpu'rea (Cav. icon. 2. p. 52. t. 166.) stem herbaceous, erect, nearly glabrous; leaves petiolate, ovate, acuminated, serrated, rounded or cordate at the base, glabrous or clothed with fine hoary pubescence; floral leaves small, ovate, acuminated, deciduous; racemes dense, branched; whorls many-flowered, approximate, secund; calyx tubular, clothed with white or purple wool, having the upper lip entire, and the teeth of the lower lip subulately mucronate; corolla about 3 times as long as the calyx: tube exserted, incurved: upper lip pubescent; style bearded on all sides. ♃. S. Native of Mexico. Jacq. schœnbr. 3. p. 2. t. 253. Habit of *S. polystàchya;* but differs in the stem being more glabrous; in the flowers being secund, densely woolly: and in the corolla being twice as long, tubular, and of a reddish purple colour.

Purple-flowered Sage. Fl. May, July. Clt. 1825. Pl. 2 to 3 feet.

† *Species doubtful whether belonging to the present section.*

250 S. cupheæfòlia (H. B. et Kunth. nov. gen. amer. 2. p. 288.) stem herbaceous, bifariously pilose; leaves petiolate, ovate-elliptic, bluntish, acute at the base, crenated, glabrous, with hairy margins; whorls 2-flowered, very remote; calyxes glabrous, ciliated, tubular, striated, having the upper lip ovate, entire, acute, and the teeth of the lower lip acute. ♃. S. Native of Peru, in woods. Stem branched. Leaves 6-9 lines long. Pedicels hairy. Bracteas ovate-lanceolate, acuminated, glabrous, with ciliated margins, deciduous. This species ought probably to be placed in section *Longiflòræ Aurantìacæ.*

Cuphea-leaved Sage. Pl. 1½ foot.

251 S. ru'fula (H. B. et Kunth, l. c. p. 291.) stem suffruticose, erect, clothed with rufous tomentum; leaves ovate, acuminated, narrowed at the base, petiolate, serrated, clothed with rufous pubescence beneath; whorls about 6-flowered, distant; calyx rather pilose, having the upper lip entire and acute, and the lower one bifid; genitals inclosed. ♄. S. Native of New Granada, on the Andes of Quindiu, near Los Gallegos. Leaves rather hairy above, 2-3 inches long. Bracteas ovate, acuminately subulate, pubescent, ciliated. Corolla purple: upper lip pubescent.

Rufous Sage. Shrub 2 to 3 feet.

252 S. Tolime'nsis (H. B. et Kunth, l. c. p. 292.) stem shrubby, erect, clothed with rufous pubescence; leaves ovate-lanceolate, acute at both ends, petiolate, densely pubescent beneath; whorls about 6-flowered, distant; calyx hairy, having the upper lip ovate, entire, acute, and the lower lip bifid; stamens inclosed. ♄. S. Native on Mount Quindiu, between Ibague and Tolima. Leaves nearly glabrous above, but beset with short scattered hairs beneath, 2-3 inches long. Bracteas ovate, acute, serrulated, pubescent beneath. Upper lip of corolla pubescent outside.

Tolima Sage. Shrub 3 to 4 feet.

253 S. di'scolor (H. B. et Kunth, l. c. p. 146.) stem shrubby, erect, clothed with hoary tomentum; young branches clammy; leaves petiolate, ovate-lanceolate, acutish, rounded at the base, quite entire, glabrous above, and clothed with white tomentum beneath; whorls about 8-flowered, distant; bracteas caducous; calyx clothed with white tomentum, campanulate, striated, having the upper lip ovate, acute, and the teeth of the lower lip short, acute; corolla twice as long as the calyx: middle segment of the lower lip 2-lobed; stamens inclosed. ♄. S. Native of the Andes of Peru, in shady places along the valley of the river Guamcabamba. Leaves 2 inches long. Corolla violaceous. This is a very distinct species, and ought probably to be placed in section *Longiflòræ Cærùleæ.*

Two-coloured-leaved Sage. Shrub 2 to 3 feet.

254 S. acutifòlia (Ruiz, et Pav. fl. per. 1. p. 24. t. 38. f. b.) shrubby, branched; branches tomentose; leaves petiolate, cordate, acute, bluntly and unequally serrated, wrinkled above, and tomentose, and very veiny beneath; whorls 6-12-flowered, approximate; flowers on short pedicels, secund; bracteas ovate-lanceolate, acute, keeled, deciduous, tomentose; calyx tomentose, having the upper lip entire, and the lower one bifid; corolla twice as long as the calyx; stamens length of corolla; stigma villous, exserted. ♄. S. Native of Peru, plentiful in meadows and humid places in Cheuchin, where it is called *Succhonca* by the natives.

Acute-leaved Sage. Shrub 4 to 5 feet.

255 S. pauciflòra (H. B. et Kunth, nov. gen. amer. 2. p. 303.) stems shrubby, erect, and are, as well as the branches, hairy; leaves petiolate, ovate, obtuse, cordate, crenated, clothed with fine white tomentum beneath; whorls 2-flowered, distant; calyx pubescent, tubular, striated, having the upper lip acute, and the segments of the lower lip acuminated; genitals exserted. ♄. S. Native of New Spain, in hot places. Branches purplish. Leaves pubescent above, 1 inch long. Bracteas oblong, shorter than the calyxes, deciduous. Corolla purple, with a hairy upper lip.

Few-flowered Sage. Shrub 1 to 2 feet.

Sect. IX. Echino'sphace (from *εχινος, echinos,* a hedge-hog; and *σφακος, sphakos,* sage; so called in reference to the spiny floral leaves and bracteas.) Benth. lab. p. 302. Floral leaves and bracteas imbricate, spinose. Calyx ovate: upper lip tridentate: lower lip shorter, bifid: teeth all spinose. Tube of corolla furnished with a ring of hairs inside; upper lip straight, emarginately bifid: lateral lobes of lower lip small, and the middle lobe large, and lacerately fringed. Connective fixed by the middle, remote, stretched out behind, and bearing a polliniferous cell, nearly similar to the other.—A Californian herb. Flowers heaped in many-flowered dense whorls, propped by bracteas.

256 S. cardua'cea (Benth. lab. p. 302.) stem herbaceous, erect, almost simple, clothed with white wool; leaves petiolate, oblong, pinnatifid, clothed with loose wool beneath: lobes ovate, sinuately toothed: teeth spinosely acuminated; whorls remote, densely many-flowered; calyx inflated, woolly; tube of corolla almost inclosed; connective free behind, and bearing an almost empty cell. ♃.? H. Native of California, Douglas. Habit of *Morìna Pérsica*, or a species of *Cárduus.*

Thistle-like Sage. Pl. 1 to 2 feet.

Sect. X. Pychno'sphace (so called from *πυχνος, pychnos,* dense; and *σφακος, sphakos,* sage; in reference to the dense whorls of flowers.) Benth. lab. p. 302. Floral leaves and bracteas imbricate, mutic. Calyx ovate; upper lip tridentate; lower lip bifid: teeth all subulate. Tube of corolla furnished with a ring of hairs inside; upper lip straight: middle lobe of the lower lip entire or emarginate. Connective fixed by the middle, remote, and extended behind, bearing a

polliniferous, almost conform cell.—A Californian herb. Whorls densely many-flowered.

257 S. columba'ria (Benth. lab. p. 302.) herbaceous, erect, a little branched; leaves deeply pinnatifid, wrinkled, almost glabrous: lobes oblong-linear, obtuse, erosely toothed or cut: terminal lobe hardly broader than the rest; floral leaves bractea-formed; whorls solitary or twin, hemispherical, densely many-flowered; bracteas broad, ovate, acuminated, membranous; calyx pubescent: upper lip elongated, concave; tube of corolla inclosed: middle lobe of lower lip crenulated; connective bearing an empty cell behind. ♃.? H. Native of California, Douglas. Habit of *Scabiòsa columbària*. Stems pubescent. Corollas a little longer than the calyxes, bluish, size of those of *S. Nilótica*.

Pigeon Sage. Pl. ½ to 1 foot.

† *A species doubtful whether belonging to sect.* X.

258 S. Leònia (Benth. lab. p. 303.) herbaceous, pubescent, branched; leaves cordate, crenated, wrinkled, petiolate; whorls 5-6-flowered, propped by sessile, ovate, acuminated bracteas; flowers pedicellate; calyx with a truncate tridentate upper lip, and a bidentate lower lip; upper lip of corolla keeled, erect, shorter than the lower lip: middle lobe of lower lip larger, emarginate; stigma trifid? the lower segments the longest; stamens 2-forked at top, with an anther on each division. ♃. G. Native of Mexico, at Chignagua, in Santa Rosa. Leònia salvifòlia, Llave ex Lexarza, nov. pl. mex. fasc. 2. p. 6.

Leon Sage. Pl. 1 foot.

Sect. XI. Hetero'sphace (from ἕτερος, *heteros*, variable; and σφακος, *sphakos*, sage.) Benth. in Hook. bot. misc. vol. 3. lab. p. 303. Floral leaves deciduous. Calyx tubular: upper lip truncate, tridentate. Tube of corolla furnished with a pilose ring inside: upper lip short, straight; lateral lobes of the lower lip small, spreading a little. Connective fixed by the middle, remote, and extended behind, bearing a polliniferous, almost conform cell.—Herbs, natives of the Mediterranean, Africa, Asia, and North America. Flowers racemose; whorls loose, few-flowered. Calyxes often coloured.

259 S. Nilótica (Vahl, enum. 1. p. 258.) stem herbaceous, erect, villous; lower leaves petiolate, ovate, crenated, erose or lyrate, rather narrowed at the base: upper ones broad, heart-shaped, nearly sessile, all green on both surfaces, and villous; floral leaves ovate-lanceolate, very acute, rather shorter than the calyxes; racemes short, branched; whorls 6-10-flowered, distinct; calyx ovate-campanulate, pubescent: teeth of lower lip lanceolate, very acute; corolla half as long again as the calyx: tube nearly equal, naked inside: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃. H. Native of Egypt. Murr. comm. gœtt. 1778. p. 98. t. 2. Jacq. hort. vind. 3. p. 48. t. 92. S. intermèdia, Schultes, obs. bot. 9. S. napæfòlia, of many authors, but not of Jacq. S. Abyssínica, Jacq. icon. rar. 1. p. 2. t. 6, but not of Lin., but probably of Lin. fil. suppl. p. 81.? S. Nùbia, Murr. comm. gœtt. 1770. p. 90. t. 3. Vahl, enum. 1. p. 259, and probably of Ait. S. applanàta, Willd. enum. suppl. 3. Hormìnum Nilóticum, Mœnch. meth. Hormìnum napifòlium, Mill. dict. no. 4.? Hairs of stem rather clammy. Floral leaves and calyxes bluish. Corollas pale blue.

Nile Sage. Fl. June, Aug. Clt. 1775. Pl. 2 to 3 feet.

260 S. sylvi'cola (Burch. cat. geogr. no. 6052.) stem herbaceous, ascending, villous; leaves on short petioles, broad-ovate, acute, toothed, cordate at the base, a little lobed, villous on both surfaces; floral leaves ovate, acuminated, shorter than the calyxes; racemes simple; whorls secund, loose, 6-flowered, distant; calyx tubularly campanulate, villous: teeth of lower lip lanceolate, all setaceously acuminated; corolla twice as long as the calyx: tube slender, exserted: upper lip, and middle lobe of lower lip emarginate. ♃.? S. Native of the Cape of Good Hope. Stems almost simple. Leaves furnished with one or two lobes on each side, canescent beneath. Corollas almost like those of *S. aurìta*, but one half smaller.

Wood Sage. Pl. 2 feet.

261 S. tenuifòlia (Burch. cat. geogr. no. 298.) stems herbaceous, erect, branched at the base, villous; leaves on long petioles, ovate-roundish, obtuse, toothed, or a little cut, subcordate, truncate or subhastate, or lobed at the base, villous on both surfaces; floral leaves rather shorter than the pedicels, ovate-lanceolate, acute; racemes simple; whorls subsecund, 2-6-flowered, remote; flowers pedicellate; calyx tubular, coloured, striated, pubescent; corolla about twice as long as the calyx: tube exserted, equal: upper lip very short: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃.? G. Native of the Cape of Good Hope. Corolla blue. Genitals exserted. Herb small, leafy and branched at the base.

Thin-leaved Sage. Pl. ½ to 1 foot.

262 S. auri'ta (Thunb. prod. p. 96.) stem herbaceous, erect, villous; leaves petiolate, lyrately pinnatifid or pinnate, with erosely toothed segments, veiny beneath, and clothed with hoary pubescence; floral leaves minute, ovate, acute; racemes simple; whorls 6-10-flowered, distant, secund; calyx sessile, tubular, elongated, coloured, striated, pubescent: teeth of upper lip setaceous, of the lower lip lanceolate, very acute; corolla more than twice as long as the calyx: tube slender, much exserted, equal: upper lip very short: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃. G. Native of the Cape of Good Hope. Stem nearly simple, erect or ascending. Calyxes bluish-purple at top. Corollas size and form of those of *S. lyràta*, but more slender.

Eared-leaved Sage. Fl. May, June. Clt. 1795. Pl. 1 to 2 feet.

263 S. sca'bra (Thunb. prod. p. 97.) stem herbaceous, erect, panicled, branched; leaves lyrately pinnatifid, wrinkled, scabrous, with erosely curled margins, veiny and canescent beneath; floral leaves minute, ovate-lanceolate; racemes elongated, a little branched; whorls 6-flowered, distant; calyx campanulate, pubescent: teeth of upper lip setaceous, of the lower lip lanceolate, acute; corolla twice as long as the calyx: tube nearly equal: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃.? G. Native of the Cape of Good Hope. Stem stiff, scabrous, pubescent. Corolla blue, similar to those of *S. runcinàta*, but a little larger.

Scabrous Sage. Fl. April, Aug. Clt. 1774. Pl. 2 feet.

264 S. runcina'ta (Lin. mant. 80.) stem herbaceous, erect, panicled, branched; leaves runcinately pinnatifid, wrinkled, rather hispid above: lobes deeply crenated: terminal lobe the largest; floral leaves minute, ovate-lanceolate, acute; racemes a little branched, few-flowered; whorls 2-6-flowered, remote; calyx ovate, pubescent: teeth of upper lip minute, setaceous, and of the lower one lanceolate-acute; corolla twice as long as the calyx: tube nearly equal: middle lobe of lower lip emarginate; connective bearing an empty cell behind. ♃.? G. Native of the Cape of Good Hope. Jacq. hort. schœnbr. 1. p. 5. t. 8. S. eròsa, Desf. cat. hort. par. p. 68. Poir. suppl. 5. p. 49. Herb usually clothed with hoary pubescence. Corollas blue. Genitals a little exserted.

Runcinate-leaved Sage. Fl. April, Sept. Clt. 1774. Pl. 1 to 2 feet.

265 S. stenophy'lla (Burch. cat. geogr. no. 1881.) plant herbaceous, erect, nearly glabrous; leaves petiolate, oblong-lanceolate or linear, runcinately-sub-pinnatifid, wrinkled: floral leaves minute, ovate-lanceolate, acute; racemes a little branched; whorls about 6-flowered, remote; calyx ovate, glabrous: teeth of lower lip lanceolate, acutish, all mutic; corolla twice as long as the calyx: tube nearly equal, hardly exserted: lips short, nearly equal; connective bearing an empty cell behind. ♃.? G. Native of the Cape of Good Hope. Allied to *S. runcinàta*, but is nearly glabrous, the stem taller and less branched, &c.

Narrow-leaved Sage. Pl.?

266 S. re'pens (Burch. cat. geogr. no. 2830.) herbaceous, quite glabrous; stems creeping at the base, leafy; floriferous branches ascending, nearly naked; leaves nearly all radical, petiolate, elongated, runcinately pinnatifid, hardly wrinkled: floral leaves ovate-lanceolate, acute, shorter than the calyxes; racemes nearly simple; whorls somewhat secund, about 6-flowered, remote; calyx ovate, with the teeth of the lower lip lanceolate, all setaceously-acuminated. ♃.? G. Native of the Cape of Good Hope. Leaves like those of *S. stenophýlla*, but the flowers are a little larger.

Creeping Sage. Shrub.?

267 S. lyra'ta (Lin. spec. p. 33.) stem herbaceous, erect, nearly simple, pilose; radical leaves lyrate, erosely-toothed, rather hispid on both surfaces; cauline leaves few, oblong-lanceolate, narrowed a long way at the base: floral leaves oblong-linear, rather shorter than the calyxes; racemes nearly simple; whorls 6-flowered, loose, distant: calyx tubularly-campanulate, nutant, pilose, with the teeth of the lower lip lanceolate, acute, of the upper one short and distant; corolla about three times as long as the calyx: tube much exserted, widened at top: middle lobe of lower lip very broad, emarginate: connective bearing an empty cell behind. ♃. H. Native of North America, in Philadelphia, Virginia, Carolina, and Georgia. Cunìla lyràta, Schranck, in syll. pl. soc. ratisb. 2. p. 57. Hormìnum lyràtum, Mill. dict. no. 2. Hormìnum Virgínicum, Lin. spec. p. 832.—Dill. elth. 219. t. 175. f. 216.—Mor. hist. 3. sect. 13. t. 27. Radical leaves 2-3 inches long. Flowers pedicellate. Calyxes coloured, ciliated with long spreading hairs. Corolla purplish, violet, 9-10 lines long.

Lyrate-leaved Sage. Fl. June, July. Clt. 1728. Pl. ½ to 1 foot.

268 S. obova'ta (Elliott, bot. carol. 1. p. 33.) stem herbaceous, erect, rather pilose; leaves broad-obovate, entire, sinuated, nearly glabrous, narrowed a long way at the base; floral leaves ovate, rather shorter than the calyxes; racemes nearly simple; whorls 6-flowered, dense, remote; calyx tubularly-campanulate, nutant, pilose: teeth of lower lip lanceolate, acute; corolla about three times longer than the calyx: tube much exserted, widened at top; connective bearing an empty cell behind. ♃. H. Native of Georgia, at the river Oakmulgee, and of New Orleans. Nearly allied to *S. lyràta*.

Obovate-leaved Sage. Pl. 1 foot.

269 S. acau'lis (Vahl. enum. 1. p. 257.) stem herbaceous, erect, nearly simple, pilose; leaves obovate, entire, sinuated, rather hispid on both surfaces, narrowed a long way at the base: floral leaves ovate, rather shorter than the calyxes; racemes almost simple; whorls 6-flowered, remote; calyx tubularly-campanulate, nutant, pilose, the teeth of the lower lip lanceolate, acute; corolla more than twice as long as the calyx: tube slender, much exserted, widened above; connective bearing an empty cell behind. ♃.? G. Native of the East Indies, Rottler. *S. ocymoìdes*, Roxb. et Benth. Wall. pl. rar. 1. p. 68. This species differs from *S. obovàta*, in the corollas being smaller and slenderer, and in the leaves being narrower. Perhaps not distinct from *S. obovàta*.

Stemless Sage. Pl. ½ foot?

270 S. Japónica (Thunb. jap. p. 22. t. 5.) stem herbaceous, erect, branched, glabrous; leaves petiolate, pinnate; leaflets ovate, acuminated, narrowed at the base, deeply-toothed, or pinnatifid, glabrous; floral leaves lanceolate, shorter than the calyxes; racemes almost simple; whorls about 6-flowered, distinct; calyx tubularly campanulate, glabrous, striated, having the upper lip entire, ovate, obtuse, and the teeth of the lower lip acute; corolla twice as long as the calyx: tube hardly exserted, equal: middle lobe of the lower lip emarginate; genitals exserted. ⊙. H. Native of Japan. Corollas blue, size of those of *S. verticillàta*. Leaves 3-4 inches long. This is a very elegant annual species.

Japan Sage. Pl. 1 foot?

271 S. Chine'nsis (Benth. lab. p. 725.) stem herbaceous, erect, pubescent; leaves petiolate, entire, or the lower ones ternate, broad-ovate, obtuse, crenated, truncate or cordate, pilose above, and glabrous beneath: floral leaves small, bractea-formed; racemes nearly simple; calyx tubularly-campanulate, striated, glabrous or hispid; corolla about twice as long as the calyx: tube hardly exserted, upper lip incurved, lower one spreading. ⊙. H. Native of China, near Kia-nang, Sir G. Staunton. Herb fasciculately-branched. Leaves about an inch long. Calyx coloured. Corolla pubescent outside. Flowers similar to those of *S. Japónica*.

China Sage. Pl.

† *Species belonging to sect.* XI. *but are not well known.*

272 S. triangula'ris (Thunb. prod. p. 96.) plant hispidly villous; stem erect, branched; leaves petiolate, cordate, triangularly-spatulate, toothed; whorls remote; flowers pedicellate; calyx angular, awned, a little shorter than the corolla. ⊙.? H. Native of the Cape of Good Hope. Branches and branchlets divaricate. Leaves hardly an inch long. Petioles length of leaves. Easily distinguished from *S. aurìta* by the petioles being without auricles, and by the stem being branched.

Triangular-leaved Sage. Pl. 2 feet.

273 S. obtusa'ta (Thunb. prod. p. 97.) villous; stem erectish, simple, or branched; leaves petiolate, ovate, deeply crenated, rarely sub-hastate, glabrous above, and pilose on the veins beneath, with ciliated edges; whorls 2-flowered; flowers pedicellate; calyxes narrow, scabrous, awned, about half the length of the corollas. ♃.? G. Native of the Cape of Good Hope. Leaves hardly an inch long. Petioles ciliated.

Blunt-leaved Sage. Pl. 1 foot.

274 S. Claytònii (Elliott, bot. carol. 1. p. 32.) stem herbaceous, erect; leaves ovate and cordate, lanceolate, pinnatifid, wrinkled, pubescent on the veins and margins; segments toothed; floral leaves ovate-cordate, acuminated, toothed, pubescent: whorls 6-flowered; calyx sub-campanulate, hispid on the margins and veins: the teeth of the upper lip connivent, and the segments of the lower lip acuminated, mucronate. ♃. H. Native of South Carolina, in arid, sandy pastures about Beaufort, abundant. Root thick; almost tuberous. Anthers black. Connective antheriferous at both ends.

Clayton's Sage. Pl. 1 foot.

Sect. XII. Notio'space (from *νοτιος*, *notios*, humid, and *σφακος*, *sphakos*, sage; the species contained in this section are inhabitants of humid places.) Benth. in Hook. bot. misc. 3. p. 374. lab. p. 309. Floral leaves and bracteas minute. Calyx ovate, the upper lip entire or shortly tridentate, with the teeth connivent; lower lip bifid. Corolla small; tube inclosed; upper lip straight, lower lip spreading a little. Connective fixed by the middle, remote, and extended behind, bearing a conform fertile cell.

275 S. plebe'ia (R. Br. prod. p. 501.) stem herbaceous, erect, branched, pubescent; leaves petiolate, oblong, wrinkled; whorls loose, about 6-flowered, racemose; racemes fastigiately-panicled; calyxes campanulate, the upper lip quite entire, and the teeth of the lower lip obtuse; corolla hardly longer than the calyx, the upper lip arched; connective bearing an empty cell behind. ♃. ? G. Native of the East Indies in humid places; of Nipaul, Oude, Hindostan, and Silhet, Wall.; Deyra Dhoon, and the banks of the river Jumna, Royle; Cashmere, Jacquemont; China, Reeves; Tropical New Holland, R. Br. S. minutiflòra, Bunge, enum, pl. chin. p. 50. S. brachiàta, Roxb. hort. beng. 4. fl. ind. 1. p. 146. S. parviflòra, Roxb. hort. beng. 4.? O'cymum fastigiàtum, Roth, nov. spec. 277. Lumnítzera fastigiàta, Spreng. syst. 2. p. 687. Leaves 2-3 inches long. Corolla having the upper lip and the middle segment of the lower lip emarginate.

Plebeian Sage. Pl. 2 to 3 feet.

276 S. Ægypti'aca (Lin. spec. p. 33.) stems procumbent, humble, much branched, clothed with hoary pubescence; cauline leaves small, remote, sessile, lanceolate-linear, acute, toothed, or the lower ones are oblong, narrowed into the petioles at the base; floral leaves minute; racemes elongated, a little branched; whorls remote, usually 2-flowered; calyx ovate, pubescent, having the upper lip shortly tridentate, and the lower lip bifid, with lanceolate subulately-acuminated teeth; corolla scarcely exceeding the calyx; connective bearing an empty cell behind. ☉. S. Native of the North and West coast of Africa, as of Egypt, Libya, Arabia, Canary Islands, Cape Verd Islands, Persia, &c. Thymus Sýrticus, Spreng. syst. 2. p. 697. Thymus hírtus, Viv. fl. libyc. p. 30. t. 14. f. 1. Melíssa perénnis, Forsk. fl. ægypt. p. 108. S. Ægyptìaca, Jacq. hort. vind. 2. p. 49. t. 108. Plant woody at base. Branches and leaves pubescent and canescent. Leaves ½ inch long. Corolla and stamens as in *S. plebèia*.

Egyptian Sage. Pl. ½ to ¾ foot.

277 S. pu'mila (Benth. lab. p. 726.) stem humble, erect, tufted, bearded by long stiff hairs; leaves approximate at the base of the stem, oblong or linear, narrowed at the base, much wrinkled, green on both surfaces: floral leaves minute; racemes a little branched; whorls remote, 2-6-flowered: upper whorls sterile; calyx ovate, pilose: upper lip shortly-tridentate: lower lip bifid, with broad-lanceolate, very acute teeth; corolla hardly exceeding the calyx; connective bearing an empty cell behind. ♃. H. Native of Cashmere, Royle. Very nearly allied to *S. Ægyptìaca*, but differs in the stems being erect and hardly branched, and in the root being perennial.

Dwarf Sage. Pl. ¼ to ½ foot.

Sect. XIII. Gymnósphace (from *γυμνος*, *gymnos*, naked; and *σφακος*, *sphacos*, sage; probably so called from the naked floriferous branches.) Benth. in Hook. bot. misc. 3. p. 374. lab. p. 310. Calyx ovate-tubular; upper lip entire, recurved; lower lip bifid. Tube of corolla short, ample, furnished with a ring of hair inside; lips short: upper one erect: lobes of lower lip spreading. Connective remote behind, deflexed, filiform, acute. Filaments erect, somewhat continuous with the connective. Perhaps a proper genus.

278 S. saxícola (Wall. ex Benth. in Wall. pl. rar. asiat. 1. p. 68. lab. p. 310.) stems tufted, branched at the base; floriferous branches erect, almost naked; radical leaves and lower cauline ones roundish-cordate, crenated, glabrous; cauline leaves very few, ovate-lanceolate, deeply-toothed: floral leaves minute, ovate; racemes a little branched; whorls loose, distinct, or the upper ones are spicate; calyx tubularly-campanulate, drooping, glabrous: teeth of lower lip lanceolate, acutish; corolla hardly exceeding the calyx; fertile anthers all adnate. ♃. F. Native of Nipaul, Wall. Stems numerous, from a thick radicant base, simple or branched under the raceme, glabrous at the base; axis of raceme villous. Radical leaves 2-3 inches long, pale beneath. Corolla small, blueish.

Rock Sage. Pl. ½ to 1½ foot.

Sect. XIV. Hemi'sphace (from *ἡμι*, *hemi*, half; and *σφακος*, *sphakos*, sage.) Benth. in Hook. bot. misc. 3. p. 374. lab. p. 310. Calyx tubular; upper lip truncate, tridentate; lower lip bifid. Tube of corolla furnished with a pilose ring inside; upper lip erectly-spreading, arched, and the lobes of the lower lip spreading. Connective remote behind, drawn out a little, deflexed, acute. Filaments straight, somewhat continuous with the connective. Herbs, native of the region of the Mediterranean, with the habit of those species contained in Sect. *Heterósphace*. Perhaps a proper genus.

279 S. verticilla'ta (Lin. spec. 37.) stems herbaceous, erect, pilosely-hispid; leaves cordate at the base, lyrate: terminal lobe very large, ovate, roundish, or entire, sinuately-crenated, hispid or woolly on both surfaces; racemes branched; whorls 20-40-flowered, remote; calyx tubular, villous: teeth of lower lip setaceously-acuminated; corolla about twice as long as the calyx: tube almost inclosed. ♃. H. Native of the South of Europe, and the North of Africa, and Caucasus.—Barrel, icon. t. 199. Hormìnum verticillàtum, Mill. dict. no. 3. Leaves large, irregularly crenated or sinuated, hispid on the nerves; floral leaves bractea-formed, broad, ovate, acuminated, ciliated, shorter than the calyxes. Calyx usually coloured. Corolla bluish violet. The whole plant is hoary.

Var. β. móllis (Benth. lab. p. 311.) leaves clothed with soft wool on both surfaces. ♃. H. S. móllis, Donn, hort. cant. edit. 1804, but not of Jacq. Corolla bluish purple.

Var. γ. pállida (Benth. lab. p. 311.) leaves almost quite entire, and are, as well as the stems, clothed with pale villi. ♃. H. Young leaves densely woolly beneath.

Whorled Sage. Fl. June, Nov. Clt. 1628. Pl. 2 to 3 feet.

280 S. napifòlia (Jacq. hort. vind. 2. p. 71. t. 152.) stem herbaceous, erect, pilosely-hispid; lower leaves lyrate, terminal lobe large, and is, as well as the superior leaves, ovate-oblong, sinuately-crenated, rounded, or cordate at the base, rather villous on both surfaces; racemes scarcely branched; whorls 6-12-flowered, remote; calyx tubular, villous, teeth all setaceously-acuminated; corolla half as long again as the calyx: tube inclosed. ♃. H. Native of Syria, among bushes about Smyrna, and of the island of Cois. S. verticillàta, var. D'Urv. in mem. soc. lin. par. 1. p. 260.? This hardly differs from *S. verticillàta*, except in the whorls being usually 10, but never 20-flowered, and in the corollas being about half the size. The leaves, as in *S. verticillàta*, are also sometimes entire. Corollas blueish purple.

Turnip-leaved Sage. Fl. June, July. Clt. 1776. Pl. 2 to 3 feet.

281 S. Russe'llii (Benth. lab. p. 312.) stems herbaceous,? erect, pubescent; leaves petiolate, oblong, acute, sinuately-toothed, thick, wrinkled, clothed with white wool on both surfaces: floral leaves ovate, acuminated, shorter than the calyxes; whorls loosely many-flowered, remote; calyx tubular: teeth all acuminated; corolla half as long again as the calyxes: tube inclosed. ♃. H. Native of Syria, near Aleppo, Russell. Flowers similar to those of *S. verticillàta*, but smaller; and the leaves are almost like those of *S. pomífera*.

Russell's Sage. Pl. 2 to 3 feet.?

† *Species, the names of which are alone known.*

1 S. bysanti'na, Juss. ex. Steud. nom. p. 725. 2. *S. Hallèri*, Fisch. ex Steud. nom. 726. 3. *S. rostràta*, Schmidt, abhandl. boh. wiss. 1. p. 11.

Cult. Many of the species of *Sálvia* are very showy when in blossom, particularly most of those species belonging to sections *Hormìnum*, *Eúsphace*, and *Calósphace*, § 7, *Longiflòræ*. Most of them thrive in a rich, light soil. The shrubby kinds are readily increased by young cuttings, under a hand-glass; those of the stove species in heat; the herbaceous perennial kinds by dividing at the root. The seeds of the annual and biennial kinds only require to be sown in the open border where they are intended to remain.

XXX. AUDIBE'RTIA (named after M. Audibert, a nurseryman of Tarascon.) Benth. in bot. reg. 17. no. 1469. lab. p. 312; but not of Benth. in bot. reg. 15. no. 1282.

Lin. syst. *Diándria*, *Monogýnia*. Calyx ovate, bilabiate; upper lip concave, entire, or shortly tridentate; lower lip bifid; throat naked inside. Corolla having the tube equal in length to the calyx, or exserted; limb bilabiate: upper lip bifid, with spreading lobes: lower lip trifid, having the lateral lobes ovate or oblong, and the middle lobe very broad and emarginate. The two lower stamens fertile, ascending, usually exserted; the rudiments of the two upper ones small and club-shaped or wanting; anthers dimidiate with a linear connective, which is articulated in the filament, ascending, bearing a one-celled linear anther at top, but not drawn out behind, or very shortly acuminated. Style subulately-bifid.—A californian genus intermediate between *Rosmarìnus* and sections *Echinósphace* and *Pychnósphace* of *Sálvia*.

1 A. grandiflòra (Benth. lab. p. 312.) stem tall, villous; leaves oblong-elliptic, sinuately-crenated, cordate at the base, wrinkled; whorls dense, many-flowered; bracteas broad-ovate, and are, as well as the calyxes, ample, membranous, coloured, and villous; stamens much exserted. ♃. ? H. Native of North California, Douglas. Lower leaves petiolate, 3-4 inches long, villous, pale or canescent beneath: upper ones sessile, smaller: floral leaves stem-clasping. Tube of corolla exserted. Upper lip of calyx obtuse.

Great-flowered Audibertia. Pl. 2 to 3 feet.

2 A. hu'milis (Benth. lab. p. 313.) suffruticose; leaves approximate at the base of the stem, petiolate, oblong-lanceolate, obtuse, crenulated, narrowed a long way at the base, wrinkled, canescent: floral leaves and bracteas lanceolate, acute, villous; genitals exserted. ♄. F. Native of North California, Douglas. Habit of a small variety of *Sálvia officinàlis*. Stem leafy and hoary at bottom, but villous at top. Lower leaves 1 to 1½ inch long. Whorls many-flowered. Upper lip of calyx tridentate. Tube of corolla hardly exserted.

Humble Audibertia. Shrub ½ foot.

3 A. stachyoi'des (Benth. lab. p. 313.) suffruticose; branches stiff, leafy; leaves on short petioles, oblong-lanceolate, obtuse, crenulated, narrowed at the base, wrinkled, canescent beneath: floral leaves and bracteas ovate, acuminated; genitals rather shorter than the corolla. ♄. F. Native of North California. Branches tomentosely-pubescent, clammy and villous above, as well as the bracteas and calyxes. Leaves 2-3 inches long, green above; petioles dilated, and stem-clasping as in the preceding species. Teeth of calyx spiny.

Stachys-like Audibertia. Shrub.

4 A. nívea (Benth. lab. p. 313.) suffruticose; branches stiff, clothed with white tomentum above; leaves nearly sessile, lanceolate, obtuse, rounded at the base, wrinkled, clothed with white tomentum on both surfaces: floral leaves and bracteas ovate-lanceolate; raceme simple; genitals exserted. ♄. F. Native of North California, Douglas. Leaves distant, 1 to 1½ inch long. Lips and teeth of calyx almost obsolete. Tube of corolla a little exserted.

Snowy Audibertia. Shrub.

5 A. inca'na (Benth. in bot. reg. t. 1469.) suffruticose; branches divaricate, branched, canescent; leaves obovate-oblong, obtuse, quite entire, narrowed at the base, canescent: floral leaves broad-ovate; racemes simple; genitals exserted. ♄. F. Native of North-west America, on the plains of the river Columbia, near Priest's rapid, and on argillaceous hills. Leaves 1 to 1½ inch long, pubescent; upper floral leaves orbicular, sessile, ciliated. Calyx pubescent; upper lip entire, obtuse. Corolla pale blue; tube exserted.

Hoary Audibertia. Fl. July, Sept. Clt. 1827. Shrub 1½ foot.

6 A. polysta'chya (Benth. lab. p. 314.) suffruticose, clothed with hoary tomentum; leaves petiolate, oblong-lanceolate, obtuse, crenulated, narrowed at the base, wrinkled, hoary on both surfaces: floral leaves and bracteas loose, lanceolate; racemules numerous, approximating into a dense, elongated panicle; genitals much exserted. ♄. F. Native of North California, Douglas. Upper lip of calyx obtuse, almost entire. Tube of corolla scarcely exserted.

Many-spiked Audibertia. Shrub 3 to 4 feet.?

Cult. The species will grow in common garden soil, and will be readily increased by cuttings and seeds. Being rather tender, they will require some shelter in winter.

XXXI. ROSMARI'NUS (from *ros*, *dew*, and *marinus*, of the sea, on account of its affecting maritime situations.) Tourn. inst. t. 92. Lin. gen. no. 38. Schreb. gen. no. 49. Juss. gen. p. 111. Benth. lab. p. 314.

Lin. syst. *Diándria*, *Monogýnia*. Calyx ovate-campanulate, bilabiate; upper lip entire; lower lip bifid; throat naked inside. Corolla with an exserted tube, glabrous inside; throat a little inflated; limb bilabiate; lips nearly equal: upper lip erect, emarginate: lower lip spreading trifid: lateral lobes oblong, erect, twisted a little: middle lobe, large, concave, dependent. Stamens 2, ascending, exserted from the superior lip, without any rudiments of upper ones; filaments inserted in the throat of the corollas, shortly-toothed near the base; anthers linear, somewhat 2-celled, with connate margins, and divaricate-confluent cells. Upper lobe of style very short; stigmas minute, terminal. Achenia dry, smooth. A South European shrub, with the calyx of *Sálvia* and *Audibértia*, and corolla and stamina of *Monárda*, unless the tooth at the base of each filament, which is probably an appendage analogous to those of *Ocymum* and *Phlòmis*.

1 R. officina'lis (Lin. spec. p. 33.) ♄. H. Native of Europe and Africa, in the region of the Mediterranean; as of Portugal, Spain, South of France, Italy, Naples, Sicily, Greece, Syria, Balearic Islands, &c., on dry hills and among rocks. Sibth. and Smith, fl. græc. 1. p. 11. t. 14. Woodv. med. bot. t. 87. R. latifolià, Mill. dict. no. 2.—Riv. mon. irr. t. 39.—Blackw. icon. 159.—Sabb. hort. rom. 3. t. 67. A densely-branched and densely-leafy shrub. Leaves sessile, linear, entire, with revolute margins, canescent beneath. Flowers disposed in short axillary racemes, few, approximate, almost sessile. Calyx purplish. Corollas white, or pale blueish-purple. Rosemary has a fragrant smell and a bitter, pungent taste. The leaves and tops are strongest in their sensible qualities; the flowers ought not to be separated from their calyxes, the active matter residing principally, if not wholly, in the latter. Rosemary yields its qualities completely to rectified spirit, but only partially to water. The leaves and tops distilled with water yield a thin, light, pale, essential oil, of great fragrancy, though not quite so agreeable as the rosemary itself. From one hundred pounds of the herb in flower eight ounces of oil have been obtained. The virtues of rosemary depend entirely on its essential oil, which seems to be combined with camphor, not only from its peculiar taste, but

from its possessing chemical properties which depend upon the presence of camphor, and from its depositing crystals of camphor when long kept. Rosemary is reckoned one of the most powerful of those plants which stimulate and strengthen the nervous system; it has, therefore, been recommended in various affections supposed to proceed from debilities or defective excitement of the brain and nerves; as in certain headachs, deafnesses, giddinesses, palsies, &c., and in some hysterical and dyspeptic symptoms.

The ancients were well acquainted with this shrub; and it is mentioned by Dioscorides, Galen, and Pliny. It has ever been treated with great respect for comforting the brain and strengthening the memory; hence the frequent allusions to this property in our old poets. Its supposed quality of strengthening the memory made rosemary an emblem of fidelity in lovers: it was accordingly worn at weddings, and perhaps, on the same principle, at funerals. Rosemary is a principal ingredient in what is known by the name of Hungary water; and the herb is taken as tea by many persons for headachs, and disorders called nervous.

There are several varieties of the rosemary, as, 1. R. angustifòlia, Mill. dict. no. 1. The narrow-leaved or garden rosemary. 2. The silver-striped-leaved rosemary. 3. The golden-striped-leaved rosemary.

Officinal, or Common Rosemary. Fl. Jan. April. Clt. 1548. Shrub 4 to 12 feet.

Cult. Rosemary thrives best on dry rocky soils by the seaside, in the countries where it grows wild. It is hardy enough to bear our winters in the open air, provided it be planted upon a poor, dry, gravelly soil, or against a wall. Rosemary, if by accident rooted in a wall, will endure the greatest cold of our winters. The striped-leaved varieties are more tender, and therefore require the protection of a frame or green-house in winter. Rosemary may be increased by planting the young cuttings in the spring just before the plants begin to shoot, in light earth under a hand-glass. When the cuttings are rooted transplant them where they are intended to remain in September.

XXXII. MONA'RDA (so called from Nic. Monárda or Monárdes, a physician of Seville in the sixteenth century.) Benth. lab. p. 315. Monárda species of Lin. and other authors. Monárda and Cheilýctis, Rafin. Monárda and Coryánthus, Nutt.

Lin. syst. *Diándria, Monogýnia.* Calyx tubular, elongated, 15-nerved, nearly equal, 5-toothed; throat villous inside, rarely almost naked. Corolla with an exserted or inclosed tube, glabrous or pubescent inside, exannulate; throat dilated a little; limb bilabiate; lips linear or oblong, nearly equal: upper lip erect, entire, or emarginate: lower lip spreading, shortly trifid at apex: the lateral lobes ovate, obtuse: the middle one narrower, oblong, retuse, or emarginate. Stamens 2 (inferior) ascending, usually exserted from the upper lip of the corolla; the rudiments of the two superior ones almost wanting; filaments toothless, inserted at the throat of the corolla; anthers linear, somewhat 2-celled: cells divaricate, confluent, with connate margins. Style almost equally bifid at top; stigmas minute, terminal. Achenia dry, smooth.—Herbs, with entire, usually toothed or crenated leaves. Flowers collected into a few dense whorls, propped by bracteas.

Sect. I. Eumona'rda (from *eu*, well, and *Monárda*. This section is supposed to contain the true species of the genus.) Benth. lab. p. 726. Genitals much exserted.

1 M. dídyma (Lin. spec. p. 32.) leaves petiolate, ovate-lanceolate, acuminated, roundly-subcordate at the base, rather hispid on both surfaces, rarely glabrous: floral leaves sessile, and are, as well as the outer bracteas, oblong-lanceolate, narrowed a long way at the base, coloured; calyx incurved, striated, coloured, with an almost naked throat; corollas quite glabrous. ♃. H. Native of North America, from Canada to North Carolina. Curt. bot. mag. t. 548. Mill. fig. t. 183. f. 1. Trew. ehret. t. 66. M. fistulòsa, var. Curt. bot. mag. t. 145.? S. coccínea, Michx. fl. bor. amer. 1. p. 16. M. purpùrea, Lam. dict. 4. p. 256. M. Kalmiàna, Pursh, fl. amer. sept. 1. p. 17. t. 1. bad. M. purpuráscens, Wender. ind. sem. hort. marb. 1828. M. Oswegoensis, Bart, prod. fl. pennsyl. 1. p. 34.? Stems fistular, acutely-tetragonal. Leaves 2-3 inches long. Whorls solitary or twin. Bracteas, calyxes, and corollas scarlet. The leaves emit a very grateful, refreshing odour.

Didymous Monarda, or Oswega tea. Fl. June, August. Clt. 1752. Pl. 2 to 3 feet.

2 M. fistulòsa (Lin. spec. p. 32.) leaves petiolate, ovate-lanceolate, roundly-subcordate at the base, glabrous, pubescent or hispid on both surfaces: floral leaves sessile, and are, as well as the outer bracteas, a little coloured; calyxes a little incurved, scarcely coloured: throat hispid inside; corolla villous. ♃. H. Native of North America, among bushes, &c., very common, West Coast, Canada, the States; Texas, and near Jalapa in Mexico. Rchb. icon. exot. 2. p. 28. t. 172. Mill. fig. t. 183. f. 2. M. altíssima, Willd. enum. p. 33. Rchb. icon. exot. 2. p. 27. t. 170. M. longifòlia, Lam. dict. 4. p. 255. M. glàbra, Lam. dict. 4. p. 256. M. rugòsa, Ait. hort. kew. ed. 2d. 1. p. 51. M. oblongàta, Ait. hort. kew. ed. 2d. 1. p. 51. M. purpùrea, Pursh, fl. amer. sept. 1. p. 17, but not of Lam. M. clinopòdia, Lin. spec. p. 32. M. allophýlla, Michx. fl. bor. amer. 1. p. 16. M. affìnis, Link, enum. 1. p. 9. Rchb. icon. exot. 2. p. 31. t. 182. M. undulàta, Tausch, Rchb. icon. exot. 2. p. 31. t. 181. M. mèdia, Willd. enum. p. 32. Sweet, fl. gard. 1. p. 98. M. violàcea, Desf. cat. hort. par. p. 66. M. involucràta, Wender. in ind. sem. hort. marb. 1828. M. commutàta, Wender, l. c. M. lilácina, Wender, l. c. M. hýbrida, Wender, l. c. M. barbàta, Wender, l. c. M. vàrians, Bart. prod. fl. penns. 1. p. 34.? M. cœrùlea, M. cristàta, M. dùbia, &c., Hortul. This species is very variable in downiness, size and colour of flowers and bracteas, and differs from *M. dídyma* in being taller; in the calyxes and bracteas being less coloured, in the corollas being smaller, more or less pubescent, and particularly in the throat of the calyx being hispid from pili inside, and usually closed. Stems fistular or filled. Leaves green or canescent. Corollas pale red or purplish, rarely deep violet or purple, never scarlet.

Var. β. *móllis* (Lin. spec. 32.) leaves clothed with soft pubescence; upper lip of corolla densely bearded. ♃. H. Native of the northern regions of North America; as the species is of the southern regions. M. móllis, Lin. amœn. acad. 3. p. 399. Rchb. icon. exot. 2. p. 28. t. 171. M. menthæfòlia, Graham, in edinb. phil. journ. vol. 21. (1829) p. 347. Hook, bot. mag. t. 2958.

Fistular-stemmed Monarda. Fl. June, Aug. Clt. 1656. Pl. 2 to 5 feet.

3 M. Bradburia'na (Beck, in Sill. amer. journ. scienc. 10. p. 260.) leaves nearly sessile, ovate-lanceolate, rounded at the base, clothed with canescent tomentum beneath, pilose on both surfaces: floral leaves and outer bracteas roundedly-sub-cordate at the base, coloured; calyx smoothish, striated, contracted above, with a hairy throat, and subulate-awned teeth; corolla hardly twice as long as the calyx, almost glabrous outside: upper lip very slender, and bearded at top. ♃. H. Native of North America in uncultivated places, near St. Louis, Beck; along the Missouri and Ohio, Torrey. M. fistulòsa, Hook. bot. mag. t. 3310, exclusive of the syn. Stems glabrous or ciliated on the angles. Whorls solitary, size of those of M. fistulòsa. Corolla pale, scarcely twice as long as the calyx; lower lip marked with purple dots.

Bradbury's Monarda. Pl. 3 feet.

4 M. Russellia'na (Nutt. trav. in ark. territ. p. 141.) almost glabrous; leaves nearly sessile, lanceolate, roundly-subcordate at the base: floral leaves and outer bracteas sessile, coloured, narrowed a long way at the base, acute, mutic; calyx nearly glabrous, with an almost naked throat, and nearly equal, lanceolate, short stiff teeth; corolla glabrous: tube much exserted: lower lip dotted. ♃. H. Native of the Arkansas, and among the Rocky Mountains, Sims, bot. mag. t. 2513. Hook, exot. fl. 2. t. 130. Sweet, fl. gard. 2. t. 166. Stem glabrous or ciliated on the angles. Leaves shining beneath, smoothish or ciliated on the edges, remotely toothed; floral leaves and outer bracteas purplish. Corolla slender, pale, elongated, dotted on the lower lip. (fig. 77.)

FIG. 77.

Russell's Monarda. Fl. Aug. Sept. Clt. 1823. Pl. 2 to 3 feet.

Sect. II. Cheily'ctis (from χειλος, *cheilos*, a lip.) Benth. lab. p. 726. Cheilýctis, Rafn. Coryánthus. Nutt. in amer. phil. trans. 5. p. 186. Stamens shorter, or equal in length to the upper lip of the corolla.

5 M. puncta'ta (Lin. spec. p. 32.) clothed with fine pubescence; leaves petiolate, lanceolate, narrowed at the base: floral leaves and outer bracteas sessile, coloured a little at the base, mutic; calyxes pubescent, having the throat shortly bearded, and the teeth nearly equal, lanceolate, short, and stiff; corolla glabrous: tube hardly exserted: lower lip dotted. ♃. H. Native from Virginia and New Jersey to Florida, Carolina, and New Orleans. Andr. bot. rep. 8. t. 546. Ker. bot. reg. t. 85. M. lùtea, Michx. fl. bot. amer. 1. p. 16. Stem ascending, branched. Leaves 2 inches long, sparingly toothed or entire. Whorls few, remote, all shorter than the leaves. Genitals equal in length to the upper lip of corolla. Corolla yellowish, dotted with brown.

Dotted-flowered Monarda. Fl. June, Oct. Clt. 1714. Pl. 1 to 1½ foot.

6 M. arista'ta (Nutt. trav. in ark. territ. ex Benth. lab. p. 318.) canescent; leaves oblong-lanceolate, narrowed at the base; floral leaves and outer bracteas sessile, a little coloured, subulately awned at apex; calyx striated, pubescent, with a bearded throat, and nearly equal, long, subulate teeth, which are pencilled at apex; tube of corolla hardly exceeding the calycine teeth. ♃. H. Native of Arkansas; Texas, at Bejar; and Rio de la Trinidad, &c. M. citriodòra, Cerv. ex Lag. nov. gen. et spec. 2. Habit and stature of *M. punctàta*. Leaves sharply and remotely toothed. Bracteas ciliated, often purplish or yellowish. Corolla yellowish?: lower lip almost dotless. Stamens shorter than the upper lip of corolla.

Awned-bractead Monarda. Fl. July, Sept. Clt. 1825. Pl. 1 to 1½ foot.

† *Species not sufficiently known.*

7 M. sca'bra (Beck, in Sill. amer. journ. 10. p. 260.) stem nearly glabrous; leaves ovate-lanceolate, subcordate, serrated, with revolute edges, scabrous, thick, dotted, on short petioles, rather villous; bracteas ovate-lanceolate; whorls of flowers large, terminal, by threes; calyx hairy, with a densely bearded throat, and short, acute, erectish teeth; corolla hairy; stamens equal in length to the upper lip. ♃. H. Native in woods on the banks of the Mississippi, near St. Louis. Stem branched. Leaves 2 to 2½ inches long. Corolla pale purple.

Scabrous Monarda. Pl. 3 feet.

8 M. gra'cilis (Pursh, fl. amer. sept. 1. p. 17.) quite glabrous; heads small, nearly naked, lateral and terminal; outer bracteas linear, ciliated; calyxes pubescent, ciliated; corolla short, very slender, glabrous; leaves linear-lanceolate, acuminated, serrated, glabrous; stem obtuse-angular, glabrous. ♃. H. Native of South Carolina and Virginia, among the mountains. Perhaps a species of *Blephília*; but there are no specimens in Pursh's herbarium to ascertain this point. Corollas purple.

Slender Monarda. Pl. 1 to 2 feet.

N.B. M. praténsis, M. rígida, and M. virgàta, Rafin, med. fl. 2. p. 37. not being recognizable by the descriptions given, are therefore excluded.

Cult. The species are of easy culture and propagation, growing freely in any soil; and are readily increased by dividing at the root. The *M. punctàta* and *M. aristàta* are more shy of cultivation than the others; and for this reason it is safer to grow them in pots, in a mixture of peat and sand.

XXXIII. BLEPHI'LIA (probably from βλεφαρις, *blepharis*, the eye-lash, in allusion to the ciliated bracteas.) Rafin. ex Benth. lab. p. 319. Monárda species of Lin. and other authors.

Lin. syst. *Diándria*, *Monogýnia*. Calyx ovate-tubular, 13-nerved, naked inside the throat, bilabiate; upper lip tridentate, with the teeth awned; lower lip bidentate, with the teeth mutic, or shortly awned. Corolla having the tube a little exserted, and exannulate inside; the throat dilated, and the limb bilabiate: lips nearly equal: the upper one erect and entire: the lower one spreading and trifid: the lateral lobes ovate-roundish, and the middle one narrower, oblong, retuse and emarginate. Rudiments of upper stamens wanting, or small and filiform: lower two fertile, ascending, exserted from the upper lip of the corolla; filaments toothless, inserted in the throat of the corolla; anthers linear, somewhat 2-celled, with connate margins, and divaricate confluent cells. Style equally bifid at top; stigmas minute, terminal. Achenia dry, smooth.—Herbs, with a habit and character between *Monárda* and *Zizíphora*; the leaves of the first, and the flowers of the latter genus. Whorls numerous, globose: upper ones approximating into a spike.

1 B. cilia'ta (Rafin, journ. phys. 89. 98.) leaves almost sessile, ovate-oblong, narrowed at the base, canescent beneath; lower floral leaves conforming to the cauline ones: upper ones and outer bracteas ovate, acute, coloured, equalling the calyxes. ♃. H. Native of Pennsylvania, Virginia, Carolina, Missouri, and near St. Louis. Monárda ciliàta, Lin. spec. 32, but not of Michx.—Mor. hist. 3. p. 374. sect. 11. t. 8. f. 6.—Pluck. phyt. t. 24. f. 1. alm. t. 164. f. 3. Stems pubescent, furnished with retrograde hairs on the angles. Leaves 2 inches long, nearly glabrous or pubescent. Whorls all distinct. Bracteas ciliated, reddish at top. Corollas blue, marked with dark purple spots.? Root creeping.

Ciliated Blephilia. Fl. July. Clt. 1798. Pl. 1 to 2 feet.

2 B. hirsu'ta (Benth. lab. p. 320.) leaves petiolate, ovate, roundly cordate at the base, hairy on both surfaces; lower floral leaves conforming to the cauline ones: upper floral leaves and bracteas linear-subulate, shorter than the calyxes; calyxes pubescent, recurved. ♃. H. Native of Virginia, on the moun-

tains; at Lake Michigan; and on the banks of the Missouri. Monárda hirsùta, Pursh, fl. amer. sept. 1. p. 19. Monárda ciliàta, Michx, fl. amer. bot. 1. p. 16. but not of Lin. Habit more branched and loose than in *B. ciliàta*. Whorls more numerous: upper ones approximate. Calyx smaller, and more hairy. Corolla more exserted, and nearly glabrous, purple or blue.

Hairy Blephilia. Fl. July, Sept. Clt. 1798. Pl. 1 to 2 feet.

Cult. For culture and propagation see *Monárda*, p. 758.

XXXIV. ZIZI'PHORA (said to be from *zizi* of the Indians; and φορεω, *phoreo*, to bear.) Lin. gen. no. 36. Schreb. gen. no. 47. Juss. gen. 111. Gærtn. fruct. 1. p. 316. t. 66. Benth. lab. p. 320.

Lin. syst. *Diándria, Monogýnia.* Calyx tubular, elongated, 13-nerved, villous inside the throat, bilabiate; upper lip tridentate, with mutic teeth. Corolla having the tube hardly exserted, and exannulate inside; the throat dilated, and the lips nearly equal: upper lip erect, entire: lower one spreading, trifid, with rounded lobes, the middle lobe longer and emarginate. Rudiments of the superior stamens almost wanting: the 2 lower ones fertile, ascending under the upper lip, and equal in length to it, or longer; filaments inserted at the throat of the corolla, toothless; anthers linear, somewhat 2-celled, with divaricate, confluent cells, and subconnate margins. Upper lobe of style very short; stigmas minute, terminal. Achenia dry, smooth.—Herbs or subshrubs, with a habit between *Monárda* and *Thỳmus*. Leaves quite entire, or furnished with a few minute teeth, lined with diverging veins beneath; floral leaves almost similar to the others, but sometimes broader, and sometimes narrower. Whorls few-flowered, usually approximate at the tops of the branches. Pedicels short, flattened, erect. Bracteas almost wanting. Flowers intermediate between those of *Blephília* and *Thỳmus*.

§ 1. *Permanent suffruticose plants.*

1 Z. clinopodioi'des (Bieb. fl. cauc. 1. p. 17.) suffruticose; leaves ovate-oblong or lanceolate; floral leaves similar to the others, or narrower, loose; whorls approximating into a roundish terminal head; calyx clothed with hoary pubescence, or ciliated with a few hairs. ♄. F. Native of Armenia, Iberia, Caucasus, Siberia, Altaian mountains, in grassy places. Habit of a large variety of *Thỳmus serpýllum*. Branches diffuse, purplish, canescent from short tomentum, like the leaves and calyxes. Corolla bluish purple. Stamens a little exserted.

Var. α, *canéscens* (Benth. lab. p. 321.) leaves for the most part narrow; calyxes less pilose. ♄. F. Cunìla capitàta, Lin. spec. p. 30. Thỳmus punctàtus, Willd. phyt. 1. p. 8. ex Rœm. et Schultes. Thymus lùcidus, Ehrh. beitr. 7. p. 150. ex Rœm. et Schultes. Z. clinopodioìdes, α. Cunìla, and β. acinoìdes, Rudolph. in mem. acad. sc. petrop. 2. p. 313. Z. tenùior, Falck. topogr. 1. p. 98. ex Rudolph. l. c. Z. Mussìni, Adam. ex Rudolph. l. c. Z. serpyllàcea, Bieb. fl. cauc. 1. p. 17. Rudolph. in mem. acad. sc. petrop. 2. p. 315. t. 12.

Var. β, *mèdia* (Benth. lab. p. 321.) leaves for the most part ovate; calyxes rather pilose. ♄. F. Native of the Caucasus, and the Altaian mountains. Z. clinopodioìdes, Rudolph. in mem. acad. petrop. 2. p. 311. t. 11. exclusive of var. α. and β. Z. serpyllàcea, Sims, bot. mag. t. 906. bad. Z. mèdia, Link, enum. 1. p. 17. Corollas reddish purple.

Clinopodium-like Ziziphora. Fl. July, Aug. Clt. 1803. Shrub trailing, ½ to 1 foot long.

2 Z. dasya'ntha (Bieb. fl. cauc. 1. p. 18.) suffruticose; leaves ovate or oblong; floral leaves conforming to the others, loose; whorls approximating into an oblong head, or the lower ones are distinct; calyx hispid, very pilose. ♄. F. Native of Caucasus and Iberia, in alpine places. Z. Puschkìni, Adams, in Web. et Mohr. cat. 1. p. 42. ex Rœm. et Schultes. Sims. bot. mag. t. 1093. bad. This differs from *Z. clinopodioìdes*, in the broader leaves, longer heads of flowers, and the very hispid calyxes; the calycine teeth are also a little longer, the corollas usually shorter, and the stamens rarely exserted. Corollas purplish blue.

Thick-flowered Ziziphora. Fl. June, Aug. Clt. 1803. Shrub procumbent.

3 Z. cane'scens (Benth. lab. p. 321.) suffruticose?; leaves ovate, clothed with hoary pubescence on both surfaces; floral leaves similar to the others; whorls approximate into a terminal head; calyx clothed with soft pubescence. ♄.? F. Native of Syria and Egypt, Labillardiere. Habit of *Z. Hispánica*. Flowers capitate, as in *Z. clinopodioìdes*, but the leaves are broader, and the calyxes smaller; but is distinguished from both in the hoary pubescence.

Canescent Ziziphora. Shrub.

§ 2. *Annual plants.*

4 Z. Hispa'nica (Lin. spec. p. 31.) annual; leaves nearly sessile, ovate or oblong; floral leaves rhomboid, longer than the calyxes; whorls distinct, axillary, approximate, 6-10-flowered; calyxes sessile. ⊙. H. Native of Spain. Lam. ill. t. 18. f. 1.—Herb branched at base; branches stiff, villous. Teeth of calyx connivent. Corolla hardly exceeding the calyx, purplish blue.

Spanish Ziziphora. Fl. June. Clt. 1759. Pl. ½ to 1½ foot.

5 Z. acinoi'des (Lin. spec. p. 31.) annual; leaves on short petioles, broad-ovate: floral ones similar to the others, longer than the calyxes; whorls few, distinct, axillary, loose, 6-10-flowered; calyxes pedicellate. ⊙. H. Native of Spain. Allied to *Z. Hispánica*; but the stems are longer and looser, the flowers larger, and the calyxes pilosely hispid.

Acinos-like Ziziphora. Fl. July, Aug. Clt. 1786. Pl. ½ foot.

6 Z. capita'ta (Lin. spec. p. 31.) leaves lanceolate, narrowed at the base: floral ones very broad, rhomb-ovate, acuminated; whorls approximating into a terminal, nearly globose head; calyxes pilosely hispid. ⊙. H. Native of the region of the Mediterranean, as of the south of Russia, in fields and on hills; on Mount Atlas, in cultivated ground; Spain; south of Italy, Armenia, Caucasus, Island of Cyprus, Tauria; Soongarian mountains, in Siberia, &c. Rudolph. in mem. acad. sc. petrop. 2. p. 308. t. 10. Lam. ill. t. 18. f. 3. Sibth. et Smith, fl. græc. 1. p. 10. t. 13.—Buxb. cent. 3. p. 28. t. 51. f. 1.—Mor. hist. sect. 11. t. 8. f. 5. Herb divaricately branched, pubescent. Floral leaves ciliated. Corolla a little longer than the calyx, red: tube slender, exserted. Stamens equalling the corolla.

Capitate-flowered Ziziphora. Fl. July, Aug. Clt. 1752. Pl. ½ to 1½ foot.

7 Z. tenu'ior (Lin. spec. p. 31.) leaves lanceolate, narrowed at the base; floral leaves almost conform to the rest; whorls all distinct, axillary; calyx very pilose, hispid; corolla exserted a very little from the calyx. ⊙. H. Native of the region of the Mediterranean; of the south of Russia, on hills; Spain, Mount Atlas, Caucasus, Altaia, &c. Lam. ill. t. 18. f. 2. S. spicàta, Cerv. ann. sc. matr. 4. p. 259. Z. serpyllàcea, Tenore, syll. p. 16.? but not of Bieb. Branches numerous, pubescent. Leaves 1 inch long, quite entire or denticulated, ciliated on the margins and middle nerve, especially the upper ones, rarely all

naked; floral leaves longer than the flowers. Teeth of calyx connivent. Corolla purplish. Stamens inclosed.

Slenderer Ziziphora. Fl. June, July. Clt. 1752. Pl. ½ to 1 foot.

8 Z. Tau'rica (Bieb. fl. taur. 3. p. 259.) leaves lanceolate, narrowed at the base: floral ones similar to the others; whorls all distinct, axillary; calyx very pilose, hispid; corolla twice as long as the calyx. ⊙. H. Native of Tauria, in dry gravelly places; Arabia and Persia. Corollas reddish purple. Very like *Z. tenùior*, but differs in the corollas being as large as those of *Thymus alpìnus*.

Taurian Ziziphora. Fl. June, Sept. Clt. 1816. Pl. ½ foot.

† *A doubtful species.*

9 Z. Java'nica (Blum. bijdr. p. 822.) flowers capitately spicate, terminal; bracteas subulate, ciliated; calyxes villous; leaves petiolate, ovate, erosely and coarsely serrated, clothed with prostrate pubescence on both surfaces. ⊙. ? H. Native of Java, in the province of Cheribon, on the top of the burning Mount Tjerimai. Upper lip of corolla reflexed, entire: lower one 3-lobed. Stamens 2, hardly exserted. Stigma unequally bifid.

Java Ziziphora. Pl. ?

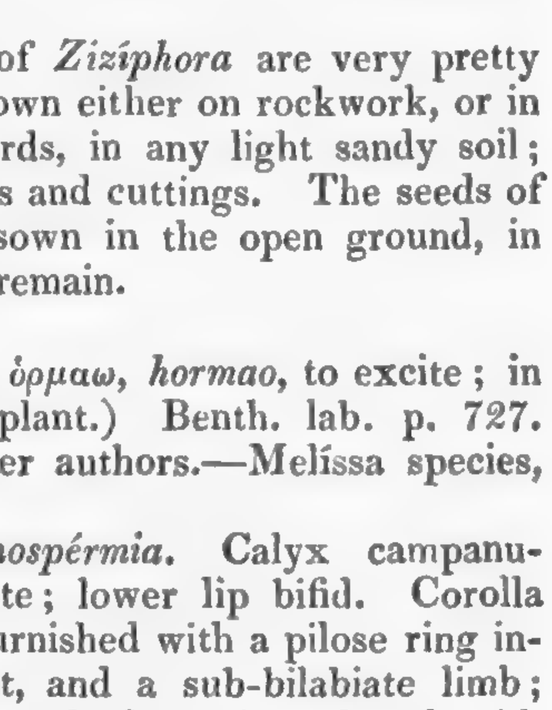
N.B. *Z. thymoìdes* of Rœm. et Schultes, is an imaginary species.

Cult. The perennial species of *Zizíphora* are very pretty rock plants. They should be grown either on rockwork, or in small pots well drained with sherds, in any light sandy soil; they are readily increased by seeds and cuttings. The seeds of annual species only require to be sown in the open ground, in April, where they are intended to remain.

XXXV. HORMI'NUM (from *ὁρμαω, hormao*, to excite; in allusion to the qualities of the plant.) Benth. lab. p. 727. Hormìnum species, Lin. and other authors.—Melíssa species, Jacq.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, bilabiate; upper lip tridentate; lower lip bifid. Corolla with an exserted tube, which is furnished with a pilose ring inside, an elongated widened throat, and a sub-bilabiate limb; the upper lip truncate, emarginate: the lower lip 3-lobed, with broad, short, rounded segments. Stamens 4, all fertile, ascending, didynamous: lower ones the longest; anthers cohering by pairs, linear, with divaricate cells. Style shortly bifid at apex: lobes subulate; stigmas minute. Achenia smoothish.—A tufted perennial herb, with numerous radical leaves, simple, almost naked stems, and purplish blue flowers.

FIG. 78.



1 H. Pyrena'icum (Lin. spec. p. 831.) ♃. H. Native of the temperate parts of Europe, on the mountains; as of the Pyrenees, Alps of Vallais and Salisburgh, &c. Sweet, fl. gard. 3. t. 252. Melíssa Pyrenàica, Jacq. hort. vind. 2. t. 183. Lam. ill. t. 515. Leaves almost all radical, petiolate, ovate, obtuse, deeply crenated, truncate at the base, or subcordate, veiny, green on both surfaces, glabrous, or rather hispid on the nerves. Floriferous stems erect, simple, furnished with 1 or 2 pairs of small, sessile, crenated leaves. Whorls distant, 6-flowered, secund. Floral leaves bractea-formed, shorter than the calyxes. Flowers on short pedicels, nutant. Calyx 13-nerved, often coloured at top, glabrous or hispid on the nerves; lips spreading: teeth acute. Corolla bluish purple, 9-10 lines long (fig. 78.)

Pyrenean Horminum. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

Cult. This is a very elegant plant when in blossom. It will grow in the open border, and is readily increased by dividing at the root, or by seed. In severe winters it is sometimes liable to be killed by damp; therefore a reserve plant or two should be grown in pots, so that they may be protected by placing them under a frame in winter.

Tribe IV.

SATUREI'NEÆ (so called from containing genera agreeing with *Saturèia* in the characters given below.) Benth. lab. p. 324. Calyx 5-toothed, equal or bilabiate, with the upper lip tridentate, and the lower one bifid. Tube of corolla exannulate inside, shorter, or scarcely longer than the imbricate calyx and bracteas; limb of corolla sub-bilabiate: upper lip flat, entire, or emarginately bifid: lower lip spreading, trifid, with flat, nearly equal lobes; or the middle lobe is rather the broadest. Stamens distant, straight, diverging, or scarcely ascending, equal, or the upper ones are shorter or abortive. The tetrandrous genera of this tribe are intermediate between tribe *Menthoìdeæ* and *Melissíneæ;* but the corolla is more decidedly bilabiate than in the former tribe; and the stamens are seldom ascending, as in the latter; from most genera of which they are also distinguished by the shortness of the tube of the corolla. The diandrous genus *Cunìla* connects tribe *Monárdeæ* with *Melissíneæ*.

XXXVI. BYSTROPO'GON (from *βυω, byo*, to close; and *πωγων, pogon*, a beard; the throat of the calyx is closed by villi inside.) Benth. lab. p. 324.—Bystropògon species, L'Her. sert. angl. 19.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx 10-13-nerved, campanulate or tubular, equal, 5-toothed; throat villous inside. Corolla with an inclosed tube, and sub-bilabiate limb; upper lip erectish, bifid; lower lip spreading, trifid: lobes all flat and entire. Stamens 4, erect, distant, shorter than the corolla, didynamous: lower ones the longest; filaments glabrous; anthers 2-celled: cells parallel. Disk equal, glandless. Style shortly bifid at apex: lobes nearly equal, linear, a little thickened, obtuse, stigmatiferous at top. Achenia dry, smooth.—Shrubs. Flowers small, cymose in the first section; the cymes dichotomous, subcorymbose, or panicled; in the second section, disposed in dense spicate whorls. Bracteas lanceolate or subulate. This genus is scarcely distinct from *Méntha*.

Sect. I. Bystropògon (see genus for derivation.) Benth. lab. p. 325. Calyx campanulate, 10-nerved. Flowers loosely cymose.

1 B. puncta'tus (L'Her. sert. angl. p. 20. t. 23.) leaves crenated, green on both surfaces, glabrous, or hardly tomentose beneath; cymes axillary, pedunculate, corymbose; calycine teeth ovate. ♄. G. Native of Madeira. Branches glabrous or pubescent. Leaves 1 to 1½ inch long. Corollas downy outside, pale purple. ?

Dotted Bystropogon. Fl. July, Sept. Clt. 1775. Shrub 2 to 3 feet.

2 B. Canarie'nsis (L'Her. sert. angl. p. 20.) branches very villous; leaves crenated, villous or glabrous, green on both surfaces; cymes axillary, pedunculate, corymbose; calycine teeth

subulate, shorter than the tube. ♄. G. Native of the Canary Islands. Méntha Canariénsis, Lin. spec. 807. Heliotròpium Canariénse, &c., Comm. hort. amst. 2. p. 129. t. 65. Floriferous branches very hispid. Corollas white. Very like the preceding, but differs in the hairiness, and the more slender calycine teeth.

Canary-Island Bystropogon. Fl. June, Aug. Clt. 1714. Shrub 3 to 4 feet.

3 B. plumòsus (L'Her. sert. angl. p. 20. t. 22.) leaves serrately crenated, clothed with fine tomentum above, and white tomentum beneath; cymes axillary, dense; calycine teeth subulate. ♄. G. Native of the Canary Islands. Habit of *B. Canariénsis*. Leaves of *B. origanifòlius*. Floral leaves shorter than the cymes. Corollas pale purple. ?

Plumose Bystropogon. Fl. June, July. Clt. 1779. Shrub 2 to 3 feet.

4 B. eria'nthos (Benth. lab. p. 727.) leaves serrated, green above, and glabrous, and hardly tomentose beneath; cymes pedunculate, corymbose; calycine teeth ovate; corolla more than twice as long as the calyx, villous outside. ♄. G. Native of the Island of Juan Fernandez, Graham.—A humble shrub, with the habit of *B. punctàtus;* but the leaves are acute and serrated, and the flowers distinct. Tube of corolla inflated beyond the calyx.

Woolly-flowered Bystropogon. Shrub dwarf.

5 B. origanifòlius (L'Her. sert. angl. p. 20.) leaves almost quite entire, clothed with white tomentum beneath; cymes pedunculate, paniculately racemose; calycine teeth subulate. ♄. G. Native of the Canary Islands. Méntha plumòsa, Lin. mant. p. 273. Floriferous branches rather tomentose. Superior floral leaves much shorter than the flowers. Flowers of *B. Canariénsis*, but the calyxes and pedicels are less hispid.

Marjoram-leaved Bystropogon. Fl. July, Aug. Clt. 1815. Shrub 2 to 3 feet.

Sect. II. Minthóstachys (from *μινθα, mintha,* mint; and *σταχυς, stachys,* a spike; the whorls of flowers are spicate, like those of some species of mint.) Benth. lab. p. 325. Calyx 13-nerved, tubular. Whorls densely spicate. This section is intermediate between *Bystropògon* and *Pychnánthemum*.

6 B. spica'tus (Benth. lab. p. 326.) leaves subserrated, green on both surfaces, glabrous; whorls dense, spicate; calycine teeth ovate. ♄. G. Native of Peru, at Parrochuca, Mathews. Shrub quite glabrous. Leaves 1 to 1½ inch long; floral leaves much smaller, clothed with hoary tomentum on both surfaces. Whorls 6-10-flowered. Calyx very villous. Corolla hardly longer than the calycine teeth. A fifth fertile stamen sometimes occurs in this species.

Spicate-flowered Bystropogon. Shrub.

7 B. tomentòsus (Benth. lab. p. 326.) leaves a little crenated, green above, and rather hispid, at length glabrous, but clothed with tomentose wool beneath; whorls dense, subspicate; calycine teeth subulate. ♄. G. Native of Peru, Ruiz. et Pav. Young branches villous. Cauline leaves 1-2 inches long, rounded at the base, obtuse and acute, white or rufescent beneath; floral leaves gradually smaller: upper ones hardly exceeding the calyxes, and clothed with soft villi on both surfaces. Corollas like those of *B. spicàta*.

Tomentose Bystropogon. Shrub.

8 B. ca'nus (Benth. lab. p. 326.) leaves ovate-lanceolate, a little toothed, canescent beneath; lower whorls distinct: upper ones subspicate; calycine teeth subulate. ♄. G. Native of Peru, Ruiz. et Pav. Branches villous, slender. Leaves an inch long, acute, cuneately rounded at the base. Flowers smaller than in the preceding.

Hoary Bystropogon. Shrub.

† *A doubtful species.*

9 B. denta'tus (Poir. suppl. 1. p. 755.) leaves ovate, hairy, serrated; whorls of flowers hispid. ♄. ? G. Native of Peru. Probably a species of *Hyptis*.

Toothed-leaved Bystropogon. Shrub. ?

Cult. The species of *Bystropògon* are shrubs of no beauty; their culture is that of other common greenhouse plants, and they are readily increased by cuttings.

XXXVII. PYCHNA'NTHEMUM (from *πυχνος, pychnos,* dense; and *ανθεμις, anthemis,* a flower; the flowers are disposed in dense whorls.) Michx. fl. bor. amer. 2. p. 7. Benth. lab. p. 326.—Brachystèmum, Michx. fl. bor. amer. 2. p. 5.—Koéllia, Mœnch. meth. 407. Túllia, Leavenworth, in Sill. journ. sc. vol. 20. p. 343.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate or tubular, somewhat 13-nerved; teeth nearly equal, straight, or the 3 upper ones are joined at the base into an upper lip; throat naked inside. Corolla with the tube equalling the calyx, and the limb sub-bilabiate; the upper lip straight, flat, entire, or shortly emarginate; the lower lip flat, trifid: lobes all ovate, obtuse. Stamens 4, nearly equal, or the lower ones are rather the longest, straight, diverging, exserted, or inclosed; anthers 2-celled: cells parallel. Style almost equally bifid at top: lobes subulate, stigmatiferous at top. Achenia dry, smooth, or minutely dotted.—Perennial, stiff, usually canescent herbs, paniculately corymbose at top. Whorls few, dense, many-flowered, propped by bracteas, usually forming a terminal head, sometimes one or more disposed along the stem beneath. Corollas white or purplish; the lower lip usually dotted with purple.

Sect. I. Tu'llia (meaning unknown to us.) Benth. lab. p. 327. Calyx ovate-tubular, somewhat bilabiate, with usually subulately awned teeth. Whorls few, ample, often loose; cymes much branched, many-flowered. Outer bracteas foliaceous: inner ones subulate. Leaves petiolate.

1 P. inca'num (Michx. fl. bor. amer. 2. p. 7.) leaves on short petioles, ovate-oblong, acute, remotely serrated, rounded at the base, pubescent, clothed with white tomentum beneath; whorls many-flowered, dense, cymose; bracteas linear, or the outer ones are lanceolate; calycine teeth acute, a little awned, nearly equal. ♃. H. Native of North America, in cornfields and among bushes from Canada to Carolina. Oríganum incànum, Walt. fl. car. p. 165. ? Clinopòdium incànum, Lin. spec. p. 822.—Dill. elth. 1. p. 87. t. 74. Plant pubescent. Leaves 1½ inch long. Corollas whitish, tinged with red. Stamens exserted.

Hoary Pychnanthemum. Fl. July, Oct. Clt. 1732. Pl. 1½ to 3 feet.

2 P. Tu'llia (Benth. lab. p. 328.) leaves petiolate, oblong, acute, a little serrated, narrowed at the base, pubescent on both surfaces, pale beneath; whorls many-flowered, cymose; bracteas linear: outer ones oblong, awned; calyx bilabiate: teeth acute, a little awned; corolla glabrous inside. ♃. H. Native of Tenessee. Túllia pychnanthemoìdes, Leavenworth, in Sill. amer. journ. sc. vol. 20. p. 343. t. 5. Plant pubescent. Leaves 2 inches long. Tube of corolla a little longer than the calyx. Stamens exserted.

Tullia Pychnanthemum. Pl. 1½ foot.

3 P. Lomi'sii (Nutt. acad. nat. sc. phil. 7. p. 100.) leaves petiolate, ovate, somewhat serrated, acute, short, glabrous above; flowers cymose, propped by many bracteas; bracteas lanceolate,

acuminated, hoary; calycine teeth short, acuminated, pilose at top; flowers spotted. ♃. H. Native of Georgia. Allied to *P. lanàta;* but readily distinguished from it, in the shorter, more glabrous leaves, more humble stature, and spotted flowers. Cymes large, usually terminal. Bracteas canescent. Corolla white or pale red, spotted with red.—A beautiful species, having the fragrance of *Penny-Royal.*

Lomis's Pychnanthemum. Pl. ½ to 1 foot.

4 P. ARISTA'TUM (Michx. fl. bor. amer. 2. p. 8. t. 33.) leaves on short petioles, oblong, acute, a little serrated, rounded at the base, glabrous on both surfaces, or scarcely tomentose; whorls many-flowered, dense; bracteas very acute: outer ones oblong: inner ones subulate; calycine teeth equal, acute, a little awned; corolla pubescent inside. ♃. H. Native from Maryland to Upper Carolina. P. verticillàtum, Pursh, fl. amer. sept. 2. p. 410. exclusive of the syn. of Michx. Orìganum clinopodioìdes, Walt. fl. car. ex Pursh. l. c. Herb a little branched, quite glabrous, pale green. Leaves 1½ to 2 inches long. Corolla hardly longer than the calyx, whitish. Stamens a little exserted.

Awned-calyxed Pychnanthemum. Fl. Aug. Clt. 1752. Pl. 1 foot.

5 P. TORRE'I (Benth. lab. p. 329.) leaves on short petioles, oblong-lanceolate or linear, acute, scarcely serrated, narrowed a long way at the base, almost glabrous; whorls dense, subcorymbose; bracteas oblong or subulate, awned; calycine teeth nearly equal, subulate; corolla pubescent inside. ♃. H. Native of the State of New York, near Princeton, Torrey; and of South Carolina, Mitchell. Stem a little branched, pubescent. Leaves 1 to 2½ inches long, green, finely downy on the veins. Calyxes and bracteas clothed with soft villi. Stamens exserted.

Torrey's Pychnanthemum. Pl. 1 to 2 feet.

6 P. HYSSOPIFÒLIUM (Benth. lab. p. 329.) leaves almost sessile, oblong-lanceolate or linear, obtuse, nearly quite entire, glabrous, or clothed with fine tomentum; whorls few, many-flowered, rather loose; bracteas subulate, awned: outer ones oblong; teeth of calyx nearly equal, subulate, stiff; corolla almost glabrous inside. ♃. H. Native of Virginia, Carolina, Georgia, and Louisiana. P. setòsum, Nutt. in journ. acad. sc. phil. 7. p. 100.? Herb a little branched, usually canescent from fine tomentum. Leaves an inch long, very rarely subserrated, with often fascicles of smaller ones in the axils. Bracteas exceeding the calyxes. Flowers similar to those of *P. aristàtum.*

Hyssop-leaved Pychnanthemum. Pl. 1 to 1½ foot.

SECT. II. BRACHYSTE'MON (from βραχυς, *brachys*, short; and στημων, *stemon*, a stamen.) Benth. lab. p. 329. Calyx ovate, with short equal teeth. Whorls dense, numerous, head-formed, almost all terminal and panicled. Bracteas oblong, lanceolate, or subulate, adpressed. Leaves usually sessile.

7 P. MU'TICUM (Pers. ench. 2. p. 128.) pubescent; stem panicled at top; leaves sessile, ovate-lanceolate, acute, a little serrated, rounded at the base, stiff: upper ones white on both surfaces; whorls very dense, capitate; bracteas ovate-lanceolate; calyxes bluntly and almost equally toothed; throat of corolla villous inside. ♃. H. Native of Upper Carolina; at St. Louis and West Chester, Drummond; Arkansas, Nuttall. Stems branched, green, villous, pubescent, or almost glabrous, as well as the lower leaves; but the upper leaves and whorls are white from tomentum. Leaves sometimes all entire, but the lower ones are usually serrated. Corolla white; lower lip dotted with purple.

Mutic Pychnanthemum. Pl. 1 to 2 feet.

8 P. PILÒSUM (Nutt. gen. amer. 2. p. 33.) stem pilose, branched a little at top; leaves lanceolate, pilose beneath, with prominent veins, obscurely denticulated; bracteas length of calyxes, clothed with hoary pubescence; heads larger than in *P. lanceolàtum.* ♃. H. Native of Kentucky and Tenessee, in valleys. Beck, in Sill. amer. journ. sc. 14. p. 117. Stems and leaves more or less pilose. Heads terminal, large. Bracteas and calyxes villous, mutic. Stamens exserted. Corolla pubescent, spotless. Said by Bentham to be the same as *P. mùticum.*

Pilose Pychnanthemum. Pl. 1 to 2 feet.

9 P. LANCEOLA'TUM (Pursh, fl. amer. sept. 2. p. 410.) stem panicled at top, with pubescent angles; leaves sessile, ovate-lanceolate or lanceolate, quite entire, rounded at the base, stiff, almost glabrous; whorls dense, numerous, villous; bracteas ovate-lanceolate; calyxes bluntly and unequally toothed; throat of corolla villous inside. ♃. H. Native of Pennsylvania, even to Upper Carolina, among the mountains. Allied to *P. mùticum;* but differs in the stem being more glabrous, and in the leaves being quite entire and all green. Stem often purplish. Leaves sometimes glabrous and sometimes villous. Corolla usually spotted, but sometimes also spotless.

Var. α, latifòlium (Benth. lab. p. 330.) leaves broader. ♃. H. Brachystèmum verticillàtum, Michx. fl. bor. amer. 2. p. 6. t. 31. Thymus verticillàtus, Poir. dict. 7. p. 653. P. verticillàtum, Pers. ench. 2. p. 128.

Var. β, angustifòlium (Benth. lab. p. 330.) leaves narrower. ♃. H. Népeta Virgínica, Willd. spec. 3. p. 56. Brachystèmum Virgínicum, Michx. fl. bor. amer. 2. p. 6. P. Virgínicum, Pers. ench. 2. p. 128. Brachystèmum lanceolàtum, Willd. enum. 2. p. 623. Thymus lanceolàtus, Poir. suppl. 5. p. 305.

Lanceolate-leaved Pychnanthemum. Fl. July, Aug. Clt. 1812. Pl. 1 to 2 feet.

10 P. LINIFÒLIUM (Pursh, fl. amer. sept. 2. p. 409.) glabrous; stem panicled at top; leaves sessile, linear, quite entire, stiff; whorls dense, numerous, terminal, almost glabrous; bracteas linear, acute, stiff; calycine teeth lanceolate-subulate, short, acute, stiff; corolla villous inside at the throat. ♃. H. Native from New England to Carolina; Georgia, and New Orleans. P. tenuifòlium, Schrad. in Steud. nom. 669.? Thymus Virgínicus, Lin. syst. p. 453. Brachystèmum linifòlium, Willd. enum. p. 623. Koéllia capitàta, Mœnch. meth. p. 408. Orìganum flexuòsum, Walt. fl. car. p. 165. ex Pursh.—Herm. par. 218.? Habit of *P. mùticum.* Margins of leaves subrevolute. Stamens a little exserted. Corolla whitish.

Flax-leaved Pychnanthemum. Fl. July, Aug. Clt. 1739. Pl. 1 to 2 feet.

11 P. NU'DUM (Nutt. gen. amer. 2. p. 34.) plant glabrous, pale green; stems nearly simple, strict; leaves sessile, ovate-oblong, obtuse, quite entire, rounded at the base; whorls loose, terminal, corymbosely panicled, glabrous; outer bracteas lanceolate-linear: inner ones very short and subulate; corollas pubescent inside. ♃. H. Native of Carolina and Georgia, on the mountains. Stems more simple and strict than in other species. Leaves erect, with subrevolute edges, scarcely an inch long. Corymbs dense. Corolla pubescent, pale.? Stamens exserted from the tube, shorter than the limb.

Naked Pychnanthemum. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 feet.

Cult. Plants of easy culture, very fragrant, but of little beauty. The species are readily increased by dividing at the root or by seed; and they thrive best in a peat border.

XXXVIII. MONARDE'LLA (a dim. of Monárda.) Benth. lab. p. 331. Pychnánthemum species, Michx. and other authors.

LIN. SYST. *Didynàmia, Gymnospérmia.* Calyx ovate-tubular, often elongated, 10-13-nerved, 5-toothed: teeth short, nearly

equal, erect; throat naked inside. Corolla with the tube equalling the calyx, or a very little exserted; throat glabrous inside; limb sub-bilabiate: upper lip bifid: lower lip trifid: lobes all oblong or linear, flat, nearly equal. Stamens 4, nearly equal, or the lower ones are the longest, straight, diverging, exserted; anthers 2-celled: cells parallel, at length diverging or divaricate. Style shortly bifid at apex; stigmas minute. Achenia dry.—Perennial herbs. Whorls large, almost globose, propped by broad bracteas, solitary, terminal. Habit different from *Pychnánthemum*, although nearly allied in characters.

1 M. monta'na (Benth. lab. p. 331.) stem erect; leaves sessile, ovate-lanceolate, acute, serrated, rounded at the base; whorls densely globose, large; outer bracteas broad-ovate, acute; calyxes tubular, almost equally toothed. ♃. H. Native of North America, on the high mountains of Carolina. Pychnánthemum montànum, Michx. fl. bor. amer. 2. p. 8. Leaves sessile, and whorls large. Corollas purple, spotted.

Mountain Monardella. Pl. 1 to 1½ foot.

2 M. Carolinia'na (Benth. lab. p. 332.) very hairy; leaves abruptly-petiolate, somewhat cordately-oval, serrated; heads involucrated by coloured bracteas; bracteoles ciliated; calyxes bearded at top. ♃. H. Native of Carolina, on the high mountains. Pychnánthemum Monardélla, Michx. fl. bor. amer. 2. p. 8. t. 34. Habit of *Monárda fistulòsa*, ex Michx. Leaves more than an inch long, acuminated. Bracteas twice as long as the calyxes. Corollas small, pale red. Pychnánthemum Monardélla, Pursh, is nothing but *Monárda fistulòsa*.

Carolinian Monardella. Fl. July, Aug. Clt. 1816. Pl. 2 to 3 feet.

3 M. odoratíssima (Benth. lab. p. 332.) stems procumbent; leaves almost sessile, oblong-lanceolate, narrowed at both ends, quite entire, hoary; whorls densely-globose, large, solitary; outer bracteas broad-ovate, very blunt, coloured; calyx tubular, elongated, almost equally toothed. ♃. H. Native of North West America, in rocky places, at the Columbia river, and on rocks among the White Mountains, Douglas. Plant suffruticose, branched, purplish at the base. Leaves hardly half an inch long, clothed with hoary tomentum on both surfaces. Corolla rose-coloured, glabrous: tube a little exserted.

Very sweet-scented Monardella. Pl. procumbent.

4 M. undula'ta (Benth. lab. p. 332.) stem procumbent at the base; branches ascending; leaves oblong-linear, obtuse, with undulately-curled edges, narrowed a short way into the petioles, green on both surfaces, glabrous; whorls densely-globose, large, solitary; outer bracteas broad-ovate, acute, membranous, mutic; calyx tubular, elongated, almost equally toothed, mutic. ♃. H. Native of North California, Douglas. Stems perennial or suffruticose at the base. Branches purplish, glabrous, or downy. Leaves thickish, 1-nerved, usually fascicled in the axles, ½ to 1 inch long. Heads and flowers as in the preceding. Calyxes villous at top.

Undulated-leaved Monardella. Pl. ½ to 1 foot.

5 M. Dougla'sii (Benth. lab. p. 332.) stem procumbent at the base; leaves petiolate, lanceolate, or linear, narrowed at both ends, green, pubescent; whorls densely-globose, large, solitary; outer bracteas ovate-lanceolate, exceeding the calyxes, aristately-subulate; calyx ovate-tubular, inflated, villous, with nearly equal, awned teeth. ♃. H. Native of North California. Herb pubescent, divaricately-branched; branches purplish. Leaves one inch long, flattish. Heads an inch in diameter. Segments of corolla and genitals shorter than in *M. odoratissima* and *M. undulàta*.

Douglas's Monardella. Pl. ½ foot.

Cult. For culture and propagation, see *Pychnánthemum*, p. 763.

XXXIX. AMARA'CUS (Αμαρακος, *amaracos*, the Greek name of Dittany, of Crete.) Mœnch. ex Benth. lab. p. 333. Oríganum, spec. of Lin. and other authors.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx ovate-campanulate, 13-nerved at the base; upper lip elongated, entire, erect; lower lip truncate, almost wanting, or very shortly bidentate; throat naked inside. Tube of corolla exserted from the calyx, equalling the imbricate bracteas; limb bilabiate; the upper lip erect, emarginate, flattish: the lower lip spreading, trifid, with nearly equal, entire lobes. Stamens 4, erect, ascending, scarcely distant, exserted, didynamous: lower ones the longest; filaments glabrous; anthers 2-celled: cells distinct, diverging, or divaricate. Upper lobe of style short; stigmas minute.—Shrubs with quite entire leaves. Flowers aggregate into oblong spikelets. Bracteas orbicular, membranous, coloured, loosely-imbricate, much longer than the calyxes, equalling the tubes of the corollas. This genus differs from *Oríganum*, from which it has been separated, in habit, calyx, corolla, &c.

1 A. dicta'mnus (Benth. lab. p. 333.) leaves almost sessile, clothed with dense wool on both surfaces, as well as the branches. ♄. F. Native of Candia, on rocks, and elsewhere in Greece. A. tomentòsus, Mœnch. Oríganum Dictámnus, Lin. spec. 823. Curt. bot. mag. t. 298.—Blackw. t. 462.—Sabb. hort. rom. 3. t. 76. Dictámnus Créticus, Bauh. pin. p. 222. Branches ascending. Leaves broad-ovate, obtuse, quite entire, rounded at the base, thick; floral leaves small, almost glabrous. Corolla without a spur, purple. Heads of flowers nutant. The fabulous qualities attributed to this plant (Dictámnus) may be seen in Virgil's 12th Æneid, and in Cicero's de Natura Deorum, 2. p. 50.

Dittany of Crete. Fl. June, Aug. Clt. 1551. Shrub 1 foot.

2 A. Tournefórtii (Benth. lab. p. 333.) leaves sessile, orbicular, sub-cordate at the base, and are, as well as the branches, quite glabrous or ciliated. ♄. F. Native of the Grecian Archipelago; as in the island of Amorgos, on rocks; and of the Levant. Oríganum Tournefórtii, Ait. hort. kew. ed. 1st. vol. 2. p. 311. Andr. bot. rep. t. 537. Sibth. et Smith, fl. græc. 6. p. 56. t. 569. Oríganum calcaràtum, Juss. ex Steud. nom. p. 572. Oríganum dictamni Cretici facie, folio crasso, nunc villoso, nunc glabro, Tourn. cor. 13. itin. 1. p. 240. with a figure. This differs from the preceding in being glabrous; in the spikes being more dense; in the bracteas being broader, and the genitals a little shorter. Lower lip of calyx distinctly bidentate. Corollas purple, furnished with a small obtuse spur under the throat. Habit of *Rhodìola ròsea*.

Tournefort's Amaracus, or Dittany of Amorgos. Fl. Aug. Sept. Clt. 1788. Shrub ½ foot.

Cult. The species of this genus are liable to be killed by severe frosts if allowed to remain in the open air; but in common winters, if planted against a south wall in a dry soil, will survive. It is, however, proper to keep a few reserve plants in pots, that they may be protected by placing them in a greenhouse or frame. A rich light soil suits them best; and cuttings are readily rooted under a hand-glass.

XL. ORI'GANUM (said to be derived from *ορος*, *oros*, a mountain; and *γανος*, *ganos*, joy, the delight of the mountain. Oríganum of Pliny, and Οριγανον of Theophrastus and Dioscorides.) Benth. lab. p. 334. Oríganum, species of Lin. and other authors.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx ovate-tubular, 10-13-nerved, striated; teeth 5, equal, or the 3 superior ones are rather the longest; throat villous inside. Corolla having the tube equal in length to the calyx, or hardly longer than it; limb sub-bilabiate; the upper lip erectish, emarginate; the lower lip spreading and trifid, with nearly equal lobes. Stamens 4, exserted, distant, somewhat didynamous, the lower ones

the longest. Style almost equally bifid at top; stigmas minute. Achenia dry, smoothish.—Herbs. Leaves quite entire, or a little toothed. Flowers collected into cylindrical or oblong spikelets. Bracteas imbricate, coloured, covering the calyxes, but more loose than in the genus *Marjoràna*.

1 O. Sipy'leum (Lin. spec. 833.) stems decumbent, paniculately-branched at top; leaves on short petioles, quite entire: lower ones roundish, hispid, or woolly: upper ones ovate, quite glabrous, glaucous; spikelets oblong, solitary, or by threes, nutant; bracteas loose, ovate, coloured; calyx quite glabrous, having the three superior teeth longer. ♄. F. Native of the Levant and Greece; on Mount Sipylos in Phrygia; and between Smyrna and Bursa, Sibthorp. Near Aleppo, Russell. On Mount Delphus, Sibthorp. O. hýbridum, Mill. dict. no. 12. O. Sipỳleum, Sibth. et Smith, fl. græc. 6. p. 57. t. 570. Oríganum, montis sipyli, Herm. lugdb. 462. t. 463. Oríganum Sipỳleus, marjoranæ foliis, Mor. hist. 3. p. 357. sect. 11. t. 4. f. 2. Procumbent at the base. Sterile branches short, very villous. Leaves thick, woolly on both surfaces. Floriferous stems glabrous, with a few remote leaves. Tube of corolla equalling the calyx. Corolla pale purple. ?

Sipylos Marjoram. Fl. June, Sept. Clt. 1699. Shrub 1 to 1½ foot.

2 O. compa'ctum (Benth. lab. p. 334.) humble, almost simple; leaves nearly sessile, ovate, obtuse, scarcely serrated; spikes densely capitate, cylindrical; bracteas elongated, lanceolate, acute, coloured, twice as long as the calyx. ♄. F. Native near Tangiers, Salzmann. O. glandulòsum, Salzm. pl. exsic. but not of Desf. Stems rising from a suffruticose base, simple. Leaves smaller and stiffer than in *O. vulgàre*, but the bracteas are a little larger, and all acute. Teeth of calyx bearded inside: the 3 upper ones rather the longest. Corolla pale purple. ?

Compact Marjoram. Pl. ½ to ¾ foot.

3 O. vulga're (Lin. spec. 824.) erect, villous; leaves petiolate, ovate, obtuse, serrated a little, rounded at the base, green on both surfaces; spikelets oblong or cylindrical, glomerate, corymbosely-panicled; bracteas ovate, obtuse, coloured, from half as long again as the calyx to twice as long. ♃. H. Native of Europe, North of Africa, and Middle Asia, by way-sides, in hedges, and in woods; plentiful in some parts of Britain; Caucasus, Siberia, Cashmere; also from Pennsylvania to Carolina, but probably escaped from gardens. Curt. lond. 3. with a figure, Woodv. med. bot. 451. t. 164. Oed. fl. dan. t. 638. Sab. hort. rom. 3. t. 75. Smith, engl. bot. 1143. O. stoloníferum, Bess. O. orientàle, Mill. dict. no. 5. O. decípiens, Wallr.—Blackw. t. 280.—Riv. mon. 60. f. 1. Habit very variable. Stems numerous, erect, more or less hairy, often reddish. Leaves more or less villous, rarely almost glabrous. Bracteas usually glabrous and reddish. Corolla exserted, usually purple, rarely white, with green bracteas. The wild marjoram is an aromatic and ornamental plant. The dried leaves, used instead of tea, are extremely grateful; they are also used in fomentations; the essential oil is so acrid that it may be considered as a caustic, and was formerly used with that intention by farriers. A little cotton moistened with it and put into the hollow of an aching tooth, frequently relieves the pain. The tops will dye linen of a reddish brown. This species is only used in cookery in default of one of the other marjorams.

Var. β, prismáticum (Gaud. ex Benth. lab. p. 335.) fructiferous spikes elongated, prismatic. ♃. H. Native of the region of the Mediterranean. O. heracleóticum, Rchb. fl. germ. exc. 313, but not of Lin. O. Créticum, Lin. spec. 823. O. macrostàchyum, Link, handb. 468. O. megastàchyum, Link, enum. 2. p. 114. ? O. latifòlium, Mill. dict. no. 3. This hardly differs from the species, except in the spikelets being elongated, and the flowers generally white; but they are also purple.

Var. γ. hùmile (Mart. Mill. dict. no. 8. Benth. lab. p. 335.) hardly half a foot high, nearly glabrous; leaves narrower, spikelets small, numerous, corymbose. ♄. H. Native of Asia, in shady places. O. hùmile, Mill. dict. no. 4. Poir. suppl. 4. p. 186. Corollas purple.

Var. δ, vìrens (Benth. lab. p. 335.) bracteas hardly coloured, usually pubescent. ♃. H. Native of Portugal and Cashmere. O. vìrens, Hoffm. et Link, fl. port. 1. p. 119. t. 9. O. oblongàtum, Link, enum. 2. p. 114. O. thymiflòrum, Rchb. fl. germ. exc. p. 313.

Common or Wild Marjoram. Fl. June, Oct. Britain. Pl. 1 to 2 feet.

4 O. norma'le (D. Don. prod. fl. nep. p. 113.) ascending, villous; leaves petiolate, ovate, bluntish, cuneately-rounded at the base, green on both surfaces; spikelets small, oblong, glomerate, corymbosely-panicled; bracteas lanceolate, acute, exceeding the calyxes a little. ♃. H. Native of the Himalaya, Cashmere, Nipaul, Kamaon, and Sirmore, Wall; and Siberia, at Lake Baical. Stems paniculately branched at top. Bracteas spreading, a little green, pubescent. Calyx of *O. vulgàre*, but the corolla is smaller, and probably purple. Stamens probably always inclosed.

Normal Marjoram. Fl. June, Aug. Clt. 1819. Pl. 1 to 2 feet.

5 O. heracleóticum (Lin. spec. p. 823.) plant erectish, glabrous or villous, glandular; leaves on short petioles, ovate, obtuse, quite entire, rounded at the base; panicle elongated; spikelets oblong or elongated, glomerate; bracteas ovate, acute, green, pubescent, equalling the calyxes. ♃. H. Native of the region of the Mediterranean; as on Mount Atlas, near Mascar; Calabria; some of the Grecian Islands; and about Smyrna and Constantinople; also about Odessa. O. glandulòsum, Desf. fl. atl. 2. p. 27. O. Smyrnæ'um, Sibth. et Smith, fl. græc. 6. p. 57. t. 571, but not of Lin. O. Créticum, Sieb. pl. exsic. and of other authors, but not of Lin.—Lob. icon. 492. A very variable species, dissimilar in habit to the others, but readily recognized by the bracteas being longer than the calyxes; by the loose spikes and small flowers. Stamens more or less villous. Leaves pale green, glabrous or pubescent. Flowers one half smaller than those of *O. vulgàre*, white. Bracteas often deciduous, usually pubescent. This, the winter sweet marjoram, requires a sheltered, dry soil, and seldom ripens seed in this country, and is usually propagated by slips or cuttings. Like other marjorams it is an aromatic, of sweet flavour, much used as relishing herbs in soups and broths, stuffings, &c. The young, tender tops and leaves together are used in summer in a green state, and they are dried for winter.

Var. β, hùmile (Benth. lab. p. 336.) ♃. H. O. parviflòrum, D'Urv. enum. pl. arch. in mem. soc. Lin. par. p. 327.

Heraclean, or Winter Sweet Marjoram, or Bastard Marjoram. Fl. June, Nov. Clt. 1640. Pl. 1 foot.

6 O. laxiflòrum (Royle, in Hook. bot. misc. 3. p. 376.) stem procumbent, villous; leaves on short petioles, broad-ovate, obtuse, almost entire, rounded at the base, green on both surfaces, pubescent; bracteas acute, rather longer than the calyxes, green, and are, as well as the flowers, disposed in very loose spikes. ♃. H. Native of the Himalaya at Nagkanda, Royle. Leaves like those of *O. vulgàre*, but differs otherwise from it in the stems being procumbent; and especially in the spikes being loose, not imbricated.

Loose-flowered Marjoram. Pl. procumbent.

7 O. Majóricum (Cambess. enum. pl. balear. p. 124.) stem loosely tomentose; leaves elliptic, pubescent; flowers fasciculate; calyx and corolla bilabiate. ♃. H. Native of the Balearic Islands, in arid places. Spikes very short, globose. Calyx glandular: upper lip deeply tridentate: lower lip shorter,

bipartite. Corolla rose-coloured, deciduous. Perhaps Thymus Richárdi, Pers. ?

Majorca Marjoram. Pl. 2 to 3 feet.

† *Doubtful species.*

8 O. puncta'tum (Poir. dict. suppl. 4. p. 186.) leaves ovate-lanceolate, dotted, glabrous; heads spherical, rather downy; bracteas acute, longer than the calyxes. ♃. H. Native country unknown. Stems glabrous. Leaves almost sessile, quite entire. Spikelets globose, size of peas. Bracteas rather pubescent. Corollas whitish. Perhaps a young specimen of *O. Heracleóticum*.

Var. β: leaves narrower, lanceolate. ♃. H.

Dotted-leaved Marjoram. Pl. 1 foot.

9 O. vestìtum (Clarke, trav. 2. p. 451.) leaves subcordate, ovate, petiolate, quite entire, tomentose on both surfaces, and very soft; spikes roundish-ovate, compact, tomentose, usually by threes. ♄. F. Native of Palestine, near Cana. Plant branched, suffruticose, hoary from tomentum. Calyx bilabiate, with a woolly throat. Corollas slender, glandularly dotted. Perhaps the same as *Marjoràna crassifòlia*.

Clothed Marjoram. Shrub branched.

10 O. salvifòlium (Roth, ex Steud. nom. p. 572.) Nothing is known of this plant but the name.

Sage-leaved Marjoram. Pl. ?

Cult. All the species are of easy culture and propagation. A sandy soil and dry situation suit them best. The herbaceous species are readily propagated by dividing at the root, and the shrubby kinds, by cuttings or slips, or by separating the rooted shoots.

XLI. MARJORA'NA (altered from the Arabic name *Maryamych*, but the marjoram of the Arabs is *Sálvia ceratophýlla*.) Mœnch. meth. 406. Benth. lab. p. 338. Oríganum species of Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx shortly campanulate at the base; limb cleft, complanately dilated above, quite entire, orbicular, with the margin implicate beneath at the base; throat naked inside. Corolla having the tube equalling the calyx, and the limb somewhat bilabiate; upper lip erectish, emarginate: lower lip spreading, trifid, with nearly equal lobes. Stamens 4, exserted, distant, somewhat didynamous: lower ones the longest; anthers 2-celled: cells parallel, diverging, or at length divaricate. Style almost equally bifid at apex; stigmas minute.—Perennial or suffruticose herbs, usually clothed with tomentose villi. Leaves quite entire or toothed. Flowers collected into short tetragonal spikelets. Bracteas orbicular, villous, not coloured, flat, equal in height to the calyxes, lying upon them, and closely imbricate.

1. M. microphy'lla (Benth. lab. p. 338.) suffruticose, procumbent; branches slender, almost glabrous, panicled; leaves small, remote, petiolate, broad-ovate, obtuse, rounded at the base, clothed with white tomentum; spikelets nearly globose, few, and sub-corymbose at the tops of the branches. ♄. F. Native of Candia, on the Sphaciotic Mountains. Oríganum Màru, Sibth. et Smith, fl. græc. 6. p. 59. t. 573. Sims, bot. mag. t. 2602. Oríganum microphýllum, Sieb. pl. exsic. crete. Branches purplish, smooth, filiform. Leaves not above a third the size of those of *M. horténsis*. Branches and calyxes clothed with tomentose villi, densely ciliated at apex. Corollas of *M. horténsis*.

Small-leaved Pot Marjoram. Shrub procumbent.

2 M. horte'nsis (Mœnch. meth. 406.) branches nearly glabrous, racemosely panicled; leaves petiolate, oblong-ovate, obtuse, quite entire, clothed with hoary tomentum on both surfaces; spikelets oblong, sessile, glomerate on the branchlets; ♄. in its native country, ⊙. in our gardens. H. Native of the North of Africa, near Mascar, on hills; and of Asia, on the Alps of Kamaon, Wall. Oríganum Marjoràna, Lin. spec. p. 824. Woodv. med. bot. 453. t. 165. Oríganum Marjoranoìdes, Willd. spec. 3. p. 137. Oríganum Wallichiànum, Benth. in Wall. pl. rar. asiat. 1. p. 31. Marjoràna crássa, Mœnch. meth. 406.? Oríganum Onìtes, Lam. dict. 4. p. 608. ex Dc. fl. fr. 3. p. 558. but not of Lin. Marjoràna vulgàris, Bauh. pin. 224. Amáracus vulgàtior, Lob. icon. 498. Oríganum acinacifòlium, Wallr. —Blackw. t 319.—Mor. hist. sect. 11. t. 3. f. 2. Branches tetragonal, pubescent, a little branched. Leaves half an inch long. Spikelets 3-5 together, nearly sessile. Bracteas and calyxes complanate, closely imbricate. Corollas small, purplish, or white. A variety of this species occurs in Miller's herbarium, under the name of O. Heracleóticum. This, the sweet or knotted marjoram, is a hardy annual in our gardens, although suffruticose in the places of its natural growth. As the seed seldom ripens in this country, it is generally procured from France. When in blossom the herb is cut over and dried for winter use; so that a sowing requires to be made every year. Like the other culinary kinds of marjoram, it is much used as a relishing herb in soups, broths, stuffings, &c. The young, tender tops and leaves are used together in summer in a green state, and they are dried for winter. For a seed-bed, 3 feet by 3 feet, a quarter of an ounce of seed will be sufficient. Sow in April on a compartment of light earth, either in small drills or broad cast; or sow a portion in a hot-bed, if requisite to have a small crop forwarded. When the plants are 1-2 or 3 inches high, thin the seed-bed, and plant those thinned out in a final bed, six inches apart, giving water; or where large supplies are required, some may remain thick, where sown, to be drawn off by the root as wanted. Sweet marjoram is a moderately-warm aromatic, yielding its virtues both to aqueous and spirituous liquors by infusion, and to water in distillation.

Garden Marjoram, or Sweet or Knotted Marjoram. Fl. June, July. Clt. 1573. Pl. 1 to 2 feet.

3 M. crassifòlia (Benth. lab. p. 339.) branches rather tomentose, racemosely-panicled; leaves sessile, ovate-elliptic, thick, clothed with soft tomentum; spikelets oblong, sessile, glomerate on the branches. ♄ F. Native of the Levant, Palestine, and Candia. Oríganum Màru, Lin. spec. p. 825, but not of other authors. Oríganum Ægyptìacum, of authors, but not of Lin. Habit of *M. horténsis*, from which it differs in the sessile, larger, thick leaves, which are densely clothed with tomentose wool on both surfaces, as well as the calyxes and bracteas. Corollas purplish.

Thick-leaved Marjoram. Fl. June, July. Clt.? Shrub 1 foot.

4 M. nervòsa (Benth. lab. p. 339.) erect, branches panicled, beset with spreading villi; leaves sessile, broad-ovate, almost quite entire, roundly-truncate at the base, or the lower ones are somewhat cordate, villous on both surfaces; spikelets oblong, small, sessile, glomerate on the branches. ♄. F., or ⊙. H. Native of Arabia and Egypt. Oríganum Syrìacum, Lin. spec. p. 824.? Oríganum Indicum Zatarhéndi, Alp. et Vesl. pl. ægypt. 31. t. 33. Màrum Syrìacum, Lob. icon. t. 499. Habit of *M. horténsis*, but the panicles are more divaricate and more branched. Leaves form of those of *M. onìtes*. Spikelets numerous, smaller, and more distinct than in *M. horténsis*. Calyxes and bracteas of *M. onìtes*. Corollas a little larger.

Nerved-leaved Marjoram. Fl. June, July. Clt. 1823. Pl. 1 foot.

5 M. Onìtes (Benth. lab. p. 339.) stems erect, nearly simple, hairy; leaves sessile, ovate, serrated a little, rather villous or

tomentose; spikelets small, ovoid, numerous, densely corymbose. ♄. F. Native of the eastern region of the Mediterranean; as of Dalmatia, Greece, and the neighbouring islands, &c. Oríganum Onìtes, Lin. spec. p. 824. Sibth. et Smith, fl. græc. 6. p. 58. t. 572. Oríganum Smyrnæ'um, Lin. spec. p. 843. Oríganum pállidum, Desf. hort. par. ed. 2d. p. 395. Pers. ench. 2. p. 129.—Bocc. mus. 2. p. 45. t. 38. Leaves half an inch long, usually cordate at the base. Corolla of *M. horténsis*, but a little smaller, whitish. This, the *pot-marjoram*, though hardy enough to stand our winters, seldom ripens its seeds in this country. It is in flower from July to November, and is propagated by seed, but chiefly from slips. It is used and cultivated for the same purposes as *sweet marjoram*.

Ass's or Pot Marjoram. Fl. July, Nov. Clt. 1759. Shrub 1 foot.

Cult. All the species of marjoram are shrubby if protected in winter; and they are readily increased by slips or cuttings. When any of them are sown to be reaped the same year treat them as recommended for *M. horténsis*, p. 766.

XLII. THY'MUS (from *θυμος*, *thymos*, of Theophrastus and Dioscorides; from *θυμος*, *thymos*, courage, strength, the smell of thyme being reviving; or from *θυω*, *thyo*, to perfume, because it was used for incense in the temples.) Benth. lab. p. 340. Thymus species, Lin. and other authors. Serpýllum, Pers. ench. 2. p. 130.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, 13-nerved, bilabiate; upper lip tridentate, spreading; lower lip bifid, with ciliated subulate segments; throat villous inside. Corolla having the tube inclosed in the calyx and imbricating bracteas, naked inside; limb sub-bilabiate; upper lip straight, emarginate, flattish; lower lip spreading, trifid, with equal lobes, or the middle lobe is longest. Stamens exserted, rarely inclosed, straight, distant, nearly equal or didynamous, lower two the longest; anthers 2-celled: cells parallel, or at length diverging. Style about equally bifid at apex; lobes subulate, stigmatiferous at apex.—Small, usually canescent under shrubs. Leaves small, quite entire, veiny, with usually revolute margins. Whorls few-flowered sometimes, all remote, and sometimes disposed in loose, dense, or imbricate spikelets. Bracteas minute. Flowers usually purplish, rarely white.

Sect. I. Mastichìna (so called from exhaling a scent like that of Mastich.) Benth. lab. p. 341. Calycine teeth, all subulate. Very nearly allied to the genus *Bystropògon*.

1 T. mastichìna (Lin. spec. 827.) plant diffuse, branched, pale green, or canescent; leaves petiolate, ovate or oblong, obtuse, narrowed at the base, naked, flat: upper and floral leaves broader; calyx villous, with plumose subulate teeth, which are longer than the tube. ♄. F. Native of Spain, Portugal, and Barbary, in sandy, uncultivated places. T. ciliàtus, Mœnch. ex Steud. nom. p. 836. Sampsùcus seu Màrum Mastichen redolens, Bauh. pin. p. 224. Màrum, Blackw. icon. t. 134. Riv. mon. t. 40. Leaves almost entire, canescent while young. Superior whorls approximating into a round head. Corolla whitish, usually shorter than the calycine teeth.

Mastich Thyme. Fl. July, Sept. Clt. 1596. Shrub 1 foot.

2 T. tomentòsus (Willd. enum. 2. p. 626.? Benth. lab. p. 341.) plant diffuse, branched, canescent; leaves scarcely petiolate, ovate or oblong, obtuse, narrowed at the base, naked, flat, clothed with hoary tomentum when young: floral leaves broad-ovate, a little imbricated; calyx very villous, having the teeth all subulate, plumose, and shorter than the tube. ♄. H. Native of Spain and the Algarves, Masson. T. marifòlius, Pourr. ex Willd. l. c. T. elongàtus, Link, enum. 2. p. 118.? This species differs from the preceding in the calyxes, and inflorescence. Heads small, numerous, almost globose.

Tomentose Mastich Thyme. Fl. June. Aug. Clt. 1816. Pl. 1 foot.

Sect. II. Serpy'llum (*ἑρπυλλον*, the Greek name of the wild thyme; from *ἑρπω*, *herpo*, to creep; in reference to the creeping stems.) Benth. lab. p. 342. Superior teeth of calyx lanceolate. Floral leaves almost of the same colour as the cauline leaves.

3 T. vulga'ris (Lin. spec. p. 825.) plant erect or procumbent at the base, clothed with hoary pubescence; leaves sessile, linear, or ovate-lanceolate, acute, with revolute edges, fascicled in the axils: floral leaves lanceolate, obtuse; whorls loose, rather distant; teeth of upper lip of calyx lanceolate, but the segments of the lower lip are subulate and ciliated. ♄. H. Native of the South West of Europe, in dry, arid, uncultivated places; as of Portugal, Spain, South of France, South of Germany, Italy, Piedmont, and Greece. Woodv. med. bot. 299. t. 109.—Blackw. icon. t. 211. Shrub much branched. Flowers purplish, smaller than those of *T. Serpýllum*. Upper whorls, or all, loosely approximate into a terminal head, or the 2 or 4 lower ones are remote.

There are two kinds of thyme cultivated for culinary purposes. The common and the lemon thyme. Of the garden or common thyme there are two varieties, the broad and narrow-leaved, besides the variegated, grown for ornament. The lemon thyme, *Thymus serpýllum*, var. *γ*, *citràtus*, is a low, trailing shrub, of a yellowish colour, having a strong scent of lemons. The young leaves and tops of both kinds are used in soups, stuffings, and sauces. For these purposes the broad-leaved common is generally preferred; but the flavour of the lemon thyme is much liked in peculiar dishes.

To raise thyme from seed is the general and most eligible method. It is occasionally multiplied by parting the roots of stocky close plants, and by slips of the young shoots. By seed, sow in March or April in a bed or border of light fine earth, either broad-cast, scattered thin and raked in lightly, which is the general course, or in small shallow drills, six inches asunder: the young plants may either remain, or be transplanted in the summer when 2 or 3 inches high. A portion may be drilled for an edging to a border. As soon as the plants are 3 or 5 inches in growth, in June or July, taking the opportunity of rain, thin them out, and plant 6 inches asunder, and water at planting. Others may be planted in a single row to form an edging to a border, either set close to form at once a full edging, or as far as 3 inches apart. Seedlings thus treated will come in for use the same year.

Those who raise considerable supplies of thyme for the markets usually sow large portions thickly in beds, to remain till of useful growth, then to be drawn off, root and top together, at different seasons as wanted; it is then tied in small bunches for market. Some persons also transplant considerable portions in spring and summer to 6-10 or 12 inches distance, to form a stocky full growth, to be drawn off in large bushy plants. Thyme is also propagated by slips of the branching shoots in the spring or early in autumn, but more especially by sections of the bush, or by removing rooted branches. Plant all these in light rich earth, and shade and water till rooted. In autumn, to provide against the effect of frosts on exotic evergreens, dry and house a store for winter; either cutting the tops or drawing the entire plants. Seed is produced abundantly in this country, and ripens in summer and autumn. Gather the seed spikes and spread them upon a cloth to dry; rub out clean, and put the seed up for sowing the following year.

Common or Garden Thyme. Fl. June, Aug. Clt. 1548. Shrub ½ to 1 foot.

4 T. tenuifòlius (Mill. dict. no. 2. Benth. lab. p. 728.) erect or procumbent at the base; branches pubescent; leaves

sessile, linear-subulate, acute, with revolute edges, fascicled in the axils, green, nearly glabrous; floral leaves lanceolate, obtuse; whorls distant; teeth of the upper lip of the calyx ovate, and the segments of the lower lip subulate. ♄. H. Native of the South of Spain, Pavon; near Cadiz, Picard. This differs from *T. vulgàris*, in the more slender, green, glabrous leaves, which are scarcely white from pubescence beneath.

Fine-leaved Thyme. Fl. June, Aug. Clt. 1548. Shrub ½ to 1 foot.

5 T. DIFFU'SUS (Salzm. pl. exsic. ex Benth. lab. p. 342.) procumbent; floriferous branches ascending, clothed with hoary pubescence; leaves sessile, linear or lanceolate-linear, fascicled in the axils, with revolute, naked margins, clothed with hoary tomentum on both surfaces; floral leaves similar to the others; whorls approximate into an oblong head; teeth of the upper lip of calyx lanceolate, acute: segments of the lower lip subulate, ciliated. ♄. F. Native of Gibraltar. T. ascéndens, Bernh. ex Rchb. fl. germ. exc. p. 313. Habit of *T. angustifòlius*. Leaves of *T. vulgàris*, of which it is probably a variety.

Diffuse Thyme. Shrub procumbent.

6 T. DECUSSA'TUS (Benth. lab. p. 342.) erect; stems much branched, pubescent; leaves sessile, ovate, obtuse, with revolute edges, clothed with fine tomentum: those of the sterile branches decussate; floral leaves similar to the rest; whorls few-flowered, capitellate; teeth of upper lip of calyx short, ovate, obtuse: segments of the lower lip subulate, ciliated. ♄. F. Native of Arabia, in the desert of Sinai, Bove. Old branches rather spiny. Whorls few, 2-4-flowered at the tops of the branches. Corollas small.

Decussate-leaved Thyme. Shrub erect.

7 T. BOVE'I (Benth. lab. p. 342.) erect; branches stiff, strict, villous; leaves on short petioles, ovate, obtuse, flattish, having the petioles and margins ciliated a little; floral leaves similar to the rest, adpressed; whorls few-flowered, spicate; upper lip of calyx large, shortly tridentate, and the segments of the lower lip subulate, ciliated. ♄. F. Native of the desert of Sinai, between Suez and Gaza, Bové; and between Aleppo and Bagdad, Olivier. Leaves almost like those of *T. piperélla*. Whorls about 6-flowered: lower one rather distant: upper whorls approximate, spicate. Calyx rather villous. Corolla of *T. Serpýllum*.

Bové's Thyme. Shrub ½ to 1 foot.

8 T. PIPERE'LLA (Lin. syst. p. 452. but not of Ait.) suffruticose, procumbent; branches ascending, stiff, pubescent; leaves petiolate, broad-ovate, obtuse, truncately subcordate at the base, not ciliated, thick, stiff, veiny, glandular: floral ones conforming to the others; calyx almost glabrous: teeth of upper lip short, ovate, and the segments of the lower lip subulate, ciliated. ♄. F. Native in the region of the Mediterranean; as of Barbary, Spain, Mount Parnassus, &c. T. gravèolens, Sibth. et Smith, fl. græc. 6. p. 61. t. 576. but not of Bieb.—Barr. icon. 694. ?—Bocc. mus. 2. p. 166. t. 117. ? Allied to *T. Serpýllum*. Corolla exceeding the calyx a little, purple. ?

Small-Peppermint Thyme. Fl. July, Aug. Clt. 1810. Shrub procumbent.

9 T. HERBABARÒNA (Lois. fl. gall. p. 360. t. 9.) procumbent, glabrous; floriferous branches shortly ascending; leaves on short petioles, ovate-lanceolate, acute, rounded at the base, ciliated a little; floral leaves conforming to the others; teeth of upper lip of calyx short, lanceolate, and the segments of the lower lip subulate, ciliated. ♄. H. Native of Corsica, Requien. T. affìnis, Sieb. pl. exsic. T. lùcidus, Guss. prod. fl. sic. suppl. 193. ? A'cynos hérba baròni, G. Don, in Loud. hort. brit. 239. Hardly distinct from *T. Serpýllum*, unless in the shape of the leaves, and more loose habit.

Herb-Baron Thyme. Fl. July, Aug. Clt. 1820. Shrub procumbent.

10 T. SERPY'LLUM (Lin. spec. 825.) suffruticose, procumbent; floriferous branches shortly ascending; leaves on short petioles, ovate, narrowed at the base, cuneated or rounded, veiny, having the petioles and margins more or less ciliated; floral leaves almost similar to the rest; teeth of upper lip of calyx lanceolate, ovate: segments of the lower lip subulate, ciliated. ♄. H. Native throughout Europe and the North of Asia, in dry exposed places; as of Britain, Sweden, Lapland, Denmark, Germany, France, Spain, Italy, Greece, European Russia, even to St. Petersburgh, Caucasus, Siberia; and the Himalaya, at Simla and Choor. T. exsérens and T. inclùdens, Ehrh. arb. p. 158. This is a very variable plant. Corollas purple. Whorls 6-12-flowered, usually approximating into a terminal head. This, the Wild Thyme, has the same sensible qualities as Garden Thyme, but the flavour is milder, and rather more grateful. It is a common notion, that the flesh of sheep that feed upon aromatic plants, particularly Wild Thyme, is superior in flavour to other mutton. The truth is, that sheep do not crop these aromatic plants, unless now and then by accident, or when they are first turned on hungry to downs, heaths, or commons; but the soil and situations favourable to aromatic plants, produce a short sweet pasturage, best adapted to feeding sheep, whom nature designed for mountains, and not for turnip grounds and rich meadows. The attachment of bees to this and other aromatic plants is well known. Few plants are subject to more varieties than Wild Thyme.

Var. α, vulgàris (Benth. lab. p. 343.) leaves smaller, with very prominent veins. ♄. H. T. Serpýllum, Lin. spec. 825. Fries. nov. fl. suec. Hook. fl. lond. vol. 3. with a figure. Smith, engl. bot. t. 1514. Woodv. med. bot. p. 301. t. 110. Curt. lond. 2. t. 47. T. sylvéstris, Schreb. and Rchb. fl. germ. exc. p. 313. T. rígidus, Rchb. T. humifùsus, Bernh. ex Rchb. fl. germ. l. c. T. collìnus, Bieb. fl. cauc. 3. p. 401. with narrower leaves. T. effùsus, Host, fl. austr. 2. p. 137. T. procèrus, Opiz. T. Kollmunzeriànus, Opiz. T. Sudéticus, Opiz. ex Rchb. fl. germ. exc. p. 312. T. serràtus, Opiz. l. c. T. lævigàtus, Vahl, symb. 2. p. 65. with cuneate-oblong, not linear leaves. T. arenàrius, Bernh. ex Rchb. fl. germ. l. c. T. melissoìdes, Fisch. T. decúmbens, Bernh. ex Rchb. fl. germ. l. c. T. glabràtus, Schultes, ex Rchb. l. c. and probably of Link. T. defléxus, Lej. ex Rchb. l. c. T. glàber, Mill. dict. no. 6. Corollas usually purple, rarely white.

Var. β, lanuginòsus; the whole plant white from wool; stems trailing. ♄. S. Native of France, at Fontainbleau; and of England, on the Gogmagog hills. T. lanuginòsus, Willd. spec. 3. p. 138. Schkuhr. handb. 2. p. 164. with a figure. Mill. dict. no. 8. T. serpýllum, var. δ, Lin. spec. p. 825.

Var. γ, citràtum; plant almost glabrous, yellowish, trailing. ♄. H. Native of Kent, and at Downton Castle, Shropshire. O. citriodòrus, Pers. ench. 2. p. 130. Schreb. ex Link, enum. 2. p. 115. T. subcitràtus, Schreb. ex Rchb. fl. germ. exc. p. 313. T. citràtus, Dumort, floril. belg. p. 47. Lemon Thyme is frequently kept in gardens for the agreeable odour of the leaves. Plants raised from seeds of this kind have not the same scent, it is therefore an accidental variety, which is preserved by means of slips or cuttings.

Var. δ, montànus (Benth. lab. p. 344.) leaves larger and less rigid. ♄. H. Native of the more southern parts of Europe. T. montànus, Waldst. et Kit. hung. 1. p. 72. t. 71. T. chamædrys, Fries. nov. fl. suec. ed. 1st. p. 35. ed. 2d. p. 197. T. pulegioìdes, Rchb. fl. germ. exc. p. 313. Cunìla thymoìdes, Lin. spec. p. 31. Hedeòma thymoìdes, Pers. ench. 2. p. 131. Zizíphora thymoìdes, Rœm. et Schultes, syst. 1. p. 209. T. nummulàrius, Bieb. fl. cauc. 2. p. 58. Sims, bot. mag. vol. 53. t. 2666. with larger broader leaves. T. pseudoserpýllum,

Rchb. T. marjoranoìdes, Desf. cat. hort. par. p. 74. Poir. suppl. 5. p. 306. T. ovàtus, Mill. dict. no. 7.

N.B. Besides the above varieties, there are numerous others which run so gradually into each other as scarcely to be distinguished.

Wild Thyme, or Mother of Thyme. Fl. June, Aug. Britain. Shrub trailing.

11 T. ANGUSTIFÒLIUS (Pers. ench. 2. p. 130.) suffruticose, procumbent; floriferous branches shortly ascending, glabrous or pubescent; leaves on short petioles, oblong-linear, narrowed at the base, veiny, having the petioles and margins ciliated; floral leaves almost similar to the others; calyxes usually glabrous: teeth of upper lip short, lanceolate-ovate, and the segments of the lower lip ciliated. ♄. H. Native of the South of Europe and Middle Asia, on dry arid hills, and by way sides; as of Portugal, Spain, South of France, South of Germany, Italy, Greece, Caucasus, and Siberia; also of Madeira and the Azores. T. aciculàris, Waldst. et Kit. hung. 2. p. 157. t. 147. T. cæspitítius, Link et Hoffm. fl. port. 1. t. 18.? Brot. phyt. p. 26. t. 11. T. rèpens, Link et Hoffm. fl. port. T. odoratíssimus, Bieb. fl. cauc. 3. p. 405. more erect plant. T. spinulòsus, Tenore, fl. nap. prod. p. 35. T. nervòsus, Gay, pl. exs. ind. itin. T. Zỳgis, Lin. spec. p. 826. and of many other authors. T. variábilis, Link et Hoffm. fl. port. 1. t. 17. T. ciliàtus, Lam. fl. fr. 2. p. 392. T. álbidus, Opiz, in bot. zeit. 1824. 2. p. 526. T. inodòrus, Lej. ex Dumort, fl. belg. p. 47. T. mìcans, Lowe, prim. fl. mader. p. 19. Thýmbra ciliàta, Tenore, fl. nap. prod. suppl. 2. p. 69. syll. fl. neap. p. 269. but not of Lin.—Barr. icon. 777. Hardly differing from some varieties of *T. Serpýllum*, unless in the narrower leaves. Corollas purple. There are varieties of this with glabrous, pubescent, or villous leaves, but usually quite glabrous. The *T. Zýgis* of the gardens is an erect, narrow-leaved, canescent plant, with white flowers.

Narrow-leaved Thyme. Fl. Aug. Clt. 1771. Shrub procumbent.

12 T. PANNÓNICUS (All. fl. ped. 1. p. 20.) suffruticose, procumbent; floriferous branches ascending, villous; leaves on short petioles, linear, or the lower ones are oblong, narrowed at the base, veiny, having the petioles and margins ciliated; floral leaves almost similar to the others; calyx villous: teeth of upper lip short, lanceolate-ovate, and the segments of the lower lip subulate, ciliated. ♄. H. Native of the South of Europe, and Middle Asia; as on the alps of Pannonia, South of Germany, Hungary, Podolia, Caucasus, Altaia, &c. T. Marschalliànus, Willd. spec. 3. p. 141. T. glabréscens, Hoffm. et Link, fl. port. 1. p. 130. t. 15.? T. Zỳgis, Pall. nov. act. petrop. 10. p. 313. but not of Lin. T. adscéndens, Bernh. ? ex Link, enum. 2. p. 115.? T. odoratíssimus, Mill. dict. no. 9. T. lanuginòsus, Mill. dict. no. 8. and other authors. T. Austrìacus, Bernh. ex Rchb. fl. germ. exc. p. 312. T. pilígerus, Opiz, ex Rchb. l. c. p. 313. Corollas purple. Hardly differing from *T. angustifòlius*, unless in the floriferous branches being longer and more erect, villous, and in the leaves being twice as long.

Pannonian Thyme. Fl. June, Aug. Clt. 1817. Shrub procumbent.

13 T. SIBTHÓRPII (Benth. lab. p. 345.) stem procumbent at the base, branched; branches erect, nearly glabrous; leaves nearly sessile, oblong-lanceolate, glabrous, nerved; floral leaves conform to the others; flowers numerous, small, somewhat spicate; calyx villous, the lips divaricate: teeth of upper lip lanceolate, very acute, and the segments of the lower lip subulate. ♄. F. Native of Greece, on the mountains. T. lanceolàtus, Sibth. et Smith, prod. fl. græc. 1. p. 419. but not of Desf. Leaves 6-9 lines long, broader than in *T. Pannónicus*. Whorls 2-6-flowered, approximating into loose spikes. Corollas hardly exceeding the calyx. Stamens exserted.

Sibthorp's Thyme. Shrub ½ foot.

14 T. LANCEOLA'TUS (Desf. fl. atl. 2. p. 30. t. 128. but not of Smith.) suffruticose, erect, clothed with soft villi; leaves nearly sessile, ovate-lanceolate, obtuse, roundly cuneated at the base, veiny, clothed with soft pubescence beneath; floral leaves similar to the others; racemes dense, secund; calyxes villous, nutant: the teeth of the upper lip ovate, acute, and the segments of the lower lip subulate. ♄. F. Native of the North of Africa, on Mount Atlas, near Tlemsen, Desf. Erect, much branched at the base. Leaves nearly an inch long. Spikes 2-3 inches long. Corollas purple. Bentham has seen specimens of this species, in which the spikes are scarcely secund.

Lanceolate-leaved Thyme. Fl. July, Aug. Clt. 1823. Shrub ½ to ¾ foot.

15 T. LINEA'TUS (Benth. in Wall. pl. rar. asiat. 1. p. 31. lab. p. 346.) procumbent; floriferous branches shortly ascending; leaves on short petioles, oblong-linear, narrowed at the base, veiny, having the petioles and margins ciliated; floral leaves ovate, rounded at the base, rather imbricate; calyx almost glabrous: teeth of upper lip short, lanceolate-ovate, and the segments of the lower lip subulate, ciliated. ♄.? F. Native of the Himalaya, among the mountains of Kamaon. This species differs from the more glabrous variety of *T. Pannónicus*, in the more loose habit and floral leaves.

Lined Thyme. Shrub procumbent.

16 T. BRACTEÒSUS (Visiani, mss. ex Benth. lab. p. 346.) procumbent; floriferous branches ascending; leaves petiolate, oblong, narrowed at the base, flat, veiny, having the margins and petioles of the upper leaves ciliated; floral leaves sessile, broadly roundish-cordate, imbricate, ciliated; calyx villous: teeth of upper lip short, ovate-lanceolate, and the segments of the lower lip short, subulate, ciliated. ♄. H. Native of Dalmatia. Corollas purple.? Habit of *T. lineàris*, but differs in the floral leaves; it differs also from *T. striàtus*, in the more loose habit, but is probably only a variety of it.

Bracted Thyme. Shrub procumbent.

17 T. STRIA'TUS (Vahl, symb. 78.?) procumbent; floriferous branches ascending, pubescent; leaves nearly sessile, linear, stiff, narrowed at the base, glabrous, ciliated; floral leaves broadly cordate-ovate, striated, and are, as well as the calyxes, pubescent, rather imbricate, approximating into an oblong head. ♄. F. Native of the South of Europe, Gibraltar, Naples; on the banks of the Bosphorus, Olivier. T. Zỳgis, Sibth. et Smith, fl. græc. 6. p. 60. t. 574. but not of Lin. T. hírtus, Willd. enum. p. 623.? T. aciculàris, Guss. prod. fl. sic. 2. p. 127. Corollas purple. Habit of *T. angustifòlius*; but the leaves are longer and stiffer, and the inflorescence is very distinct. The floral leaves are veiny, stiff, with ciliated edges.

Striated-leaved Thyme. Shrub procumbent.

18 T. HIRSU'TUS (Bieb. fl. cauc. 2. p. 59. 3. p. 408.? Benth. lab. p. 346.) procumbent; floriferous branches ascending, clothed with hoary pubescence; leaves sessile, linear, somewhat fascicled in the axils, with flat ciliated margins, clothed with hoary tomentum on both surfaces; floral leaves broader, closely approximate, as well as the flowers, into an oblong head. ♄. H. Native of Greece and Tauria. T. vulgàris, Sibth. et Smith, fl. græc. prod. 1. p. 419. but not of Lin. This species differs from *T. villòsus* in the quite entire floral leaves; and from *T. diffùsus* and *T. angustifòlius*, in the broader floral leaves; and from *T. striàtus* in the hairiness.

Hairy Thyme. Fl. July, Aug. Clt. 1821. Shrub procumbent.

19 T. VILLÒSUS (Lin. spec. 827.) suffruticose, procumbent;

branches short, rather hairy; leaves oblong-linear, flattish, with ciliated margins; floral leaves oblong-lanceolate, serrated at top, and are, as well as the calyxes, coloured; whorls few-flowered, approximate. ♄. F. Native of the Grecian Archipelago. Sibth. et Smith, fl. græc. 6. p. 62. t. 578. Hoffm. et Link, fl. port. 1. t. 14. Corollas purple. Habit of *T. angustifòlius;* from which it differs in the leaves being more ciliated, and especially in the calyxes being twice the size, and in the floral leaves, which are coloured as in *Thýmbra spicàta.* Whorls loose, not imbricate. Corolla scarcely exceeding the calyx.

Villous Thyme. Fl. June, July. Clt. 1759. Shrub procumbent.

20 T. CAPITELLA'TUS (Hoffm. et Link, fl. port. 1. t. 12.) shrubby, canescent; leaves lanceolate, obtuse, with revolute edges, clothed with hoary tomentum beneath; floral leaves subimbricate, broad-ovate, exceeding the calyxes; whorls few-flowered, collected into globose terminal heads. ♄. F. Native of Portugal, beyond the Tagus, near Lisbon, Link; and in the Algarves, Masson. Habit and cauline leaves of *T. vulgàris.* Heads of flowers very numerous, size of peas. Calyx small, with short spreading teeth. Corolla purplish? scarcely longer than the calyx.

Small-headed Thyme. Shrub.

21 T. NUMI'DICUS (Desf. fl. atl. 2. p. 29.? Benth. lab. p. 347.) erect or prostrate at the base; branches clothed with hoary pubescence; leaves sessile, oblong-linear or spatulate, small, fascicled, flat, glabrous, ciliated a little; floral leaves imbricating, very broad at the base; whorls closely approximate into small globose heads; calyx villous: teeth of upper lip lanceolate, acute, and the segments of the lower lip subulate. ♄. F. Native of Spain, Pavon; and of Barbary, near La Calle, Desf. Habit of *T. vulgàris;* but differs from it in the shorter glabrous leaves, and especially in the inflorescence. Heads hardly larger than peas, hairy. Floral leaves clasping the flowers, ciliated, ex Desf. Corollas small, rose-coloured.

Numidian Thyme. Fl. July, Aug. Clt. 1816. Shrub ½ foot.

22 T. HISPA'NICUS (Poir. dict. 7. p. 646.) shrubby, erect; leaves linear, ciliated; flowers capitate, rather villous. ♄. F. Native of Spain, and of North Africa, on the sea-shore. Branches numerous, slender. Leaves sessile. Teeth of calyx sub-setaceous, ciliated. Corolla purplish, longer than the calyx. Stamens rather longer than the corolla. Very nearly allied to *T. Numídicus,* and probably only a variety of it.

Spanish Thyme. Shrub ½ foot.

23 T. CAPITA'TUS (Hoffm. et Link, fl. port. 1. p. 123.) procumbent at the base, much branched; branches erect, canescent; sterile branches sub-spinescent; leaves sessile, linear or oblong, flat; floral leaves imbricate, ovate, ciliated, green, covering the calyxes. ♄. H. Native of the region of the Mediterranean, in dry, arid, stony places; as of Barbary, near Tangiers; Portugal, Spain, Sicily, Naples, Greece, Syria, Palestine, &c. T. Créticus, Brot. phyt. p. 27. t. 12. T. Marinósci, Tenore, fl. nap. prod. p. 35. syll. p. 296. Saturèia capitàta, Lin. spec. 795. Sibth. et Smith, fl. græc. 6. p. 36. t. 544.—An elegant, densely branched shrub. Heads of flowers globose or oblong, composed of 6-flowered whorls. Corollas exserted, purple. Stamens exserted.

Capitate-flowered Thyme. Fl. June, Oct. Clt. 1596. Shrub ½ to 1 foot.

SECT. III. PSEUDOTHY'MBRA (from ψευδος, *pseudos,* falsehood; and θυμβρα, *thymbra,* a sweet-scented herb allied to Thyme.) Benth. lab. p. 348. Floral leaves large, membranous, coloured.

24 T. CEPHALÒTUS (Lin. spec. 826.) erect, branched, clothed with hoary pubescence; leaves sessile, linear, with revolute edges, small, fascicled: floral leaves large, ovate, acute, rather membranous, coloured, covering the calyxes. ♄. H. Native of Spain and Portugal. Habit of *T. vulgàris,* but the inflorescence is very distinct. Floral leaves sessile, with ciliated edges, purplish. Heads of flowers size of cherries. Corolla downy outside, purplish or white: tube exserted from the calyx. Stamens diverging, about equal in length to the corolla.

Headed Thyme. Fl. June, Sept. Clt. 1759. Shrub ½ to 1 foot.

25 T. CILIA'TUS (Benth. lab. p. 348.) shrubby, erect; branches pubescent or villous; leaves oblong-lanceolate or linear, obtuse, flat, green, veiny, having the margins a little ciliated; floral leaves large, broad-ovate, acute, rather membranous, nerved, coloured, ciliated, imbricate, covering the calyxes. ♄. F. Native of the North of Africa, on arid hills near Mascar, Desf.; and near Galla, Masson; and the Canary Islands. Thýmbra ciliàta, Desf. fl. atl. 2. p. 10. t. 122. An elegant much branched shrub. Heads of flowers ovate, cylindrical. Bracteas purplish. Teeth of calyx ciliated: lower teeth the longest. Corollas violaceous. Stamens scarcely longer than the corolla.

Ciliated Thyme. Fl. June, Aug. Clt. 1824. Shrub ½ to 1 foot.

† *Species not sufficiently known, or doubtful.*

26 T. PULCHE'LLUS (Meyer, verz. pflanz. p. 87.) stems shrubby at the base, erect, pubescent on the angles; leaves quite glabrous, flat, oblong or linear, obtuse: lower ones elliptic; whorls spicately approximate; teeth of the upper lip of the calyx nearly equal, subulate; stamens exserted. ♄. H. Native of Caucasus, on gypsaceous hills at the river Anticeta.

Neat Thyme. Shrub erect.

27 T. SERPYLLOI'DES (Bory, ann. gen. 3. p. 18.) stems fruticose, procumbent; leaves linear or lanceolate, obtuse, a little ciliated at the base; flowers capitate. ♄. H. Native of Spain, on Sierra Nevada, among rocks. Allied to *T. angustifòlius.* There are varieties of this with white and purple flowers.

Serpyllum-like Thyme. Shrub procumbent.

28 T. RICHA'RDI (Pers. ench. 2. p. 130.) flowers capitate; bracteas ovate, and are, as well as the calyxes, stiff; leaves broad-ovate, nerved beneath. ♄. H. Native of the Balearic Islands, Ant. Richard. Perhaps the same as *Oríganum Majóricum,* Cambess.

Richard's Thyme. Shrub.

29 T. MULTIFLÒRUS (Pers. ench. 2. p. 131.) flowers axillary, pedunculate; peduncles many-flowered; calyxes oblong, with acute teeth; leaves ovate, glabrous, having the veins prominent beneath. ♄.?H. Formerly cultivated in the garden of Trianon, Persoon. Allied to *Calamíntha.* Leaves dotted beneath.

Many-flowered Thyme. Pl.?

30 T. HIRSUTI'SSIMUS (Poir. dict. 7. p. 650.) leaves ovate-lanceolate, nearly sessile, hairy; spikes capitately verticillate; bracteas ciliately hairy. ♄. T. Native of the Levant. Erect, humble, much branched. Leaves small. Flowers disposed in short spicate heads at the tops of the branches, dense, very villous. Bracteas lanceolate, equalling the flowers, ciliated. Corolla purplish, rather longer than the calyx. Teeth of calyx subulate, acuminated, rather spiny, nearly equal, ciliated. Perhaps the same as *Micromèria nervòsa.*

Very-hairy Thyme. Shrub ½ foot.

31 T. A'LBICANS (Hoffm. et Link, fl. port. t. 11.) flowers

verticillately capitate, terminal and axillary; leaves lanceolate, white beneath; calycine teeth nearly equal, subulate, ex Poir. dict. suppl. 5. p. 305. ♄. H. Native of Portugal. Perhaps the same as *Micromèria Græ'ca.*

Whitish-leaved Thyme. Shrub.

32 T. MEGAPOTA'MICUS (Spreng. cur. post. p. 224.) stem erect, herbaceous; leaves linear, convolute, rough from dots; peduncles crowded, exceeding the leaves. Native of the South of Brazil, at Rio Grande. Perhaps the same as *Hedeòma multiflòra.*

Rio Grande Thyme. Pl. ?

33 T. LONGICAU'LIS (Presl, fl. sic. 37.) stems very long, creeping, puberulous; leaves cuneiform-oblong, obtuse, length of calyxes, which are pubescent; calycine teeth ciliated, subulate; anthers exserted. ♃. ? H. Native of Sicily.

Long-stemmed Thyme. Pl. creeping.

34 T. *Æ*GYPTI'ACUS (Bernh. ex Steud, nom. p. 835.) Nothing is known of this plant but the name.

Egyptian Thyme. Shrub.

35 T. CAMPHORA'TUS (Hoffm. et Link, fl. port.) ♄. H. Native of Portugal.

Camphorated Thyme. Shrub.

Cult. All the species of *Thymus* prefer a dry, light, sandy soil, and an exposed situation. They are of easy culture and propagation; and are readily increased either by divisions slips, cuttings, or seeds, as recommended for *Thymus vulgàris*, p. 767. Some of the more tender and rarer species should be grown in pots, and placed among other Alpine plants, that they may be sheltered from the frosts of winter.

XLIII. SATURE'IA (Ssatter is the Arabic name for all labiate plants.) Lin. gen. no. 707. Schreb. gen. 961. Juss. gen. p. 112. Benth. lab. p. 351.

LIN. SYST. *Didynàmia, Gymnospérmia.* Calyx campanulate, 10-nerved, equal, 5-toothed or obscurely-bilabiate; throat naked inside, or furnished with a few hairs. Corolla having the tube equalling the calyx and imbricating bracteas; limb bilabiate; upper lip erect, flat, entire, or emarginate: lower one spreading, trifid, with flat nearly equal lobes. Stamens 4, erectish, diverging: lower ones longer, exserted; anthers 2-celled: cells parallel or diverging. Style about equally bifid at top; lobes subulate, stigmatiferous at apex.—Aromatic herbs or under shrubs. Leaves small, quite entire, often fasciculate in the axils. Whorls sometimes few-flowered, with short bracteas or without bracteas; sometimes many-flowered, or collected into heads, propped by bracteas.

SECT. I. SATURE'IA (see genus for derivation.) Benth. lab. p. 352. Whorls few-flowered; bracteas small or wanting.

1 S. HORTE'NSIS (Lin. spec. 795.) annual, erect, pubescent; whorls sub-secund, remote, or the upper ones are somewhat spicate. ⊙. H. Native of the South of Europe; as of Spain, South of France, Italy: it is also to be found in North America, Cape of Good Hope, and in the Indian Peninsula; but has probably been introduced from Europe. Lam. ill. t. 504. f. 1. S. viminea, Burm. fl. ind. p. 126. but not of Lin.—Sabb, hort. rom. 3. t. 70.—Blackw. icon. t. 419.—Mor. hist. sect. 11. t. 17. f. 1. Herb much branched, usually purplish. Leaves oblong-linear, acute, entire. Whorls usually 6-flowered. Bracteas linear, or altogether abortive. Corolla pale red, scarcely exceeding the calycine teeth. Stamens shorter than the lobes of the corolla. Summer savory is raised from seed, being an annual. In March or April sow either in small drills, 9 by 6 inches apart, or on smoothed surfaces, and raked in lightly. The plants may either remain to be thinned, or some may be transplanted in June, 9 by 6 inches asunder. The herb comes in for gathering from June to October. When a store is to be dried, draw it by the roots. Abercrombie.

Garden or Summer Savory. Fl. June, Aug. Clt. 1652. Pl. ½ to 1 foot.

2 S. RUPE'STRIS (Wulf. in Jacq. misc. 2. p. 130. icon. rar. 3. t. 494.) suffruticose; branches ascending; leaves petiolate, ovate, obtuse, glabrous, or rather canescent; racemes dense, many-flowered, sub-secund; teeth of calyx short, acutish. ♄. H. Native of Carniola, Hungary, Croatia, Carinthia, Dalmatia, &c., in dry rugged mountainous places. S. thymifòlia, Scop. fl. carn. ed. 2d. t. 29.? Calamíntha rupéstris, Host, fl. austr. 2. p. 131. Melíssa álba, Waldst. et Kit. pl. rar. hung. 3. p. 227. t. 205. Népeta Croática, Spreng. syst. 2. p. 727. Népeta pùmila, Spreng. cent. spec. min. cogn. p. 29. Habit between *Saturèia* and *Melíssa*. Leaves almost quite entire. Whorls many-flowered, disposed in dense spikes or racemes. Bracteas minute. Throat of calyx glabrous. Corolla white, 2-3 times longer than the calyx, tinged with blue.

Rock Savory. Fl. June, July. Clt. 1798. Shrub 1 to 1½ foot.

3 S. MONTA'NA (Lin. spec. 794.) suffruticose, erect, glabrous, or scabrously-pubescent; leaves oblong-linear, acute, or the lower ones are spatulate or cuneated; whorls many-flowered, loose, secund, approximating into spikes or racemes. ♄. H. Native in the region of the Mediterranean, in arid, exposed places, and on mountains; in the Pyrenees, near Bagneres de Luchon; Spain, Portugal, North of Africa, South of France and Germany, Greece, Italy, Naples, &c. Sibth. et Smith. fl. græc. 6. p. 35. t. 543. S. trífida, Mœnch. meth. p. 386. S. subspicàta, Vis. spec. pl. dalm. 11. t. 4. S. Illyrica, Host, fl. austr. 2. p. 133. S. variegàta, Host, fl. austr. 2. p. 134. S. hyssopifòlia, Bert. ann. di stor. nat. 1829. fasc. 3. p. 406. Micromèria montàna, Rchb. fl. germ. exc. p. 311. Micromèria pygmæ'a, Rchb. l. c. S. pygmæ'a, Sieb. pl. exs. ex. Rchb. l. c. Micromèria variegàta, Rchb. fl. germ. exc. p. 859.—Sab. hort. rom. 3. t. 64.—Mor. hist. sect. 11. t. 17. f. 3. Shrub erect or ascending, much branched. Branches beset with very short reflexed hairs. Lower whorls rather remote. Corolla white or purplish, more than twice as long as the calyx. Winter Savory, Suriette, French, Saturei, Germ. Satureggia, Italian, was cultivated in England in 1562; that is as far back as we have any printed registers; for there can be no doubt that this and summer savory, with other pot-herbs, were much cultivated in far earlier times, before the spices of the East Indies were known and in common use. This kind of savory is generally propagated by slips or cuttings of the young side shoots in April, May, and June, or July, planted in a shady border and watered; also by dividing at the root. When the plants are a little advanced in branchy growth, they may be transplanted. Set some in single plants a foot apart; others to form a close edging. In spring and autumn loosen the earth a little about the plants, and trim off decayed and irregular parts. It continues useful for summer and winter; and some may be gathered, when of full growth, in autumn, to dry for winter use.

Mountain or Winter Savory. Fl. June, July. Clt. 1562. Shrub ½ to 1 foot.

4 S. MU'TICA (Fisch et Meyer, ind. sem. hort. petesb. 1836. p. 49.) plant clothed with hoary pubescence; stems erect, much branched; branches twiggy: leaves oblong or almost linear; cymes axillary, few-flowered; bracteoles linear, much shorter than the calyxes; calyx bilabiate, with sub-linear mutic lobes, the lower 2 the longest. ♄. H. Native of Caucasus, on the Talusch Mountains, in arid, stony places. Allied to *S. montàna*, but differs in the segments of the calyx being mutic, and from *S. intermèdia*, in the stem being tall and erect, in the leaves being narrower and distant, in the bracteoles being minute, &c.

Mutic-calyxed Savory. Fl. June, July. Clt. 1836. Shrub erect.

5 S. virga'ta (Vis. ex. pl. exs. un. itin. wurtemb. ex Benth. lab. p. 353.) suffruticose, hispidly-scabrous; leaves oblong-linear, acute; whorls many-flowered, nearly equal, rather remote, disposed in long twiggy racemes. ♄. H. Native of Dalmatia, Naples, &c. Micromèria spicàta, Rchb. fl. germ. exc. p. 311. S. fasciculàta, Tausch, in syll. pl. soc. ratisb. 2. p. 248.? but not of Biv. S. cuneifòlia, Tenore, fl. nap. t. 151. f. 2. syll. p. 277. S. obovàta, Lag. ex Spreng. syst. 2. p. 720. This does not differ in any respect from *S. montàna*, unless in the inflorescence and hairiness; the teeth of the calyx is also a little shorter, and the flowers smaller. Racemes never beyond a foot in length.

Twiggy Savory. Shrub 1 to 2 feet.?

6 S. spinòsa (Lin. spec. 795.) suffruticose, erect, tortuosely-branched; branches tomentose, spinescent; leaves oblong, acute, glabrous; whorls few, few-flowered. ♄. F. Native of the Grecian Islands. Sibth. et Smith, fl. græc. 6. p. 36. t. 545. Much branched. Branches short, all ending in spines. Leaves shorter and broader than those of *S. montàna*, and the flowers smaller. Corollas purplish.?

Spiny-branched Savory. Shrub ½ foot.

7 S. inodòra (Salzm. pl. tang. exs. ex Benth. lab. p. 354.) suffruticose, diffuse, nearly glabrous, branches ascending; leaves linear-spatulate, obtuse, with ciliated edges: superior leaves exceeding the flowers; flowers few, nearly sessile; calycine teeth bluntish. ♄. F. Native near Tangiers, Salzmann. A very distinct species, with the habit of *Thymus angustifòlius*. Branches scabrously-pubescent: branchlets short, densely clothed with leaves at top. Throat of calyx naked inside.

Scentless Savory. Shrub diffuse.

Sect. II. Tragorìganum (from τραγος, *tragos*, a goat, and οριγανον, *origanon*, marjoram, goat's marjoram.) Benth. lab. p. 354. Whorls densely-globose, many-flowered, remote, propped by bracteas. Calyx about equal in height to the tube of the corolla.

8 S. Thy'mbra (Lin. spec. 794.) suffruticose, diffuse, scabrously hispid; leaves oblong-linear, or the lower ones are obovate-cuneated, acute; whorls many-flowered, dense, nearly globose, all remote. ♄. H. Native of the Grecian islands, and the mountains of Syria and Palestine. Sibth. et Smith, fl. græc. 6. p. 33. t. 541. Thymus tragorìganum, Lin. mant. p. 84. Saturèia tragorìganum, Tausch. in syll. pl. soc. ratisb. 2. p. 248.—Sab. hort. rom. 2. t. 71.—Mor. hist. sect. 11. t. 17. f. 6.—Park. theatr. 5. f. 4.—Barr. icon. rar. t. 898. Leaves more acute, shorter and a little broader than those of *S. montàna*. Whorls 20-40-flowered. Bracteas ovate, lanceolate, acute, adpressed, equalling the calyxes, hispid from spreading pili, as well as the calyxes. Teeth of calyx nearly equal, lanceolate-subulate. Corollas smaller than those of *S. montàna*.

Thymbra Savory. Fl. May, July. Clt. 1739. Shrub 1 to 2 feet.

Sect. III. Pychnothy'mus (from πυχνος, *pychnos*, dense; and θυμος, *thymos*, thyme; in reference to the dense heads of flowers.) Benth. lab. p. 354. Whorls collected into an oblong head, propped by bracteas. Calyx minute.

9 S. rìgida (Bartr. in herb. Banks ex Benth. lab. p. 354.) suffruticose, procumbent; branches ascending, rather pilose at top; leaves lanceolate, obtuse, with revolute margins; whorls collected into an oblong head; bracteas imbricate, very villous; calyx very short, membranous. ♄. F. Native of Eastern Florida. Branches almost simple, numerous. Leaves sometimes glabrous, and sometimes hispid. Bracteas a little coloured, lanceolate, obtuse. Tube of corolla equalling the bracteas; limb like that of *Pychnánthemum*.

Stiff Savory. Shrub ½ foot.

† *Doubtful species.*

10 S. interme'dia (Meyer, verz. pflanz. p. 91.) plant clothed with canescent pubescence; stems diffuse, much branched, shrubby at the base; leaves obovate-oblong, bluntish, a little crenated; cymes axillary, few-flowered; bracteas nearly linear, rather shorter than the calyxes; calyx bilabiate, with linear-lanceolate mutic lobes. ♄. H. Native of Caucasus, in stony places, near Swant. Leaves of *S. Thýmbra*, and the calyxes almost of *S. montàna*.

Intermediate Savory. Shrub.

11 S. sessiliflòra (Presl, fl. sic. p. 36.) stem shrubby at the base; branches diffuse, clothed with velvety pubescence; leaves linear-lanceolate, acute, ciliated, dotted, scabrous above; fascicles of flowers sessile, disposed into an oblong, leafy spike; mouth of calyx ciliated, and the teeth ovate, erectly spreading; tube of corolla twice as long as the calyx. ♄. H. Native of Sicily.

Sessile-flowered Savory. Shrub diffuse.

12 S. hirsu'ta (Presl, del. prag. 79.) stems simple, hairy; hairs erectly spreading; leaves ovate-lanceolate, hispid; peduncles axillary, short, 1-3-flowered; bracteas about equal in length to the calyxes. ♄.? H. Native of Sicily. Perhaps referrible to *Micromèria microphýlla* or *M. Juliàna*.

Hairy Savory. Shrub.?

13 S. parviflòra (Presl, fl. sic. p. 36.) stems suffruticose at the base, villous; leaves villous, ovate-lanceolate, twice the length of the internodes; fascicles of flowers sessile, 3-flowered, disposed into a leafy spike; bracteas numerous, setaceous; teeth of the calyx erect; tube of corolla exceeding the length of calyx. ♄. H. Native of Sicily.

Small-flowered Savory. Shrub.

14 S. angustifòlia (Presl, fl. sic. 36.) stem suffruticose, spreading, scabrously-pubescent, as well as the leaves; leaves oblong-lanceolate; fascicles of flowers shorter than the leaves; teeth of calyx erectly-spreading; tube of corolla exceeding the calyx a little. ♄. H. Native of Sicily.

Narrow-leaved Savory. Shrub diffuse.

15 S. longiflòra (Presl, fl. sic. p. 36.) stem suffruticose, diffuse; leaves ovate-lanceolate, canescent beneath; fascicles of flowers equal in length to the leaves; teeth of calyx spreading; tube of corolla twice as long as the calyx. ♄. H. Native of Sicily.

Long-flowered Savory. Shrub diffuse.

16 S. campane'lla (Ehrenb. naturg. reize, p. 13.) suffruticose; branches pubescent; leaves ovate-lanceolate, acute, quite entire, rather hispid, nearly sessile; cymes of flowers a little longer than the leaves, bracteate; calyx shortly campanulate, deeply 5-toothed. ♄. F. Native of the North of Africa, near Castelnuovo, Ehrenberg.

Small-bell calyxed Savory. Shrub.

17 S. O'lla (Ehrenb. l. c.) suffruticose; branches rather bristly; leaves narrow-linear and lanceolate-linear, acute, setosely hispid; cymes of flowers hardly longer than the leaves, bracteate; calyx shortly campanulate, deeply 5-cleft. ♄. F. Native along with the preceding. Habit almost of *S. Thýmbra*, but the leaves and flowers are larger.

Olla Savory. Shrub.

18 S. sca'bra (Presl, fl. sic. p. 36.) ♄.? H. Native of Sicily. Thymus scaber. Presl, del. prag.

Scabrous Savory. Shrub.

19 S. globífera (Desf. ex Steud. nom.) Nothing is known of this plant but the name.

Globe-bearing Savory. Shrub.
Cult. For culture and propagation, see *Thýmus*, p. 771.

XLIV. HYSSO'PUS (Hyssopus, of Pliny; ὕσσωπος, of Dioscorides; derived from the Hebrew name of Hyssop, *ezob*, or the Arabic name *azzof*.) Benth. in bot. reg. vol. 15. lab. p. 356. Hyssòpus species, Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 15-nerved, equal, or with a somewhat oblique mouth; teeth 5, equal; throat naked inside. Corolla having the tube equalling the calyx, bilabiate; upper lip erect, flat, emarginate: lower lip spreading trifid, middle lobe the largest. Stamens 4, exserted, diverging, didynamous: lower ones the longest; anthers 2-celled: cells linear, divaricate. Style somewhat equally bifid at top; lobes subulate, stigmatiferous at apex. This genus differs from all others belonging to the tribe *Saturèia* in the calyx, which is more allied to tribe *Nepèteæ*.

1 H. officina'lis (Lin. spec. 767.) ♄. H. Native of the South of Europe and Middle Asia; South of France, Italy, South of Germany, South of Russia; Caucasus and the Altaian Mountains. Woodv. med. bot. 181. t. 65. Jacq. austr. 3. t. 254.—Riv. mon. irr. t. 68.—Sabb. hort. rom. 3. t. 79. Shrub usually glabrous, diffuse, much branched. Corollas blueish purple, rarely white. Whorls 6-15-flowered, approximate into terminal secund spikes, or the lower whorls are remote. Outer bracteas lanceolate-linear, acute, scarcely shorter than the calyxes; inner bracteas minute.

Var. α, latifòlius (Benth. lab. p. 357.) leaves elliptic, glabrous, quaternately decussate, green. ♄. H. H. Fischèri, Hortul. H. alopecuroìdes, Fisch. ex Hortul. H. officinàlis, β, decussàtus, Pers. ench. 2. p. 114. H. myrtifòlius, Desf. hort. par.

Var. β, vulgàris (Benth. lab. p. 357.) leaves linear, lanceolate, usually glabrous, green on both surfaces. ♄. H. H. officinàlis, Lin. spec. 767. Jacq. fl. austr. 2. t. 254. Lam. ill. t. 502. and other authors. H. rùber. Bernh.

Var. γ, angustifòlius (Benth. lab. p. 357.) leaves narrow, obtuse, quite entire, with sub-revolute edges, narrowed more to the base, green on both surfaces. ♄. H. Native of Caucasus and other places in Asia. H. angustifòlius, Bieb. fl. cauc. 2. p. 38. and 3. p. 389. H. Orientàlis, Adam. ex Willd. enum. 2. p. 600. H. Caucásicus, Spreng. ex Steud. nom. ?

Var. δ, canéscens (Dl. fl. fr. suppl. 396. Benth. lab. p. 357.) The whole plant is canescent from villi of pubescence. ♄. H. Native of Switzerland and France, among the mountains. H. Schleichèri, G. Don. in Loud. hort. brit. p. 233. H. officinàlis, Schleich. Corollas blue. This is an elegant plant when in blossom.

The common hyssop, *hysope*, French, *isop*, Germ. and *isopo*, Ital., has a strong aromatic flavour, and warm pungent taste. The leaves and young shoots are occasionally used as a pot-herb, and the leafy tops and flower-spikes are cut, dried, and preserved for medicinal purposes. Its virtues depend entirely on an essential oil, which rises in distillation both with water and with alcohol. Besides the general virtues of an aromatic, its preparations were formerly recommended in humoral asthmas, coughs, and other disorders of the breast and lungs, and were said to promote expectoration. There are several varieties of *hyssop* cultivated, as the white and red-flowered; but the blue-flowered is the original colour, and most commonly cultivated.

Common or *Officinal* Hyssop. Fl. June, Sept. Clt. 1548. Shrub 1 to 2 feet.

Cult. Hyssop is raised from seed, by slips and cuttings of the branches, and by dividing the plant at the root. It likes a dry, sandy soil. When it is propagated by seed, sow in March or April a small portion either broad-cast and raked in, or in small drills 6 inches apart. The plants may mostly be transplanted into final beds in June or July, 9 inches apart, or some may be planted as an edging, or you may also sow some seed for an edging, to remain where sown. Give the edgings occasional trimmings in their established growth, cutting away also any decayed flower-spikes in autumn. You may take rooted offsets from established plants in March, April, August, or September; cuttings from the stalks in April and May; also cuttings of the young shoots in June and July. After May shade for a time, or plant in a shady border. If for culinary purposes the distance from plant to plant may be nine inches; in the physic garden 18 inches or 2 feet. Water at planting, and twice or thrice a week in dry weather till rooted.

XLV. COLLINSO'NIA (named by Linnæus in honour of Peter Collinson, F. R. S., a most distinguished promoter of botanical studies, and the first who introduced this plant, among many others, to the English gardens, Miller.) Lin. gen. no. 40. Schreb. gen. no. 51. Gærtn. fruct. p. 317. t. 66. Juss. gen. p. 112. ed. Usteri, p. 125. Benth. lab. p. 357.

Lin. syst. *Diándria, Monogýnia.* Fructiferous calyx declinate, ovate, 10-nerved; throat almost naked inside; limb bilabiate; upper lip truncate, flattish, tridentate: lower lip bifid. Corolla exserted, sub-campanulate; tube a little exserted; throat widened; limb sub-bilabiate, the 4 superior lobes nearly equal: the lower lobe usually the longest, declinate, flattish, toothed or lacerately fringed. Stamens 2 or 4, divaricate, much exserted: upper ones the shortest, or altogether abortive; anthers 2-celled: cells divaricate, often confluent. Style about equally bifid at top; stigmas minute, terminal. Achenia dry and smooth.—Strong-scented herbs, with the habit almost of *Plectránthus*, Section *Germànea*. Cauline leaves large, but the floral leaves are small and bractea-formed. Flowers pedicellate, solitary; pedicels opposite, disposed in simple but usually paniculately-branched racemes. Calyx small, in the floriferous state, but increasing much to the fructiferous state. Corollas yellow, or yellowish purple.

1 C. Canade'nsis (Lin. spec. p. 30. hort. cliff. 14. t. 5.) stems almost glabrous; leaves broad-ovate, acuminated, rounded at the base, sub-cordate, or rarely cuneated, glabrous; panicles elongated, loose, many-flowered; flowers diandrous. ♃. H. Native from Canada to Carolina, among rocks and stones, in woods. C. decussàta, Mœnch, meth. p. 379. C. ovàlis, Pursh, fl. amer. sept. 1. p. 21. C. cuneàta, Wender. schrift. nat. ges. marb. ? Stem branched, glabrous or a little downy. Leaves ample, glabrous, or minutely-glandular, serrately-crenated. Corolla yellow, 4 times longer than the floriferous calyx.

Mr. Bartram was the first who discovered this plant, and sent it to Europe. It has a peculiar scent, which is agreeable but very strong. It is reputed to be an excellent remedy against pains in the limbs and a cold, if the parts affected be rubbed with it: a decoction of it is also said to have cured the bite of the rattle-snake. In the States they call the plant horse-weed, because the horses eat it in the spring before any other plant comes up.

Canadian Collinsonia. Fl. Aug. Oct. Clt. 1734. Shrub 1 to 2 feet.

2 C. tuberòsa (Michx. fl. bor. amer. 1. p. 17.) leaves somewhat rhomboid-oval, acute, cuneated at the base; panicles elongated, loose, much branched, many-flowered; flowers diandrous. ♃. F. Native of Carolina, in shady, humid parts of woods. C. serótina, Walt. fl. car. 65. ex Pursh. Stem almost terete at bottom, branched. Leaves 1½ inch long; cauline ones opposite, cordate. Calycine teeth setaceous, much longer than the tube. Flowers much smaller than those of *C. Canadénsis*.

Tuberous-rooted Collinsònia. Fl. Aug. Clt. 1806. Pl. 1 to 1½ foot.

3 C. scabriu'scula (Ait. hort. kew. ed. 2d. vol. 1. p. 20.) stems procumbent, almost glabrous; leaves petiolate, ovate, acute, toothed, rounded at the base, glabrous or rather pilose above, glabrous beneath; racemes simple, axillary, and terminal; flowers diandrous. ♃. H. Native of Carolina and Florida, and at Jacksonville in Louisiana. C. scàbra, Pers. ench. 1. p. 29. Pursh. fl. amer. sept. 1. p. 20. C. præ'cox, Walt. fl. car. p. 65. Leaves hardly 2 inches long, smaller than the rest. Racemes pubescent. Flowers one half smaller than those of *C. Canadénsis*. Corollas reddish yellow, Pursh. Stems sometimes erectish, and the racemes a little branched.

Roughish Collinsònia. Fl. July, Sept. Clt. 1776. Pl. proc.

4 C. puncta'ta (Elliott, bot. car. 1. p. 36.) leaves ovate-lanceolate, acuminated, acute at the base, pubescent, and dotted beneath; panicles compound; stamens 4, the 2 upper ones sterile, capitate, the 2 lower ones filiform, much exserted. ♃. F. Native of Carolina in boggy places, common. Root tuberous. Stems scabrous, pubescent, branched at top. Leaves pubescent above, and rather tomentose beneath. Corolla yellowish, downy outside, and pilose inside.

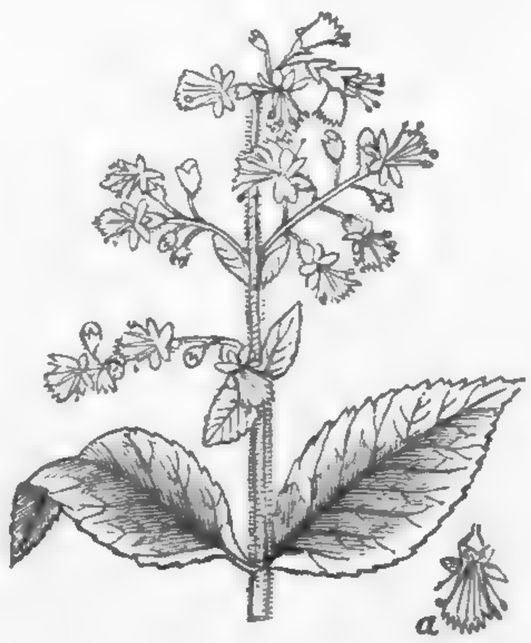
Dotted Collinsònia. Pl. 2 to 6 feet.

5 C. verticilla'ta (Baldw. in Elliott, bot. car. 1. p. 36.) stem glabrous and naked at the base, clothed with clammy pubescence above; leaves broad-ovate, acuminated, roundly-cuneated at the base, approximating by twin pairs, and therefore falsely verticillate; raceme loose, almost simple; flowers tetrandrous. ♃. F. Native of Georgia. Herb almost simple. Leaves large, more narrowed at the base than in *C. Canadénsis*. Lower whorls 6-flowered; upper ones 2-flowered. Corolla 3 times longer than the calyx, downy outside. Stamens nearly equal, 2 ascending and 2 declinate.

Whorled-leaved Collinsònia. Pl. 1 foot.

6 C. anisat'a (Pursh. fl. amer. sept. 1. p. 21.) leaves broad-ovate, a little toothed, roundly-truncate at the base, wrinkled, pubescent on the nerves beneath, and on the stems; panicle dense; flowers tetrandrous. ♃. F. Native of Georgia, on the mountains, Lyon. Sims. bot. mag. 1213. Stem a little branched, rufescent, clothed with clammy pubescence. Leaves shorter than in *C. Canadénsis*. Corollas size of those of *C. Canadénsis*, pale yellow, glabrous outside.

FIG. 79.



Anise-scented Collinsonia. Fl. Sept. Oct. Clt. 1806. Pl. 2 to 3 feet.

Cult. The species are generally strong coarse plants, of no beauty. They grow well in common garden soil, but prefer peat, and a moist situation; and they are readily increased by dividing at the root in spring. All of them, except *C. Canadénsis*, require protection in severe frosts, by covering them over with haulm of other herbs, or by mulching them with horse litter.

XLVI. CUNI'LA (The name of a plant in Pliny, κονιλη of Nicander; supposed to be derived from κωνος, *konos*, a cone, because the flowers grow in heads resembling a cone.) Benth. lab. p. 360. Cunìla, species of Lin. and other authors. Zizíphora species, Rœm. et Schultes.

Lin. syst. *Diándria, Monogýnia.* Calyx about 13-nerved, ovate-tubular, equal, 5-toothed; throat villous inside. Corolla having the tube equalling the calyx, naked inside, and the limb bilabiate; upper lip erect, flattish, usually emarginate; lower lip spreading trifid, with nearly equal entire lobes, the middle lobe rather the largest and emarginate. Stamens 2, erect, exserted, without any rudiments of the upper 2; filaments glabrous, toothless; anthers 2-celled: cells parallel, or at length divaricate. Style shortly bifid at apex; lobes nearly equal, subulate, minutely stigmatiferous at top. Achenia dry, smooth.—Herbs, shrubs, and under shrubs. Whorls sometimes loosely corymbose; sometimes axillary and few-flowered, much shorter than the leaves; sometimes densely many-flowered, approximating into terminal spikes or heads. Flowers small, white, or purplish. Corolla usually villous inside; lower lip dotted.

1 C. maria'na (Lin. spec. 30.) herbaceous; leaves nearly sessile, ovate, serrated, cordate at the base: floral ones almost similar: lower ones exceeding the flowers; cymes pedunculate, loosely corymbose. ♃. F. Native from Canada to Carolina, on dry mountains. Sweet fl. gard. 3. t. 243. Zizíphora Mariàna, Rœm. et Schultes, syst. 1. p. 208. Saturèia origanoìdes, Lin. spec. ed. 1st, p. 568.—Mor. hist. 413. sect. 11. t. 19. f. 7. —Pluck. mant. t. 344. f. 1. Herb branched; branches short, glabrous, but pubescent at the nodi. Whorls few. Cymes forked on both sides. Corolla about twice as long as the calyx, pubescent inside, red.

Mariane Cunila. Fl. July, Sept. Clt. 1759. Pl. 1 foot.?

2 C. incìsa (Benth. lab. p. 361.) shrubby; leaves petiolate, ovate-rhomboid, coarsely and deeply serrated, quite entire at the base, cuneated: floral leaves conform to the others, exceeding the flowers; cymes small, pedunculate, sessile, sub-capitate. ♄. F. Native of the South of Brazil, Sello. Shrub, much branched, densely leafy; branches pubescent. Leaves glabrous, glandular, Corolla pubescent inside.

Cut-leaved Cunila. Shrub.

3 C. angustifòlia (Benth. lab. p. 361.) shrubby, glabrous; leaves on short petioles, elliptic-linear, quite entire or serrated: floral leaves conform, exceeding the flowers; whorls loose, few-flowered; flowers minute. ♄. F. Native of the South of Brazil, Sello. Shrub densely leafy, with glabrous branches. Leaves glabrous, minutely glandular. Corolla pubescent inside.

Narrow-leaved Cunila. Shrub.

4 C. inca'na (Benth. lab. p. 361.) shrubby; leaves on short petioles, ovate-oblong or obovate, obtuse, quite entire, clothed with hoary tomentum on both surfaces; floral leaves similar to the others, exceeding the flowers; whorls 2-6-flowered. ♄. F. Native of the South of Brazil, Sello. Habit of *Micromèria obovàta*. Corolla downy outside.

Hoary Cunila. Shrub.

5 C. leuca'ntha (Benth. lab. p. 361.) herbaceous, glabrous; leaves on short petioles, ovate-oblong, quite entire, rounded at the base; cymes scarcely pedunculate, rather loose, many-flowered. ♃. F. Native of Mexico. Stems erect, many from the same root. Leaves furnished with minute yellow resinous dots. Whorls loose: lower ones remote, 16-20-flowered. Pedicels and calyxes pubescent. Corollas white, pilose outside.

White-flowered Cunila. Pl.

6 C. polya'ntha (Benth. lab. p, 362.) herbaceous; stem erect, pubescent; leaves on short petioles, ovate, sub-serrated, rounded at the base; whorls loose, many-flowered, disposed in long racemes. ♃. F. Native of Mexico, Berlandier. Leaves downy. Whorls 40-50-flowered. Branches of cymes divaricately dichotomous. Corolla white, size of those of *C. Mariàna*.

Many-flowered Cunila. Pl. 1 to 1½ foot.

7 C. lythrifòlia (Benth. bot. reg. vol. 15. lab. p. 362.) herbaceous; stem erect, pubescent; leaves oblong-lanceolate, serrated; whorls dense, many-flowered, spicate: lower ones distinct; calyxes very villous. ♃. F. Native of Mexico, near Real del Monte. Leaves 1½ to 2 inches long, pubescent from

short tomentum, as well as the branches. Corollas similar to *C. Mariàna.*

Loosestrife-leaved Cunila. Pl. 1 to 1½ foot.

8 C. stri'cta (Benth. lab. p. 362.) herbaceous; stem erect, strict; leaves linear, obtuse, quite entire, stiff; whorls dense, many-flowered, approximate into a terminal spike, which is interrupted at the base. ♃. F. Native of Brazil, in marshes near Ricaô de Senelon; also in the Missions of the Uruguay, St. Hil. Habit of *Keìthia.* Plant quite glabrous. Leaves 1 to 1½ inch long, glandular. Floral leaves bractea-formed, ciliated. Corolla white, having the lower lip dotted with purple.

Strict Cunila. Pl. 1 to 2 feet.

9 C. spica'ta (Benth. lab. p. 362.) herbaceous, procumbent; branches villous; leaves on short petioles, obovate-oblong, obtuse, remotely serrated, narrowed at the base; whorls densely many-flowered, approximating into terminal spikes. ♃. F. Native of the South of Brazil, Sello. Stem beset with simple subfasciculate villi. Leaves scarcely ½ an inch long, subfasciculate in the axils while young, clothed with adpressed pili above, and glandular beneath, and ciliated on the nerves with long hairs. Lower whorls remote. Calyxes ciliated. Tube of corolla villous inside.

Spiked-flowered Cunila. Pl. procumbent.

10 C. menthoi'des (Benth. lab. p. 363.) herbaceous, procumbent; branches villous; leaves petiolate, broad-ovate, obtuse, scarcely crenated, rounded at the base; whorls densely many-flowered, distinct, or the upper ones are approximate. ♃. F. Native of the South of Brazil, Sello. Leaves ½ an inch, downy above, glandular on both surfaces, ciliated on the nerves beneath. Corolla villous inside.

Mint-like Cunila. Pl. procumbent.

11 C. galioi'des (Benth. lab. p. 363.) suffruticose, procumbent; leaves small, fascicled, lanceolate, bluntish, quite entire, whorls many-flowered, dense, approximate into an elongated spike, which is a little interrupted at the base. ♄. F. Native of Brazil, in fields and marshes in the province of St. Paul, from Castro to Curitiba, St. Hil.; South of Brazil, Sello. Branches pubescent, and upper surfaces of leaves. Leaves 2-3 lines long, glabrous and glandular beneath. Corolla pale blue, pubescent outside, twice as long as the calyx; throat villous inside.

Galium-like Cunila. Shrub procumbent.

12 C. fasciula'ta (Benth. lab. p. 363.) suffruticose, procumbent; branches pilosely hispid; leaves nearly sessile, fascicled, oblong, obtuse, quite entire, with revolute edges, hispid on both surfaces; whorls dense, many-flowered, collected into ovoid terminal heads. ♄. F. Native of the South of Brazil, Sello. Inner bracteas linear, striated, ciliated. Corolla downy outside, and villous inside.

Fascicled-leaved Cunila. Shrub procumbent.

13 C. microce'phala (Benth. lab. p. 364.) procumbent; branches scarcely pubescent; leaves petiolate, oblong or obovate, obtuse, quite entire, or subsinuately serrated, narrowed at the base, glabrous, flat; whorls dense, many-flowered, forming small, globose, nearly terminal heads. ♃. G. Native of the South of Brazil and Peru. Stems much branched. Leaves distant, subfasciculate in the axils, glandular beneath. Corolla white: throat villous inside.

Small-headed Cunila. Pl. procumbent.

14 C. verticilla'ta (Mœnch, ex Steud. nom. p. 899.) this plant is entirely unknown at the present day. Zizíphora verticillàta, Steud. nom.

Whorled Cunila. Pl. ?

Cult. A light rich soil is the best for these plants; and the species may either be increased by cuttings, seeds, or by dividing at the root. All of them require protection in winter.

Tribe V.

MELISSI'NEÆ (the genera contained in this tribe agree with *Melissa* in the characters given below.) Benth. lab. p. 365. Calyx 13, rarely 10-nerved, 5-toothed, bilabiate, rarely equal; upper lip tridentate; lower lip bifid. Tube of corolla exserted, rarely inclosed, exannulate inside; limb bilabiate: upper lip straight, entire, or emarginately-bifid, flattish, rarely galeate: lower lip spreading, with flat, nearly equal lobes, or the middle lobe is generally the broadest, entire or emarginate. Stamens ascending, didynamous; superior ones the shortest, and sometimes abortive.

XLVII. HEDEO'MA (a Greek name for Mint.) Pers. ench. 2. p. 134. Benth. lab. p. 365. Cunìla species of Lin. Zizíphora species of Rœm. et Schultes.

Lin. syst. *Diándria, Monogýnia.* Calyx ovate-tubular, somewhat gibbous below at the base, 13-striped, bilabiate; upper lip tridentate, or rather trifid: lower lip bifid; throat villous inside. Tube of corolla equalling the calyx, or a little exserted; limb bilabiate: upper lip erect, entire, emarginate or almost bifid, flat: lower lip spreading, trifid, with nearly equal lobes, or the middle lobe is rather the broadest, entire, or emarginate. Stamens 2, fertile, ascending; anthers 2-celled: cells diverging or divaricate; rudiments of the two upper stamens wanting or sterile, short, subulate, and capitate. Lobes of style nearly equal, or the lower one is elongated, or a little flattened, stigmatiferous at top and margin, involving the upper one at the base, which is very short. Achenia dry, smooth.—Herbs or subshrubs. Leaves small, quite entire, or a little toothed. Whorls loose, few-flowered, axillary, approximating into terminal racemes.

Sect. I. Mósla (the Nipalese name of *H. Nepalénsis.*) Benth. lab. p. 366. Calyx ovate; upper lip spreading, flattish, shortly tridentate.—Herbs, with toothed leaves.

1 H. Nepale'nsis (Benth. lab. p. 366.) stem herbaceous, erect, branched, almost glabrous; leaves petiolate, ovate, narrowed at both ends, serrated, flat, nearly glabrous; floral leaves small; whorls 2-flowered, secund, loosely racemose. ⊙. ? H. Native of the Himalaya, Deyra Dhoon, and Cashmere. Cunìla Nepalénsis, D. Don, prod. fl. nep. p. 107. Lycòpus dianthèra, Roxb. fl. ind. 1. p. 145. Melíssa Nepalénsis, Benth. in Wall. pl rar. asiat. 1. p. 66. Mósla ocymoìdes, Hamilt. mss. Cunìla Buchanàni, Spreng. syst. 1. p. 54. Stem roughish on the angles. Leaves ½ to 1 foot, green above, and paler beneath. Corolla hardly equalling the calyx.

Nipaul Hedeoma. Pl. 1 to 3 feet.

2 H. pulegioi'des (Pers. ench. 2. p. 131.) stem herbaceous, erect, branched, pubescent; leaves petiolate, ovate, narrowed at the base, subserrated, flat, pubescent; floral leaves similar to the others; whorls axillary, 6-flowered; corolla equalling the calyx. ⊙. H. Native from Canada to Carolina, in dry fields, and on the mountains. Melíssa pulegioìdes, Lin. spec. ed. 1st. p. 593. Cunìla pulegioìdes, Lin. spec. p. 30. Zizíphora pulegioìdes, Rœm. et Schultes, syst. 1. p. 209. Habit of *Melíssa A'cinos.* Leaves ½ an inch long. Corolla downy outside, bluish: upper lip subemarginate. Rudiments of upper filaments short, subulate, capitate. Lower lobe of style elongated.

Pennyroyal-like Hedeoma. Pl. ½ foot.

3 H. piperi'ta (Benth. lab. p. 730.) stem herbaceous, pubes-

cent; leaves nearly sessile, ovate, obtuse, a little crenated, rounded at the base, almost glabrous; floral leaves almost similar to the others; whorls axillary, about 6-flowered; corolla exceeding the calyx. ♃. G. Native of New Spain, Moçino et Sessé. Cunìla piperìta, Moc. et Sessé, mss. Stem with a perennial base, branched. Corollas purplish. Upper lobe of style very short. Habit of *Melissa*, sect. *Acinos*.

Pepper Hedeoma. Pl.?

Sect. II. Hedeòma (see genus for derivation.) Benth. lab. p. 367. Calyx tubular, terete: teeth all subulate.—Suffruticose plants, with quite entire leaves.

4 H. Gillie'sii (Benth. lab. p. 367.) stem suffruticose, glabrous; leaves nearly sessile, linear, obtuse, quite entire, narrowed at the base, glabrous; whorls 2-flowered; corolla hardly exceeding the calyx, which is glabrous. ♄. G. Native of Chili, near Mendoza, at Cerro de Achiras. Leaves like those of *Thymus vulgàris*, dotted, glandular, subfasciculate. Corolla violaceous; upper lip shortly emarginate: middle lobe of lower lip entire. Lower lobe of style flattened, recurved: upper lobe very short. Rudiments of sterile stamens short.

Gillies's Hedeoma. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

5 H. polygalæfòlia (Benth. lab. p. 367.) stem suffruticose at the base, much branched; leaves numerous, sessile, ovate, obtuse, quite entire, narrowed at the base, coriaceous, glabrous; flowers approximate at the tops of the branches; corolla half as long again as the calyx, which is glabrous. ♄. G. Native of the South of Brazil, Sello. Stems procumbent at the base, densely tufted. Leaves dotted. Corolla downy outside; upper lip emarginately bifid: lobes of lower lip entire. Lower lobe of style subulate, involving the upper one at the base. Rudiments of sterile stamens none.

Milkwort-leaved Hedeoma. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot, tufted.

6 H. multiflòra (Benth. lab. p. 367.) stem suffruticose, much branched at the base; branches pubescent; leaves nearly sessile, linear, quite entire, with revolute margins, scabrous from dots, shortly hispid; whorls axillary, 2-6-flowered; corolla about twice as long as the calyx, which is hispid. ♄. G. Native of the South of Brazil, Sello. Habit of *Micromèria Græca*. Stems floriferous almost their whole length. Corolla pubescent outside; upper lip emarginate: middle lobe of lower lip entire. Lower lobe of style subulate, involving the upper one. Rudiments of sterile stamens wanting.

Many-flowered Hedeoma. Shrub $\frac{1}{2}$ foot.

7 H. Drummóndi (Benth. lab. p. 368.) stem suffruticose, much branched; branches pubescent; leaves petiolate, oblong-linear, quite entire; whorls 6-10-flowered; corolla hardly exceeding the calyx, which is hispid. ♄. F. Native of Mexico, at Monterey, in the province of Texas. Leaves $\frac{1}{2}$ an inch long, obtuse, pubescent. Corollas minute.

Drummond's Hedeoma. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

8 H. hí'spida (Pursh, fl. amer. sept. 2. p. 414.) annual, erect; branches rather villous; leaves sessile, linear, obtuse, quite entire; floral leaves conforming to the others, exceeding the flowers; whorls about 6-flowered; bracteas lanceolate-subulate, equalling the calyxes; calyx ciliately hispid, deeply bilabiate; corolla scarcely exceeding the calyx. ⊙. H. Native of North America, at the Missouri, Mississippi, and among the Rocky Mountains. Cunìla híspida, Spreng. syst. 1. p. 54. Zizíphora híspida, Rœm. et Schultes, syst. mant. 1. p. 179. Hedeòma hírta, Nutt. gen. amer. 1. p. 16. Plant much branched, densely leafy. Leaves $\frac{1}{2}$ an inch long, green. Whorls numerous: upper ones approximate. Calyx gibbous at the base: teeth awned.

Hispid Hedeoma. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. The annual species, like other half hardy annuals, are reared on a hot-bed, and afterwards planted out into the open ground about the end of May. The shrubs should be grown in pots in light rich earth; and they will be readily increased by cuttings and seeds.

XLVIII. MICROME'RIA (from μικρος, *mikros*, small; and μερις, *meris*, a part; probably from the small parts of the plants.) Benth. in bot. reg. vol. 15. lab. p. 368.—Saturèia and Thymus species of Lin. and other authors.—Sabbàtia, Mœnch. meth. p. 386. but not of Pursh.—Piperélla, Presl, fl. sic.? without character.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx tubular, 13, rarely somewhat 15-nerved, 5-toothed; teeth nearly equal, straight, or scarcely disposed into 2 lips; throat usually villous inside. Tube of corolla equal, straight, naked inside, usually shorter than the calyx; limb bilabiate: upper lip erect, flattish, entire or emarginate; lower lip spreading, with flat, nearly equal lobes, or the middle lobe is broadest, entire or emarginate. Stamens 4, didynamous: lower ones the longest, ascending, approximating by pairs at the apex, rarely a little divergent; filaments toothless; anthers free, 2-celled: connective usually thickened; cells distinct, parallel, diverging, or a little divaricate. Lobes of style sometimes equal, subulate, with minute, terminal stigmas: sometimes the superior lobe is very short, and the lower one elongated, recurved, and flattened, with a stigmatiferous margin. Achenia dry, smooth.—Undershrubs or herbs. Whorls axillary or spicate, rarely cyme-formed, subpanicled. Flowers generally small, purplish or white. This genus is nearly allied to *Saturèia* and *Melissa*; and differs from the first by the nervation of the calyx and stamens; and from the last chiefly in the calyx, which is less bilabiate.

Sect. I. Hesperothy'mus (from ἑσπερος *hesperos*, the evening; and θυμος, *thymos*, thyme; probably from their exhaling a stronger scent in the evening.) Benth. lab. p. 371. Flowers solitary, on axillary pedicels, 1-3 on both sides; pedicels longer than the calyxes. Common peduncle wanting, rarely elongated.—American herbs, having the leaves usually crenated.

1 M. glabe'lla (Benth. lab. p. 371.) glabrous; stem herbaceous, erect, small; leaves sessile, oblong-linear, obtuse, quite entire; whorls about 6-flowered; pedicels elongated, naked; calyx sub-bilabiate: teeth all subulate: throat villous inside. ♃. H. Native of North America; in Canada; near New York; and on rocks along the rivers St. Lawrence, Ohio, Tenessee, and Mississippi. Cunìla glabélla, Michx. fl. bor. amer. 1. p. 13.? Hedeòma glàbra, Nutt. gen. amer. 1. p. 16. Zizíphora glabélla, Rœm. et Schultes, syst. 1. p. 209. Stem stoloniferous at the base. Upper lip of corolla, and middle segment of the lower lip entire. Style about equally bifid.?

Glabrous Micromeria. Pl. small.

2 M. Arkansa'na (Benth. lab. p. 730.) stem branched; leaves linear-lanceolate, serrated in front: upper ones quite entire; whorls about 4-flowered; pedicels bibracteate at the base. ♃. H. Native of the Arkansas, Nuttal. Hedeòma Arkansàna, Nutt. in trans. amer. phil. soc. n. s. 5. p. 186. Habit of *M. glabélla*, with the scent of Pennyroyal. The whole plant is glabrous and glandular. Pedicels equalling the cylindrical calyxes; teeth of calyx setaceous. Corolla sub-campanulate, blue, with a white palate.

Arkansas Micromeria. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

3 M. bracteola'ta (Benth. lab. p. 371.) pubescent; stems simple, slender; leaves linear-lanceolate, acute at both ends,

quite entire; pedicels with setaceous bracteoles, 3-5-flowered; calyx oblong, equal; corolla minute. ♃. H. Native of Carolina, Nuttall. Hedeòma bracteolàta, Nutt. gen. amer. addenda. Zizíphora bracteolàta, Rœm. et Schultes, syst. mant. 1. p. 179.

Bracteolate Micromeria. Pl. ¼ to ½ foot.?

4 M. stoloní'fera (Benth. lab. p. 371.) stems herbaceous, prostrate, radicant, glabrous; leaves sessile, ovate-roundish, obtuse, subcrenated, and somewhat cordate at the base, glabrous; pedicels elongated, naked; teeth of calyx ovate-lanceolate: throat villous inside. ♃. F. Native of New Spain, Moçino et Sessé. Nearly allied to *M. Brównei;* but differs in the more firm, acutely tetragonal stems, and broader sessile leaves.

Stoloniferous Micromeria. Pl. prostrate.

5 M. brównei (Benth. lab. p. 372.) stems herbaceous, prostrate, glabrous; leaves petiolate, ovate-rounded, obtuse, a little crenated, glabrous; pedicels elongated, naked; teeth of calyx ovate-lanceolate: throat villous inside. ♃. F. Native of Florida, Jamaica, Santa Fe de Bogota, and Brazil. Thymus Brównei, Swartz, fl. ind. occ. 2. p. 1011. prod. p. 89. Stems usually creeping, and rooting at the base. Leaves truncate or subcordate at the base. Whorls 2-flowered. Corollas pale purple, small. Tube a little exserted.

Browne's Micromeria. Pl. prostrate.

6 M. Xalape'nsis (Benth. lab. p. 372.) stems herbaceous, prostrate, pilose; leaves nearly sessile, ovate, a little crenated, ciliated; pedicels elongated, naked; teeth of calyx ovate-lanceolate: throat villous inside. ♃. F. Native of Mexico, between Pilela and Xalapa, in humid places. Thymus Xalapénsis, H. B. et Kunth, nov. gen. 2. p. 316. Allied to *M. Brównei;* but differs in the nearly sessile leaves, which are ovate, not rounded, and in the hairs of the stem being long and white; and from *M. stolonífera*, in the narrower pilose leaves.

Xalapa Micromeria. Pl. prostrate.

7 M. Cunningha'mii (Benth. lab. p. 730.) stems herbaceous, prostrate, finely pubescent; leaves petiolate, rounded, almost quite entire; pedicels elongated, naked; calyx hairy, with ovate-lanceolate teeth, and a naked throat. ♃. F. Native of New Zealand, on the west coast, at the river Mangamaka Hokianga, Cunningham. Habit of *M. Brównei.* Teeth of calyx villous inside, but the throat is naked. Tube of corolla inclosed.

Cunningham's Micromeria. Pl. prostrate.

8 M. Dougla'sii (Benth. lab. p. 372.) stems herbaceous, prostrate; leaves petiolate, ovate-rounded, obtuse, crenated, roundedly truncate at the base, glabrous on both surfaces; peduncles elongated, bracteate at the base or middle; teeth of calyx subulate: throat naked inside. ♃. F. Native of North West America, at the river Columbia. Thymus Douglàsii, Benth. in Linnæa, 6. p. 80. Thymus Chamissònis, Benth. in Linnæa, 6. p. 80. Branches very long, prostrate, creeping, pubescent. Corolla purple, downy outside: upper lip emarginate; and the middle lobe of lower lip entire. Lobes of style unequal.

Douglas's Micromeria. Pl. prostrate.

Sect. II. Pipere'lla (a dim. of *Piper*, pepper.) Benth. lab. p. 373. Flowers almost sessile, or collected into sessile or pedunculate heads. Pedicels almost wanting, or shorter than the calyxes. Whorls axillary or subspicate.—Undershrubs, rarely herbs. Leaves quite entire, veiny, often hard; floral leaves almost similar to the cauline ones.

* *Species natives of Europe and Africa.*

9 M. Julia'na (Benth. lab. p. 373.) pubescent, suffruticose; branches erect, strict; leaves sessile: lower ones ovate: upper ones lanceolate-linear, all obtuse, and quite entire, with revolute edges; fascicles of flowers dense, on short peduncles; bracteas about equal in length to the sessile calyxes; calycine teeth subulate, stiff, hardly so long as the breadth of the tube: throat naked inside. ♄. F. Native of the region of the Mediterranean, on dry and stony hills; as in Sicily, Naples, Dalmatia, and several of the Grecian islands. Saturèia Juliàna, Lin. spec. 793. Sibth. et Smith, fl. græc. 6. p. 32. t. 540. Tenore, fl. nap. t. 151. f. 3. Sabbàtia corymbòsa, Mœnch. meth. p. 386.—Ger. emac. 576. f. 3.—Park. theatr. 5. f. 3.—Mor. hist. 3. p. 412. sect. 11. t. 17. f. 4.—Lob. icon. 245. Stems procumbent, much branched. Corollas very minute, pale red. Upper lobe of style the shortest. Plant with a fragrant smell.

Var. β, hirsùta (Benth. lab. p. 373.) hairy, hard, a foot high, or more, a little branched. ♄. F. Native of Sicily. Saturèia Juliàna, var. canéscens, Guss. prod. fl. sic. 2. p. 114. Saturèia hirsùta, Presl, del. prag. p. 79.

St. Julian's Micromeria. Fl. May, Sept. Clt. 1596. Shrub ½ to 1 foot.

10 M. Græ'ca (Benth. lab. p. 373.) pubescent; branches erect or ascending; leaves sessile: lower ones ovate, obtuse: superior ones lanceolate-linear, all quite entire, with revolute margins; fascicles of flowers loose, almost secund, pedunculate; bracteas, for the most part, one half shorter than the calyxes; calycine teeth subulate, longer than the breadth of the tube: throat villous inside. ♄. F. Native of the region of the Mediterranean, on dry stony hills; as of Portugal, Spain, Corsica, Italy, Naples, Sicily, Syria, and many of the Grecian islands, &c. Saturèia Græ'ca, Lin. spec. 794. Sibth. et Smith, fl. græc. 6. p. 34. t. 542. Tenore, fl. nap. t. 151. f. 2. Saturèia micrántha, Hoffm. et Link, fl. port. 1. p. 142. Thymus hírtus, Russ. nat. hist. alep. 2. p. 256. Thymus micránthus, Brot. phyt. p. 30. t. 13.—Alp. exot. 265. t. 264.—Mor. hist. 3. p. 411. sect. 11. t. 17. f. 2. This is a very variable plant. Stem woody at the base, procumbent. Corolla exceeding the calyxes a little, pale purple: upper lip shortly emarginate. Lobes of style equal.

Var. β, longiflòra (Guss. prod. fl. sic. 2. p. 117.) corolla twice as long as the calyx. ♄. F. Native of Sicily and Naples. Saturèia Consentìna, Tenor. fl. nap. 3. p. 151. f. 9. syll. p. 279. This is distinguished from the species by the greater stature and larger flowers.

Var. γ, densiflòra (Benth. lab. p. 373.) fascicles of flowers more dense, and on shorter peduncles; throat of calyx less villous inside. ♄. F. Saturèia tenuifòlia, Tenore, fl. nap. t. 151. f. 4. prod. p. 33. Guss. prod. fl. sic. 115. Micromèria tenuifòlia, Rchb. fl. germ. exc. p. 310. Saturèia hírta, Host, fl. austr. 2. p. 134.? Thymus virgàtus, Tenor. fl. nap. t. 155. f. 3. syll. 296. Saturèia congésta, Horn. hort. hafn. Spreng. syst. 2. p. 720.

Grecian Micromeria. Fl. June, July. Clt. 1759. Shrub ¾ foot.

11 M. parviflòra (Rchb. fl. germ. exc. p. 859.) almost glabrous; branches erectish; leaves sessile, all linear, quite entire, with revolute margins; peduncles equalling the leaves, loosely 3-flowered; bracteas minute; calycine teeth subulate: the upper ones the broadest: throat villous inside. ♄. F. Native of Dalmatia, on the confines near Albania, among the mountains of Patrovitch. Saturèia parviflòra, Vis. pl. rar. dalm. in bot. zeit. 1829. Saturèia inodòra, Host, fl. austr. 2. p. 135. but not of Salzm. This is a very distinct species from *M. Græ'ca;* the leaves are much narrower and glabrous; the flowers are on long pedicels, and fewer; the form and length of the calycine teeth are unequal.

Small-flowered Micromeria. Shrub.

12 M. te'nuis (Benth. lab. p. 374. and 731.) suffruticose, procumbent; branches ascending, clothed with floccose wool; leaves sessile, linear, acute, quite entire, with revolute margins, woolly; whorls 2-6-flowered; calyxes sessile: teeth subulate, stiff, longer than the breadth of the tube. ♄. F. Native of the Canary Islands, on the mountains. Saturèia tènuis, Link, in L. de Buch, beschr. can. ins. p. 143. M. lanàta, Benth. lab. p. 374. Floriferous branches densely leafy. Flowers usually solitary, axillary, rather shorter than the floral leaves. Corolla hardly exceeding the calycine teeth.

Slender Micromeria. Shrub procumbent.

13 M. lana'ta (Benth. lab. p. 731.) suffruticose, procumbent; branches ascending, clothed with floccose wool; leaves sessile, linear, obtuse, quite entire, with revolute margins, woolly; whorls 6-10-flowered; cymes pedunculate; calyxes sessile: teeth short, soft, tomentose. ♄. F. Native of the Canary Islands, on the mountains. Saturèia lanàta, Link, in L. de Buch. beschr. can. ins. p. 143. M. tènuis, Benth. lab. p. 374. Very nearly allied to *M. tènuis*.

Woolly Micromeria. Shrub procumbent.

14 M. va'ria (Benth. lab. p. 374.) suffruticose, procumbent, pubescent, or villous; leaves sessile: lower ones ovate: upper ones lanceolate, subfasciculate in the axils, all obtuse, with revolute edges, rather canescent beneath; flowers minute, sessile, disposed in pedunculate or sessile fascicles; bracteas minute; calyx tubular, pubescent, shorter than the floral leaves: throat villous inside. ♄. F. Native of the Canary Islands, very common. Saturèia vària, Berth. et Webb, mss. Thymus ericæfòlius, Roth. cat. 2. p. 50. ex Willd. enum. 624. Thymus inodòrus, Benth. in Linnæa, 6. p. 77. but not of Desf. Saturèia thymoìdes, Lowe, prim. fl. mader. p. 19. Stems much branched. Calyx often purplish. Corolla purplish, hardly exceeding the calyx.

Various Micromeria. Fl. June, Aug. Clt. 1806. Pl. procumbent.

15 M. approxima'ta (Rchb. fl. germ. exc. p. 859.) suffruticose, procumbent, pubescent, or villous; leaves sessile, lanceolate; superior leaves linear, somewhat fascicled, all bluntish, with subrevolute edges; flowers on short pedicels; bracteas equalling the pedicels; calyx tubular, pubescent: throat villous inside. ♄. F. Native of the region of the Mediterranean, on dry hills; as of Sicily, Naples, Albania. Saturèia fasciculàta, Rafin. prec. p. 39. Saturèia approximàta, Biv. manip. 5. p. 13. Thymus fruticulòsus, Bert. amœn. ital. p. 101. Very nearly allied to *M. vària;* but differs in the flowers being almost twice the size; and in the leaves being longer. Corolla purple, twice as long as the calyx.

Approximate-leaved Micromeria. Fl. June, Aug. Clt. 1822. Shrub procumbent.

16 M. inodòra (Benth. lab. p. 375.) suffruticose; branches pubescent; leaves sessile, very numerous, fascicled, small, lanceolate, obtuse, with revolute edges, canescent, ciliated; whorls few-flowered; flowers almost sessile, among the fascicles of the leaves; bracteas minute; calyx tubular, almost glabrous: throat villous inside. ♄. F. Native of Algiers, on arid hills, and the Balearic Islands. Thymus inodòrus, Desf. fl. atl. 2. p. 30. t. 129. Shrub much branched, erect. Corolla purple, longer than the calyx: lobes all obtuse, entire. This differs from *M. vària*, in the stem being more erect; in the leaves being smaller, more numerous, and narrower. This is probably the same as the preceding.

Scentless Micromeria. Shrub 1 foot.

17 M. densiflòra (Benth. lab. p. 375.) suffruticose, diffuse, glabrous; branches short; leaves approximate, sessile, lanceolate-linear, acute, with revolute margins; floral leaves equalling the calyxes; whorls about 10-flowered, densely approximate into ovate spikes; calyxes sessile, tubular, almost glabrous, having the throat villous inside, and the teeth lanceolate-subulate, erect, scarcely so long as the breadth of the tube. ♄. F. Native of the Canary Islands, Broussonet. Habit of *Thymus Serpyllum*, var. *angustifòlia*. Leaves green above, and canescent beneath. Calyx purplish. Corolla purple, a little longer than the calyx, glabrous. Style almost equally bifid.

Dense-flowered Micromeria. Shrub diffuse.

18 M. Forbe'sii (Benth. lab. p. 376.) pubescent, suffruticose, procumbent; branches ascending; leaves almost sessile, ovate, obtuse, rounded at the base, flat, or with subrevolute edges, pubescent on both surfaces; floral leaves exceeding the flowers a little; whorls dense, few-flowered; calyxes almost sessile, ovate-cylindrical: teeth short, setaceous, shorter than the corolla: throat villous inside. ♄. F. Native of the Island of St. Nicholas, one of the Cape Verds. This differs from *M. Teneriffæ*, in the pubescence, stronger branches, larger, more numerous leaves, and shorter, almost sessile calyxes.

Forbes's Micromeria. Shrub.

19 M. cane'scens (Guss. pl. rar. p. 228. t. 42. prod. fl. sic. 2. p. 120.) canescent from villi; stem slender; lower leaves ovate: upper ones lanceolate-linear, acute; peduncles axillary, 2-7-flowered, solitary or twin, rather secund; bracteas short, about equal in length to the pedicels; calyx very villous. ♄. F. Native of Sicily, on arid calcareous hills. Corolla purple. Allied to *M. Græ'ca*.

Canescent Micromeria. Shrub ½ to 1 foot.

20 M. nervòsa (Benth. lab. p. 376.) pubescent, suffruticose; branches ascending; leaves sessile, all ovate, acute, quite entire, flat, or with rather revolute margins; whorls many-flowered: superior ones approximate; fascicles of flowers loose, scarcely pedunculate; bracteas very short; calyx pilose, with spreading setaceous teeth: throat rather villous inside. ♄. F. Native of the region of the Mediterranean, on dry arid hills, and in the fissures of rocks; as of Mount Atlas, South of Sicily; Naples, by the sea side; Grecian Islands, and Lybia. Saturèia nervòsa, Desf. fl. atl. 2. p. 9. t. 121. f. 2. Saturèia filifòrmis, Tenor. prod. and marin. viag. bot. 1. p. 299. ex Tenore, syll. p. 279. Thymus filifòrmis, Sieb. pl. cret. exs. but not of Lin. Thymus Mastichìna, Smith, prod. fl. græc. but not of Lin. Branches simple. Corollas hardly longer than the calyx, red: upper lip shortly emarginate.

Nerved Micromeria. Shrub ½ to 1 foot.

21 M. microphy'lla (Benth. lab. p. 377.) suffruticose, nearly glabrous, pubescent, or villously canescent; branches filiform; leaves small, ovate or oblong, obtuse, flat, or with subrevolute margins; fascicles of flowers pedunculate, loose, many-flowered; bracteas about equal in length to the pedicels; calyxes ovate, almost glabrous, or covered with short villi: throat rather villous inside. ♄. F. Native of the region of the Mediterranean; as in the fissures of rocks on Mount Atlas; Sicily, on arid hills; Naples, and Island of Melita. Stems decumbent. Corollas purple.

Var. α, glabriúscula (Benth. lab. p. 377.) small, pale green, nearly all glabrous. ♄. F. Saturèia microphýlla, var. α, Guss. prod. fl. sic. 2. p. 120. Thymus Teneríffæ, Hortul. but not of Pers. Saturèia Teneríffæ, Link, enum. 2. p. 101.

Var. β, villòsa (Benth. lab. p. 377.) plant firmer, often purplish or canescent; stems and calyxes villous. ♄. F. Saturèia microphýlla, b. c. d. Guss. prod. fl. sic. 2. p. 120, 121. Thymus microphýllus, D'Urv. enum. in mem. soc. Lin. par. 327. Saturèia filifòrmis, Desf. fl. atl. 2. p. 8. t. 121. f. 1.?

Small-leaved Micromeria. Fl. June, July. Clt.? Shrub ½ to 1 foot.

22 M. ova'ta (Benth. lab. p. 377.) suffruticose, procumbent; branches ascending, villous; leaves sessile, ovate, bluntish, subcordate at the base, with revolute edges, pubescent on both surfaces; floral leaves shorter than the peduncles, or the upper ones are longer; fascicles of flowers pedunculate, loose; teeth of calyx setaceous; throat of calyx villous inside. ♄. F. Native of Abyssinia, Salt. Saturèia ovàta, R. Br. in append. to Salt, abyss. Allied to *M. Forbèsii* and *M. microphýlla;* it differs from the first in the branches being more slender; in the flowers being smaller; and in the fascicles being pedunculate; and from the latter, in the leaves being broader at the base; in the margins being very revolute, and in the floral leaves being narrower.

Ovate-leaved Micromeria. Shrub procumbent.

23 M. filifórmis (Benth. lab. 378.) suffruticose, diffuse, glabrous; branches filiform; leaves nearly sessile, ovate: lower ones cordate: superior ones rounded at the base, all bluntish, and quite entire, flat; whorls about 2-flowered; pedicels minutely bracteate at the base, about equal in length to the calyxes; calyx tubular, declinate, or nutant: teeth subulate, rather shorter than the corolla: throat rather villous inside. ♄. F. Native of the region of the Mediterranean; as of Spain and the Balearic Islands. Thỳmus filifórmis, Ait. hort. kew. 2. p. 313. Piperélla filifórmis, Presl, fl. sic. p. 36. Cunìla thymoìdes, Gowan, herb. ex Benth. Habit of *M. microphýlla*, but the branches are more slender and the leaves more remote. Leaves generally purplish. Corollas purplish. Style about equally bifid.

Filiform Micromeria. Fl. June, July. Clt. 1770. Shrub diffuse.

24 M. puncta'ta (Benth. lab. p. 378.) suffruticose, branches elongated, slender, finely pubescent; leaves nearly sessile: lower ones ovate, acute: superior ones oblong, obtuse, narrowed at the base, with scarcely revolute edges: uppermost leaves about equalling the flowers; fascicles of flowers on short peduncles; bracteas minute; calyxes sessile, nearly glabrous, small, ovate, cylindrical, with short setaceous teeth: throat villous inside. ♄. F. Native of Abyssinia, Salt. Saturèia punctàta, R. Br. in append. to Salt, abyss. Habit of *M. Græ'ca*, with the flowers of *M. Teneríffæ*. Leaves distant. Peduncles 3-6-flowered.

Dotted Micromeria. Shrub.

25 M. Teneríffæ (Benth. lab. p. 378.) suffruticose, diffuse, almost glabrous; branches stiff, slender, pubescent above; leaves sessile, ovate, acute, rigid, glabrous, flat: lower ones broader and somewhat plicate: superior ones almost lanceolate, about equal in length to the flowers; fascicles of flowers dense, on short peduncles; bracteas very short; calyxes sessile, pubescent, cylindrical: teeth setaceous, about equal in length to the corolla: throat villous inside. ♄. F. Native of Teneriffe, plentiful. Thỳmus Teneríffæ, Poir. dict. 7. p. 650. Thỳmus terebinthinàceus, Willd. enum. p. 624. Allied to *M. microphýlla*, but differs in the branches being elongated and woody, and in the leaves being more acute, stiffer, and longer; in the flowers being sessile, and in the calyx being elongated and more slender. Corollas small, purple.

Teneriffe Micromeria. Shrub ½ to 1 foot.

26 M. biflòra (Benth. lab. p. 378.) suffruticose, much branched, tufted; branches ascending, pubescent or pilose; leaves sessile, ovate, acute, flat, with sub-revolute edges, stiff, glabrous, rather cordate at the base: superior ones shorter than the flowers; whorls loosely few-flowered; bracteas about equal in length to the pedicels; calyxes pedicellate, sub-secund, finely pubescent, or rather pilose: throat villous inside. ♄. F. Native of Nipaul and Kamaon, Wall; Mussooree, Royle; Nielgherri, Wight. Thỳmus biflòrus, Hamilt. in D. Don. prod. fl. nep. p. 112. Stems densely branched at the base; branches densely leafy. Corolla half as long again as the calyx: upper lip emarginate. Lobes of style nearly equal. Hardly differing from *M. Teneríffæ*, unless in habit, and in the larger, stiffer leaves.

Two-flowered Micromeria. Shrub ½ foot.

27 M. subcorda'ta (Vis. mss. ex Benth. lab. p. 379.) suffruticose; branches short, erectish, nearly simple, pubescent; leaves sessile, flat, broad-ovate, obtuse, broadly and truncately cordate at the base: floral leaves narrower; fascicles of flowers secund; peduncles few-flowered; calyx cylindrical, pubescent, with subulate teeth and a naked throat; corollas exserted. ♄. F. Native of Dalmatia. Stems many, woody at the base; erect or procumbent at the base. Bracteas short, lanceolate. Corolla equal in length to the calycine teeth.

Subcordate-leaved Micromeria. Pl. ¼ to ½ foot.

28 M. pipere'lla (Benth. lab. p. 379.) suffruticose, branches ascending, pubescent; leaves sessile, broad-ovate, obtuse, rounded or sub-cordate at the base, glabrous on both surfaces: upper leaves oblong, small; fascicles of flowers loose, pedunculate, secund, few-flowered; bracteas small, oblong; calyxes nearly sessile, tubular, pubescent, with subulate teeth, the 3 superior teeth spreading; throat naked inside. ♄. F. Native of the South of Europe; as of Piedmont, and Croatia. Thỳmus piperélla, All. ped. 1. p. 21. t. 37. f. 3. bad. Waldst. et Kit. pl. rar. hung. 2. p. 169. t. 156. but not of Lin. Thỳmus marginàtus, Smith, in Dicks. pl. sic. no. 71. Thỳmus Croáticus, Pers. ench. 2. p. 130. Calamíntha Croática, Host, fl. austr. 2. p. 132. Branches herbaceous. Whorls remote. Peduncles 3-5-flowered. Calyx and Corolla purplish and pubescent.

Small Peppermint Micromeria. Shrub ½ foot.

29 M. Forskœ'lii (Benth. lab. p. 379.) stems decumbent, imbricate; leaves ovate, acute; flowers axillary, solitary, sessile. ♄. F. Native of Kurma, Forsk. Thỳmus imbricàtus, Forsk. fl. ægypt. p. 108. Calyx striated, having the throat closed with villi, 5-toothed. Flowers red. Leaves ciliated on the keels, ex Benth.

Forskœl's Micromeria. Shrub procumbent.

30 M. Sina'ica (Benth. lab. p. 380.) suffruticose; branches elongated, almost simple; leaves almost sessile, ovate, flat, or with revolute edges: superior ones exceeding the flowers; fascicles of flowers dense, scarcely pedunculate; calyxes almost sessile, ovate, with short setaceous teeth; corollas minute. ♄. F. Native of Arabia, among rocks, in the desert of Sinai, Bové. Habit of *M. Græ'ca*, but is distinguished from it by the leaves, dense whorls, and small ovate calyxes. Leaves remote. Whorls 12-30-flowered, all remote. Flowers smaller than in any other species.

Sinai Micromeria. Shrub ½ to 1 foot.?

* * *Species natives of Australia.*

31 M. satureioìdes (Benth. lab. p. 380.) glabrous; stems erect, branched; leaves nearly sessile, rather elliptic or lanceolate, obtuse, flat; whorls loose, 3-10-flowered; calyxes finely pubescent, cylindrical, with short lanceolate teeth, and with the throat villous inside; corollas scarcely exceeding the calyxes. ♄.? F. Native of New Holland, at Lake George, Cunningh.; about Port Jackson, R. Br. Méntha satureioìdes, R. Br. prod. p. 505.? Stems slender, rooting at the base. Flowers on short pedicels, 3-5 in each fascicle. Bracteas scarcely equalling the pedicels.

Savory-like Micromeria. Shrub ¼ to ½ foot.

32 M. Austra'lis (Benth. lab. p. 380.) stems ascending, with marginate scabrous angles; leaves lanceolate; calyxes tomentose: teeth obsoletely bearded inside at the base; flowers verticillate; stamens exserted; superior lip of corolla 2-lobed. ♄.? F. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Méntha austràlis, R. Br. prod. p. 505.

Southern Micromeria. Shrub.?

33 M.? gra'cilis (Benth. lab. p. 830.) glabrous, or clothed with fine down, pale green; stems erect; leaves on short petioles, ovate, or the superior ones are ovate-lanceolate, obtuse, flat; whorls about 6-flowered; calyxes pubescent, cylindrically campanulate, with lanceolate, acute teeth, which are shorter than the breadth of the tube, and the throat is naked inside; corollas scarcely exceeding the calyxes. ♄.? F. Native of Van Diemen's Land. Méntha grácilis, R. Br. prod. p. 505.? but not of Smith. Méntha Dieménica, Spreng. syst. 2. p. 724. This differs principally from *M. satureioìdes* in the broader bases of the leaves, pubescence, and in the calyxes being larger and sessile, and in the throat being naked inside. This species differs from the characters of the genus in the stamens being distant and straight, not ascending.

Slender Micromeria. Shrub.?

* * * *Species natives of America.*

34 M. obova'ta (Benth. lab. p. 381.) stem shrubby, divaricate, much branched; leaves obovate, obtuse, quite entire, narrowed at the base, with revolute margins, wrinkled, canescent on both surfaces; flowers almost sessile. ♄. S. Native of Jamaica. Saturèia vimínea, Lin. amœn. 5. p. 399. Swartz. obs. p. 220. Saturèia incàna, Spreng. syst. 2. p. 719. Zygis aromática, Desv. in Hamilt. prod. fl. ind. occ. p. 46. Xenópoma obovàtum, Willd. ex Colla. hort. rip. p. 147. t. 25. Mentha vimínea, &c. Browne, jam. 258. Leaves half an inch long. Corolla about twice as long as the calyx, whitish. Lower lobe of style long and flattened.

Obovate-leaved Micromeria. Fl. June, July. Clt. 1783. Shrub 2 to 12 feet.

35 M. nubígena (Benth. lab. p. 381.) procumbent, much branched, hispid; leaves small, petiolate, broad-ovate, obtuse, quite entire; whorls 2-flowered; flowers nearly sessile; calycine teeth nearly equal, acute, and the throat villous inside. ♄.? G. Native of Peru, in rugged places, on the burning mounts Paracé and Rucu-Pichincha, and at Surucucha. Thymus nubígenus, H. B. et Kunth, nov. gen. 2. p. 316. Habit of *Thymus Serpyllum*. Stems rather woody at the base. Branches pubescent at the base. Corolla about twice as long as the calyx, pubescent outside.

Cloud-growing Micromeria. Shrub procumbent.

36 M. Gillie'sii (Benth. lab. p. 381.) procumbent, finely clothed with pubescence; leaves sessile, oblong, obtuse, quite entire; whorls generally 2-flowered; flowers nearly sessile; calycine teeth stiff, sub-revolute, and the throat rather villous inside. ♄. F. Native of Chili, near Mendoza, Gillies. Whorls rarely so much as 6-flowered. Bracteas small, setaceous. Corolla quite glabrous, scarcely longer than the calyx; upper lip emarginate. Lobes of style flattened, at length revolute.

Gillies's Micromeria. Shrub procumbent.

37 M. Bolivia'na (Benth. lab. p. 731.) glabrous or clothed with fine down; leaves nearly sessile, oblong, obtuse or obovate, quite entire, flat; whorls few-flowered; flowers nearly sessile; calycine teeth short, obtuse, erect, and the throat naked inside. ♄. F. Native of Bolivia. Nearly allied to *M. obovàta*, but differs in the leaves being much smaller, flat, and in the calyxes being shorter. Leaves greenish on both surfaces. Corolla smaller than in *M. obovàta*, scarcely half as long again as the calyx.

Bolivia Micromeria. Shrub.

Sect. III. Pseudomeli'ssa (ψευδος, *pseudos*, *falsehood*, and μελισσα, *melissa*, a bee, also the name of balm.) Benth. lab. p. 383. Cymes of whorls elongated, pedunculate, sub-dichotomous. Leaves often toothed.—European herbs. The species are probably referrible to the genus *Melissa* ex Benth.

38 M. pule'gium (Benth. lab. p. 382.) herbaceous, ascending, pubescent: leaves petiolate, ovate, toothed, green on both surfaces; racemes coarctate, secund; cymes sub-dichotomous, few-flowered; teeth of calyx setaceous, nearly equal, and the throat villous inside. ♃.? H. Native of Austria and Hungary. Melissa Pulègium, Rochel, del. pl. rar. bannat. p. 62. t. 22. f. 8. Calamíntha origanifòlia, Host, fl. austr. 2. p. 120. Melíssa subnùda, Waldst. et Kit. pl. rar. hung. 3. p. 296. t. 262.? Calamíntha subnùda, Host, fl. austr. 2. p. 130. Thymus subnùdus, Spreng. syst. 2. p. 698. Stems erect, almost simple, hoary from short reflexed pili. Calyx cylindrical. Corolla about twice as long as the calyx, form of *Saturèia*, purple.?

Pennyroyal Micromeria. Pl. ascending.

39 M. marifo'lia (Benth. lab. p. 382.) plant hoary, ascending; leaves ovate or oblong, obtuse, almost quite entire, canescent above, and white beneath; racemes loose, many-flowered; teeth of calyx obtuse, nearly equal: throat villous inside; corolla about twice as long as the calyx. ♄. F. Native of Portugal, Spain, Syria, Tauria, Piedmont, &c., in dry rocky places. Melíssa fruticòsa, Lin. spec. 828. Melissa Crética, Lam. dict. 4. p. 79. and of many authors, but not of Lin. Calamíntha Crética, Lam. fl. fr. 2. p. 395. Népeta Crética, Dietr. ex Steud. nom. p. 521. Thymus Créticus, D. C. fl. fr. 3. p. 564, but not of Brot. Thymus Barrelièri, Spreng. syst. 2. p. 698. Melíssa marifòlia, Pers. ench. 2. p. 132. Népeta marifòlia, Cav. icon. 6. p. 55. t. 576. Bystropògon marifòlius, Juss. ex Steud. nom. p. 521. Thymus marifòlius, Willd. enum. 2. p. 624. Népeta serpyllifòlia, Bieb. fl. cauc. 2. p. 40. cent. pl. ross. 1. t. 28. Népeta parvifòlia, Hortul.—Barr. icon. 1166. Corolla milk-coloured, spotted with purple, more than twice as long as the calyx. Habit of *Melíssa*, sect. *Calamíntha*, but the calyx is altogether that of *Micromèria*.

Cat-thyme-leaved Micromeria. Fl. June, Sept. Cult. 1800. Shrub 1 to 2 feet.

Cult. The greater number of the species of *Micromèria* are under-shrubs, very few herbaceous annuals. They are too tender to stand the open air in this country; they should therefore be grown in pots, and placed among other Alpine plants, so that they may be sheltered under glass in winter; but they will grow very well in summer on rockwork, and probably might survive our milder winters in such a situation. A light, rich earth is the best soil for them, and the pots should be well drained with sherds. The seeds of annual kinds may be sown in the open ground in April, in a warm, sheltered situation.

XLIX. MELI'SSA (from μελισσα, *melissa*, a bee; from μελι, honey: bees are said to gather abundance of honey from this plant.) Benth. lab. p. 383. Melissa Clinopòdium and Thymus, species of Lin. and other authors. Calamíntha and A'cinos, Mœnch. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 13-nerved, usually striated, bilabiate; upper lip generally spreading, tridentate: lower lip bifid; throat naked or villous inside. Tube of corolla straight or incurvedly ascending, naked inside, usually exserted; throat generally inflated; limb bilabiate; upper lip erect, flattish, entire, or emarginate: lower one spreading, with flat lobes, the middle lobe usually the broadest, entire, or emarginate. Stamens 4, didynamous, ascending, approximate by pairs at apex, or rarely a little distant, lower two the longest: the superior 2 sometimes sterile; filaments toothless; anthers free, 2-celled: connective often thickened: cells distinct, parallel, diverging. Lobes of style sometimes equal, subulate, with minute terminal stigmas; sometimes the lower lobe is elongated, recurved, flattened, with stigmatiferous margins. Achenia dry,

smooth.—Under shrubs, but usually herbs, with variable inflorescence. Flowers purplish, white or yellow.

Sect. I. Calamíntha (from καλος, *kalos*, beautiful; and μινθα, *mintha*, mint; in reference to the beauty of the plants and their affinity to *Méntha*.) Benth. lab. p. 386. Calamíntha, Mœnch. meth. 408. Racemes loose, rather secund. Cymes of whorls, pedunculate, dichotomous. Bracteas minute. Calyx almost terete, striated, hardly gibbous at the base: throat villous inside.

1 M. incàna (Benth. lab. p. 386.) herbaceous or suffruticose at the base, procumbent; branches ascending, clothed with hoary tomentum; leaves petiolate, small, orbicular, almost entire, clothed with hoary tomentum on both surfaces; racemes rather secund; whorls few-flowered; cymes hardly dichotomous; calyxes shortly bilabiate, and the throat naked inside; corolla hardly twice as long as the calyx. ♃. H. Native of the Grecian Archipelago, frequent, and about Athens; also of Syria, near Aleppo. Melíssa, Crética, Russel, nat. hist. alep. but not of Lin. Thymus incànus, Sibth. et Smith, fl. græc. 6. p. 62. t. 577. This species is intermediate between *Melíssa* and *Micromèria*. Upper whorls dense; lower ones more loose.

Hoary Balm. Pl. ½ to 1 foot.?

2 M.? Cre'tica (Lin. spec. p. 828.) herbaceous, humble, procumbent at the base; branches ascending, pilosely hispid; leaves petiolate, small, roundish, obtuse, almost quite entire, clothed with soft villi on both surfaces; racemes sub-secund; cymes scarcely dichotomous, few-flowered; calyx shortly bilabiate, the throat villous inside; corolla scarcely twice as long as the calyx. ♃. H. Native of Candia. Thymus hírtus, Sieb. pl. exs. but not of others.—Barr. icon. t. 1166.—Bauh. hist. 3. p. 230. f. 2.—Park. theatr. p. 36. t. 37. f. 4. Allied to *M. incàna*, but differs in the stem and leaves being villous, not tomentose. Corolla white, purplish.?

Cretan Balm. Fl. June, July. Clt. 1596. Shrub ½ to 1 foot.

3 M. thymifo'lia (Benth. lab. p. 386.) stems herbaceous, ascending, clothed with hoary pubescence; leaves petiolate, ovate, obtuse, hardly crenated, cuneated at the base or rounded, rather canescent; racemes loose, secund; cymes dichotomous; flowers small; calyx shortly bilabiate, with acute teeth; corolla about twice as long as the calyx. ♃. H. Native of Carniola, on rocks and old walls. Saturèia thymifòlia, Scop. fl. carn. 1. p. 428. ex. Host. Calamíntha thymifòlia, Host, fl. austr. 2. p. 132. Thymus origanifòlius, Vis. in bot. zeit. 1830. 1. p. 15. It appears intermediate between *Micromèria marifòlia* and *Melissa Népeta*. Leaves hardly ½ an inch long, sometimes quite entire, full of glandular dots, canescent beneath from tomentum. Corolla pale purplish: upper lip emarginate.

Thyme-leaved Balm. Pl. 1 foot.

4 M. glandulòsa (Benth. lab. p. 387.) stems herbaceous; branches almost glabrous; leaves petiolate, broad-ovate, acutish, coarsely serrated, rounded at the base, nearly glabrous; racemes very loose, few-flowered, secund; cymes dichotomous: calyx bilabiate, with acute teeth; corolla hardly larger than the small calyx. ♃. H. Native of Corsica, Requien; of Sardinia, Moris. Thymus glandulòsus, Req. in ann. sc. nat. par. 5. p. 386. Branches slender, slightly downy. Throat of calyx closed by villi. Corolla white or pale purple.

Glandular Balm. Shrub ½ to 1 foot.

5 M. ne'peta (Lin. spec. 828.) stems herbaceous; branches procumbent, ascending, or erectish, villous; leaves petiolate, broad-ovate, obtuse, crenated, rounded at the base, villous on both surfaces, pale beneath; raceme elongated, loose, many-flowered, secund; cymes dichotomous; calyx shortly bilabiate, with subulate teeth; corolla half as long again as the calyx, hardly twice as long. ♃. H. Native of the Southern parts of Europe, in dry situations, among rubbish, and by way-sides; as in the South of France, Portugal, Piedmont, Naples, Grecian Islands, South of Tauria, &c. Thymus Népeta, Smith, fl. brit. 2. p. 642. engl. bot. t. 1414. Hook, fl. lond. vol. 1. with a figure. Calamíntha parviflòra, Lam. fl. fr. 2. p. 396. Calamíntha trichótoma, Mœnch. meth. p. 409. Thymus diffùsus, Hortul. Thymus Brauneànus, Hoppe. Calamíntha rotundifòlia, Host, fl. austr. 2. p. 131. Calamíntha oblìqua, Host, fl. austr. 2. p. 131. Calamíntha Népeta, Hoffm. et Link, fl. port. Calamíntha canéscens, Presl, fl. sic. p. 37. Melíssa obtusifòlia, Pers. ench. 2. p. 122.—Black, herb. t. 167.—Riv. mon. t. 47.—Lob. icon. t. 513. Leaves ½ to 1 inch long, deep green above, and hoary beneath. Throat of calyx bearded. Corolla white and pale purple. The plant has a strong aromatic smell, approaching to that of pennyroyal, and a moderately pungent taste, somewhat like spearmint, but warmer. Infusions of the leaves were given as tea in weaknesses of the stomach, flatulent cholics, &c.

Var. β, *Athónica* (Benth. lab. p. 387.) more humble and more glabrous; leaves greener. ♃. H. Native of Mount Athos. Thymus Athónicus, Bernh. ex Rchb. pl. germ. exc. p. 329. under no. 2242. Calamíntha Athónica, Rchb. l. c. Melíssa Athèos, Hortul.

Cat-mint Balm or Field Balm. Fl. July, Oct. England. Pl. 1 to 1½ foot.

6 M. calami'ntha (Lin. spec. p. 827.) stems herbaceous; branches ascending, villous; leaves petiolate, broad-ovate, bluntish, serrately crenated, rounded or truncated at the base, green on both surfaces, villous; raceme loose, secund; cymes very loose, subdichotomous, few-flowered; calyx distinctly bilabiate, with subulate teeth: lower teeth elongated; corolla more than twice as long as the calyx. ♃. H. Native of Middle and South Europe, and Middle Asia; as of England, France, Germany, Portugal, Spain, Italy, Greece, Armenia, and Siberia, &c., on hills and in open woods. Thymus Calamíntha, Scop. fl. carn. ed. 2d. no. 733. Smith, engl. bot. t. 1676. Calamíntha montàna, Lam. fl. fr. 2. p. 396. Cal. officinàlis, Mœnch. meth. 409. Cal. menthæfòlia, Host, fl. austr. 2. p. 129. Thymus umbròsus, Spreng. cent. pl. min. cogn. p. 41. T. moschatéllus, Poll. fl. veron. p. 15. ex Poir, supp. 5. p. 304. Cal. umbròsa, Rchb. fl. germ. exc. p. 329.? exclusive of numerous synonymes. Melíssa intermèdia, Baumg.? ex Rchb. Melíssa umbròsa, of German authors. Cal. vulgàris, Sweet. Melíssa foliòsa, Opiz. ex unio. itin. Stems more erect and firm than in *M. Népeta*. Leaves larger, usually an inch and a half long. Flowers fewer. Calyx twice the size, and more deeply bilabiate. Corolla red, marked with deeper spots.

Var. β, *villosíssima* (Benth. lab. p. 388.) plant more villous; leaves smaller, but the calyx and corolla are about the same size. ♃. H. Native of Spain and the Canary Islands. Thymus calaminthoìdes, Rchb. fl. lus. mad. exsic.

Calamint or Mountain Balm. Fl. July, Aug. Clt. England. Pl. ½ to 1½ foot.

Sect. II. Calomeli'ssa (from καλος, *kalos*, beautiful, and μελισσα, *melissa*, a bee, also the name given to balm; so called on account of the beauty of the plants.) Benth. lab. p. 388. Whorls many-flowered, nearly equal, condensed. Bracteas ovate or oblong. Throat of calyx villous inside.

7 M. Carolinia'na (Benth. lab. p. 388.) herbaceous, glabrous; leaves petiolate, ovate, obtuse, a little crenated, narrowed at the base; whorls nearly equal, many-flowered, condensed; corolla twice as long as the calyx. ♃. H. Native of Carolina, Georgia; and Louisiana, at Covington. Thymus Caroliniànus, Michx. fl. bor. amer. 2. p. 9. Calamíntha Caroliniàna, Sweet, hort. brit. p. 409. Cal. grandiflòra, Pursh, fl. amer. sept. 2. p.

414. Thymus grandiflòrus, Sims, bot. mag. t. 997. Floriferous branches elongated, twiggy, glabrous, or pubescent. Leaves half an inch long. Corolla an inch long, glabrous, pale red.

Carolina Balm. Fl. June, July. Clt. 1804. Pl. 1 foot.

Sect. III. A'cinos (from *ακινος, akinos*, the Greek name of a balsamic plant now unknown.) Benth. lab. p. 389. A'cinos, Mœnch. meth. 407. Whorls about 6-flowered; pedicels erect, short, stiff. Bracteas minute or wanting. Calyx gibbous beneath at the base, nearly terete, deeply striated, and the throat villous inside.

8 M. A'cinos (Benth. lab. p. 889.) herbaceous, annual, erectish, pubescent or villous; leaves ovate, sub-serrated: floral leaves similar to the others, exceeding the flowers, which are almost sessile; whorls 6-flowered; lips of calyx short; corolla hardly exceeding the calyx. ⊙. H. Native of Europe, in corn fields; as of Britain, Sweden, Portugal, Naples, Greece, about Petersburgh, and of the Caucasus. Thymus A'cinos, Lin. spec. 826. Hook. fl. lond. vol. 1. with a figure, Smith, engl. bot. t. 411. A'cinos thymoìdes, Mœnch. meth. 407. A'cinos vulgàris, Pers. ench. 2. p. 131. Thymus heterophýllus, Poir. dict. 7. p. 648. Thymus canéscens, Dumort, florul. belg. 47. Calamíntha arvénsis, Lam. fl. fr. 2. p. 394.—Lob. icon. 1. t. 506. f. 1. —Riv. mon. t. 43. f. 2.—Mor. hist. 3. p. 404. sect. 11. t. 18. f. 1. Stems branched, usually procumbent at the base; branches usually purplish, more or less villous. Whorls distant. Corollas purplish blue: upper lip entire. Lower lobe of style flattened. This plant has a pleasant aromatic smell.

Basil Balm, or Basil Thyme. Fl. June, Aug. Britain. Pl. ½ foot.

9 M. Pataviˋna (Benth. lab. p. 389.) herbaceous, ascending, pubescent; leaves petiolate, ovate, acute, scarcely serrated, veiny, almost glabrous: floral ones similar to the rest, longer than the calyxes; lips of calyx shorter than the tube; corollas scarcely twice as long as the calyxes. ♃. H. Native of the South of Europe; as of Spain, South of France, Italy, Piedmont, Naples; and on Mount Parnassus. Thymus Patavìnus, Jacq. obs. bot. 4. p. 7. t. 87. A'cinos Patavìnus, Pers. ench. 2. p. 131. Calamíntha Patavìna, Host, fl. austr. 2. p. 133. Melíssa marjoranæfòlia, Mill. dict. no. 7. Thymus suavèolens, Smith, prod. fl. græc. 1. p. 420. Thymus acinoìdes, Tenore, prod. fl. nap. p. 35. syll. 296.—Bocc. mus. t. 45. f. 3. Larger and firmer plant than *M. A'cinos*, with the flowers twice the size; and smoother and more erect than *M. alpìna*, to which it is more nearly allied. Corollas pale red, or purplish red.

Paduan Balm. Fl. June, Aug. Clt. 1776. Pl. ½ to ¾ foot.

10 M. microphyˊlla (Benth. lab. p. 390.) suffruticose, small, diffuse, nearly glabrous; leaves petiolate, roundish, quite entire: floral ones similar to the others; whorls 4-6-flowered; flowers almost sessile; lips of calyx much shorter than the tube; corolla almost twice as long as the calyx. ♄. F. Native of Corsica, on the mountains. Thymus Córsicus, Pers. ench. 2. p. 131. Plant small, much branched; branches short, pilose while young. Leaves small, glabrous, or a little pilose. Flowers similar to those of *M. Patavìna*, but the calyxes are longer and slenderer.

Small-leaved Balm. Shrub small.

11 M. alpiˋna (Benth. lab. p. 390.) perennial, diffuse, pubescent, or villous; leaves petiolate, roundish, or ovate, hardly serrated; floral leaves about equal in length to the calyxes; whorls 4-6-flowered; flowers almost sessile; lips of calyx shorter than the tube; corolla more than twice as long as the calyx. ♃. H. Native of the South of Europe, in mountainous and shady places; as of the South of France, Germany, Italy, &c. Thymus alpìnus, Lin. spec. 826. Sims. bot. mag. 2152. Jacq. austr. 1. p. 60. t. 97. A'cinos alpìnus, Mœnch. meth. p. 407. A'cinos diffùsus, Bonningh. fl. monast. ex Bot. zeit. 1825. 1. p. 333.? Thymus nummulariæfòlius, Lois. ex herb. D. C. Thymus montànus, Crantz, stirp. austr. p. 278. Thymus villosíssimus, Tausch, in syll. pl. ratisb. 2. p. 248. ?—Bocc. mus. 2. p. 50. t. 45. Stem much branched at the base, rather woody; floriferous branches ascending, usually villous. Leaves smaller, but generally broader than those of *M. A'cinos*, and *M. Patavìna*. Calyx purplish. Corollas larger than those of *M. Patavìna*, purplish-blue; upper lip and middle lobe of lower lip shortly emarginate. Lower lobe of style flattened.

Alpine Balm. Fl. June, Sept. Clt. 1731. Pl. ½ foot.

12 M. graveˋolens (Benth. lab. p. 390.) herbaceous, annual, erect, villous; leaves petiolate, ovate, a little serrated: floral leaves similar to the rest, exceeding the flowers; whorls 6-flowered; flowers almost sessile; lips of calyx incurved, equalling the tube; corolla scarcely half as long again as the calyx. ⊙. H. Native of Caucasus, Naples, Island of Cyprus, Transylvania, Tauria, and Iberia; frequent about Madrid, and between Bagdad and Kermancha, &c. Thymus gravèolens, Bieb. fl. cauc. 2. p. 60. pl. rar. ross. 1. t. 38. A'cinos gravèolens, Link, enum. host. berol. 2. p. 117. Thymus cànus, Stev. ex. Hoffm. in comm. soc. phys. med. mosq. 1. p. 46. ex Bieb. Thymus exíguus, Sibth. et Smith, fl. græc. 6. p. 61. t. 575. A'cinos cànus, Rchb. fl. germ. exc. p. 327. Herb simple or branched. Leaves like those of *M. Patavìna*, but more villous. Flowers larger than in *M. A'cinos*, but smaller than in *M. Patavìna*, purplish blue.

Strong-scented Balm. Fl. June, Aug. Clt. 1820. Pl. ¼ foot.

† *Species evidently belonging to sect.* III., *but are not sufficiently known.*

13 M. purpuraˊscens (Benth. lab. p. 391.) stem branched, divaricate, tomentose; leaves ovate, a little serrated: upper ones crowded, coloured; whorls 1-2-flowered, rather approximate. ⊙. H. Native of Spain, Clemente. A'cinos purpuráscens, Pers. ench. 2. p. 13. Thymus purpuráscens, Poir. dict. 7. p. 654. Leaves reddish violet, especially the veins. Corollas rather large, red. Apparently an intermediate plant between *M. vulgàris* and *M. alpìnus*, and probably only a variety of the latter.

Purplish Balm. Fl. June, July. Clt. 1820. Pl. ½ foot.

14 M. rotundifòlia (Benth. lab. p. 391.) leaves orbicular, mucronate, having the veins prominent beneath; stems procumbent, villous at top as well as the calyxes. ♃. ? H. Native of Hungary. A'cinos rotundifòlius, Pers. ench. 2. p. 131. Thymus rotundifòlius, Poir. dict. 7. p. 654. Thymus melissoìdes, Bernh. ex Rchb. fl. germ. exc. p. 327.

Round-leaved Balm. Pl. procumbent.

Sect. IV. Clinopòdium (from *κλινη, kline*, a bed; and *πους ποδος, pous podos*, a foot; heads of flowers like turned bed-feet.) Benth. lab. p. 391. Clinopòdium, Lin. and other authors. Whorls many-flowered or loosely few-flowered, equal; common peduncles almost wanting; pedicels filiform, not flattened. Bracteas subulate, sometimes minute, sometimes equalling the calyxes. Calyx gibbous on the under side at the base or almost equal: throat naked, or a little villous inside.

15 M. deˋbilis (Benth. lab. p. 391.) plant herbaceous, small, weak, glabrous; leaves petiolate, ovate, serrated: floral leaves smaller; whorls few-flowered; pedicels elongated, filiform; bracteas minute; throat of calyx naked inside. ♃. H. Native of Altaia, in shady places, near Alexandrowsk; and in the Soongarian desert, about Mount Kent. Thymus dèbilis, Ledeb. fl. alt. 2. p. 391. fl. ross. alt. ill. t. 438. Herb hardly 3-4 inches high, quite glabrous. Leaves ½ inch long, narrowed a long way into the petioles at the base. Corolla shorter than the calyx.

Weak Wild Basil. Pl. ¼ to ½ foot.

16 M. umbròsa (Bieb. fl. cauc. 2. p. 63. but not of German authors) plant herbaceous, diffuse, pubescent or villous; leaves petiolate, ovate, serrately crenated, rounded at the base; whorls equal, globose, many-flowered; bracteas minute, or the outer ones are subulate, one half shorter than the calyxes. ♃. H. Native of Iberia, in woods; Caucasus, on the Talusch mountains; Himalaya, Wall. Royle; mountains in the Peninsula of India, Wight; Ceylon, Walker; Cashmere, Jacquemont. Clinopòdium rèpens, β, Benth. in Wall. pl. rar. asiat. 1. p. 66. Stems procumbent, creeping at the base. Leaves scarcely an inch long. Whorls 20-40-flowered. Corolla purplish, scarcely half as long again as the calyx.

Shaded Wild Basil. Pl. procumbent.

17 M. rè'pens (Benth. lab. p. 392.) herbaceous, diffuse, rooting at the base, pubescent or villous; leaves petiolate, ovate, obtuse, serrately crenated, rounded at the base; whorls equal, globose, many-flowered; bracteas subulate, numerous, equalling the calyxes. ♃. H. Native of Nipaul. Clinopòdium rèpens, α, Wall. pl. rar. asiat. 1. p. 66. Thy'mus rèpens, D. Don, prod. fl. nep. p. 113. Habit of *M. umbròsa*. Bracteas more dense, and more hairy, ciliated. Corolla purplish.

Creeping Balm. Pl. procumbent.

18 M. origanifòlia (Benth. lab. p. 392.) suffruticose; stems ascending, branched, hispid; leaves ovate, quite entire, hispid; whorls nearly sessile: lower ones on long peduncles, emulating branches; bracteas linear-lanceolate, hispid, scarcely longer than the calyxes. ♄. H. Native of Mount Lebanon. Clinopòdium origanifòlium, Labill. pl. syr. dec. 4. p. 14. t. 9. Corolla rather hairy, purplish.?

Marjoram-leaved Balm. Fl. June, Aug. Clt. 1825. Shrub 1½ foot.

19 M. Clinopòdium (Benth. lab. p. 392.) herbaceous, erect, villous; leaves petiolate, ovate, obtuse, crenated a little, rounded at the base; whorls equal, globose, many-flowered; bracteas subulate, numerous, equalling the calyxes. ♃. H. Native throughout Europe and Middle Asia, in woods, hedges, and by waysides; from Scotland and Sweden to Spain, Sicily, Greece, and Caucasus; and North America; but probably introduced from Europe to the latter country. Clinopòdium vulgàre, Lin. spec. p. 821. Smith, engl. bot. t. 1401. Clinopòdium Ægyptìacum, Lam. dict. 2. p. 50. Mill. dict. no. 6. fig. t. 95. Clinopòdium atropurpùreum, and C. variegàtum, Hortul. Clinopòdium plumòsum, Sieb. in bot. zeit. 1822. t. 242.? Thymus sylvàticus, Bernh. ex Steud. nom. p. 208.—Riv. mon. irr. t. 43. —Sabb. hort. rom. 3. t. 65, 66.—Mor. hist. sect. II. t. 8. f. 1. Stems simple, or a little branched. Leaves petiolate, 1-2 inches long, pale or canescent beneath, with entire or obscurely crenulated margins: floral ones smaller, sessile. Calyxes and bracteas very pilose. Corolla twice as long as the calyx, bright red.

Bed-foot or Common Wild Basil. Fl. June, Aug. Britain. Pl. 1 to 2 feet.

Sect. V. Meliphy'llum (from μελι, *meli*, honey; and φυλλον, *phyllon*, a leaf; so called from the sweet-scented leaves.) Benth. lab. p. 393. Melíssa, Lin. and other authors. Whorls few-flowered, rather loose, secund. Bracteas few, usually ovate. Calyx scarcely gibbous at the base, spreading; upper lip almost glabrous; throat naked inside, or villous. Corolla white or yellowish: tube recurvedly ascending.

20 M. officina'lis (Lin. spec. 827.) herbaceous, erect, branched; leaves broad-ovate, crenated, truncate at the base, or cordate; floral leaves almost similar to the cauline leaves; whorls axillary, loose, secund; bracteas few, ovate; corolla a half again as long as the calyx. ♃. H. Native of the South of Europe and Middle Asia, in mountain woods; as of Portugal, Spain, South of France, Italy, Sicily, Greece, about Aleppo, Tauria, Iberia, and Caucasus. Woodv. med. bot. t. 147. M. gravèolens, Host, fl. austr. 2. p. 128. M. foliòsa, Opiz, ex Rchb. fl. germ. exc. p. 329. M. occidentàlis, Rafin. M. Cŏrsica, Host. —Sabb. hort. rom. 3. t. 61.—Blackw. herb. t. 27.—Lob. icon. t. 277. Plant very variable in hairiness, size, form, and bases of leaves, and length of corollas. Leaves from ½ to 2-3 inches long, those of the stems and sterile branches truncate or cordate at the base: upper floral and rameal ones smaller, rounded or cuneated at the base, all obtuse, or the upper ones are acute, more or less villous on both surfaces. Whorls distant. Cymes distinct, 3-6-flowered. Corolla white or pale yellow, twice as long as the calyx.

Balm, in its recent state, has a weak, roughish, aromatic taste, and a pleasant smell, somewhat of the lemon kind. It is now little used, unless for making a simple balm tea, which affords a grateful diluent drink in fevers, and for forming a light agreeable beverage, under the name of balm wine. Anciently it was generally recommended in hypochondriacal affections, and by Paracelsus promised a complete renovation of man. From the fondness of bees for this plant, it was named *Apiástrum*, *Melissa*, *Melissophýllum*; and was directed by the ancients, among other herbs, to be rubbed upon the hive, to render it agreeable to the swarm.

Var. β, *villòsa* (Benth. lab. p. 393.) leaves shorter; plant more villous; odour disagreeable. ♃. H. Native of Italy, about Rome, Greece, &c. M. Romàna, Mill. dict. no. 2. M. hirsùta, Balb. M. cordifòlia, Pers. ench. 2. p. 132. M. Taŭrica, Hortul. M. altíssima, Sibth. et Smith, fl. græc. 6. p. 63. t. 579. Corollas white, smaller than those of the species.

Officinal or Common Balm. Fl. June, Oct. Clt. 1573. Pl. 2 to 4 feet.

21 M. hirsu'ta (Blum. bijdr. p. 830.) heads verticillate, axillary; leaves ovate-oblong, bluntly serrated, and are, as well as the calyxes, hairy. ♃. H. Native of Java, on the top of Mount Tjerimai, in the province of Cheribon. Allied to *M. officinàlis*.

Hairy Balm. Pl. 2 to 3 feet.?

22 M. parviflòra (Benth. in Wall. pl. rar. asiat. 1. p. 65. lab. p. 394.) herbaceous, erect, nearly glabrous; leaves ovate or ovate-lanceolate, acute, somewhat serrated, rounded at the base or cuneated; floral leaves similar to the others; whorls axillary, loose, secund; bracteas few, small, oblong-linear; corollas scarcely longer than the calyxes. ♃.H. Native of Nipaul and Kamaon, Wall.; Deyra Dhoun, Royle. Scutellària Japónica, Burm. fl. ind. p. 130. Geniósporum axillàre, Benth. in Wall. pl. asiat. rar. 2. p. 18. This has the character of *M. officinàlis*, but the habit is very different. The whole plant is purplish and glabrous, except a few hairs on the angles of the stem and nerves of the leaves. Leaves hardly an inch long. Inflorescence of *M. officinàlis*. Corollas blue, hardly exserted.

Small-flowered Balm. Pl.

23 M. fla'va (Benth. in Wall. pl. rar. asiat. 1. p. 65. lab. p. 394.) herbaceous, erect, nearly glabrous; leaves ovate or ovate-lanceolate, acute, serrately crenated, rounded at the base; floral leaves similar to the rest; whorls axillary, loose, secund; bracteas few, oblong-linear; corolla about thrice as long as the calyx. ♃. H. Native of Nipaul, Wall. Habit of *M. parviflòra*. Calyxes coloured at top. Corolla yellow, incurvedly ascending.

Yellow-flowered Balm. Pl.?

Sect. VI. Macromeli'ssa (from μακρος, *macros*, long; and μελισσα, *melissa*, balm; so called in reference to the long corollas.) Benth. lab. p. 394. Whorls very loose, usually few-

flowered; cymes umbel-formed; peduncles elongated, scarcely dichotomous. Throat of calyx spreading, almost naked inside: lips very deep, spreading. Corolla elongated, purplish: tube dilated. Stamens rather distant at apex.

24 M. grandiflòra (Lin. spec. 827.) herbaceous, erectish, sparingly pilose; leaves petiolate, ovate, acute, coarsely toothed, rounded or cuneated at the base, green on both surfaces; racemes loose, few-flowered; cymes pedunculate, hardly dichotomous, few-flowered; corolla ample, more than twice the length of the calyx. ♃. H. Native of Europe, in shady woods; as of the Pyrenees, Cevennes, Piedmont, Switzerland, Germany, Mounts Athos, and Olympus; South of Tauria, about Baidar. Bieb. Curt. bot. mag. 208. Calamíntha grandiflòra, Mœnch. meth. p. 408. Thỳmus grandiflòrus, Scop. carn. ed. 2d. no. 732. D. C. fl. fr. 3. p. 562.—Riv. mon. t. 46.—Mor. hist. sect. 11. t. 21. f. 1.—Besl. hort. eyst. 7. t. 7. f. 1. Stems branched at the base, and decumbent. Branches erectish. Whorls few, subsecund. Leaves 2-3 inches long. Corolla 1 to 1½ inch long, purplish; throat much inflated. Stamens loosely approximate. There is a variety of this with white flowers, and another with red flowers; both much inferior to the purple: there is also a variety with variegated leaves. The leaves, when bruised, have the smell of common balm.

Great-flowered Balm. Fl. June, July. Clt. 1596. Pl. 1 foot.

25 M. macroste'ma (Moc. et Sessé, mss. ex Benth. lab. p. 395.) shrubby; branches divaricate, villous in the young state; leaves petiolate, ovate, or oblong, acute, roundly cuneated at the base, serrated, green above, and pale beneath, nearly glabrous, or rather hispid on both surfaces; whorls loose, rather secund, few-flowered; peduncles and pedicels elongated; calyxes glabrous: upper lip spreading. ♄. H. Native of New Spain. Leaves distant, ½ to 1 inch long. Cymes generally 2-3-flowered. Corolla downy, about 4 times the length of the calyx, with a dilated tube: upper lip, and middle lobe of lower lip emarginate, like the preceding.

Long-crowned Balm. Shrub 1 to 2 feet. ?

Sect. VII. Heteromeli'sson (from ἕτερος, *heteros*, variable; and μελισσα, *melissa*, a bee, also the name given to balm.) Benth. lab. p. 395. Whorls irregular, few or many-flowered, rather secund, usually ending in leafy branches. Bracteas subfoliaceous. Calyx elongated, not gibbous at the base, scarcely bilabiate: teeth straight, setaceous: throat almost naked inside. Corolla elongated, purple: tube erectish.

26 M. longicau'lis (Wall. mss. ex Benth. lab. p. 395.) suffruticose; branches elongated, decumbent, pubescent; leaves ovate-oblong, obtuse, a little toothed, cuneate, or narrowed at the base, rather villous: floral ones similar to the rest; whorls few-flowered, irregular, secund; calyx elongated, a little declinate, with lanceolate, subulate teeth. ♃. H. Native of Nipaul, Wall. Thỳmus piperìtus, D. Don, prod. fl. nep. p. 112. Thỳmus origanifòlius, D. Don, prod. fl. nep. p. 112. Clinopòdium longicaûle, Benth. in Wall. pl. rar. 1. p. 66. Stems weak, woody at the base; branches purplish at top. Leaves scarcely ½ an inch long, quite entire, or furnished with 1 or 2 crenæ on both sides. Bracteas foliaceous. Corolla violaceous, hardly twice as long as the calyx. Superior stamens usually abortive. Probably a proper genus, intermediate between *Hedeòma* and *Melissa*.

Long-stemmed Balm. Pl. decumbent.

† *Doubtful species.*

27 M. rugòsa (Lour. coch. p. 368.) annual, erect, much branched; leaves very rugose, roundish, acuminated; racemes crowded, axillary and terminal. ☉. H. Native of Cochinchina. Stem tetragonal. Leaves serrated, petiolate. Corolla white, tinged with red. The whole plant is obscure green, except the corollas.

Wrinkled-leaved Balm. Pl. 1½ foot.

28 M. obtusifòlia (Pers. ench. 2. p. 132.) leaves broad-ovate, obsoletely serrated, rounded at apex; stem villous; peduncles simply divided and solitary, much shorter than the leaves; corolla pale violet. ♃. ? G. Native of South America, Michx.

Blunt-leaved Balm. Pl. ?

29 M. veronicæfòlia (Pers. ench. 2. p. 132.) leaves broad-ovate, serrated, petiolate; stem branched, diffuse; peduncles elongated, branched. ♃. H. Native of the Bahamas. Thỳmus veronicæfòlius, Spreng. syst. 2. p. 698. Stem villous. Leaves nearly glabrous. Calyx glabrous. Corolla purplish inside, variegated with violaceous and white spots. Habit of *Verónica arvénsis*.

Speedwell-leaved Balm. Pl. ½ foot. ?

† † *Doubtful Clinopòdia of authors.*

30 M. Asia'tica; leaves oblong, nerved, wrinkled, tomentose beneath; spikes verticillate, terminal. ♄. G. Native of Cochinchina. Clinopòdium Asiáticum, Lour. coch. p. 374. Stem suffruticose, tetragonal, simple, villous. Leaves ovate-oblong, blunt, serrated. Flowers violaceous, disposed in an oblong, compound, terminal spike. Calyx bilabiate, entire, unequal, very pilose. Upper lip of corolla concave, equally trifid: lower lip refracted, quite entire, longer.

Asiatic Balm. Shrub 2½ feet.

31 M. hu'milis; plant humble, branched; leaves wrinkled; heads flattened. ♃. H. Native of Carolina. Clinopòdium hùmile, Mill. dict. no. 4.

Humble Balm. Pl. dwarf.

32 M. Carolinia'na; stem erect, not branched; leaves villous beneath; whorls fewer; bracteas longer than the calyxes. ♃. H. Native of Carolina. Clinopòdium Caroliniànum, Mill. dict. no. 5.

Carolina Balm. Pl. 1 foot. ?

Cult. All the species of Balm will grow in common garden earth, and are of easy culture. The perennial herbaceous kinds are readily increased by parting the roots; the suffruticose species by cuttings or parting; and seeds of annual kinds may be sown either on rockwork or in the open border. The species belonging to section *A'cinos* are all well fitted for decorating rockwork.

L. GARDO'QUIA (dedicated to Don Diego Gardoqui, Minister of Finance under Charles IV. of Spain, who greatly promoted the publication of the "Flora Peruviana.") Ruiz, et Pav. prod. fl. per. et chil. p. 130. syst. veg. per. p. 149. D. Don, in Sweet, fl. gard. n. s. 3. t. 271. Benth. lab. p. 397. Rizòa, Cav. icon. 6. p. 56.—Cunìla species, Nutt.—Melíssa species, Spreng.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 13-nerved, a little incurved, with an equal or oblique mouth; teeth short, straight, nearly equal or sub-bilabiate. Tube of corolla much exserted, straight, or incurved, naked inside; limb bilabiate: upper lip erect, flattish, emarginate: lower one spreading a little, with flat lobes, the middle lobe the broadest. Stamens 4, subdidynamous, loosely ascending, rather distant at apex: lower ones the longest: superior ones now and then abortive; filaments toothless; anthers 2-celled: cells distinct, parallel, or somewhat divergent. Lobes of style nearly equal. Achenia

dry, smooth.—Much branched, leafy, shrubs or under-shrubs, often procumbent. Flowers beautiful, usually scarlet. This genus is not distinct from *Micromèria*, unless in the length of the corolla, and erect lobes of the limb.

1 G. MULTIFLÒRA (Ruiz, et Pav. syst. veg. fl. per. et chil. p. 149.) shrubby, nearly glabrous; leaves petiolate, ovate, bluntish, crenated a little, rounded at the base, green, pale beneath; floral leaves conforming to the others; whorls loose, subsecund; cymes pedunculate, scarcely dichotomous; calyx almost glabrous, with acute teeth, and the throat naked inside; corolla 3 times as long as the calyx. ♄. G. Native of Chili, in the province of Conception, in fields. Rizòa ovatifòlia, Cav. icon. 6. p. 56. t. 578. bad. Stems hard at the base, but scarcely woody. Branches, leaves, and calyxes glabrous, or clothed with fine pubescence. Leaves an inch long. Corolla more than an inch long, beautiful, scarlet or purple. Stamens a little exserted.

Many-flowered Gardoquia. Shrub 1 foot.

2 G. RUGÒSA (Benth. lab. p. 399.) shrubby, villous; leaves petiolate, ovate-rhomboid, serrately toothed, rounded at the base, coriaceous, wrinkled, villous on both surfaces, hardly canescent beneath; whorls loose, many-flowered; calyx villous, with subulate ciliated teeth, and with the throat almost naked inside; corolla scarcely twice as long as the calyx. ♄. G. Native of Peru, Ruiz, et Pav. Hairs rufous. Leaves 1 to 1½ inch long. Cymes on short peduncles. Corolla villous. Anthers approximating by pairs.

Wrinkled Gardoquia. Shrub.

3 G. ELLI'PTICA (Ruiz, et Pav. syst. fl. per. p. 149.) shrubby, erect; branches glabrous; leaves petiolate, ovate, acutish, serrately crenated, rounded at the base, or cuneated, green on both surfaces, glabrous, or a little ciliated; floral leaves smaller; whorls usually 6-flowered; calyx green, pilose, with acute teeth, and with the throat naked inside; corolla about 4 times as long as the calyx. ♄. G. Native of Peru, towards Cheuchin and Sayan, Ruiz et Pav.; in the valley of Canta, between Obrajillo and Pacron, Chruikshanks. Leaves about an inch long. Corolla about 1½ inch long, pubescent, scarlet: lobes short. Stamens exserted.

Elliptic-leaved Gardoquia. Shrub erect.

4 G. THYMOI'DES (H. B. et Kunth, nov. gen. amer. 2. p. 314.) shrubby; branches pubescent; leaves ovate, acute, subcordate, with revolute, subserrated margins, nearly glabrous above, but clothed with hoary pubescence beneath; whorls many-flowered, distant; calyx pubescent, with unequal, acuminately subulate segments; corolla about 3 times the length of the calyx. ♄. G. Native on the Andes of Quito. ? Leaves 3 lines long. Flowers pedunculate. Corolla yellow? pubescent outside; throat bearded with long hairs behind; limb spotted with purple.

Thyme-like Gardoquia. Shrub.

5 G. E'LEGANS (H. B. et Kunth, nov. gen. amer. 2. p. 315.) shrubby; branches pubescent, clothed with white tomentum while young; leaves roundish-rhomboid, obtuse, serrated, pubescent above, and clothed with white tomentum beneath; peduncles axillary, usually 3-flowered; calyx tomentose, with unequal acuminated teeth. ♄. G. Native of Quito, on the declivity of the burning mount Catopaxi, between Mulalo and Pansache. Shrub aromatic. Leaves entire towards the base, 9 lines long. Corolla red, downy outside: throat yellow, spotted with red.

Elegant Gardoquia. Shrub 3 to 4 feet.

6 G. PULCHE'LLA (H. B. et Kunth, l. c.) shrubby; branches pubescently tomentose; leaves ovate or roundish-ovate, obtuse, cuneated at the base, with subrevolute crenated margins, rather scabrous above, and clothed with white tomentum beneath; peduncles usually 3-flowered; calyx clothed with tomentose pubescence, with acuminately-subulate, unequal teeth. ♄. G. Native of Peru, in hot places between Cascas and Contumasay. Leaves 8-9 lines long. Flowers on long pedicels.

Neat Gardoquia. Shrub 3 to 4 feet.

7 G. TOMENTÒSA (H. B. et Kunth, l. c. p. 314.) shrubby; branches pubescent; leaves roundish-ovate, acutish, rather truncate at the base, with revolute serrated margins, pubescent above, and clothed with white tomentum beneath; peduncles axillary, usually 3-flowered; calyx clothed with tomentose pubescence, with unequal acuminated teeth; corolla 3 times as long as the calyx. ♄. G. Native of the kingdom of Quito, near Llactacunga, Hambato, and Riobamba Nuevo. Shrub aromatic. Leaves hardly ½ an inch long. Flowers pedicellate, Corolla pale red, pubescent outside; tube short; throat bearded by long hairs. Stamens inclosed.

Tomentose Gardoquia. Shrub 3 feet.

8 G. GRANDIFLÒRA (H. B. et Kunth, l. c.) branches pubescent; leaves roundish-ovate, obtuse, acute at the base, toothed towards the apex, pubescent above, and clothed with hoary tomentum beneath; flowers axillary, solitary; calyx clothed with hoary tomentum, with acuminated nearly equal teeth; corolla 4 times as long as the calyx. ♄. G. Native of South America, in the valley of the river Chambo, between Mount Tunguragua and Penipe. Leaves ½ an inch long. Flowers on short peduncles. Corolla yellow, downy outside; throat bearded inside. Stamens a little exserted. From the description, this does not appear to differ from *G. incàna*, unless in the leaves being serrated at apex.

Great-flowered Gardoquia. Shrub 3 feet.

9 G. BREVIFLÒRA (Benth. lab. p. 401.) shrubby, hoary; leaves on short petioles, roundish-ovate, obtuse, with scarcely revolute margins, pubescent above, and clothed with hoary pubescence beneath; floral leaves similar to the rest, equalling the calyxes; whorls 2-6-flowered, secund; calyx a little coloured, with lanceolate-acute teeth, and with the throat naked inside; corolla exceeding the calyx a little. ♄. G. Native of Peru, Ruiz et Pavon. Habit of *G. incàna;* but the leaves are shorter, broader, and greener above, obtuse, or shortly mucronate. Hardly distinct from the genus *Micromèria*, in consequence of the corolla hardly exceeding the calyx.

Short-flowered Gardoquia. Shrub.

10 G. INCA'NA (Ruiz et Pav. syst. fl. per. p. 150.) shrubby, hoary; leaves on short petioles, ovate, obtuse, quite entire, flat, pale above, and clothed with hoary tomentum beneath; floral leaves similar to the others, equalling the calyxes; whorls 2-6-flowered; calyx hoary, with an oblique mouth, and short acute teeth, and with the throat naked inside. ♄. G. Native of Peru. Ruiz et Pav. fl. per. ined. 4. t. 493. f. 4. Leaves of *Heliánthemum cànum*, ½ an inch long. Corolla beyond an inch in length, yellow. Genitals a little exserted.

Hoary Gardoquia. Shrub.

11 G. HOOKE'RI (Benth. lab. p. 401.) shrubby, quite glabrous; leaves obovate, quite entire, narrowed into the short petioles at the base, green on both surfaces; peduncles 2-3-flowered; calyx glabrous, subbilabiate, having the upper lip shortly tridentate, erect: throat clothed by villi inside. ♄. G. Native of Florida. D. Don, in Sweet. fl. gard. n. s. 3. t. 271.

FIG. 80.

Cunìla coccínea, Nutt. ex Hook. exot. fl. 3. t. 163. Melíssa coccínea, Spreng. syst. 2. p. 224. Leaves ½ an inch long, 1-3 nerved, glandularly dotted. Peduncles sometimes short and 1-flowered. Corolla scarlet, clothed with glandular pubescence. Stamens distant, a little exserted. (fig. 80.)

Hooker's Gardoquia. Fl. June, Oct. Clt. 1834. Shrub 1 to 2 feet.

12 G. seri'cea (Presl, mss. ex Benth. lab. p. 402.) suffruticose, procumbent, clothed with silky tomentum; leaves sessile, linear, quite entire, with revolute margins, clothed with silky wool on both surfaces; floral leaves and bracteas similar to the cauline leaves, but smaller; flowers axillary, solitary; calyx silky, with short, nearly equal teeth: throat naked inside. ♄. G. Native of Peru, in the valleys of the Cordillera. Leaves 3-5 lines long. Corolla 10-11 lines long, scarlet, pubescent. Stamens exserted: superior ones inclosed or abortive.?

Silky Gardoquia. Shrub procumbent.

13 G. argen'tea (H. B. et Kunth, nov. gen. amer. 2. p. 313.) shrubby, clothed with silky silvery pubescence; leaves oblong-lanceolate, obtuse, with revolute, quite entire margins; flowers axillary, solitary; calyx bilabiate, silky, with acute teeth, and a naked throat; corolla 3 times as long as the calyx. ♄. G. Native of Peru, on the Andes near Micuipampa. Leaves 2-3 lines long. Calyx tridentate. Corolla scarlet, downy outside; throat bearded below. Stamens inclosed.

Silvery Gardoquia. Shrub.

14 G. di'scolor (H. B. et Kunth, nov. gen. 2. p. 312.) branchlets clothed with canescent pubescence; bark soluble; leaves oblong, acute, cuneated at the base, quite entire, puberulous above, but clothed with silky hoary pubescence beneath; flowers axillary, solitary; calyx villous, having the throat closed with white hairs: the limb bilabiate, with lanceolate-acute, unequal segments; corolla 2-4 times as long as the calyx. ♄. G. Native of the Spanish Main, on Silla de Caraccas. Leaves on short petioles, 4-8 lines long. Throat of corolla naked. Corolla purple.

Discoloured-leaved Gardoquia. Fl. April, July. Clt. 1827. Shrub.

15 G. Gillie'sii (Graham, in edinb. phil. journ. 1831. sept. 377. Benth. lab. p. 402.) suffruticose; branches divaricate, pubescent; leaves oblong-linear or cuneated, obtuse, quite entire, narrowed at the base, green on both surfaces, flat; floral leaves similar to the others, and are, as well as the bracteas, rather shorter than the calyxes; whorls few, many-flowered, rather loose, irregular; calyx elongated, erect, with lanceolate-subulate, nearly equal teeth, and the throat naked inside. ♄. G. Native of Chili, near Valparaiso. G. Chilénsis, Hook. et Arn. in Beech. voy. pt. bot. p. 58. Stems divaricate or procumbent. Branches ending each in a long terminal raceme. Leaves 3-6 lines long. Calyx bilabiate. Corolla pubescent; scarlet.

Gillies's Gardoquia. Fl. April, July.? Clt. 1828. Shrub procumbent.

16 G. obova'ta (Ruiz, et Pav. syst. fl. per. p. 150.) shrubby; branches canescent; leaves obovate-oblong, narrowed at the base, with revolute, quite entire margins, smoothish above, pale and few-veined beneath, glabrous on both surfaces; whorls about 2-flowered, secund; calyx nearly glabrous, with short obtuse teeth, and with the throat villous inside. ♄. G. Native of Peru, at Cheuchin. Ruiz, et Pav. fl. per. ined. 4. t. 494. f. a. Leaves 3-4 lines long, on very short pedicels. Corolla about 3 times as long as the calyx, very villous. Stamens much exserted.

Obovate-leaved Gardoquia. Shrub 3 feet.

17 G. glabra'ta (H. B. et Kunth, nov. gen. 2. p. 313.) branches pubescent; leaves lanceolate-oblong, acute at both ends, with revolute serrated margins, glabrous, full of glandular dots beneath; flowers axillary, solitary; calyx glandularly dotted, bilabiate, with acuminated, nearly equal teeth, or the 3 upper teeth are longest; corolla twice as long as the calyx. ♄. G. Native near Quito. Leaves on short petioles, scarlet, shining above, ½ an inch long. Corolla downy outside, with a pilose throat. Stamens inclosed.

Glabrous Gardoquia. Shrub.

18 G. taxifòlia (H. B. et Kunth, l. c. p. 312.) branches clothed with hoary villi; leaves linear-lanceolate or oblong, obtuse, narrowed at the base, quite entire, glabrous, dotted beneath; flowers axillary, solitary; calyx bilabiate, with acuminated, nearly equal teeth, and having the throat closed by hairs. ♄. G. Native of New Granada, on the Andes, especially on the declivity of Paramo de Saraguru, near Onâ. Leaves 4-5 lines long. Corolla red,? pubescent outside, with a rather pilose throat. Genitals exserted.

Yew-leaved Gardoquia. Shrub.

19 G. stria'ta (Ruiz, et Pav. syst. fl. per. p. 148.) shrubby; branches clothed with wool-like villi; leaves small, ovate, quite entire, flat, or complicate, quite glabrous on both surfaces, striated or ciliated on the back; whorls 2-flowered, secund; calyx glabrous, with short obtuse teeth, and the throat rather villous inside. ♄. G. Native of Peru, on arid hills in the provinces of Tarma and Huanuco. Ruiz, et Pav. fl. per. ined. 4. t. 494. f. b. Leaves sessile, 2 lines long, rounded or subcordate at the base: upper ones obtuse. Corolla scarlet, downy outside, 3 times the length of the calyx. Stamens a little exserted.

Striated-leaved Gardoquia. Shrub 3 feet.

20 G. microphy'lla (H. B. et Kunth, l. c. p. 311.) branches crowded, pubescently pilose while young; leaves ovate, obtuse, cordate, with revolute, quite entire margins, glabrous, having the margins and middle nerve ciliated; flowers axillary, solitary; calyx rather scabrous, bilabiate, with acute, ciliated, unequal teeth, and a naked throat; corolla 5 times as long as the calyx. ♄. G. Native of the Andes of Pasto, in frigid places near Rio Blanco, between Guachucal and Tulcan. Leaves on short petioles, hardly a line long. Pedicels short. Corolla red, downy outside; throat bearded. Stamens hardly exserted.

Small-leaved Gardoquia. Shrub 2 to 3 feet.

21 G. Jameso'ni (Benth. lab. p. 404.) shrubby, procumbent, glabrous; leaves small, broad-ovate, obtuse, quite entire, flat, or conduplicate, green and glabrous on both surfaces; whorls about 2-flowered; calyx glabrous, with short obtuse teeth, and with the throat naked inside. ♄. G. Native of Peru, at Paramo de Antisana, Jameson. Leaves hardly a line long, numerous, sessile. Corolla smaller than that of *G. revolùta*, pale red, pubescent outside. Stamens all fertile.

Jameson's Gardoquia. Shrub procumbent.

22 G. revolu'ta (Ruiz, et Pav. syst. fl. per. p. 149.) suffruticose, procumbent; branches pubescent; leaves small, roundish, very blunt, quite entire, cordate at the base, with revolute margins, glabrous above, clothed with white tomentum beneath; whorls about 2-flowered; calyx tomentose, with short broad teeth, and the throat almost naked inside. ♄. G. Native of Peru, in the fissures of rocks towards Huassa-huassi, Panao, and Huariaca, Ruiz, et Pav.; Cordilleras, Hænke and Mathews. Leaves numerous, sessile, hardly a line long, blistered. Flowers usually solitary, but sometimes 3 on each peduncle. Corolla scarlet, 10-11 lines long, pubescent, a little incurved. Stamens all fertile.

Revolute-leaved Gardoquia. Shrub procumbent.

† *Doubtful species.*

23 G. capita'ta (Spreng. syst. cur. post. p. 225.) heads

ovate, on long peduncles; bracteas and calyxes spinose; leaves fascicled, linear-oblong, with revolute, quite entire margins, hispid, as well as the stem, which is branched. ♄. ? G. Native of Rio Grande.

Capitate-flowered Gardoquia. Shrub. ?

24 G. SPICA'TA (Spreng. l. c.) spikes terminal, villous; leaves subfascicled, spatulate, almost quite entire, rough. ♄. G. Native of Rio Grande.

Spiked-flowered Gardoquia. Shrub. ?

Cult. Most of the species of *Gardòquia* bear large scarlet blossoms, and are, therefore, showy, and worth cultivating. A light rich soil, or one composed of equal parts of sand, loam, and peat, will suit the species well. Cuttings strike root readily in the same kind of soil, with a hand-glass placed over them.

LI. GLE'CHON (from γληχων, *glechon*, the Greek name for Pennyroyal; this genus has been so called from its similarity to Pennyroyal.) Spreng. syst. cur. post. p. 227. Benth. lab. p. 405.

LIN. SYST. *Diándria, Monogýnia.* Calyx ovate or tubular, 13-nerved, equal or sub-bilabiate, 5-toothed, the 2 lower teeth usually the longest. Tube of corolla equalling the calyx, naked inside; limb bilabiate; upper lip emarginate or semi-bifid, falcate, arched or galeate, erect, or lying on the lower lip; lower lip spreading, with flat entire lobes: lateral lobes the broadest, often adhering to the upper lip at the base. Two lower stamens fertile, ascending under the upper lip, or exserted a little from the notch; filaments glabrous; anthers 2-celled: cells linear, parallel, diverging, or at length divaricate. Style glabrous, having the upper lobe very short, and the lower one elongated and flattened. Achenia oblong, smooth, dry.—Usually canescent, suffruticose plants. Leaves for the most part small; floral leaves similar to the others, rarely smaller, and bractea-formed. Whorls axillary, 2-6-flowered, rarely disposed in short racemes towards the tops of the branches. Corollas yellowish, flesh-coloured, or blue. The galeate upper lip of the corolla in this genus separates it from all other genera of tribe *Melissíneæ*.

1 G. SPATULA'TA (Benth. lab. p. 406.) leaves petiolate, roundish-spatulate, subcrenated, thick, clothed with canescent tomentum on both surfaces; teeth of calyx short, the 2 lower ones the longest; upper lip of corolla erect, subgaleate. ♄. F. Native of Brazil, near Anjo, in the Missions of the Uruguay; and near Santa Maria, in the province of Rio Grande do Sul, very plentiful. Shrub procumbent at the base; branches ascending, clothed with tomentose pubescence. Floral leaves conforming to the rest, shorter than the flowers. Corolla pubescent.

Spatulate-leaved Glechon. Shrub procumbent.

2 G. THYMOI'DES (Spreng. syst. cur. post. p. 227.) leaves petiolate, obovate, subcrenated, greenish on both surfaces, and nearly glabrous; calycine teeth very short, nearly equal; upper lip of corolla large, galeate. ♄. F. Native of the South of Brazil, Sello. Branches clothed with hoary pubescence. Leaves obtuse or emarginate, glandular beneath: floral ones similar to the others. Whorls 2-flowered. Corolla twice as long as the calyx, downy outside.

Thyme-like Glechon. Shrub.

3 G. SERPYLLIFÒLIA (St. Hil. mss. ex Benth. lab. p. 407.) leaves small, petiolate, ovate, obtuse, quite entire, greenish on both surfaces, glabrous; calycine teeth subulate, rather unequal: longer ones equalling the tube; upper lip of corolla large, falcate. ♄. F. Native of Brazil, in the province of Cisplatin, among stones from Santa Theresa to Rocha. Branches prostrate, glabrous, or finely tomentose. Leaves 2-3 lines long, form of those of *Thymus Serpyllum*, glandularly dotted; floral leaves conforming to the others, but usually a little larger, exceeding the calyxes. Whorls 2-flowered. Corollas flesh-coloured, size of those of *G. thymoìdes*, but the upper lip is less incumbent. Perhaps a variety of *G. marifòlia*.

Serpyllum-leaved Glechon. Shrub prostrate.

4 G. MARIFÒLIA (Benth. lab. p. 407.) leaves on short petioles, ovate, quite entire or scarcely crenated, pale on both surfaces, and finely tomentose; calycine teeth setaceous, nearly equal, about equal in length to the tube; upper lip of corolla erect, subgaleate. ♄. F. Native of the South of Brazil, Sello. Shrub procumbent, rooting at the base; branches clothed with hoary tomentum. Adult leaves nearly glabrous, glandular on both surfaces; floral leaves conforming to the others. Whorls 2, rarely many-flowered. Corollas size of those of *G. thymoìdes*, pubescent outside.

Cat-Thyme-leaved Glechon. Shrub procumbent.

5 G. CANE'SCENS (St. Hil. mss. ex Benth. lab. p. 407.) leaves nearly sessile, roundish, sub-crenated, canescent on both surfaces; calycine teeth setaceous, nearly equal, equalling the tube in length; upper lip of corolla erect, subgaleate. ♄. F. Native of Brazil, in the Missions of the Uruguay, in sandy places, among palms, near Carapuru, Villanova, &c.; also in the provinces Cisplatin and St. Catharine. G. cándida, Benth. mss. in mus. berol. Rooting at the base; branches elongated, clothed with hoary tomentum as well as the leaves; floral leaves conforming to the others. Whorls 2-6-flowered. Corolla flesh-coloured or yellowish, dotted with purple. Perhaps a variety of *G. marifòlia*.

Canescent Glechon. Shrub $1\frac{1}{2}$ to $2\frac{1}{2}$ feet.

6 G. ORIGANIFÒLIA (Benth. lab. p. 408.) stem hairy; leaves sessile, broad-ovate, or roundish, crenated, cordate at the base, green on both surfaces, tomentosely pubescent, or villous; calycine teeth subulate, lower ones longer than the tube; corolla hardly exceeding the calycine teeth; upper lip galeate. ♄. F. Native of Brazil, in the province of Minas Geraes, on the Juruoca mountains, and near Villa Rica, St. Hil.; South of Brazil, Sello. Procumbent; branches elongated. Floral leaves conforming to the others, rather shorter than the flowers. Whorls 6-10-flowered. Corolla white or yellowish.

Marjoram-leaved Glechon. Shrub procumbent.

7 G. SQUARRÒSA (Benth. lab. p. 408.) leaves almost sessile, ovate, rounded at the base, or sub-cordate, stiff, complicate, glabrous, or ciliated; calycine teeth subulate: lower ones equal in length to the tube; upper lip of corolla galeate. ♄. F. Native of Brazil, in humid pastures, near Carrancas, in the province of Minas Geraes; and in the Campos Geraes, in the province of St. Paul, St. Hil.; South of Brazil, Sello. Procumbent at the base; branches ascending or erect, glabrous, pubescent, or villous. Leaves 3-4 lines long, glandular on both surfaces; floral leaves conforming to the rest, shorter than the flowers. Whorls about 6-flowered. Corolla white or pale blueish, villous outside, exceeding the calycine teeth.

Squarrose Glechon. Shrub.

8 G. CILIA'TA (Benth. lab. p. 408.) stem pilose; leaves ovate or oblong, quite entire, narrowed at the base, green on both surfaces, ciliated; calycine teeth subulate, longer than the tube; upper lip of corolla galeate. ♄. F. Native of Brazil, in the province of Rio Janeiro, ? Sello. Procumbent at the base; branches erect, pubescent, or pilose. Leaves $\frac{1}{2}$ an inch long; superior and floral leaves almost sessile: lower ones on short petioles, quite entire, or furnished with 1 or two teeth, glandular on both surfaces: floral ones twice the length of the flowers. Whorls about 6-flowered. Corolla longer than the calycine teeth, villous outside.

Ciliated-leaved Glechon. Shrub procumbent.

9 G. RI'NGENS (Benth. lab. p. 409.) leaves petiolate, ovate, quite entire, rather canescent on both surfaces; floral leaves small; calycine teeth lanceolate, shorter than the tube; corolla 3 times the length of calyx: upper lip elongated, falcate. ♄. F. Native of the South of Brazil, Sello. Shrub clothed with hoary tomentum, with the habit of *Heliánthemum halimifòlium*. Leaves glandular; floral leaves shorter than the calyxes. Corolla downy outside. Whorls 6-10-flowered.

Ringent-flowered Glechon. Shrub erect.

10 G. MYRTOI'DES (St. Hil. mss. ex Benth. lab. p. 409.) branches villous; leaves ovate, crenated, narrowed at the base, green on both surfaces, or rather canescent beneath, roughish; calyx tubular, with lanceolate, acute teeth, which are shorter than the tube; upper lip of corolla erect, arched. ♄. G. Native of Brazil in elevated places, on Serra do Papagaio, in the province of Minas Geraes. Shrub much branched. Floral leaves conforming to the others, equalling the calyxes. Corolla blue, about half again as long as the calyx. Odour of *Méntha Pulègium*. Habit between *Glèchon* and *Keíthia rubiàcea*.

Myrtle-like Glechon. Shrub 3-4-feet.

Cult. For culture and propagation, see *Gardòquia*, p. 787.

LII. KEI'THIA (named in honour of the Rev. Patrick Keith, F. L. S., a distinguished physiological botanist, and author of "System of Physiological Botany," two vols. 8vo. London, 1816.) Benth. lab. p. 409.

Lin. syst. *Diándria, Monogýnia*. Calyx tubular, about 13-nerved, striated, with an equal or oblique mouth, and 5 nearly equal teeth; throat naked, or villous inside. Corolla with an exserted tube, and a bilabiate limb: upper lip erect, emarginate, flat: lower lip spreading, trifid, with flat nearly equal lobes. Two lower stamens fertile, ascending, without any vestiges of the upper ones; anthers 2-celled, with a thick connective and distinct divaricate cells. Lobes of style nearly equal, or the lower one is longest and flattened, involving the base of the upper one.—Herbs, sub-shrubs, or shrubs. Whorls sometimes axillary and sometimes approximating into terminal spikes. Corollas usually scarlet. This genus differs from *Melissa* in the more regular calyx, and the abortion of the 2 upper stamens, which latter character alone separates it from *Gardòquia*.

Sect. I. Eriothy'mus (from *εριον, erion*, wool; and *θυμος, thymos*, thyme; woolly thyme.) Benth. lab. p. 410. A shrub, with divaricate leafy branches. Cymes pedunculate, few-flowered. Throat of calyx villous inside. Upper lip of corolla bifid. Perhaps a proper genus.

1 K. RUBIA'CEA (Benth. lab. p. 410.) shrubby; branches and leaves nearly glabrous; cymes umbel-formed, clothed with soft hairs; calyx acutely toothed. ♄. G. Native of Brazil, in the province of Minas Geraes, on mountains at Villa Ricca and elsewhere. Angles of branches pubescent. Leaves ½ an inch long, sessile, ovate, obtuse, quite entire, glabrous, rounded or sub-cordate at the base. Throat of calyx closed by a ring of hairs. Stamens exserted.

Rubiaceous Keithia. Shrub.

Sect. II. Kei'thia (see genus for derivation.) Benth. lab. p. 410. Branches herbaceous, elongated, procumbent, leafy. Whorls axillary, few-flowered. Throat of calyx naked inside. Upper lip of corolla scarcely emarginate.

2 K. SCUTELLARIOI'DES (Benth. lab. p. 410.) branches glabrous or ciliated on the angles; leaves glabrous; flowers nearly sessile; corolla hardly twice as long as the calyx. ♃. G. Native of Brazil, in the province of Minas Geraes, on the top of Mount Itambe, Mart.; and in marshes near Silio, &c., South of Brazil, Sello. Leaves sessile, lanceolate, crenated, cordate at the base. Whorls usually 6-flowered, secund. Corolla downy outside, purple. Stamens equalling the corolla.

Skull-cap-like Keithia. Pl. procumbent.

3 K. PILÒSA (Benth. lab. p. 411.) branches, leaves, and calyxes pilose; flowers almost sessile; corolla more than twice the length of the calyx. ♃.? G. Native of Brazil, in humid pastures, at Morangara and near Castro in Campos Geraes, in the province of St. Paul, St. Hil.; South of Brazil, Sello. Habit of the preceding, but the flowers are generally solitary, and twice the size. Corolla deep purple, 9-10 lines long.

Pilose Keithia. Pl. procumbent.

4 K. CILIA'TA (Benth. lab. p. 732.) erect; leaves and calyxes ciliated with long stiff hairs; whorls sub-racemose; flowers sessile; corolla half again as long as the calyx. ♃.? F. Native of Texas. Herb a little branched; branches clothed with fine tomentose pubescence. Leaves ½ to 1 inch long. Whorls 6-flowered.

Ciliated Keithia. Pl. ½ foot.

Sect. III. Rhabdocau'lon (from *ραβδος, rhabdos*, a twig; and *καυλον, kaulon*, a stem; in reference to the twiggy branches.) Benth. lab. p. 411. Under shrubs or herbs; branches twiggy, erect, leafy at the base, or nearly altogether naked. Whorls approximating into terminal spikes. Calyx acutely toothed; throat very villous inside.

5 K. VILLÒSA (Benth. lab. p. 411.) stem erectish, branched, clothed with hoary villi; leaves sessile, oblong-linear, obtuse, with revolute margins, villous on both surfaces; racemes spike-formed, dense, a little branched; whorls 6-flowered; flowers sessile; corolla about twice as long as the hoary villous calyx. ♃.? F. Native of the South of Brazil, Sello. Leaves ½ an inch long. Corollas villous outside. Stamens hardly exserted.

Villous Keithia. Pl. 1½ foot.

6 K. LAVANDULOI'DES (Benth. lab. p. 411.) stem erect, branched, clothed with silky tomentum; leaves sessile, oblong-linear, acute, with sub-revolute edges, silky on both surfaces: racemes spike-formed, dense, interrupted at the base; whorls many-flowered; flowers sessile; corolla half again as long as the calyx. ♃.? G. Native of Brazil, in the province of Minas Geraes, in fields near Congonhas do Campo; and in humid places near Fazenda de Carapicuva, in the province of St. Paul, St. Hil.; South of Brazil, Sello. Nearly allied to *K. villòsa*, but differs in the pubescence being short, silky, and adpressed, and in the corollas being shorter, &c.

Lavender-like Keithia. Pl. 1½ foot.?

7 K. GRA'CILIS (Benth. lab. p. 412.) stem herbaceous; branches erect, tetragonal, almost naked, nearly glabrous; raceme terminal; whorls remote, 2-6-flowered; teeth of calyx acute. ♃.? F. Native of Brazil, in grassy fields, in the provinces of Minas Geraes, St. Paul, and Rio Grande do Sul. Stems nearly simple, glabrous, or with lines of pubescence. Leaves few, 2-3 lines long: floral ones and bracteas hardly a line long. Corolla purplish, pubescent, half as long again as the calyx. Stamens inclosed.

Slender Keithia. Pl. 1 to 1½ foot.

8 K. DENUDA'TA (Benth. lab. p. 412.) stem herbaceous; branches erect, somewhat articulated, nearly naked, glabrous; racemes short, terminal, dense; flowers pedicellate; corolla more than twice as long as the calyx, which is pubescent. ♃.? F. Native of Brazil, in dry desert fields, in the province of Minas Geraes, Mart. and St. Hil.; South of Brazil, Sello. Stems rising from a hard base, almost simple. Leaves few, ses-

sile, 6-8 lines long, linear, obtuse, quite entire, glabrous: floral ones smaller. Racemes branched a little. Corolla clothed with silky villi outside. Stamens hardly exserted.

Naked-branched Keithia. Pl. 2 to 3 feet.

SECT. IV. GYMNOCY'LIX (from *γυμνος*, *gymnos*, naked; and *κυλιξ*, *kylix*, a calyx; in allusion to the throat of the calyx being naked inside.) Benth. lab. p. 412. Herbs, with erect, strict, nearly naked branches. Whorls few-flowered, distinct, subracemose. Calyx bluntly toothed; throat naked inside.

9 K. COCCI'NEA (Benth. lab. p. 412.) branches tetragonal, like other species, but sub-articulated, glabrous; whorls few, subracemose towards the tops of the branches. ♃. ? G. Native of Brazil, in the province of Minas Geraes, on Mount Itambe, Mart.; and in marshes on Serra da Ibitipoca, St. Hil. Branches and leaves altogether as in *K. denudàta*. Whorls usually 2-flowered. Flowers on short pedicels. Corolla scarlet, more than an inch long, about 3 times as long as the calyx. Stamens exserted.

Scarlet-flowered Keithia. Pl. 2 to 3 feet.

Cult. For culture and propagation, see *Gardòquia*, p. 787.

LIII. THY'MBRA (*θυμβρα*, *thymbra*, is the Greek name for a sweet-scented herb.) Lin. gen. no. 708. Schreb. gen. no. 962. Juss. gen. 115. Benth. lab. 413.

LIN. SYST. *Didynàmia*, *Gymnospérmia*. Calyx erect, oblong, flat above, bilabiate; upper lip tridentate, erect; lower lip bifid; throat villous inside. Tube of corolla a little exserted; upper lip erect, emarginate, flattish; lower lip spreading trifid, with flat lobes, middle lobe rather the largest. Stamens 4, ascending under the upper lip, lower ones the longest; anthers approximate by pairs, 2-celled: cells distinct, parallel. Style about equally bifid at apex; lobes subulate, stigmatiferous at top. An under shrub, with the habit of *Hyssòpus*, and the characters of *Melissa*.

1 T. SPICA'TA (Lin. spec. 795.) ♄. F. Native of the region of the Mediterranean, on dry hills, among heath; as of Achaia, Melos, Samos, Cyprus, Candia; Asia Minor, about Smyrna, and of Palestine. Sibth. et Smith, fl. græc. 6. p. 37. t. 546. T. verticillàta, Lin. spec. p. 796.; this is a monstrous garden variety. ? T. ambígua, Clarke, trav. 4. p. 239.—Barr. icon. 281. t. 1230.—Plukn. phyt. t. 116. f. 5. A stiff, hard, procumbent shrub, with ascending hardly pubescent branches. Leaves of the sterile branches small, decussate, obtuse; those of the fertile branches an inch long, linear, acute, stiff, flat or complicate, ciliated. Whorls many-flowered, disposed in spikes, which are sometimes interrupted. Floral leaves and bracteas broad-lanceolate, acute, coloured, ciliated, and closely imbricated with the flowers, and covering the calyxes. Calyx glabrous or ciliated on the nerves. Corolla purple.

Spicate-flowered Thymbra. Fl. June, July. Clt. 1699. Shrub ½ to 1 foot.

Cult. This is a plant well fitted for rockwork, or to be grown in pots among other Alpine plants. A poor stony or gravelly soil suits it best; for in no other soil will it survive our winter without shelter. The plant is readily propagated by young cuttings and by seed.

LIV. DICERA'NDRA (from *δις*, *dis*, twice, *κερας*, *keras*, a horn, and *ανηρ ανδρος*, *aner andros*, a male; the anthers are 2-horned, each of the cells being spurred at top.) Benth. in bot. reg. vol. 15. lab. p. 413. Ceranthèra, Elliott, bot. car. 2. p. 93. but not of Beauv.

LIN. SYST. *Didynàmia*, *Gymnospérmia*. Calyx about 13-nerved, tubular, striated, bilabiate; upper lip spreading, entire, or shortly tridentate; lower lip bifid; throat pilose inside. Corolla bilabiate, with an exserted, straight tube, which is naked inside. Stamens 4, didynamous, ascending, approximate: lower ones the longest; anthers 2-celled: cells divaricate, spurred at top: spurs in both cells equal, straight, acute, and length of the cells. Style villous, bifid at top; lobes subulate, equal, stigmatiferous at top. This genus is readily distinguished by the form of the anthers.

1 D. LINEA'RIS (Benth. l. c.) ♄. ? F. Native of Carolina, between the rivers Flint and Chatahouchie, Elliott. Ceranthèra linearifòlia, Elliott, l. c. Habit of the narrow-leaved variety of hyssop. Stems erect, twiggy, pubescent. Leaves sessile, narrow, ½ to 1 inch long, quite entire, glabrous, fascicled in the axils. Whorls 6-flowered. Corolla twice as long as the calyx, downy.

Linear-leaved Dicerandra. Pl. ?

Cult. For culture and propagation, see *Thýmbra*, above.

LV. POGO'GYNE (from *πωγων*, *pogon*, a beard; and *γυνη*, *gyne*, a female; in reference to the villous style.) Benth. lab. p. 414.

LIN. SYST. *Didynàmia*, *Gymnospérmia*. Calyx about 13-nerved, campanulate, striated; teeth straight, lanceolate, the 2 lower ones twice as long as the 3 upper ones; throat naked inside, Corolla bilabiate; tube exserted, straight, naked inside; upper lip erect, flattish, entire; lower lip spreading, trifid, with flat entire lobes. Stamens 4, didynamous, ascending, approximate at apex, lower 2 the longest; anthers 2-celled: cells parallel, distinct, mutic. Style villous, bifid at apex; lobes subulate, equal, stigmatiferous at top.—Herbs. Whorls densely spicate at the tops of the branches. Floral leaves, bracteas, and calyxes ciliated with long white hairs.

1 P. DOUGLA'SII (Benth. lab. p. 414.) floral leaves and bracteas exceeding the flowers; stamens shorter than the corolla; lower calycine teeth more than twice as long as the tube. ♃. ? F. Native of North California, Douglas. Stems a little branched, quite glabrous. Leaves petiolate, 1 to 1½ inch long, oblong, obtuse, quite entire, green, glabrous. Corolla purplish ?; throat pilose inside.

Douglas's Pogogyne. Pl. 1 foot.

2 P. MULTIFLÒRA (Benth. lab. p. 414.) floral leaves and bracteas shorter than the corollas; stamens exserted. ♃. ? F. Native of North California, Douglas. This differs from *P. Douglàsii*, in the stem being divaricately branched; in the spikes being smaller, and more numerous; and in the flowers being smaller. Lower calycine teeth hardly twice as long as the tube.

Many-flowered Pogogyne. Pl. 1 foot. ?

3 P. PARVIFLÒRA (Benth. lab. p. 414.) floral leaves exceeding the flowers; stamens shorter than the corolla; lower calycine teeth hardly longer than the tube. ♃. ? F. Native of North California, Douglas. Allied to *P. Douglàsii*; but the spikes are hardly an inch long; the leaves narrower and smaller, and the flowers one half smaller.

Small-flowered Pogogyne. Pl. 1 foot. ?

Cult. For culture and propagation see *Prunélla*, p. 791.

Tribe VI.

SCUTELLARI'NEÆ (this tribe contains plants agreeing with the genus *Scutellària* in the characters given below.) Benth. lab. p. 416. Calyx bilabiate; upper lip truncate, entire, or sub-tridentate. Tube of corolla exserted, ascending, annulate inside or naked; upper lip of limb arched. Stamens 4, ascend-

ing under the upper lip, didynamous: the 2 lower ones the longest.

LVI. PRUNE'LLA (from the German die Braune, a disease of the jaws and throat which this plant is said to cure.) Lin. gen. no. 735. Schreb. gen. no. 990. Benth. lab. p. 416. Brunélla, Tourn. inst. t. 84. Juss. gen. p. 116. Mœnch, meth. F. Hamilt. mon. in Ser. bull. bot. 1. p. 153.

Lin. syst. *Didynàmia*, *Gymnospérmia*. Calyx tubularly campanulate, irregularly somewhat 10-nerved, and reticulately veined, flat above, bilabiate; upper lip flat, broad, truncate, shortly tridentate: lower lip semi-bifid, with lanceolate segments: throat naked inside. Tube of corolla ample, exserted, ascending, annulate inside, near the base, with short hairs or scales, inflated under the throat beneath, and a little contracted at the throat; upper lip erect, galeate, rather carinated above, entire; lower lip dependent, with the lateral lobes oblong and deflexed, and the middle lobe roundish concave and crenulated. Stamens 4, didynamous, ascending: lower 2 the longest; filaments toothless at the base, glabrous, shortly bidentate at top, especially the upper ones; the lower tooth antheriferous. Anthers approximate by pairs under the upper lip, free, 2-celled: cells distinct, divaricate. Style glabrous, bifid at top; lobes subulate, stigmatiferous at the extremity. Achenia oblong, dry, smooth. —Herbs. Whorls 6-flowered, densely spicate. Floral leaves bractea-formed, orbicular, permanent, equalling the calyxes, and imbricated with them.

1 P. hyssopifòlia (Lin. spec. 837. Lam. fl. fr. 2. p. 366. under Brunella.) leaves sessile, oblong, or lanceolate, quite entire, strigosely hispid; lateral teeth of upper lip of calyx lanceolate. ♃ H. Native of Spain, South of France and Piedmont, in dry open places. Brunélla Canadénsis. Mill. dict. no. 2. P. hyssopifòlia, Rchb. icon. bot. eur. 3. p. 42. t. 243.—Mor. hist. 3. p. 364. sect. 11. t. 5. f. 7. Stems ascending, and like the leaves stiffer than in *P. vulgàris*. Superior leaves somewhat stem clasping. Corollas smaller than those of *P. grandiflòra*, but larger than those of *P. vulgàris*, purple, rarely white.

Hyssop-leaved Self-heal. Fl. July, Aug. Clt. 1731. Shrub ½ to 1 foot.

2 P. grandiflòra (Lin. spec. p. 837. Mœnch. meth. 414. under Brunella.) leaves petiolate, ovate, quite entire or toothed; lateral teeth of upper lip of calyx lanceolate; corollas large, more than twice as long as the calyxes. ♃.H. Native throughout Europe, along with P. vulgàris, in woods and other shady places. Jacq. austr. 4. t. 377. Curt. bot. mag. t. 337. and 2014. P. speciòsa, Wender. schrift. nat. gesel. marb. ex Benth. P. hastæfòlia, Brot. fl. lus. 1. p. 181. This hardly differs from *P. vulgàris*, unless in the size of the flowers. Herb glabrous or villous. Leaves usually toothed at the base, sometimes sub-hastate, and sometimes quite entire. Corolla more than an inch long, violet or purple, seldom white.

FIG. 81.

Great-flowered Self-heal. Fl. July, Sept. Clt. 1598. Pl. ½ to ¾ foot.

3 P. vulga'ris (Lin. spec. p. 837.) leaves petiolate, ovate or oblong, entire, toothed or deeply pinnatifid; teeth of upper lip of calyx truncate, awned or almost mutic, rarely sub-lanceolate; corolla half as long again as the calyx, or scarcely twice as long as the calyx. ♃. H. Native throughout the world in temperate regions, Europe, Asia, Africa, America, and Australia. Stems branched from the base; branches decumbent at the base. Plant glabrous or pilose. Corollas violaceous, purple, white, rarely pale red.

Var. α, hìspida (Benth. lab. p. 417.) stem and leaves villously hispid; leaves almost entire. ♃. H. Native of the mountains of India and South of Europe. P. hìspida, Benth. in Wall. pl. asiat. rar. 1. p. 66. P. hirsùta, Wender. schrift, nat. gesel. marb.? P. hírta, Bernh.? ex Benth. Corollas violaceous.

Var. β, vulgàris, (Benth. lab. p. 417.) leaves entire, ovate or oblong, glabrous or sparingly hispid. ♃. H. Native of Europe and Asia, very plentiful, America, Australia. P. vulgàris, Lin. spec. p. 837. Hook, fl. lond. vol. 3. icon. Curt. lond. 4. t. 42. Fl. dan. 910. Mart. fl. rust. t. 137. Smith, engl. bot. t. 961. Sabb. hort. rom. 3. t. 32. P. officinàlis, Crantz, fl. austr. 279. P. intermèdia, Brot. fl. lus. 1. p. 180. but not of Rchb. P. latifòlia, Donn. hort. cant. P. réptans, Dumort, fl. belg. p. 44. P. surrécta, Dumort, fl. belg. p. 44. P. Fischeriàna, F. Hamilt. mon. p. 164.? P. Pennsylvánica, Willd. enum. p. 631. P. Caroliniàna, Mill. dict. no. 6. P. æquinoxiàlis, H. B. et Kunth, nov. gen. amer. 2. p. 323. t. 162. P. ovàta, Pers. ench. 2. p. 137. Riv. mon. t. 29. f. 1. Mill. fig. t. 70. f. 2. Corolla violaceous, seldom white or red. This plant being astringent, it was formerly used in fluxes and in gargarisms, for aphtha and inflammations of the fauces. It was considered as one of the best vulnerary herbs, but is now out of use.

Var. γ, elongàta, (Benth. lab. p. 417.) leaves entire, oblong-lanceolate, glabrous or sparingly villous. ♃. H. Native of North America, plentiful, but rare in Asia and Europe. P. elongàta, Dougl. mss. B. Pennsylvánica, Willd. enum. p. 631. B. Australácica, Moric. ex Hamilt. mon. p. 162. t. 7. f. A. B. P. angustifòlia, Wender. schrift, nat. gesel. Marb.? ex Benth. Corollas violaceous.

Var. δ, parviflòra, (Benth. lab. p. 417.) leaves almost entire, ovate, sparingly hispid; corolla scarcely exceeding the calyx. ♃. H. Native of Europe, in the region of the Mediterranean. B. parviflòra, Poir. suppl. 1. p. 711.

Var. ε, pinnatífida (Benth. lab. p. 418.) cauline leaves all or many of them cut or pinnatifid; corollas purple. ♃. H. Native of the South of Europe. P. longifòlia, Pers. ench. 2. p. 137. Rchb. icon. bot. eur. 6. p. 21. t. 588. P. pinnatífida, Pers. ench. 2. p. 137. P. incìsa, Link, enum. 2. p. 121.? P. dissécta, Wender. schrift. nat. gesell. Marb.? P. vulgàris pinnatífida, Rchb. icon. bot. eur. 3. p. 39. t. 239.

Var. ξ, laciniàta (Benth. lab. p. 418.) cauline leaves deeply pinnatifid, or the lower ones are entire; corollas white or cream-coloured. ♃. H. Native of Europe, plentiful, but rare in North America. P. laciniàta, Lin. spec. p. 837. Jacq. fl. austr. 4. p. 41. t. 378. Rchb. icon. bot. eur. 3. p. 38. t. 239. B. sulfùrea, Mill. dict. no. 5. P. álba, Pall ex Bieb. fl. cauc. 2. p. 67. B. verbénæ foliis, Vaill, bot. par. t. 5. f. 1.

Common Self-heal. Fl. July, Sept. Britain. Pl. ½ to 1 foot.

Cult. All the species and varieties of *Prunélla* are showy when in blossom, and are therefore well fitted for decorating the front of flower borders, or ornamenting rockwork. They grow in any common garden soil, but prefer a moist, shady situation; for in rich land, or in an open situation, they seldom continue more than two years. They are readily increased by division and by seed. The seed should be sown in autumn as soon as gathered, and the plants will rise early in spring; but if the sowing be deferred till spring, the plants seldom rise until the spring of the following year.

LVII. CLEO'NIA (probably adopted by Linnæus from Cleonicium of Pliny, and κλεωνικιον of Dioscorides.) Lin. gen. no. 736. Schreb. gen. no. 991. Gærtn. fruct. 1. t. 66. Brunélla species, Lam. et Juss.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, 10-nerved, obliquely bilabiate; upper lip broad, shortly tridentate; lower lip bifid, with pilose sinuses. Tube of corolla slender, exserted, ascending, naked inside, and the throat a little dilated; upper lip erect, galeate, keeled, entire; lower lip short, dependent, with oblong, erectish, lateral lobes, and a spreading, emarginately bifid middle lobe. Stamens 4, didynamous, ascending; lower two longest; filaments toothless at the base, glabrous, but shortly bifurcate at apex, the upper fork subulate, and the lower fork a little flattened and antheriferous; anthers approximate by pairs, 2-celled: cells divaricate. Style shortly quadrifid at apex, with nearly equal subulate lobes, which are stigmatiferous at top. Achenia large, orbicular, a little compressed. This genus has most of the characters of *Prunélla*, with the corolla of *Scutellària*.

1 C. Lusita'nica (Lin. spec. p. 837.) ⊙. H. Native of Spain, in the sterile fields of Arragon; Portugal, Barbary. Mill. fig. t. 70. f. 1. Prunélla intermèdia, Rchb. icon. bot. eur. 3—4. t. 205, but not of Brot. Búgula, Gærtn. fruct. 1. p. 318. t. 66. f. 7.—Mor. hist. 3. p. 363. and 391. sect. 11. t. 5. f. 4. Habit of *Prunélla vulgàris*, var. laciniàta. Stem branched at the base; branches hispid. Leaves sessile, oblong-lanceolate or linear, green, rather hispid. Whorls 6-flowered, disposed in loose spikes. Corollas form and size of those of *Scutellària galericulàta*, blue or violet, pubescent outside, 3 times as long as the calyx.

Portugal Cleonia. Fl. June, July. Clt. 1710. Pl. ½ to 1 foot.

Cult. The seeds of *Cleònia* should be sown in autumn, and the plants will come up the following spring; as seeds sown in the spring frequently take a whole year to vegetate.

LVIII. SCUTELLA'RIA (from *scutella*, a little saucer; in reference to the form of the calyx.) Lin. gen. no. 734. Schreb. gen. no. 989. Juss. gen. no. 117. Benth. lab. p. 419. Cássida, Tourn. inst. t. 84. Mœnch.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, bilabiate; lips entire, from the coalition of the sepals, closed after the falling of the corollas, and at length cleft even to the base: superior lip furnished with a dilated scale at top, which is concave above, falling away at maturity: lower lip permanent. Tube of corolla much exserted, naked inside, straight or usually recurvedly ascending beyond the calyx, dilated into the throat above; limb bilabiate; upper lip entire at apex, or emarginate; lower lip spreadingly dilated, convex, emarginate at apex; the lateral lobes sometimes free and spreading, but usually joined to the upper lip, rarely to the lower lip. Stamens 4, ascending under the galea, didynamous; the 2 lower ones the longest. Anthers approximate by pairs, ciliated, those of the lower stamens dimidiate, and those of the superior stamens 2-celled, cordate; cells sub-divaricate. Superior lobe of style very short; lower one stigmatiferous at top. Ovarium oblique, elevated upon the incurved gynophore. Achenia dry, naked, tubercled, glabrous or clothed with adpressed tomentum.—Annual or perennial herbs, rarely shrubs. Inflorescence sometimes tetragonally spicate, with membranous, sub-imbricated coloured floral leaves; sometimes racemose, with small floral leaves; sometimes axillary, with the floral leaves almost similar to the cauline leaves. Peduncles solitary, 1-flowered in the axils of the floral leaves, short, usually opposite, except in sect. *Heteranthèsia*, in which both the floral leaves and flowers are scattered. Bracteas almost wanting. Corollas blue or yellow, rarely purple or scarlet.

Sect. I. Lupulina'ria (so called from containing *S. lupulìna.*) A. Hamilt. mon. p. 11. Benth. lab. p. 423. § 1. Spicàtæ, Benth. in bot. reg. vol. 18. Floral leaves usually membranous. Flowers disposed in tetragonal spikes; or sub-racemose, and scarcely secund.

1 S. orienta'lis (Lin. spec. p. 834.) stems procumbent; leaves petiolate, ovate, deeply toothed or pinnatifid, hoary beneath; floral leaves membranous, entire, sub-imbricated; spikes tetragonal, oblong. ♃. H. Native of the South-east of Europe and Middle Asia, among rocks and on calcareous mountains; as of Croatia, Syria, Persia, Armenia, Tauria, and Caucasus; Altaian mountains, Himalaya, Kanaour, &c. Sibth. et Smith, fl. græc. 6. p. 64. t. 580. Rchb. icon. bot. eur. 1. p. 10. t. 8. f. 17. Sims, bot. mag. 2120. S. Sievérsii, Bunge, in Led. fl. alt. 2. p. 394. fl. ross. alt. ill. t. 123. S. Caucásica, Arth. Hamilt. mon. 141.—Tourn. itin. 3. p. 306. icone.—Comm. rar. 30. icone.—Mart. cent. t. 18. Stems much branched, radicant, creeping; branches ascending, clothed with fine hoary tomentum. Leaves obtuse, cuneately truncate at the base. Corolla yellow, pubescent. The floral leaves vary much in size. (fig. 82.)

FIG. 82.

Var. β, pinnatífida (Lin. spec. p. 834. Rchb. icon. bot. eur. 1. p. 10. t. 8. f. 16.) leaves smaller, deeply pinnatifid. ♃. H. Native of the region of the Mediterranean. S. orientàlis incàna, foliis laciniatis, flore luteo, Tourn. cor. 11.

Eastern Skullcap. Fl. July, Sept. Clt. 1729. Pl. ½ foot.

2 S. grandiflòra (Sims, bot. mag. t. 635.) stems procumbent; leaves petiolate, ovate-roundish, deeply toothed, hoary from soft tomentum beneath, or on both surfaces; floral leaves entire, rather membranous, imbricate; spikes tetragonal, oblong. ♃. H. Native of the Altaian mountains, in stony places at the river Tschuja. S. pulchélla, Bunge, enum. crit. pl. alt. ined. Allied to *S. orientàlis*, but with a different habit and leaves. Branches smoothish. Leaves not half the size of those of *S. orientàlis*. Floral leaves greenish, pubescent. Corollas red, with a yellow lip, about the size of those of *S. orientàlis*.

Great-flowered Skullcap. Fl. July, Aug. Clt. 1804. Pl. ½ foot.

3 S. prostra'ta (Jacquemont, mss. ex Benth. lab. p. 733.) stems prostrate; leaves petiolate, broad-ovate, deeply crenated, green on both surfaces, and clothed with soft pubescence; floral leaves quite entire, rather membranous, imbricate; spikes tetragonal, oblong. ♃. H. Native of the North of India, about Pangui, Rarang, and Choupienna, Jacquemont. Habit and form of leaves of *S. grandiflòra*, and the flowers of *S. orientàlis;* but differs from both in the leaves being green on both surfaces. Corolla yellowish, size of that of *S. orientàlis:* upper lip violaceous above.

Prostrate Skullcap. Pl. prostrate.

4 S. fruticòsa (Desf. cat. hort. par. p. 63.? Benth. lab. p. 424.) stems suffruticose; branches ascending, clothed with hoary tomentum or wool; leaves on short petioles, ovate-cordate, deeply crenated; floral leaves ovate, quite entire, wrinkled, hoary, and rather woolly; flowers opposite, subsecund? racemose. ♄. F. Native of Syria, near Aleppo, Russel; Persia, Persoon.? Stems numerous, branched a little, clothed with white wool on the upper part. Leaves similar to those of *S.*

orientàlis. Corollas size of those of *S. orientàlis*, with a yellow tube, and blueish-yellow lips.

Shrubby Skullcap. Shrub ascending.

5 S. pinnatífida (Arth. Hamilt. mon. 16. t. 2. f. 2.) the whole plant pilose; leaves ovate, of the same colour on both surfaces, petiolate, pinnatifid: lobes oblong, obtuse; flowers loosely imbricated into a spike; bracteas ovate, toothed, coloured a little. ♃. H. Native of the Levant, between Kermancha and Amadan. This differs from *S. orientàlis*, in the flowers being a little larger; in the bracteas being pinnatifid; in the leaves being deeply cut, and in being covered with wool on both surfaces.

Pinnatifid-leaved Skullcap. Pl. ½ foot.?

6 S. alpìna (Lin. spec. p. 834.) stems procumbent; leaves nearly sessile, or on short petioles, ovate, serrately crenated, of the same colour on both surfaces; floral leaves membranous, imbricated; spikes tetragonal, oblong. ♃. H. Native of the Pyrenees, Switzerland, Upper Italy, Calabria, Croatia, Galicia, Siberia, in all temperate parts, and on the Altaic mountains. All. ped. p. 142. t. 26. f. 3. Waldst. et Kit. hung. 2. p. 146. t. 137. Sweet, fl. gard. 1. t. 90. Bot. reg. 1460. S. Altàica, Fisch. cat. hort. gorenki. p. 39. Sweet, fl. gard. 1. t. 45. S. variegàta, Spreng. fil. tent.—Gmel. sib. 3. p. 229. no. 52. t. 48. S. compréssa, Arth. Hamilt. mon. p. 29. Habit of *S. orientàlis*. Branches pilose or pubescent. Leaves green, pubescent, or pilose; floral leaves coloured, pilose. Corolla altogether purple, or the tube and lower lip is yellow, 12-15 lines long.

Var. β, lùtea; flowers yellow. ♃. H. S. lupulìna, Lin. spec. p. 835. Schmidt, icon. t. 73. Bot. reg. 1493. S. vérna, Bess. prim. fl. gal. 2. p. 43.

Alpine Skullcap. Fl. June, Oct. Clt. 1752, *β*. 1731. Pl. procumbent.

Sect. II. Heteranthe'sia (from ἕτερος, *heteros*, variable; and ανθος, *anthos*, a flower; in allusion to the flowers being scattered, not opposite, as in the other sections.) Benth. lab. p. 425. § 2. Racemosæ, floribus sparsis, Benth. in bot. reg. vol. 18. Floral leaves small, green. Flowers racemose, secund, all or only the upper ones scattered, not opposite.

7 S. longifòlia (Benth. in bot. reg. vol. 18. lab. p. 425.) glabrous; stems erect; leaves petiolate, ovate-lanceolate, acuminated, remotely toothed, roundly cuneated at the base; floral leaves linear, minute, deciduous; racemes elongated, a little branched; flowers secund, scattered; corolla 8 times as long as the calyx, which is glabrous. ♃. F. Native of New Spain. Leaves 3 inches long. Corolla scarlet, pubescent, more than an inch long: lips short, erect.

Long-leaved Skullcap. Pl. 1½ foot.

8 S. multiflòra (Benth. l. c. lab. p. 426.) stems erect, finely pubescent; leaves petiolate, ovate, acuminated, bluntly and sinuately toothed, roundly truncate at the base; floral leaves lanceolate-linear, rather longer than the calyxes; racemes elongated, simple; flowers secund, scattered; corolla 5 times the length of the calyx, which is villous. ♃. F. Native of New Spain, Moçino et Sessé. Stem a little branched. Leaves similar to those of *S. longifòlia*, but broader; floral leaves permanent. Flowers sometimes alternate, usually many, and collected into false whorls. Corolla purple? 10-11 lines long, incurved, villous.

Many-flowered Skullcap. Pl. 1 foot.?

9 S. atriplicifòlia (Benth. l. c. lab. 426.) plant clothed with hoary pubescence; leaves petiolate, broad-ovate, bluntish, almost quite entire or repand, truncate at the base, and subcordate, rather fleshy; floral leaves ovate, acuminated, rather longer than the calyxes; racemes elongated, simple; flowers secund, scattered; corolla about 6 times the length of the calyx. ♃.? G. Native of Peru? Pavon. Lower flowers opposite: upper ones falsely verticillate. Floral leaves deciduous. Corolla about an inch long, almost straight, nearly glabrous.

Atriplex-leaved Skullcap. Pl. 1 foot.?

10 S. cocci'nea (H. B. et Kunth, nov. gen. amer. 2. p. 325.) stems erect, branched, downy; leaves oblong, obtuse at both ends, quite entire, glabrous, of a violet-purple colour beneath; racemes terminal; flowers scattered. ♃. G. Native of New Granada.? Roots fascicled, terete, nearly simple. Leaves sometimes puberulous beneath, about 2 inches long. Pedicels and petioles pubescent. Bracteas lanceolate, obtuse, pubescent, equalling the pedicels. Corolla scarlet, smoothish.

Scarlet-flowered Skullcap. Pl. 1 foot.?

11 S. incarna'ta (Vent. choix. t. 39.) stems erect, pubescent, branched; leaves cordate, toothed, tomentose beneath; spikes terminal, secund; bracteas linear-lanceolate, equalling the pedicels. ♃.? G. Native near Santa Fe de Bogota. Leaves petiolate, 1-3 inches long, pubescent above. Calyx tubular, compressed, villous, nearly entire. Corolla pubescent, of a beautiful red, 6 times the length of the calyx.

Flesh-coloured-flowered Skull-cap. Pl. 1 foot.?

12 S. tubiflòra (Benth. l. c. lab. p. 427.) stems ascending, branched, pubescent; leaves petiolate, ovate, obtuse, coarsely crenated, rounded at the base, rather hispid above, and clothed with soft pubescence beneath; floral leaves ovate, imbricate before the expansion of the flowers; racemes simple; flowers secund, scattered; corolla 6 times as long as the calyx. ♃.? G. Native of the South of Brazil, Sello. Herb many-stemmed; branches terete. Leaves an inch long, pubescent: floral leaves rather large. Corolla an inch long, with a slender tube.

Tube-flowered Skullcap. Pl. 1 foot.?

13 S. uliginòsa (St. Hil. mss. ex Benth. lab. p. 427.) stems ascending or erect, branched, pubescent; leaves petiolate, ovate, coarsely crenated, rounded or subcordate at the base, almost glabrous on both surfaces; floral leaves small, loose; racemes simple; flowers subsecund, scattered; corolla 5 times as long as the calyx. ♃.? G. Native of Brazil, in boggy parts of woods in the province of St. Paul, St. Hil. Branches terete. Leaves twice the size of those of *S. tubiflòra*, sometimes glabrous, and sometimes rather pilose; the upper surfaces hispid. Floral leaves oblong, rather shorter than the calyxes, glabrous. Corolla scarcely ½ an inch long, blue, with a white palate and slender tube.

Bog Skullcap. Pl. ½ to 1 foot.

14 S. breviflòra (Benth. l. c. lab. p. 427.) glabrous; stems erect; leaves petiolate, ovate, acuminated, bluntly and sinuately toothed, roundly truncate at the base; floral leaves lanceolate-linear, rather longer than the calyxes; racemes elongated, simple, loose; flowers secund, scattered; corolla about 3 times as long as the calyx, which is glabrous. ♃. G. Native of Peru, Pavon. Intermediate between *S. multiflòra* and *S. uliginòsa*. Leaves 1½ to 2 inches long. Corolla glabrous, bluish, 4-5 lines long, with a spreading limb.

Short-flowered Skullcap. Pl. 1½ foot.

15 S. purpura'scens (Swartz, fl. ind. occ. 2. p. 1013.) stems erectish, humble, finely pubescent, or almost glabrous; leaves petiolate, broad-ovate, obtuse, sinuately crenated, very broadly truncate at the base, rounded or subcordate, rather hispid above, glabrous beneath, or on both surfaces; floral leaves minute, deciduous; racemes loose; flowers secund, scattered, or the lower ones are opposite; calyxes shorter than the pedicels, large, and nearly glabrous in the fructiferous state. ♃. G. Native of Brazil, in the province of Bahia; and of Caraccas; also of the West Indies, in Guadaloupe and St. Vincent. S. Felisbérti, Nees et Mart. in nov. act. bonn. 11. p. 77. Herb slender,

flaccid. Floral leaves minute. Corolla half an inch long, pubescent, purplish.

Purplish-flowered Skullcap. Fl. June, July. Clt. 1820. Pl. ½ foot.

16 S. AGRE'STIS (St. Hil. mss. ex Benth. lab. p. 428.) stems erectish, finely pubescent; leaves petiolate, ovate-roundish, obtuse, sinuately crenated, cordate at the base, rather hispid above, and nearly glabrous beneath; floral leaves minute, almost wanting; racemes short, simple; flowers scarcely secund, scattered. ♃. G. Native of Brazil, at San Miguel da Jetiquinhonha, in the province of Bahia. Herb much branched at the base. Branches, petioles, and nerves of leaves, canescent from fine tomentum. Leaves ½ to 1 inch long, green on both surfaces. Corolla blue, about 4 lines long. Nearly allied to the preceding.

Field Skullcap. Pl. ¼ to ½ foot.

17 S. DI'SCOLOR (Colebr. in Wall. pl. rar. asiat. 1. p. 66.) stems rooting at the base, leafy, ascending, almost naked above; leaves petiolate, ovate, obtuse, crenated, roundly cuneated at the base: lower leaves cordate: floral ones minute; racemes elongated, somewhat branched at the base; flowers secund, scattered. ♃. F. Native of Nipaul and Silhet. S. I'ndica, D. Don, prod. fl. nep. p. 109. but not of Lin. Leaves 1½ to 2 inches long, pubescent on both surfaces, usually purplish beneath. Corolla hardly downy outside, violaceous, ½ an inch long.

Two-coloured-leaved Skullcap. Pl. 1 to 1½ foot.

Sect. III. STACHY'MACRIS (from *σταχυς*, *stachys*, a spike; and *μακρος*, *macros*, long; in reference to the long spikes or racemes of flowers.) Arth. Hamilt. mon. p. 17. Benth. lab. 428. § 2. Racemosæ, * * floribus oppositis, Benth. in bot. reg. vol. 18. Floral leaves green, small, different in form from the cauline leaves. Flowers racemose, secund, opposite.

18 S. I'NDICA (Lin. spec. p. 833. but not of D. Don.) stems procumbent at the base; branches ascending, villous; leaves small, petiolate, roundish, crenated, cordate at the base, clothed with soft pubescence on both surfaces; floral leaves minute; racemes almost simple, dense; flowers opposite, secund; floriferous calyxes pubescent, shorter than the pedicels; lower lip of corolla very broad. ♃. G. Native of China, near Macao, Sir G. Staunton; Japan, Thunb.; Java, in hedges about Tugu, in the province of Buitenzorg, Blume.—Pluck. alm. t. 441. f. 1.? Leaves scarcely ½ an inch long, form of those of Ground-ivy. Corolla smoothish, white, ex Thunb. Anthers of upper stamens bearded.

Indian Skullcap. Pl. ½ to 1 foot.

19 S. JAPÓNICA (Morren, et Decaisne, in ann. sc. nat. par. 1834. 2. p. 315.) stems prostrate at the base; branches ascending, quadrifariously puberulous; leaves ovate, obtuse, coarsely crenated, rounded at the base, glabrous, petiolate; floral leaves becoming gradually smaller; flowers opposite, loose; calyx rather pilose; corolla pubescent, blue. ♃. H. Native of Japan, Siebold.

Japan Skullcap. Pl. ascending.

20 S. COLEBROOKIA'NA (Wall. pl. rar. asiat. 1. p. 67.) stem erect, branched, finely pubescent; leaves petiolate, ovate-roundish, obtuse, crenated: lower leaves cordate at the base: upper leaves deltoid, roundly truncate at the base, all finely pubescent on both surfaces: floral leaves minute; raceme simple, loose; flowers opposite, secund; floriferous calyxes pubescent, shorter than the pedicels, but increased and glabrous in the fructiferous state; lower lip of corolla very broad. ♃. G. Native of the Peninsula of India. Allied to *S. violàcea;* but the stem is firmer and more branched, and the form of the leaves is different. Leaves scarcely an inch long.

Colebrooke's Skullcap. Pl. ½ to 1 foot.

21 S. VIOLA'CEA (Heyne, ex Wall. pl. asiat. rar. 1. p. 66. Benth. lab. p. 429.) stem erect or ascending, pubescent; leaves petiolate, cordate-ovate, crenated, rather hispid above, and pubescent beneath, or glabrous; floral leaves sessile, ovate, shorter than the pedicels; raceme loose, nearly simple; flowers opposite, secund. ♃. G. Native of the Indian Peninsula, Ceylon, &c. S. I'ndica, Roxb. hort. beng. p. 45. but not of Lin. Stem a little branched, hispid, or pubescent, rarely almost glabrous. Corolla ½ an inch long, violaceous.

Var. β, hispidior (Benth. lab. p. 429.) plant more hispid. ♃. G. S. Wightiàna, Benth. in Wall. pl. rar. asiat. 1. p. 67. S. nodulòsa, Arth. Hamilt. mon. p. 26.?

Violaceous-flowered Skullcap. Pl. ½ to 1 foot.

22 S. OBLÓNGA (Benth. in bot. reg. vol. 18. lab. p. 429.) stems ascending, pubescent; leaves petiolate, oblong-elliptic, acutish, subserrated at apex, rounded at the base, and quite entire, almost glabrous; floral leaves ovate, minute; raceme loose, almost simple; flowers opposite, secund; calyxes equalling the pedicels: fructiferous ones large, nearly glabrous; lower lip of corolla very broad. ♃. S. Native of Ceylon, Macrae. Very nearly allied to *S. violàcea*, but differs in stature, inflorescence, and flowers. Leaves scarcely an inch long.

Oblong-leaved Skullcap. Pl. procumbent.?

23 S. INCU'RVA (Wall. pl. asiat. rar. 1. p. 67. Benth. lab. p. 430.) stems ascending, branched, pubescent; leaves almost sessile, oblong-elliptic, acute, remotely serrated, nearly glabrous; floral leaves minute; racemes terminal, simple; flowers opposite, secund; pedicels 3 times as long as the calyxes; tube of corolla slender, incurved; lips of corolla deeply cleft: the upper lip large, cucullate, the lower one shorter. ♃. S. Native near Ava, on Mount Taong Dong.

Incurved-flowered Skullcap. Pl. ascending.

24 S. GRÓSSA (Wall. l. c. Benth. l. c.) stems procumbent at the base; branches ascending, villous; leaves petiolate, ovate, acuminated, crenated, roundly truncate at the base, almost glabrous; floral leaves petiolate: lower ones almost similar to the cauline leaves: upper ones scarcely exceeding the calyxes; racemes loose, simple; flowers opposite, secund; corollas elongated, slender. ♃. S. Native of the mountains of Kamaon and Syen, &c. Stem rather woody at the base. Leaves 1 to 1½ inch long, pubescent on the nerves. Corolla 9 lines long, hardly pubescent.

Coarse Skullcap. Pl. procumbent.

25 S. COLU'MNÆ (All. pedem. 1. p. 40. t. 84. f. 2.) stems erect, branched, pubescent; leaves petiolate, ovate, crenated, broadly-cordate or truncate at the base, scarcely wrinkled, finely pubescent; floral leaves ovate, shorter than the fructiferous calyxes; raceme elongated, loose, branched a little, pilose; flowers opposite, secund; pedicels shorter than the fructiferous calyxes, which are large and pilose; corolla 6 times longer than the calyx. ♃. H. Native of the South of Europe, in woods and in fields; as near Paris, North of Sicily; Italy, from Piedmont to Naples; Hungary, Dalmatia, Island of Cyprus, and near Constantinople. Sweet, fl. gard. 1. t. 52. S. peregrìna, Sibth. et Smith, fl. græc. 6. p. 66. t. 582. but not of Lin. S. altíssima, Arth. Hamilt. mon. 18. and many other authors, and probably of Lin. Cássida racemòsa, Mœnch. meth. 414.? S. pállida, Guss. fl. sic. prod. 2. p. 137.? but not of Bieb.—Column. ecphr. 1. p. 187. t. 189. Leaves 2 inches long. Corolla dark purple, pubescent, almost an inch long: lips white.

Columna's Skullcap. Fl. June, Aug. Clt. 1806. Pl. 2 to 3 feet.

26 S. Tournefórti (Benth. in bot. reg. vol. 18. lab. p. 431.) quite glabrous; stems erect, branched; leaves petiolate, ovate, or ovate-lanceolate, coarsely crenated: lower ones broadly subcordate at the base: superior ones roundish, truncate: floral leaves ovate-lanceolate, rather shorter than the fructiferous calyxes; racemes elongated, loose, glabrous; flowers opposite, secund; calyxes longer than the pedicels: fructiferous ones large, glabrous; corolla 6 times longer than the calyx. ♃. H. Native of Persia; and at the Caspian Sea, near Lenkoran. This is very nearly allied to *S. commutàta*, but differs in the cordate leaves, and larger, glabrous corollas.

Tournefort's Skullcap. Pl. 1 to 2 feet.

27 S. commuta'ta (Guss. prod. fl. sic. 2. p. 136.) stems erect, branched, nearly glabrous; leaves petiolate, ovate, or ovate-lanceolate, crenated, broadly cordate at the base, scarcely wrinkled, glabrous; floral leaves ovate, rather shorter than the fructiferous calyxes; racemes elongated, loose, a little branched, glabrous; flowers opposite, secund; calyxes longer than the pedicels, large and glabrous in the fructiferous state; corolla 4 times longer than the calyx. ♃. H. Native of the South-east of Europe, and Middle Asia, in groves; as of Hungary, Dalmatia, Tauria, and Caucasus. S. peregrìna, Waldst. et Kit. pl. rar. hung. 2. p. 154. t. 125. but not of Lin. S. altíssima, Lin. spec. p. 836.? Benth. in bot. reg. vol. 18. Nearly allied to *S. Colúmnæ;* but differs from it in smoothness, and in the corollas being half the size. Corollas purple. There are several plants in the gardens similar to this; one with dark purple, pubescent, dense flowers, *S. altíssima*, Hort.; another with bluish purple flowers, having the lower lip whitish, *S. colúmnæ*, Hort.; and a third with the flowers altogether blue, *S. peregrìna*, Hort.

Changed Skullcap. Fl. June, Oct. Clt. 1683. Pl. 2 feet.

28 S. peregri'na (Lin. spec. p. 836.) stems procumbent; branches elongated, glabrous or pubescent at top; leaves petiolate, ovate, obtuse, crenated, roundly truncate at the base, glabrous; floral leaves bractea-formed, petiolate, ovate-oblong, acute at both ends, quite entire, pubescent; racemes elongated, loose; flowers nearly sessile, opposite, secund; calyxes large, rather pilose; corolla pubescent outside. ♃. H. Native of Tauria and Sicily. S. rubicúnda, Horn. hort. hafn. Spreng. syst. 2. p. 702. Stems dark purple, or reddish. Whorls almost an inch distant. Corolla violaceous, hardly 5 lines long.

Foreign Skullcap. Fl. June, Oct. Clt. 1823. Pl. 2 feet.

29 S. a'lbida (Lin. mant. p. 248.) branches divaricate, pubescent; leaves petiolate, broad-ovate, obtuse, crenated, roundly truncate at the base, or the lower ones are cordate, finely pubescent; floral leaves petiolate, ovate-oblong, acute at both ends, quite entire, pilose, exceeding the calyxes; racemes elongated, loose; flowers nearly sessile, opposite, secund; calyxes very pilose; corolla villous outside. ♃. H. Native of the South-east of Europe, and Middle Asia, in mountain woods; as of the Bithynian Olympus; near Constantinople, Candia, Mount Lebanon, South of Tauria, Siberia, &c. Arth. Hamilt. mon. 21. t. 1. Sibth. et Smith, fl. græc. 6. p. 65. t. 581. S. Crética, Mill. dict. S. nigréscens, Spreng. syst. 2. p. 702. S. pállida, Bieb. fl. cauc. 2. p. 65. but not of Gussone.—Sab. hort. rom. 3. t. 29. Rachis of raceme villous. Corolla half an inch long, dirty white.

Whitish-flowered Skullcap. Fl. June, Aug. Clt. 1771. Pl. 1 to 2 feet.

30 S. hi'rta (Sibth. et Smith, fl. græc. 6. p. 66. t. 583.) very hairy; leaves petiolate, ovate, obtuse, crenated, roundly truncate at the base, or cordate, hairy on both surfaces, scarcely wrinkled; floral leaves petiolate, oblong, about equal in length to the calyxes; racemes loose; flowers nearly sessile, opposite, secund; fructiferous calyxes inflated, very pilose; corolla villous outside. ♃. H. Native of Candia, and Mount Lebanon. Stem branched. Corollas almost of *S. Colúmnæ*.

Hairy Skullcap. Fl. June, July. Clt. 1825. Pl. 1 foot.

31 S. salviæfòlia (Benth. lab. p. 433.) stems ascending, hispid; leaves petiolate, ovate, subcordate at the base, much wrinkled, hispid; floral leaves bractea-formed, petiolate, oblong, wrinkled, about equal in length to the calyxes; racemes loose; flowers opposite, secund; calyxes villous. ♃. H. Native of Greece. Corollas pubescent, size of those of *S. peregrìna*, or a little larger.

Sage-leaved Skullcap. Pl. ½ foot.

32 S. versi'color (Nutt. gen. amer. 2. p. 38.) stems erect, branched, pubescent; leaves petiolate, broadly-ovate, crenated, deeply cordate at the base, pubescent on both surfaces, wrinkled; floral leaves sessile, broad-ovate, quite entire, rather longer than the calyxes; raceme simple, or a little branched, elongated, many-flowered; flowers opposite, subsecund; calyxes hairy. ♃. H. Native of the flats and open woods of Ohio and Arkansas, Nuttall; at Lexington, in Kentucky, Torrey; Louisiana, Drummond. S. cordifòlia, Muhl, cat. The whole plant pubescent, the racemes viscid. Leaves 2-4 inches long. Corolla pubescent, with a slender tube, a dilated blue throat, and a white lower lip.

Var. β, bracteàta (Benth. lab. p. 433.) floral leaves larger, and coloured a little. ♃. H. Native of Texas, at Rio Brazos.

Party-coloured-flowered Skullcap. Pl. 3 to 4 feet.

33 S. cane'scens (Nutt. gen. amer. 2. p. 38.? Benth. lab. p. 433.) stems tall, branched, pubescent; leaves petiolate, ovate, or ovate-lanceolate, acute, crenated, narrowed at the base, rounded, or the lower ones are cordate, pubescent on both surfaces, hoary beneath: floral leaves oblong, exceeding the calyxes; racemes loose, panicled, canescent; flowers opposite, secund; calyxes clothed with hoary tomentum; corolla pubescent outside. ♃. H. Native of Canada, Ohio, Kentucky, Upper Louisiana, &c., in open woods. S. serràta, Spreng. syst. 2. p. 703. and many other authors, but not of Andr. S. pubéscens, Muhl, cat.? S. incàna, Spreng. in Steud. nom. p. 757.? Leaves 2-3 inches long. Corolla blue, 8-9 lines long.

Canescent Skullcap. Pl. 2 to 3 feet.

34 S. serra'ta (Andr. bot. rep. t. 494.) stem tall, branched, glabrous; leaves petiolate, ovate, acutish, crenately serrated, cuneated at the base, quite entire, nearly glabrous on both surfaces; floral leaves oblong-lanceolate: upper ones scarcely longer than the pedicels; racemes loose, nearly simple; flowers opposite, secund; calyxes strigosely pubescent; corollas large, pubescent outside. ♃. H. Native of North America, Andrews; near Fredericstown, Herb. monac. Leaves purplish above, and pale beneath. Racemes glabrous or pubescent. Corolla blue, beyond an inch long.

Serrated-leaved Skullcap. Fl. June, Sept. Clt. 1800. Pl. 4 feet.

35 S. pilòsa (Michx. fl. bor. amer. 2. p. 11.) stem erect, almost simple, pubescent; leaves remote, on short petioles, ovate, obtuse, crenated: lower ones rounded at the base: superior ones cuneated, or narrowed, pubescent on both surfaces, or pilose; floral leaves obovate-lanceolate, about equal in length to the calyxes; racemes loose, a little branched, panicled; flowers opposite, secund; calyxes villous; corollas pubescent outside: throat a little dilated. ♃. H. Native of Pennsylvania; at West Chester, Virginia, Carolina, Georgia, &c., in shady woods. S. Caroliniàna, Walt. fl. car. p. 163. S. ellíptica, Muhl, cat.? Leaves 1½ inch long. Corolla blue, 8-9 lines long, pubescent.

Var. β, pubéscens; plant clothed with fine pubescence, not

pilose. ♃. H. Native of New Jersey, at Princetown, Torrey. S. ovalifòlia, Pers. ench. 2. p. 136. ?

Pilose Skullcap. Fl. June, Aug. Clt. 1825. Pl. 1 to 3 feet. ?

36 S. villòsa (Elliott, bot. car. 2. p. 90.) stem erect, branched, villous; leaves large, lanceolate, acute at both ends, coarsely toothed, villous beneath, rather hispid above; racemes panicled, crowded with flowers. ♃. H. Native of Georgia, between the rivers Oakmalgu and Flint, Elliott.

Villous Skullcap. Pl. 2 to 3 feet. ?

37 S. integrifòlia (Lin. spec. 836.) stems erect, almost simple, pubescent; leaves remote, on short petioles, oblong-lanceolate or linear, obtuse, quite entire, or the lower leaves are toothed, nearly glabrous; floral leaves exceeding the calyxes; racemes a little branched, loose; flowers opposite, secund; calyx pubescent; corolla almost glabrous, having the top of the tube and the throat widely dilated. ♃. H. Native from Pennsylvania and New York, to Carolina and Georgia, in dry or humid places. S. polymórpha, Arth. Hamilt. mon. p. 38. S. hyssopifòlia, Lin. spec. p. 836. S. Caroliniàna, Lam. dict. 7. p. 706. ill. t. 515. f. 3. S. ovalifòlia, Pers. ench. 2. p. 136. ?—Pluckn. phyt. t. 313. f. 4. Habit of *S. pilòsa*, but the leaves and flowers are very different. Leaves purplish beneath: upper ones 1 to 1½ inch long, glabrous or pubescent. Corollas large, blue, 8-9 lines long, the lower lip marked with deeper spots.

Var. β, *hispida* (Benth. lab. p. 435.) stems hispid; corollas villous. ♃. H. Native of New Orleans.

Entire-leaved Skullcap. Fl. June, Sept. Clt. 1731. Pl. 1 to 2 feet.

38 S. linea'ris (Benth. in Wall. pl. rar. asiat. 1. p. 66. lab. p. 435.) stems procumbent; leaves nearly sessile, oblong-linear, obtuse, almost entire, with subrevolute margins, canescent beneath; floral leaves ovate, concave, rather longer than the calyxes; racemes simple, dense; flowers opposite, subsecund; calyxes pilose; corollas almost glabrous. ♃. H. Native of Kamaon. Stems numerous from a thick woody base, pilosely pubescent. Leaves 6-9 lines long, almost glabrous above. Corollas cream-coloured, nearly an inch long: lips broad, purplish. Genitals a little exserted.

Linear-leaved Skullcap. Pl. procumbent, ½ foot.

39 ? S. visci'dula (Bunge, enum. pl. chin. p. 52.) stems decumbent; leaves sessile, linear-oblong, obtuse, quite entire, flat, green on both surfaces, viscid; floral leaves ovate, concave, rather longer than the calyxes; calyxes pilose; corollas nearly glabrous. ♃. H. Native of the North of China, in gravelly places between Jui-lin and Zsimin-i, Bunge. Habit of *S. lineàris;* but differs in the leaves being green on both surfaces, and viscid, and a little broader. Corollas cream-coloured. Perhaps this species, with *S. lineàris*, should have been placed in section *Lupulinària*.

Viscid Skullcap. Pl. decumbent.

40 S. macra'ntha (Fisch. Rchb. icon. bot. eur. 5. p. 52. t. 488. Benth. lab. p. 436.) stems procumbent at the base, ascending, almost glabrous; leaves sessile, lanceolate, obtuse, quite entire, rounded at the base, nearly glabrous, ciliated; floral leaves longer than the calyxes; racemes simple; flowers opposite, secund; calyxes pilose; corolla ample, pubescent outside, the tube dilated above. ♃. H. Native of Dahuria, North of China. S. grandiflora, Bunge, but not of Sims. Scutellària, &c., Gmel. sib. 3. p. 228. no. 50. Stems usually purplish, having the angles usually ciliated, the rest glabrous. Leaves deep green above, glabrous, or with a few short hairs, paler beneath, and quite glabrous. Corolla an inch long, blue. This species connects sections *Stachymórpha* and *Galericulàta*, but has the habit of the latter.

Long-flowered Skullcap. Fl. July, Sept. Clt. 1827. Pl. ½ to ¾ foot.

Sect. IV. Galericula'ta (from *galericulus*, a narrow-brimmed hat; in reference to the form of the calyx.) Arth. Hamilt. mon. p. 31. Benth. lab. p. 436. § 3. Axillàres, Benth. in bot. reg. vol. 18. Floral leaves green, similar to the cauline leaves, but gradually smaller. Flowers opposite, secund, axillary, or the upper ones are somewhat racemose.

41 S. angustifòlia (Pursh, fl. amer. sept. 2. p. 412.) nearly glabrous; stems erect, almost simple; lower leaves petiolate, ovate, toothed: superior ones nearly sessile, oblong-linear, quite entire, all roundly cuneated at the base; floral leaves similar to the rest: upper ones sterile; flowers axillary, opposite, secund; calyxes shorter than the pedicels. ♃. H. Native of North-west America, along the river Kooskoosky, Pursh; at Fort Vancouver, on the Columbia, Douglas. Herb glabrous, or finely pubescent. Corolla 8 lines long, blue. ?

Narrow-leaved Skullcap. Pl. ½ foot.

42 S. scordifòlia (Fisch, ind. sem. hort. petrop. p. 62. Trev. in nov. act. bonn. 13. p. 185.) glabrous; stems branched; leaves on short petioles, oblong-lanceolate, obtuse, quite entire, or remotely serrated, rounded or cuneated at the base; floral leaves similar to the rest; flowers axillary, opposite, secund. ♃. H. Native of the Altaic mountains, and at Lake Baikal, and of Kamtschatka. S. Adámsii, Spreng. syst. 2. p, 701. ? Arth. Hamilt. mon. p. 34. t. 2. f. 3. Scutellària, &c., Gmel. sib. 3. p. 229. no. 51. t. 47. ? Cássida, &c., Amm. stirp. 43. t. 55.—A species intermediate between *S. angustifòlia* and *S. galericulàta*. Corollas blue, longer than those of *S. angustifòlia*.

Var. β, *Adámsii* (Benth. lab. p. 437.) leaves less toothed; floral leaves smaller; flowers subracemose. ♃. H.

Scordium-leaved Skullcap. Fl. June, July. Clt. 1817. Pl. ½ foot.

43 S. galericula'ta (Lin. spec. p. 835.) stems branched, divaricate; leaves on short petioles, ovate-lanceolate, acute, roundly cordate at the base, crenated: floral leaves similar; flowers axillary, opposite, secund, on short pedicels. ♃. H. Native of Europe, Asia, and North America, in humid places, by the sides of ditches, ponds, rivers; almost in every part of Europe; plentiful in Britain. Smith, engl. bot. t. 523. Hook, fl. lond. vol. 2. with a figure. Curt. lond. 3. t. 36. Fl. dan. t. 637. S. epilobiifòlia, Arth. Hamilt. mon. p. 32.—Riv. mon. t. 77. f. 1.—Sabb. hort. rom. 3. t. 30.—Mor. hist. sec. 11. t. 20. f. 6. ord. 3. Cássida galericulàta, Scop. carn. no. 741. Hall, helv. no. 28. Mœnch. meth. p. 413. Plant very variable in stature and pubescence, but readily distinguished by the form of the leaves and flowers. Corolla 7-8 lines long, blue, whitish underneath. The plant was formerly considered a cure for certain fevers.

Hooded or Common Skullcap. Fl. June, Sept. Britain. Pl. ½ to 1 foot.

44 S. hastæfòlia (Lin. spec. p. 835.) stems ascending, nearly simple, glabrous; leaves on short petioles, ovate-lanceolate, obtuse, quite entire, truncate at the base, and hastately sub-lobate: floral ones similar to the rest; flowers opposite, secund, subracemose; calyxes pubescent; corolla elongated, with a dilated throat: galea shorter than the lower lip. ♃. H. Native of France, Austria, and Germany, Sweden; and Caucasus, at the river Kuma. Cássida hastifòlia, Scop. fl. carn. 1. p. 439.—Riv. mon. irr. t. 77. f. 2. This differs from *S. galericulàta* in the leaves being hastate at the base, in the corollas being a little longer, and more approximate into a terminal raceme. Corollas blue.

Halbert-leaved Skull-cap. Fl. June, July. Clt. 1798. Pl. ½ foot.

45 S. rivula'ris (Wall. pl. rar. asiat. 2. p. 66. Benth. lab. p. 438.) quite glabrous; stem procumbent at the base; branches ascending, almost simple; lower leaves petiolate, ovate-roundish, and the middle ones ovate-lanceolate, obtuse, crenated, dilated and cordate at the base: superior and floral leaves smaller, narrowed at the base; flowers opposite, secund, sub-racemose; calyxes and corollas glabrous. 4. H. Native of Nipaul and China, by sides of rivulets and rivers. S. peregrìna, Roxb. hort. beng. p. 45. but not of Lin. S. barbàta, D. Don. prod. fl. nep. p. 109. S. squamulòsa, Arth. Hamilt. mon. p. 35. Stems rooting at the base. Lower cauline leaves an inch long, those of the sterile branches hardly ½ an inch. Corolla 4 lines long, blueish, hairy.

Rivulet Skullcap. Pl. ½ to 1 foot.

46 S. rumicifòlia (H. B. et Kunth, nov. gen. amer. 2. p. 324.) quite glabrous; stems humble, diffuse, branched; lower leaves petiolate, broad-ovate, hastately cordate at the base: middle ones lanceolate, acute, hastate at the base: upper and floral leaves nearly sessile, lanceolate, or linear, rounded or narrowed at the base; flowers minute, opposite, secund. 4. F. Native of Mexico, at the Hacianda de la Llaguna; Santa Fe de Bogota; Montevideo; Brazil, at Rio Pardo, in the province of Rio Grande do Sul; Mendoza, Valparaiso, and Buenos Ayres. Herb small, much branched, and rooting at the base. Leaves of sterile branches, often shaped like those of *Rùmex acetocélla*. Lower cauline leaves ½ an inch long: upper 3 lines long. Corolla hardly 3 lines long, downy outside. Genitals a little exserted.

Sorrel-leaved Skullcap. Pl. ½ to 1 foot.

47 S. mi'nor (Lin. spec. p. 835.) plant humble, glabrous; leaves on short petioles: lower ones broad-ovate: middle ones ovate-lanceolate, cordate at the base, sub-hastate: upper and floral leaves lanceolate, rounded at the base, all obtuse; flowers small, axillary, opposite, secund; corolla almost glabrous, with the throat hardly dilated. 4. H. Native of Europe and Siberia; plentiful in Britain in moist places, as by the sides of rivulets, rivers, canals, ponds, &c. Smith, engl. bot. t. 524. Hook, fl. lond. vol. 2. icone. Curt. fl. lond. 4. t. 43. S. breviflòra, Turcz. mss.—Mor. hist. sect. 11. t. 20. f. 8. Leaves like that of *S. galericulàta*, but the plant is of lower stature. Leaves a little toothed or entire. Corolla 3 lines long, red.

Smaller Skullcap. Fl. July, Aug. Britain. Pl. ¼ to ½ foot.

48 S. Havane'nsis (Jacq. obs. 2. p. 5. t. 29.) stem branched, procumbently erect; leaves cordate-ovate, obtuse, crenated, nearly glabrous; flowers axillary; both lips of corolla trifid. 4. G. Native of Cuba, among rocks; near Havana, by the sea-side. Jacq. amer. pict. 85. t. 165. Leaves hardly ½ an inch long. Corolla nearly an inch long, blue.

Havana Skullcap. Fl. May, June. Clt. 1793. Pl. proc.

49 S. microphy'lla (Moc. et Sesse, ex Benth. lab. p. 439.) pubescent; stem diffuse, humble, branched; leaves petiolate: lower ones roundish, sinuately crenated: superior leaves ovate: uppermost ones almost quite entire, narrowed at both ends; flowers small, axillary, opposite, secund; pedicels longer than the calyxes. 4. F. Native of New Spain. Very nearly allied to *S. hùmilis*, but villous. Corollas size of those of *S. mìnor*.

Small-leaved Skullcap. Pl. humble.

50 S. hu'milis (R. Br. prod. p. 507.) plant strigosely pubescent; stem humble; leaves on short petioles: lower ones rounded, deeply crenated: upper ones ovate, roundly dilated, sub-hastately lobed, all cordate at the base: upper floral leaves hardly exceeding the calyxes; flowers small, axillary, opposite, secund. 4. F. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Leaves hardly 3-4 lines long. Corolla twice as long as the calyx. Genitals a little exserted.

Humble Skullcap. Fl. June, July. Clt. 1823. Pl. ¼ foot.

51 S. pa'rvula (Michx. fl. bor. amer. 2. p. 12.) stem humble, divaricate, branched, pubescent; lower leaves on short petioles, ovate-roundish: middle, superior, and floral leaves sessile, ovate, or ovate-lanceolate, all obtuse, quite entire, rarely toothed, subcordate at the base; flowers small, axillary, opposite, secund; corolla nearly glabrous, with a scarcely dilated throat, hardly twice as long as the calyx. 4. H. Native of Canada, on the banks of rivers, and in other humid places, Virginia, banks of Missouri; at Lexington in Kentucky; Texas, at Rio Brazos. Hook. exot. fl. 2. t. 106. S. ambígua, Nutt. gen. amer. 2. p. 37. Herb densely leafy, more or less pubescent. Leaves small. Corollas small pale blue. Genitals a little exserted.

Small Skullcap. Fl. June, Aug. Clt. 1822. Pl. ¼ foot.

52 S. resinòsa (Torrey, in ann. lyc. 2. p. 232.) clothed with minute glandular pubescence; stem humble, erect, much branched; leaves scarcely petiolate, broad-ovate, obtuse, quite entire, rounded at the base: floral leaves similar to the rest; flowers axillary, opposite, secund; corolla villous, more than 4 times as long as the calyx. 4. H. Native of North America, at the river Canadian, among the Rocky Mountains. Habit of *S. párvula*, but more stiff and more branched. Leaves 4-5 lines long. Corolla blue, size of those of *S. galericulàta*, villous.

Resinous Skullcap. Pl. ½ foot.

53 S. antirrhinoi'des (Benth. lab. p. 440.) stem diffuse, branched, glabrous; leaves on short petioles, ovate, obtuse, quite entire, narrowed at the base, thickish, glabrous or finely pubescent; floral leaves similar to the rest: upper ones sterile; flowers axillary, opposite, secund; calyxes shorter than the pedicels. 4. H. Native of North-west America, near Fort Vancouver, on the Columbia river. Habit of *Antirrhìnum sempervìrens*. Leaves ½ an inch long. Flowers similar to those of *S. angustifòlia*.

Snap-Dragon-like Skull-cap. Pl. diffuse.

54 S. nervòsa (Pursh, fl. amer. sept. 2. p. 412.) stem almost simple, glabrous; lower leaves petiolate, rounded: middle ones sessile, broad-ovate, dentately crenated, cordate at the base: upper floral leaves ovate-lanceolate, quite entire, all glabrous or rather hispid above, with scabrous margins; flowers small, axillary, opposite, secund; corollas almost glabrous, twice or thrice longer than the calyxes. 4. H. Native of North America, among bushes on the banks of the rivers Schuylkill, Susquehanna, Missouri, and Ohio. Herb slender, pale green. Largest leaves 10-12 lines long. Corollas full a little larger than those of *S. párvula* or *S. mìnor*, blue.

Nerved-leaved Skullcap. Fl. July, Aug. Clt. 1826. Pl. ½ to 1 foot.

55 S. Drummóndi (Benth. lab. p. 441.) stems ascending, a little branched, villous; leaves petiolate, ovate, obtuse, crenated, cuneated at the base: floral leaves more entire, smaller, all villous on both surfaces; flowers small, axillary, opposite, secund; corolla villous, scarcely thrice as long as the calyx. 4. F. Native of Texas, at Rio Brazos. Leaves ⅓ an inch long. Corolla 3-4 lines long, blue.

Drummond's Skullcap. Pl. ½ foot.

56 S. mòllis (R. Br. prod. p. 507.) stem nearly simple, pubescent; leaves petiolate, ovate-roundish, obtuse, coarsely crenated, broadly cordate at the base: upper and floral leaves ovate-lanceolate, acute, all clothed with soft villi on both surfaces; flowers opposite, secund, axillary, or the upper ones are subracemose; corolla twice as long as the calyx, which is shorter than the pedicels. 4. H. Native of New Holland. Stem a little branched. Corolla 3-4 lines long.

Soft Skullcap. Pl. 1 to 1½ foot.

57 S. tuberòsa (Benth. lab. p. 441.) stem humble, simple, erect, villous; leaves petiolate, broad-ovate, obtuse, coarsely

crenated, roundly truncate at the base: floral leaves oblong, all villous on both surfaces; flowers axillary, opposite, secund; corolla villous, more than 4 times as long as the calyx. ♃. H. Native of North California, Douglas. Stems simple, rising from a tuberous root. Leaves 4-5 lines long: floral ones shorter than the flowers, but exceeding the calyxes. Corolla size of that of *S. galericulàta*, with a slender tube.

Tuberous-rooted Skullcap. Pl. 1-3 inches.

58 S. cæru'lea (Moc. et Sessé, ex Benth. lab. p. 442.) stem nearly simple, pubescent; leaves on short petioles, ovate-rhomboid, obtuse, crenated, rounded at the base: floral leaves nearly similar to the others but narrower, the uppermost ones lanceolate, almost quite entire, all pubescent above; flowers opposite, secund, axillary, or the uppermost ones are sub-racemose, nearly sessile; corolla 6 times longer than the calyx. ♃. F. Native of Mexico. Stems ascending. Lower leaves small: middle ones an inch long. Corolla 8-9 lines long, pubescent, blue.

Var. β. Leaves pubescent on both surfaces. ♃. F. Mexico, near Tlalpuxahua.

Blue-flowered Skullcap. Pl. ½ to 1 foot.

59 S. Mocinia'na (Benth. lab. p. 442.) branches ascending, ? villous at the base; leaves petiolate, ovate, somewhat sinuately crenated, green on both surfaces, rather hispid above, and almost glabrous beneath: lower floral leaves similar to the rest: uppermost ones small and oblong; flowers opposite, secund; corolla 6 times longer than the calyx, which is pedicellate. ♃. F. Native of New Spain. Branches rather woody at the base. Leaves an inch long. Corolla showy, scarlet, 1½ inch long, nearly glabrous.

Moçino's Skullcap. Pl. ?

60 S. malvæflòra (H. B. et Kunth, nov. gen. 2. p. 325.) stem branched, pubescent; leaves roundish, ovate, obtuse, coarsely serrate-crenated, beset with adpressed hairs above, and glabrous beneath; flowers opposite, pedicellate, sub-spicate. ♃. G. Native of New Granada, in bushy, mountain places, near St. Anna, in the province of Mariquito. Leaves petiolate, 8-10 lines long. Calyx pubescent. Corolla blue. ? This species with the two following probably belong to the genus *Perilòmia*.

Mallow-flowered Skull-cap. Pl.

61 S. Cumane'nsis (H. B. et Kunth, l. c.) shrubby; leaves ovate, or ovate-orbicular, obtuse, rounded at the base or cuneated, crenated, clothed with hairy pubescence on both surfaces, canescent beneath; flowers opposite, pedicellate. ♄. G. Native of America, in dry places near Cumana and Bordones. Leaves 8-12 lines long. Pedicels and calyxes pubescent. Corolla 5 times as long as the calyx, pubescent.

Cumana Skullcap. Shrub.

62 S. volu'bilis (H. B. et Kunth, l. c.) twining; leaves elliptic, rounded at both ends, crenated, pubescent above, but clothed with soft pilose tomentum beneath and hoary; flowers opposite, pedicellate. ♃. ? ◠. S. Native of New Granada, in woods, near Loxa and Gonzanama. Leaves petiolate, reticulately 5-nerved, 14-16 lines long. Stem pilose. Calyx pilosely pubescent. Corolla downy, red. ?

Twining Skullcap. Pl. twining.

Sect. V. Maschalóstachys (from *μασχαλη, maschale*, an axil, and *σταχυς, stachys*, a spike; in reference to the axillary spikes.) Benth. lab. p. 443. § 4. Lateriflòræ, Benth. in bot. reg. vol. 18. Floral leaves green, similar to the lower cauline leaves: upper ones small, bractea-formed. Flowers opposite, secund, disposed, in axillary and terminal racemes.

63 S. re'pens (Hamilt. in D. Don. prod. fl. nep. p. 110.) clothed with hoary pubescence, clammy above; branches scandent; leaves petiolate, ovate, crenated, rounded at the base, subcordate: uppermost ones acute, rather cuneated at the base: floral leaves ovate, obtuse, rather exceeding the calyxes; racemes numerous, axillary, and terminal, short, loose; flowers opposite, secund. ♄. ◠. G. Native of the East Indies, in Nipaul, Kamaon, Ava, &c. S. càna, Wall. pl. asiat. rar. 1. p. 67. S. Wallichiàna, Arth. Hamilt. mon. 28. t. 2. f. 1. Leaves 1½ inch long. Corolla 7-8 lines long, yellow.

Creeping Skullcap. Shrub climbing.

64 S. sca'ndens (Hamilt. in D. Don. prod. fl. nep. p. 110.) stem scandent; branches glabrous, very acutely tetragonal; leaves on short petioles, ovate-lanceolate, acuminated, crenated, roundedly cordate at the base, glabrous: floral leaves broad-ovate, acuminated, hardly exceeding the calyxes; racemes axillary and terminal, pubescent; flowers opposite, secund. ♄. ◠. G. Native of Nipaul and Kamaon. S. angulòsa, Benth. in Wall. pl. asiat. rar. 1. p. 67. S. celtidifòlia, Arth. Hamilt. mon. p. 27. Branches often glaucescent. Corolla an inch long, hairy.

Climbing Skullcap. Shrub climbing.

65 S. lateriflòra (Lin. spec. p. 835.) glabrous; stems erect, fleshy; leaves petiolate, ovate-lanceolate, acuminated, rounded at the base: upper floral leaves hardly exceeding the calyxes; racemes axillary and terminal, flowers opposite, secund. ♃. H. Native of North America, on margins of ponds, lakes, and ditches, from New York to the North-west coast, and from Canada to Carolina. Cássida lateriflòra, Mœnch. meth. Plant glabrous. Stem much branched. Corolla blue, hardly 3 lines long. Achenia tubercled.

Lateral-flowered Skullcap. Fl. June, Sept. Clt. 1752. Pl. 1 foot.

Cult. Most of the species of *Scutellària* are very pretty while in blossom, and are therefore well fitted for decorating the fronts of flower borders, being short in stature. They will grow in any common soil, and are readily increased by division and by seed. Those species marked greenhouse and frame require protection in winter, but answer well when planted out into the open ground during the summer months. The shrubby kinds will be readily increased by young cuttings.

LIX. PERILO'MIA (from *περι, peri*, around, and *λωμα, loma*, a fringe; in allusion to the membranaceously winged achenia.) H. B. et Kunth, nov. gen. 2. p. 326. Benth. lab. p. 445.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, bilabiate; lips entire, closed after the falling of the corolla, at length cleft even to the base: the upper lip furnished with a short scale, deciduous: lower lip permanent. Corolla with an exserted, recurvedly ascending tube, which is naked inside, a rather dilated throat, and a short bilabiate limb, having the upper lip erectish, emarginately bifid, and the lower lip trifid; the lateral lobes short and spreading a little, and the middle lobe larger, spreading, and emarginate. Stamens 4, ascending, didynamous, the lower ones the longest; anthers approximate by pairs, glabrous, those of the lower stamens dimidiate, and those of the upper stamens 2-celled. Upper lobe of style very short; lower one stigmatiferous at apex. Ovarium nearly sessile, on a thick disk, which is usually increased into an obtuse tooth. Achenia dry, with membranaceously winged margins.—Herbs or shrubs. Flowers axillary, solitary. Floral leaves almost similar to the cauline ones. This genus differs from *Scutellària*, in the form of the corolla and winged achenia.

1 P. scutellarioi'des (H. B. et Kunth, nov. gen. 2. p. 327. t. 157.) glabrous; leaves petiolate, ovate, rounded at the base or subcordate, those of the panicle, branches, and floral ones small; racemes slender; flowers secund; corolla scarcely 3 times as long as the calyx, which is glabrous. ♃. S. Native of Peru, Jos. de Jussieu. Stems apparently scandent. Leaves 1½ inch

long, coarsely crenated; upper and floral ones hardly 2-3 lines long. Panicle like that of *Odontìtes rùbra*. Flowers opposite, scarlet, ? clothed with rufous pubescence outside.

Skullcap-like Perilomia. Pl. climbing.

2 P. ocymoi'des (H. B. et Kunth, l. c. p. 328.) glabrous or scarcely pubescent; leaves petiolate, ovate, crenated, roundedly truncate at the base: floral leaves similar to the rest, but gradually smaller; racemes elongated; corolla 4-5 times longer than the calyx. ♃. G. Native of Peru, in dry places, near Alausi, Humb. et Bonpl.; near Obrajillo, Cruikshanks; at Cuesta de Parrochuta, Mathews. Leaves ½ to 1½ inch long. Corolla scarlet, 7-8 lines long.

Basil-like Perilomia. Pl. erect.

3 P. fruticòsa (Schiede et Deppe, in Linnæa, 5. p. 102.) pubescent or hairy; leaves ovate or elliptic, acuminated, coarsely and unequally serrated, and almost entire, pale beneath; racemes 3-9-flowered. ♄. G. Native of Mexico, among bushes at Jalapa, and on Serro Colorado. Leaves 1 to 4 inches long. Flowers opposite. Corolla showy, scarlet, about 15 lines long, pubescent underneath.

Shrubby Perilomia. Shrub.

4 P. tomentòsa (Benth. lab. p. 446.) leaves ovate, pubescent above, clothed with white tomentum beneath; corolla about 3 times longer than the calyx, which is clothed with woolly villi. ♃. G. Native of Mexico, Moçino et Sessé. Habit of *P. ocymoìdes*. Flowers a little smaller. Perhaps woody.

Tomentose Perilomia. Shrub. ?

† *A doubtful species.*

5 P. du'bia (Spreng. syst. 2. p. 704.) leaves ovate-oblong, acute, serrated; calyxes and fruit pubescent. ♃.? S. Native of Brazil, Sello.

Doubtful Perilomia. Pl.?

Cult. For culture and propagation, see *Prostanthèra*, p. 800.

Tribe VII.

PROSTANTHE'REÆ (this tribe contains genera agreeing with the genus *Prostanthèra*, in the characters given below.) Benth. lab. p. 447. Calyx campanulate, sometimes bilabiate; lips flat, entire, or the lower lip is bidentate or bifid; sometimes equal and 5-toothed; throat naked inside. Corolla with a short ample tube, a campanulate throat, and a bilabiate limb; lips flattish; upper lip emarginate or bifid; lower lip trifid. Stamens 4, didynamous, shorter than the corolla; lower ones sometimes the longest and sometimes abortive. Achenia coriaceous, wrinkled reticulately. Style almost permanent.

LX. CHILO'DIA (from χειλος, *cheilos*, a lip, and οδους, *odous*, a tooth; application not evident.) R. Br. prod. p. 507. Benth. lab. p. 447.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, bilabiate; tube short, 13-nerved; upper lip entire; lower lip emarginate; throat naked inside. Corolla with a short ample tube and a campanulately sub-bilabiate limb: upper lip erect, flattish, emarginately bifid: lower lip trifid, the middle lobe the largest and bifid, all flat and spreading. Stamens 4, nearly equal, shorter than the tube; filaments glabrous, naked; anthers 2-celled: cells parallel, glabrous, naked, mutic. Style shortly bifid at apex; lobes unequal, stigmatiferous at apex.—A shrub, with the habit of *Prostanthèra*.

1 C. scutellarioi'des (R. Br. p. 507.) ♄. G. Native of New Holland, about Port Jackson. Prostanthèra empetrifòlia, Sieb. pl. nov. holl. exs. no. 187. A shrub, with glabrous or pubescent branches. Leaves sessile, scarcely ½ an inch long, linear or lanceolate, acute, quite entire, with sub-revolute edges, green on both surfaces, glabrous, or finely downy beneath in the young state; floral leaves exceeding the flowers. Pedicels axillary, bibracteate. Calyxes ciliated. Corolla blue, glabrous, exceeding the calyx a little.

Skull-cap-like Chilodia. Shrub.

Cult. For culture and propagation, see *Prostanthèra*, p. 800.

LXI. CRY'PHIA (from κρυφιος, *kryphios*, hidden; in allusion to the inclosed corollas.) R. Br. prod. p. 508. Benth. lab. p. 448.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx bilabiate, bibracteate, closed; lips entire, equal. Corolla inclosed, ringent; upper lip or galea very short; middle segment of the lower lip rather the largest. Anthers mutic.—Glandular, strong-scented shrubs. Leaves small, entire, size of those of *Thymus Serpyllum*. Peduncles axillary, solitary, 1-flowered. Intermediate between *Chilòdia* and *Prostanthèra*.

1 C. serpyllifòlia (R. Br. p. 508.) leaves oblong-linear, flattish, and are, as well as the calyxes, glabrous, scarcely longer than the fructiferous peduncles; branchlets almost glabrous; down very fine and adpressed. ♄. G. Native of New Holland, on the South Coast.

Wild Thyme-leaved Cryphia. Shrub.

2 C. microphy'lla (R. Br. p. 508.) leaves oval, convex, very minute, fascicled, and are, as well as the calyxes, pubescent, much longer than the peduncles; branches pubescent; down spreading, curved. ♄. G. Native of New Holland, on the south coast. Probably only a variety of the preceding.

Small-leaved Cryphia. Shrub.

Cult. For culture and propagation, see *Prostanthèra*, p. 800.

LXII. PROSTANTHE'RA (from προσθηκη, *prostheke*, an appendage, and ανθηρα, *anthera*, an anther; in reference to the connectives of the anthers being spurred underneath.) Labill. nov. holl. 2. p. 18. R. Br. prod. p. 508. Benth. lab. p. 448.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate; tube short, 13-striped; lips undivided, closing the fruit; throat naked inside. Corolla with a short ample tube, a campanulate throat, and a bilabiate limb; upper lip erect, flattish, emarginately bifid; lower lip spreading, 3-lobed, the middle lobe the largest, entire, or bifid. Stamens 4, ascending, scarcely didynamous: lower ones rather the longest; filaments glabrous, naked; anthers all approximate, 2-celled: cells parallel, having the connective spurred beneath. Style shortly bifid at apex: lobes nearly equal, stigmatiferous at apex. Achenia nucumentaceous, rather baccate, coriaceous, and reticulately wrinkled in the dried state. Albumen wanting or small.—Strong-scented shrubs, beset with sessile glands. Leaves opposite. Flowers sometimes racemose, terminal, the floral leaves soon falling off; sometimes solitary in the axils of the floral leaves, which are similar to the cauline ones. Bracteas small, under the calyx.

1 P. lasia'nthos (Labill. nov. holl. 2. p. 18. t. 157.) shrubby; leaves oblong-lanceolate, dentately serrated, glabrous; racemes panicled; corolla hairy; longer spur of anther exceeding the cell: shorter one equal in length to the cell, adnate. ♄. G. Native of New South Wales, about Port Jackson; and of Van Diemen's Land. Andr. bot. rep. t. 641. Ker. bot. reg. t. 143. Sims, bot. mag. t. 2434. Branches nearly glabrous. Leaves green. Corolla white, tinged with red; throat spotted with red inside.

Woolly-flowered Prostanthera. Fl. June, July. Clt. 1808. Shrub 3-6 feet.

2 P. CÆRU'LEA (R. Br. prod. p. 508.) shrubby; leaves lanceolate, dentately serrated, glabrous; racemes rather panicled, divided a little; corolla beardless outside; spurs of anthers nearly equal, adnate, scarcely exceeding the cells. ♄. G. Native of New South Wales, about Port Jackson, &c. Habit of *P. lasiánthos*. Leaves narrower. Corolla glabrous, blue, size of those of *P. lasiánthos*.

Blue-flowered Prostanthera. Shrub 3 to 4 feet. ?

3 P. INCI'SA (R. Br. prod. p. 509.) branchlets nearly glabrous; leaves ovate-oblong, narrowed at the base, toothed or cut, glabrous, glandular on both surfaces; racemes few-flowered; upper lip of calyx narrower, and twice as long as the lower lip; spurs equal, adnate, shorter than the cells. ♄. G. Native of New South Wales, about Port Jackson. Leaves ½ to ¾ inch long. Floral leaves small: upper ones wanting or deciduous. Corolla twice as long as the calyx, nearly glabrous.

Cut-leaved Prostanthera. Shrub 3 to 5 feet. ?

4 P. SIEBE'RI (Benth. lab. p. 451.) branchlets nearly glabrous; leaves ovate-oblong, deeply toothed, narrowed a long way at the base, glabrous: racemes loose, few-flowered; lips of calyx equal; spurs of anthers equal, adnate, shorter than the cells. ♄. G. Native of New South Wales, from Port Jackson towards the south. P. incìsa, Sieb. fl. nov. holl. exs. 189. but not of R. Br. Leaves on long petioles, nearly an inch long; floral leaves smaller: upper ones minute. Very like *P. incìsa*.

Sieber's Prostanthera. Shrub 6 feet.

5 P. PRUNELLOI'DES (R. Br. prod. p. 508.) leaves thick, ovate, entire, or coarsely toothed, glabrous: floral leaves bractea-formed, deciduous; racemes terminal, a little panicled; corolla hairy outside; longer spur of anther twice as long as the cell. ♄. G. Native of New South Wales, about Port Jackson; frequent on stony hills at Hunter river. Angles of stem denticulated. Leaves an inch long: floral leaves ciliated, deciduous. Corolla twice as long as the calyx. Flowers almost like those of *P. lasiánthos*.

Prunella-like Prostanthera. Shrub.

6 P. OVALIFÒLIA (R. Br. prod. p. 509.) branches clothed with fine down; leaves oval, glabrous, entire, and sometimes with a few crenatures; racemes short, terminal, and axillary; calyx glabrous, glandular; spurs of anthers equal, adnate, equal in length to the cells. ♄. G. Native of New Holland, on the east coast, within the tropic, and on the north-west coast. Leaves 4-6 lines long.

Oval-leaved Prostanthera. Shrub humble.

7 P. ATRIPLICIFÒLIA (Cunningh. mss. ex Benth. lab. p. 451.) branchlets tomentose; leaves ovate-oblong, quite entire, glabrous; racemes loose, terminal; calyxes glabrous; spurs of anthers equal, adnate, equal to the cells in length. ♄. G. Native of the interior of New Holland; on arid, sterile hills at the river Lachlan. Shrub dense, sweet-scented. Leaves on short petioles, 4-6 lines long. Corollas purple. Very nearly allied to *P. ovalifòlia*.

Atriplex-leaved Prostanthera. Shrub.

8 P. COTINIFÒLIA (Cunningh. mss. ex Benth. lab. p. 452.) branches tomentose; leaves orbicular, thickish, glabrous, quite entire, retuse, or emarginate at apex; racemes elongated; lips of calyx quite entire. ♄. G. Native of New Holland, in the interior. Very nearly allied to *P. rotundifòlia*, but differs in the leaves being never crenated, and in the longer racemes.

Cotinus-leaved Prostanthera. Shrubs.

9 P. RETU'SA (R. Br. prod. p. 509.) leaves orbicular, crenated, glabrous, glandular on both surfaces; flowers axillary; lower lip of calyx retuse; spurs of anthers scarcely exceeding the cells. ♄. G. Native of Van Diemen's Land. Very nearly allied to *P. rotundifòlia*.

Retuse-leaved Prostanthera. Shrub.

10 P. ROTUNDIFÒLIA (R. Br. prod. p. 509.) branchlets tomentose; leaves orbicular or spatulate, thickish, glabrous, entire, or crenated; flowers sub-racemose; calyx glabrous, with quite entire lips; spurs of anthers equal, adnate, shorter than the cells. ♄. G. Native of Van Diemen's Land. Leaves 3-4 lines long. Racemes sub-secund, simple or compound. Corolla large, nearly glabrous outside.

Round-leaved Prostanthera. Clt. 1824. Shrub 3 to 6 feet.

11 P. NI'VEA (Cunningh. mss. ex Benth. lab. p. 452.) quite glabrous; leaves linear, quite entire, with smooth revolute margins; racemes loose, terminal; calyx glabrous, having the upper lip large, ciliated, one half shorter than the lower lip; one spur of each anther twice as long as the cell: the other shorter, adnate. ♄. G. Native of the interior of New Holland, on sterile rocky mountains. Leaves ½ to 1 inch long. Flowers sub-secund. Corolla snow-white, twice as long as the calyx, downy outside.

Snow-white-flowered Prostanthera. Shrub 3 feet.

12 P. BAXTE'RI (Cunningh. mss. ex Benth. lab. p. 452.) branches clothed with white tomentum; leaves linear, quite entire, with smooth revolute edges, glabrous; flowers sub-axillary; calyx clothed with silky tomentum; upper lip large, lower one shorter. ♄. G. Native of New Holland, at King George's Sound, Baxter. Leaves ½ an inch long. Flowers in the axils of the floral leaves.

Baxter's Prostanthera. Shrub.

13 P. LINEA'RIS (R. Br. prod. p. 509.) quite glabrous; leaves linear, quite entire, glabrous, smooth, with sub-recurved margins; racemes terminal; calyxes glabrous, finely ciliated; longer spur of each anther twice as long as the cell. ♄. G. Native of New South Wales, at Port Jackson, R. Br.; on rocks at Springfield and elsewhere, Cunningh. Leaves about an inch long, obtuse. Corolla a little longer than the calyx, downy outside, with a villous throat.

Linear-leaved Prostanthera. Clt. 1824. Shrub 3 to 4 feet.

14 P. DENTICULA'TA (R. Br. prod. p. 509.) branchlets scabrous from pubescence; leaves linear, entire, glabrous, glandular beneath, tubercularly denticulated above, near the recurved margin; calyxes ciliated, rather pilose; longer spur of anther rather exceeding the cell. ♄. G. Native of New South Wales, about Port Jackson, and on mountains near Bathurst. Habit of *Westríngia*. Branches nearly terete. Leaves sessile. Racemes loose, secund, terminal. Corolla twice as long as the calyx.

Denticulated-leaved Prostanthera. Clt. 1824. Shrub 3 to 4 feet. ?

15 P. CRYPTANTHOI'DES (Cunningh. mss. ex Benth. lab. p. 453.) glabrous; leaves lanceolate or linear, obtuse, quite entire or denticulated, fascicled in the axils: floral leaves similar to the rest; flowers few, axillary; calyx glabrous, having the upper lip tridentate; longer spur of anther twice the length of the cell. ♄. G. Native of New Holland, on rocks at Hunter's river.—An humble, glandular, rather clammy shrub, glabrous, or furnished with a few scattered hairs. Leaves scarcely 2-3 lines long. Bracteas foliaceous, equalling the calyxes. Corolla more than twice as long as the calyx.

Cryptantha-like Prostanthera. Shrub humble.

16 P. ASPALATHOI'DES (Cunningh. mss. ex Benth. lab. p. 453.) branches pubescent; leaves small, linear, quite entire, with revolute margins, nearly glabrous, fascicled; floral leaves similar to the others; flowers few, axillary, nearly sessile; calyx glabrous, with nearly equal, quite entire lips. ♄. G. Native of the interior of New Holland, on sterile hills at the river Lachlan. Shrub decumbent. Branches clammy. Leaves 1-2 lines long, furnished with a few hairs while young. Corolla scarlet, glabrous outside, more than twice as long as the calyx.

Aspalathus-like Prostanthera. Shrub decumbent.

17 P. CALE'YI (Benth. lab. p. 454.) branches pubescent;

leaves small, ovate-elliptic, obtuse, with revolute edges, fascicled in the axils, scarcely pubescent; floral leaves conforming to the others; flowers few, axillary, pedicellate; calyx pubescent, with quite entire lips; longer spur of anther about equal in length to the cell. ♄. G. Native of New Holland, Caley. Allied to *P. aspalathoìdes*, but distinct. Leaves 1-2 lines long, convex. Corolla hardly exceeding the calyx.

Caley's Prostanthera. Shrùb humble.

18 P. microphy'lla (Cunningh. mss. ex Benth. lab. p. 454.) branches almost glabrous; leaves small, thick, all obtuse, quite entire, spreadingly recurved, glabrous: floral leaves similar to the others; flowers few, axillary; calyx pubescent, with nearly equal, quite entire lips; spurs of anthers adnate: longer one scarcely exceeding the cell. ♄. G. Native of the interior of New Holland, in desert places near the river Lachlan.—A humble, much branched shrub. Leaves numerous, scarcely a line long: the floral ones and bracteas similar. Corolla scarlet, hardly twice as long as the calyx, pubescent outside.

Small-leaved Prostanthera. Shrub humble.

19 P. saxi'cola (R. Br. prod. p. 509. Benth. lab. p. 454.) leaves linear-oblong, quite entire, thick, rather pilose while young; floral leaves similar to the others, exceeding the flowers; flowers axillary; calyx hairy at top; longer spurs of anther twice the length of the cell. ♄. G. Native of New South Wales, about Port Jackson; and on rocks near Bathurst, on the west side of the Blue Mountains. Stem diffuse, suffruticose at the base, R. Br.—A slender shrub, with twiggy, hairy branches. Leaves sessile, 3-6 lines long, obtuse. Corolla twice as long as the calyx, pubescent outside, ex Benth. Lips of calyx nearly equal, R. Br.

Stone Prostanthera. Shrub diffuse.

20 P. marifòlia (R. Br. prod. p. 509.) branches hairy; leaves ovate, or elliptic-lanceolate, quite entire, with revolute edges, hispid on both surfaces; flowers axillary, subracemose; calyx hairy, with nearly equal lips; lower lip retuse; spurs of anthers exceeding the cells a little. ♄. G. Native of New South Wales, at Port Jackson, and on the Blue Mountains. Leaves distant, nearly sessile, 2-4 lines long; floral leaves equalling the calyxes. Calyx bluish at top. Corolla a little longer than the calyx.

Cat-Thyme-leaved Prostanthera. Shrub 1 to 1½ foot.

21 P. thymifòlia (Cunningh. mss. ex Benth. lab. p. 455.) branchlets finely pubescent; leaves ovate, roundish, few-crenated, glabrous, with recurved margins; flowers shortly racemose; calyx almost glabrous, with quite entire lips; spurs of anthers equal, adnate, shorter than the cells. ♄. G. Native of New South Wales, near Port Jackson; and at Springwood. P. retùsa, Sieb. fl. nov. holl. exs. but not of R. Br. Leaves on short petioles, 1-2 lines long, glabrous, or ciliated with a few hairs on the nerves beneath: floral leaves minute, deciduous. Calyx glabrous, or ciliated on the stripes. Corolla white, glabrous, exceeding the calyx a little. Nearly allied to *P. violàcea*.

FIG. 83.

Thyme-leaved Prostanthera. Shrub.

22 P. viola'cea (R. Br. prod. p. 509.) leaves roundish, crenated, with revolute edges, pubescently hairy on both surfaces, as well as on the branches; racemes dense, few-flowered; calyx pubescently hairy, with quite entire lips: lower lip twice as long as the upper, and narrower; spurs of anthers equal, rather shorter than the cells. ♄. G. Native of New South Wales, at Port Jackson. Bot. reg. 1072. Leaves 3-4 lines long; floral leaves small: upper ones minute. Corolla violaceous, twice as long as the calyx. (Fig. 83.)

Var. β, *glàbrior* (Benth. lab. p. 455.) leaves smaller, and more glabrous. ♄. G. Native of New South Wales, near Port Jackson; at Springwood, and on the Blue Mountains. This appears to be an intermediate plant between *P. violàcea* and *P. thymifòlia*.

Violaceous-flowered Prostanthera. Fl. May, Aug. Clt. 1820. Shrub 4 to 6 feet.

23 P. inca'na (Cunningh. mss. ex Benth. lab. p. 455.) leaves ovate, obtuse, crenated, bullately wrinkled, hispid from villi on both surfaces, as well as the branches; racemes very short, dense; spurs of anthers equal, adnate, shorter than the cells. ♄. G. Native of New South Wales, on the Blue Mountains; and on rocks at the junction of the rivers Nepean and Warragumba. Shrub divaricately branched. Leaves ½ an inch long; floral leaves smaller, sometimes coloured a little. Flowers almost sessile. Corolla purple, scarcely pubescent outside, exceeding the calyx a little.

Hoary Prostanthera. Shrub 5 to 6 feet.

24 P. rugòsa (Cunningh. mss. ex Benth. lab. p. 456.) leaves crenated, bullately wrinkled, hispid from villi on both surfaces, as well as the branches; flowers few, axillary; calyx hispid: upper lip somewhat tridentate, and the lower one emarginate; spurs of anthers shorter than the cells. ♄. G. Native of New Holland, at the river Hunter. Habit and leaves that of *P. violàcea*, but more hispid; but the inflorescence and calyx are very distinct. Corolla almost glabrous outside.

Wrinkled-leaved Prostanthera. Shrub 5 to 6 feet.?

25 P. rhómbea (R. Br. prod. p. 509.) leaves rhombeo-orbicular, quite entire, shining above in the adult state, glandular beneath; branches and calyxes pubescent; flowers axillary; spurs of anthers shorter than the cells. ♄. G. Native of New South Wales, about Port Jackson. Branches divaricate, sparingly pilose. Leaves almost sessile, bullately convex above, 2-4 lines long; floral leaves similar to the rest, on short pedicels. Corolla scarcely exceeding the calyx.

Rhomb-leaved Prostanthera. Clt. 1823. Shrub 3 to 4 feet.?

Cult. All the species are showy when in blossom. A light rich soil, or one composed of equal parts of loam, peat, and sand, will answer. Cuttings of young wood strike root readily in the same kind of soil, with a hand-glass over them.

LXIII. HEMIA'NDRA (from ἡμι, *hemi*, a half; and ανηρ ανδρος, *aner andros*, a male; so called in allusion to the dimidiate anthers.) R. Br. prod. p. 502. Benth. lab. p. 456.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx campanulate, striated at the base; lips flat, closed over the fruit: upper lip entire, mucronate: lower one semi-bifid. Corolla with a short ample tube, a campanulate throat, and a bilabiate limb; lips flat, spreading: upper one bifid: lower one 3-lobed, the middle lobe emarginate. Stamens 4, loosely ascending, didynamous: lower ones the longest; filaments glabrous, naked; anthers dimidiate: fertile cell ascending, and the sterile cell slender, and descending on the filament. Style almost equally bifid at apex; lobes subulate, stigmatiferous at tops.—A small shrub, with the habit of *Prostanthèra*.

1 H. pu'ngens (R. Br. prod. p. 502.) ♄. G. Native of New Holland, on the south coast, R. Br.; on hills near Swan River, Frazer.—A stiff, decumbent, densely leafy shrub; branches hard, glabrous or pubescent at the base. Leaves ses-

sile, lanceolate, very acute, pungent, quite entire, glabrous, rigid, 1-3-nerved beneath; floral leaves similar, exceeding the calyxes. Corolla glabrous, twice as long as the calyx, white, tinged or dotted with purple. Plant without any scent when dried, not aromatic like the species of *Prostanthèra*.

Pungent-leaved Hemiandra. Shrub decumbent.

Cult. For culture and propagation see *Prostanthèra*, p. 800.

LXIV. HEMIGE'NIA (from ἡμι, *hemi*, a half, and γενεα, *genea*, an offspring; in reference to only one of the cells of each anther being fertile.) R. Br. prod. p. 502. Benth. lab. p. 457.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx subcampanulate, deeply 5-cleft, equal. Corolla with a short tube, which is naked inside; a wide throat, and a sub-bilabiate limb: upper lip flat, sub-bifid: lower lip spreading, trifid, the middle lobe semi-bifid. Stamens 4, somewhat ascending, didynamous: lower ones the longest. Anthers approximate; one of the cells ascending and polliniferous; the other descending, of a different form, and empty. Style shortly bifid at apex. Achenia reticulately wrinkled.—Shrubs, with the habit of *Westríngia* or *Macrocòrys*. Flowers axillary, solitary. Beard of upper anthers very short, similar to the crest of the spurs in *Prostanthèra*.

1 H. purpu'rea (R. Br. prod. p. 502.) leaves 3 in a whorl; corolla shorter than the calyx. ♄. G. Native of New South Wales, at Port Jackson.—A slender shrub, with twiggy, leafy, glabrous branches. Leaves sessile, half an inch long, or longer, linear, acute, nearly terete, glabrous. Corolla bluish-purple, glabrous outside; but the lower lip is villous above.

Purple-flowered Hemigenia. Shrub.

2 H. Siebe'ri (Benth. lab. p. 457.) leaves 4 in a whorl; corolla exceeding the calyx. ♄. G. Native of New South Wales, about Port Jackson. H. purpùrea, Sieb. pl. nov. holl. exs. no. 191. Shrub more rigid, and larger than *H. purpùrea*. Leaves thicker, broader, and blunter, often mucronulate. Lower lip of corolla densely villous.

Sieber's Hemigenia. Shrub.

Cult. For culture and propagation see *Prostanthèra*, p. 800.

LXV. WESTRI'NGIA (named, by Sir J. E. Smith, after J. P. Westring, physician to the king of Sweden.) Smith, tracts, p. 277. t. 3. R. Br. prod. p. 501. Benth. lab. p. 457.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx campanulate, 10-nerved, equal, 5-toothed: throat naked inside. Corolla with a short tube, which is naked inside: a wide throat, and a sub-bilabiate limb; upper lip flat, bifid, rather spreading; lower lip spreading, 3-lobed, the middle lobe rather bifid. Stamens 4, erect, distant, inclosed in the tube of the corolla; superior 2 fertile, bearing dimidiate, 1-celled, glabrous anthers: lower 2 sterile, bearing bipartite anthers, the lobes linear, dependent, and empty. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia coriaceous, reticulately wrinkled.—Shrubs. Leaves permanent, 3-4 in a whorl, quite entire; floral leaves similar to the rest, with 1-flowered axils. Flowers 3-4 in a whorl, sometimes distant, and sometimes approximate into a short terminal raceme. Bracteas minute, adpressed to the calyx.

1 W. rosmarinifórmis (Smith, tracts. p. 277. t. 3.) leaves 4 in a whorl, lanceolate, with revolute edges, almost glabrous above, and silvery beneath; floral leaves about twice as long as the calyxes; calyx silvery, having the teeth one half shorter than the tube. ♄. G. Native of New South Wales, frequent on sandy hills about Port Jackson, Botany Bay, and towards the South. Andr. bot. rep. t. 214. Cunìla fruticòsa, Willd. spec. 1. p. 122. Young branches covered with dense silky hairs. Leaves an inch long, sessile. Flowers 4 in a whorl, like the leaves. Corollas villous outside, and bearded inside by a few hairs, white: lower lip spotted. Filaments villous.

Rosemary-formed Westringia. Fl. May, Aug. Clt. 1791. Shrub 1 to 3 feet.

2 W. Dampie'ri (R. Br. prod. p. 501.) leaves 4 in a whorl, linear, with revolute margins, nearly glabrous above, and cinereous beneath; floral leaves twice as long as the calyxes; calyx silvery, having the teeth one half shorter than the tube. ♄. G. Native of New South Wales, about Port Jackson; and on sandy hills at King George's Sound. Hook. bot. mag. t. 3308. Hardly to be distinguished from *W. rosmarinifórmis*, except in the more numerous, narrower, longer leaves, which are less silky beneath. Corolla white; lower lip spotted with red and yellow. (Fig 84.)

FIG. 84.

Dampier's Westringia. Fl. May, Aug. Clt. 1803. Shrub 1 to 3 feet.

3 W. brevifòlia (Benth. lab. p. 459.) leaves 4 in a whorl, elliptic-lanceolate, with revolute margins, shining above and silvery beneath; floral leaves rather shorter than the calyxes; calyx silvery, having the teeth one half shorter than the tube. ♄. G. Native of Van Diemen's Land, Gunn. Very similar to *W. rosmarinifórmis;* but differs from it in the much smaller, more glabrous leaves, and smaller flowers.

Short-leaved Westringia. Shrub.

4 W. ri'gida (R. Br. prod. p. 501.) leaves 3 in a whorl, linear-lanceolate, with revolute edges, glabrous above, and cinereous beneath, as well as the calyxes; teeth of calyx one half shorter than the tube. ♄. G. Native of New Holland, on the south coast; frequent on rocks by the sea side in Rottnest Island; and at the mouth of Swan River, on the west coast. Very nearly allied to *W. Dampièri;* but differs in the shorter leaves being 3 in a whorl, and usually shortly mucronate.

Stiff Westringia. Fl. May, Aug. Clt. 1823. Shrub 1 to 3 feet.

5 W. cine'rea (R. Br. prod. p. 501.) leaves 3 in a whorl, linear-lanceolate, divaricate, mucronate, pungent, with revolute margins, cinereous on both surfaces, as well as the calyxes; calycine teeth very short. ♄. G. Native of New Holland, on the south coast, R. Br.; on the south-west coast, at King George's Sound; and in the Dick Hartog Island, on the west coast, Cunningham. Hook. bot. mag. t. 3307.—A much branched, humble shrub. Leaves form of those of *W. Dampièri*. Flowers sessile. Upper lip of corolla villous, pale purple; but the lower lip is white; both lips are spotted with purple dots.

Cinereous Westringia. Fl. May, Aug. Clt. 1821. Shrub humble.

6 W. angustifòlia (R. Br. prod. p. 501.) leaves 3 in a whorl, linear, spreading, with revolute edges, scabrous above in the adult state, and cinereous beneath, as well as the calyxes; calycine teeth one half shorter than the tube. ♄. G. Native of Van Diemen's Land.

Narrow-leaved Westringia. Fl. May, Aug. Clt. 1823. Shrub.

7 W. eremi'cola (Cunningh. mss. ex Benth. lab. p. 459.)

leaves 3 in a whorl, linear, with revolute margins, cinereous beneath; calyxes clothed with silky pubescence, having the teeth rather longer than the tube. ♄. G. Native of New Holland, in the interior; in deserts near the river Lachlan, and on rocks near Bathurst, Cunningh.; at the river Macquarie, and in the valleys of Lushington and Glen Finlas, ex herb. Hook. Branches divaricate, very leafy. Leaves scarcely ½ an inch long.

Desert Westringia. Shrub.

8 W. longifòlia (R. Br. prod. p. 501.) leaves 3 in a whorl, linear, with recurved margins, and are, as well as the calyxes, green on both surfaces; calycine teeth length of tube. ♄. G. Native of New South Wales, about Port Jackson, on the banks of rivulets. Prostanthèra lineàris, Sieb. fl. nov. holl. exs. but not of R. Br. Angles of branches rough. Leaves an inch long, rather scabrous above, and pilose beneath while young.

Long-leaved Westringia. Clt. 1823. Shrub 1 to 3 feet. ?

9 W. gla'bra (R. Br. prod. p. 501.) leaves 3 in a whorl, linear-lanceolate, flat, glabrous on both surfaces, as well as the calyxes. ♄. G. Native of tropical New Holland. Allied to *W. longifòlia;* but the leaves are broader, and flat, and the whole plant quite glabrous. Leaves about an inch long. Flowers nearly sessile.

Glabrous Westringia. Clt. 1824. Shrub.

10 W. rubiæfòlia (R. Br. prod. p. 501.) leaves 4 in a whorl, elliptic, flattish, quite glabrous, shining; calyx nearly glabrous, having the teeth rather longer than the tube. ♄. G. Native of Van Diemen's Land. This differs from *W. rosmarinifórmis* in its smoothness, acuter calycine teeth, shorter, broader leaves, with the edges almost flat. Whorls 6-8-flowered.

Madder-leaved Westringia. Clt. 1820. Shrub.

Cult. For culture and propagation see *Prostanthèra*, p. 800.

LXVI. MICROCO'RYS (from μικρος, *micros*, small; and κορυς, *korys*, a helmet; probably from the upper lip or galea of corolla.) R. Br. prod. p. 502. Benth. lab. p. 460.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, about 10-nerved, equal, 5-toothed; throat naked inside. Corolla with the tube equal in length to the calyx, naked inside: throat widened: limb sub-bilabiate; upper lip flattish, emarginately bifid, erectly spreading: lower lip spreading, trifid. Stamens 4, erect, distant, inclosed in the tube of the corolla: upper 2 fertile, bearing dimidiate, 1-celled, bearded anthers: lower 2 sterile, bearing bipartite anthers, the lobes linear, dependent, and empty. Style almost equally bifid at top; lobes subulate, stigmatiferous at apex.—Shrubs, with the habit of *Westringia*. Leaves 3 in a whorl. Flowers small, white or purple, solitary in the axils of the floral leaves, which are similar to the cauline leaves, and, like them, 3 in a whorl.

1 M. virga'ta (R. Br. prod. p. 502.? Benth. lab. p. 461.) leaves oblong-linear, obtuse, and are, as well as the calyxes, glabrous; bracteas caducous; corolla hairy outside. ♄. G. Native of New Holland, on the south coast; and in boggy places at King George's Sound.

Twiggy Microcorys. Shrub.

2 M. barba'ta (R. Br. prod. p. 502.) leaves linear, obtuse, glabrous; calyxes and corollas hairy outside; bracteas caducous. ♄. G. Native of New Holland, on the south coast, R. Br.; at King George's Sound, ex herb. Hook. Very nearly allied to *M. virgàta*, but differs from it in the calyxes being densely villous, &c.

Bearded-flowered Microcorys. Shrub.

3 M. purpu'rea (R. Br. prod. p. 502.) leaves oval-oblong, with recurved margins, furnished with a few short hairs on both surfaces, dotted beneath; branchlets silky; calyxes greyish; bracteas setaceous, permanent. ♄. G. Native of New Holland, on the south coast.

Purple-flowered Microcorys. Shrub.

Cult. For culture and propagation see *Prostanthèra*, p. 800.

Tribe VIII.

NEPE'TEÆ (the genera contained in this tribe agree with *Népeta* in the characters given below.) Benth. lab. p. 462. Calyx equal, oblique, or sub-bilabiate; upper teeth the largest. Corolla inclosed or exserted; throat usually inflated; upper lip rather arched: lower lip spreading. Stamens 4, didynamous, ascending or diverging, the upper ones the longest. The whole of this tribe may not inappropriately be considered as a single genus, ex Benth.

LXVII. LOPHA'NTHUS (from λοφος, *lophos*, a crest; and ανθος, *anthos*, a flower; in allusion to the crenated or crested middle lobe of lower lip of corolla.) Benth. in bot. reg. vol. 15. lab. p. 462. Hyssòpus species of authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 15-nerved, rather incurved, with an oblique, 5-toothed mouth: superior teeth rather the longest. Corolla having the tube equalling the calyx, naked inside; and the limb bilabiate; the upper lip erectish, emarginately bifid: lower one spreading a little, trifid, the middle lobe broadly crenated. Stamens 4, didynamous, distant or divaricate: lower ones the shortest; anthers 2-celled: cells parallel, at length rather diverging. Style shortly bifid at apex; lobes nearly equal, subulate, stigmatiferous at apex. Achenia dry, smooth, naked.

Sect. I. Chiasta'ndra (probably from χειω, *cheio*, to scatter abroad, and ανηρ ανδρος, *aner andros*, a male; perhaps from the inequality of the stamens.) Benth. lab. p. 462. Whorls collected into terminal spikes. Upper stamens declinate: lower ones ascending. Leaves entire.

1 L. urticifòlius (Benth. lab. p. 462.) glabrous; leaves cordate-ovate, crenated, green on both surfaces; spikes dense, oblong; calycine segments linear-subulate; genitals much exserted. ♃. H. Native of North-west America, at Lewis and Clark's River, frequent. Stem branched. Bracteas rather shorter than the calyxes, coloured. Corollas purplish.

Nettle-leaved Lophanthus. Fl. July, Aug. Clt. 1826. Pl. 3 to 4 feet.

2 L. anisa'tus (Benth. in bot. reg. t. 1282.) glabrous; leaves ovate or ovate-lanceolate, acute, crenated, green above and white beneath; spikes cylindrical, interrupted at the base; calycine segments lanceolate, acute; genitals exserted. ♃. H. Native of North America, in bushy places at the rivers Missouri, Nutt.; Saskatchawan, Columbia, and Red River, Douglas. Hyssòpus anisàtus, Nutt. gen. amer. 2. p. 27. Hyssòpus díscolor, Desf. cat. hort. par. ed. 3d. p. 97. Stàchys fœnículum, Pursh, fl. amer. sept. 2. p. 407. Hyssòpus Fœnículum, Spreng. cent. pl. min. cogn. p. 24. Stem branched. Flowers one half smaller than those of *L. urticifòlius*. Corollas blue, incurved.

Anise-scented Lophanthus. Fl. July, Sept. Clt. 1825. Pl. 2 to 3 feet.

3 L. rugòsus (Fisch. et Meyer, ind. sem. hort. petrop. 1835. p. 30.) nearly glabrous; leaves wrinkled, cordate-ovate, caudately acuminated, serrately toothed, of the same colour on both surfaces; spikes dense, oblong; calycine lobes lanceolate,

acutish; genitals much longer than the corolla. ♃. H. Native of China. Stature of *L. urticifòlius;* but differs in the leaves being caudately acuminated; in the calycine lobes being acutish. Corollas blue. Odour of Peppermint.

Wrinkled-leaved Lophanthus. Pl. 2 to 4 feet.

4 L. scrophulariæfòlius (Benth. lab. p. 463.) stem pubescent; leaves ovate, serrately crenated, green on both surfaces, glabrous above, and pubescent beneath; spikes cylindrical, interrupted at the base; calycine teeth lanceolate, acute. ♃. H. Native of North America, in shady humid places from Pennsylvania to Virginia, rare, Pursh; at West Chester, Drummond. Hyssòpus scrophulariæfòlius, Willd. spec. 3. p. 48. Hyssòpus catariæfòlius, Hort. par. Habit of *L. anisàtus;* but differs in the leaves being broader, pubescent beneath, not white; and in the flowers being a little larger. Corolla blue.? Calyx coloured at top.

Scrophularia-like Lophanthus. Fl. July, Aug. Clt. 1800. Pl. 3 to 4 feet.

5 L. nepetoi'des (Benth. lab. p. 463.) glabrous; leaves ovate, acutish, serrately crenated, green on both surfaces, glabrous, or scarcely pubescent beneath; spikes cylindrical, interrupted at the base: calycine teeth ovate, bluntish. ♃. H. Native from Pennsylvania to Virginia, Pursh; near St. Louis, on the Mississippi; and near West Chester, Drummond. Hyssòpus nepetoìdes, Lin. spec. p. 796. Jacq. hort. vind. 1. p. 28. t. 69. Leaves $1\frac{1}{2}$ to 2 inches long, rounded or subcordate at the base. Corolla yellowish-white, scarcely exceeding the calycine teeth. Achenia villous at top.

Nepeta-like Lophanthus. Fl. Aug. Oct. Clt. 1692. Pl. 3 to 5 feet.

Sect. II. Resupina'ria (so called from the almost resupinate flowers of the species.) Benth. lab. p. 464. Cymes axillary, pedunculate, loose, few-flowered. Flowers almost resupinate. Lower stamens nearly erect; upper ones ascending.

6 L. Chine'nsis (Benth. lab. p. 464.) leaves ovate or oblong, crenated: floral ones similar to the others; cymes axillary, pedunculate, loose, few-flowered. ♃. H. Native of the North of China, ex Lin.; Siberia, about Peshkova, near Nertscha, Patrin. Hyssòpus lophánthus, Lin. spec. p. 796. Jacq. hort. vind. 2. p. 85. t. 182. Hyssòpus resupinàtus, Mœnch. Népeta lophántha, Fisch. Plant rather clammy, glabrous, or scarcely pubescent. Leaves an inch long. Peduncles subsecund, bearing unilateral cymes at apex. Corollas blue: tube shortly exserted. Achenia oblong, smooth.

China Lophanthus. Fl. Aug. Sept. Clt. 1752. Pl. $1\frac{1}{2}$ to 2 feet.

Cult. For culture and propagation see *Népeta*, p. 811.

LXVIII. NE'PETA

(a name used by Pliny; derived from *nepa*, a scorpion; being supposed to be efficaceous against the bite of the scorpion. Linnæus derives it from Nepet, a town in Tuscany.) Lin. gen. no. 710. Schreb. gen. no. 964. Juss. gen. p. 113. ed. Usteri, p. 126. Benth. lab. p. 464. Catària, Tourn. inst. p. 202. t. 95. Mœnch. Glechòma, Lin.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 13-15-nerved, for the most part incurved, with an obliquely 5-toothed mouth; rarely ovate, straight, with the mouth and teeth equal. Corolla having the tube slender at the base, inclosed or exserted, naked inside, the throat widened, and the limb bilabiate; upper lip straight, and rather concave, emarginate or bifid; lower lip spreading, trifid, the middle lobe large, sometimes sub-bifid, with reflexedly spreading lobes, and sometimes entire, concave, and crenulated. Stamens 4, didynamous, ascending: lower ones the shortest. Anthers usually approximate by pairs, 2-celled; cells diverging, at length divaricate. Style about equally bifid at apex; lobes subulate, stigmatiferous at apex. Achenia dry, smooth, naked.

Sect. I. Schizone'peta (from σχιζω, *schizo*, to cut; and *Népeta;* in allusion to the cut leaves of the species.) Benth. lab. p. 468. Whorls crowded: upper ones approximating into somewhat interrupted terminal spikes; cymes all sessile. Bracteas various. Calyx tubular, straight, but usually incurved, with an equal or oblique mouth. Stamens exserted a little, loosely ascending. Leaves dissected or lobed.

1 N. botryoi'des (Ait. hort. kew. 2. p. 287.) plant ascending, humble, much branched, pubescent; leaves petiolate, deeply sub-bipinnatifid: segments oblong-lanceolate or linear, obtuse, quite entire, or somewhat pinnatifid; floral leaves linear-subulate; spikes cylindrical, hardly interrupted at the base; racemes simple, spike-formed; bracteas and calycine teeth acute. ♃. H. Native of Eastern Siberia, in the Altaic region, at the rivers Katunga and Tschuja, Bunge; in the Kirghisean Steppe, Meyer. N. multífida, Lin. fil. suppl. 273. N. ánnua, Pall. in act. petrop. 1779. 2. p. 263. t. 12. N. bipinnàta, Cav. icon. 1. p. 36. t. 49. Leaves usually bipinnatifid: upper ones simply pinnatifid: floral ones minute. Bracteas minute. Calyx with an oblique mouth. Corolla cream-coloured or white, villous. Stamens rather shorter than the corolla.

Botrys-like Cat-mint. Fl. June, July. Clt. 1779. Pl. $\frac{1}{2}$ to 1 foot.

2 N. tenuifòlia (Benth. lab. p. 468.) stems procumbent, glabrous, or finely pubescent; leaves petiolate, pinnate: segments oblong-linear, acute, a little serrated, narrowed at the base, almost glabrous on both surfaces; upper leaves and floral ones entire; spikes slender, interrupted at the base; corollas minute, exceeding the calyxes a very little. ♃. H. Native of China, between Pekin and Jehol, Sir G. Staunton. This species differs from *N. lavandulàcea*, in the leaves, slender spikes, and minute flowers; and from *N. botryoìdes*, in the elongated, procumbent stems, &c.

Fine-leaved Cat-mint Pl. procumbent.

3 N. lavandula'cea (Lin. fil. suppl. 272.) plant ascending, pubescent; leaves petiolate, deeply pinnatifid at the base, with oblong or ovate, obtuse segments; floral leaves ovate, acuminated; spikes cylindrical, interrupted at the base; calycine teeth very short, ovate; corolla about twice as long as the calyx. ♃. H. Native of Eastern Siberia, in the Altaic region, in dry mountain places frequent. N. multífida, Lin. spec. 799. Rchb. icon. bot. eur. 6. p. 22. t. 530. N. lobàta, Rudolph. ex Steud. nom. p. 552. Lophánthus multífidus, Benth. in bot. reg. vol. 15. under no. 1282. Saussùrea pinnatífida, Mœnch. meth. p. 388. Lavándula foliis ovatis, &c., Gmel. sib. 3. p. 242. t. 55. Stems many, simple. Leaves sometimes all cut into 5-7 segments, sometimes deeply pinnatifid, or nearly entire. Corolla blue, incurved. Mouth of calyx hardly oblique.

Lavender-like Cat-mint. Fl. July, Aug. Clt. 1796. Pl. 1 2 feet.

Sect. II. Pychnone'peta (from πυχνος, *pychnos*, dense; and *Népeta;* so called in allusion to the dense spikes of the species.) Benth. lab. p. 469. Whorls crowded: upper ones, or all, collected into terminal spikes; cymes all sessile. Outer bracteas alone imbricate, equalling the calyxes. Calyx tubular, straight or incurved, with an equal or oblique mouth.

4 N. linea'ris (Royle, ex Benth. in Hook. misc. 3. p. 377.) stems ascending, nearly glabrous; leaves sessile, linear, acutish, quite entire, narrowed at the base, green and glabrous on both surfaces; spikes ovate, few-flowered; bracteas lanceolate-subu-

late; calyx elongated, with lanceolate teeth, which are shorter than the tube. ♃. H. Native of the Himalaya. Stems procumbent at the base. Leaves 1-2 inches long. Spike short, rather interrupted. Teeth of calyx villous. Corolla blue? with a slender exserted tube.

Linear-leaved Cat-mint. Pl. humble.

5 N. CONNA'TA (Royle, l. c.) stems erect, villous; leaves sessile, lanceolate, acute, quite entire, cordately stem-clasping at the base, rather connate, green on both surfaces, glabrous; spike oblong, dense, or rather interrupted at the base; bracteas lanceolate-subulate, ciliated, equalling the calyxes; calycine teeth subulate, longer than the tube. ♃. H. Native of the valley of Cashmere, Royle. Stems simple. Leaves 2-3 inches long. Corolla incurved, exceeding the calycine teeth a little.

Connate-leaved Cat-mint. Pl. 1 to 2 feet. ?

6 N. NERVÒSA (Royle, l. c.) glabrous; stem humble, erect, branched; leaves on short petioles, lanceolate, acute, serrated, rounded at the base, green on both surfaces; spike oblong, dense; outer bracteas ovate, very acute, ciliated, longer than the calyxes; calycine teeth long-subulate, about equal in height to the tube. ♃.? H. Native of the valley of Cashmere, Royle. Herb branched at the base. Leaves 1-2 inches long. Mouth of calyx almost equal. Corolla incurved, twice as long as the calyx.

Nerved-leaved Cat-mint. Pl. ½ to 1 foot.

7 N. ERIO'STACHYS (Benth. lab. p. 734.) stem erect, nearly simple, pubescent; leaves almost sessile, ovate, obtuse, crenated, roundly subcordate at the base, green above, and glabrous, hoary beneath; spike oblong, dense; bracteas oblong-linear and subulate, equalling the calyxes; calycine teeth subulate, rather longer than the tube, and are, as well as the bracteas, villous. ♃.? H. Native of Cashmere, in the valleys of Baspa and Paber, in elevated grassy places on the margins of woods, &c., Jacquemont. Allied to *N. connàta* and *N. nervòsa*, but the leaves are very distinct. Leaves 1 to 1½ inch long. Bracteas entire.

Woolly-spiked Cat-mint. Pl. 1 to 2 feet.

8 N. CAMPE'STRIS (Benth. lab. p. 734.) pubescent, or nearly glabrous; stems ascending, almost simple; leaves almost sessile, lanceolate, acute, serrated, rounded at the base, green on both surfaces; spike elongated, somewhat interrupted at the base; outer bracteas lanceolate, very acute, ciliated, about equal in length to the calyxes; calycine teeth subulate, about equal in length to the tube. ♃. H. Native of Cashmere, in fields, frequent, Jacquemont. Allied in the form of the leaves to *N. nervòsa;* and in the flowers to *N. spicàta.* Spikes and bracteas altogether that of *N. spicàta.*

Field Cat-mint. Pl. 1 to 2 feet. ?

9 N. ELA'TA (Royle, ex Benth. in Hook. bot. misc. 3. p. 378. lab. p. 469.) stem erect, glabrous; leaves petiolate, oblong-ovate, or ovate-lanceolate, crenated, broadly cordate at the base, green and glabrous on both surfaces; spikes oblong-cylindrical, rather interrupted; bracteas lanceolate-subulate, rather shorter than the calyxes; calyx glabrous, with subulate teeth, which are about equal in length to the tube. ♃. H. Native of the Himalaya, at Simlah, and in the valley of Cashmere. Stem a little branched. Leaves 2-3 inches long. Corolla incurved, twice as long as the calyx, with an exserted tube. Plant glabrous in every part except the calycine teeth, which are pubescent; and the petioles and floral leaves, which are somewhat ciliated.

Tall Cat-mint. Pl. 2 to 3 feet.

10 N. SPICA'TA (Benth. in Wall. pl. asiat. rar. 1. p. 64. lab. p. 470.) plant erect, nearly glabrous; leaves petiolate, ovate, obtuse, crenated, cordate at the base, green on both surfaces; racemes spike-formed, short, dense; bracteas oblong or lanceolate-linear, subulate, acuminated, equalling the calyxes; calycine teeth long-subulate, about equal in length to the tube. ♃. H. Native of Himalaya, in the provinces of Kamaon and Bhuddrinah, Wall.; Valley of Cashmere, Royle, and at Simlah, Lady Dalhousie. Betónica lævigàta, D. Don. prod. fl. nep. p. 110. Stem a little branched, with pubescent angles. Leaves 1 to 1½ inch long: floral leaves broad-ovate, sessile. Calyxes sessile, incurved, with a nearly equal mouth. Corolla incurved, twice as long as the calyx, red.? Bentham has specimens of this gathered in Cashmere by Jacquemont, having the stems and leaves sometimes hispid, and the leaves scarcely cordate at the base.

Spiked Cat-mint. Pl. ½ to 1 foot.

11 N. RAPHANORHI'ZA (Benth. lab. p. 734.) stem ascending, pubescent at the base, rather clammy; leaves petiolate, ovate, bluntish, serrately crenated, truncate at the base, rather hispid, green on both surfaces; spike short, dense, somewhat interrupted at the base; outer bracteas oblong, narrowed at both ends, almost equalling the calyxes; teeth of calyx subulate, hispid, unequal, shorter than the tube, which is nearly glabrous. H. Native of Cashmere, in grassy places, Jacquemont. Root thick, like that of *N. tuberòsa.* Leaves like those of *N. spicàta,* but smaller.

Raddish-rooted Cat-mint. Pl. ?

12 N. DI'SCOLOR (Royle, ex Benth. in Hook. bot. misc. 3. p. 378. lab. p. 470.) stem ascending, villous at the base; leaves petiolate, ovate, obtuse, crenated, sub-cordate at the base, green above and hoary beneath; spike oblong, dense, or somewhat interrupted at the base; bracteas oblong-linear, very acute, equalling the calyxes; calyx nearly glabrous, with subulate teeth, which are about equal in length to the tube. ♃. H. Native of the Himalaya, Syen, and Mussooree, Royle. Leaves like those of *N. Mussìni,* but smaller. Bracteas and calycine teeth ciliated.

Discoloured-leaved Cat-mint. Pl. ascending.

13 N. MÓLLIS (Benth. lab. p. 734.) stems ascending, villous: leaves on short petioles, ovate, obtuse, a little crenated, cordate at the base, clothed with soft villi on both surfaces, rather canescent beneath; superior leaves small, remote; spikes slender, rather interrupted; bracteas oblong-linear, very acute, equalling the calyxes; calyx finely pubescent, having the teeth much shorter than the tube. ♃. H. Native of the valley of Cashmere, Jacquemont. Allied to *N. díscolor.* Whorls distinct, scarcely 6-flowered. Corolla pale red, the lower lip dotted with purple, not blue, as in the other species of the present section.

Soft Cat-mint. Pl. ascending.

14 N. ELLI'PTICA (Royle, ex Benth. in Hook. bot. misc. 3. p. 378. lab. p. 470.) stem erect, rather villous; leaves sessile, ovate, elliptic, obtuse, toothed, cordate at the base, green on both surfaces, glabrous; spike interrupted at the base; floral leaves and bracteas ovate-lanceolate, very acute, ciliated, rather longer than the calyxes; calycine teeth subulate, about equal in length to the tube. ♃. H. Native of the Himalaya, from Cashmere to Syen, Royle. N. polystàchya, Benth. in Hook. bot. misc. 3. p. 378. Leaves elegantly and regularly toothed, an inch long. Calyx and corolla of *N. spicàta.*

Var. β, parviflòra (Benth. lab. p. 470.) flowers smaller. ♃. H. Native of Simlah, Lady Dalhousie.

Elliptic-leaved Cat-mint. Pl. 1 to 2 feet.

15 N. GRA'TA (Benth. lab. p. 735.) stem erect, branched, clothed with fine pubescence; leaves nearly sessile, ovate, obtuse, crenated, rounded at the base or sub-cordate, wrinkled, pubescent on both surfaces, or nearly glabrous above, rather canescent beneath; spikes ovate-oblong, thick, interrupted at the base; mouth of calyx very oblique, sub-bilabiate; corolla scarcely twice as long as the calyx. ♃. H. Native of Cash-

mere, in stony, grassy, and humid places, Jacquemont. Very like *N. supìna;* odour of *Sálvia officinàlis.*

Grateful-scented Cat-mint. Pl. 1 to 1½ foot.

16 N. multibractea'ta (Desf. fl. atl. 2. p. 11. t. 123.) erect, pubescent; leaves on short petioles, ovate-oblong, crenated, cordate at the base, green on both surfaces; racemes spike-formed, dense, simple, somewhat interrupted at the base; bracteas linear-subulate, coloured, equalling the calyxes; tube of corolla equalling the calycine teeth. ♃. H. Native of Mount Atlas, near Tlemsen. Stems almost simple. Lower leaves 1-2 inches long, striped, purplish; whorls dense, many-flowered: lower ones distant. Corollas purple, similar to those of *N. reticulàta.*

Many-bractead Cat-mint. Fl. July, Aug. Clt. 1817. Pl. 3 feet.

17 N. Vailla'nti (Benth. lab. p. 471.) plant erect, nearly glabrous; leaves petiolate, broad-ovate, obtuse, cordate at the base: superior leaves almost sessile, green on both surfaces; raceme simple, interruptedly spike-formed; whorls few-flowered; outer bracteas oblong, bluntish, adpressed, striated, coloured a little, and are, as well as the calyxes, pubescent; tube of corolla shortly exserted. ♃. H. Native of the Levant. Stems many from the same root. Leaves an inch long, broadly crenated, rather pubescent on the veins beneath. Corolla glabrous, incurved, twice as long as the calyx. Calycine teeth linear-lanceolate; upper ones narrower.

Vaillant's Cat-mint. Pl. 1 foot.

18 N. Apu'lea (Ucria, ex Guss. prod. fl. sic. 2. p. 80.) plant erect, nearly glabrous; leaves sessile, ovate-lanceolate, crenated, cordate at the base, green on both surfaces; racemes spike-formed, dense, simple; bracteas oblong-lanceolate, coloured a little, about equal in length to the calyxes; calycine teeth lanceolate, longer than the tube; tube of corolla much exserted. ♃. H. Native of Sicily, on calcareous hills; and of the North of Africa, at Tangiers. N. tuberòsa, Desf. fl. atl. 2. p. 10. but not of Lin. N. ròsea, Salzm. pl. tang. exs. ex Benth. lab. p. 471. Stems generally simple, glabrous, or downy. Leaves smaller. shorter, and less wrinkled than in *N. tuberòsa.* Calyx 5-toothed, nearly equal. Corolla pubescent, violaceous, middle lobe of lower lip crenulated.

Apulean Cat-mint. Pl. 1 foot.

19 N. tuberòsa (Lin. spec. p. 798.) stem erect, simple, rather woolly; lower leaves petiolate; superior ones sessile, ovate-lanceolate, crenated, dilated at the base, cordate, green on both surfaces, or rather woolly beneath, wrinkled; racemes spike-formed, dense, simple, elongated; bracteas broad-ovate, reticulated, coloured, equalling the calyxes; tube of corolla equalling the calycine teeth. ♃. H. Native of the South of Spain, Portugal; Atlas, near Tlemsen, Sicily. N. tuberòsa, Rchb. icon. bot. eur. 5. p. 23. t. 439. N. lanàta, Jacq. obs. bot. 3. p. 21. t. 75. N. reticulàta, Desf. fl. atl. 2. p. 11. t. 124. Rchb. icon. bot. eur. 5. p. 23. t. 440. N. violàcea, Brot. N. scàbra, Tausch, in bot. zeit. 1831. 1. p. 218. N. foliòsa, Mor. elench. sard. ex Linnæa, 5. p. 69.—Barrel. icon. t. 602.—Ger. emac. t. 685. f. 7. Root fasciculately tuberous. Stems beset with rather clammy loose wool. Leaves 2-3 inches long. Calyx a little incurved, with narrow-lanceolate teeth. Corollas blue, or pale purple; middle lobe of lower lip crenulated.

Tuberous-rooted Cat-mint. Fl. June, Aug. Clt. 1683. Pl. 1 to 2 feet.

20 N. Scordòtis (Lin. spec. p. 798.) plant ascending, tomentose; leaves petiolate, ovate-roundish, obtuse, cordate at the base, villously woolly on both surfaces, wrinkled; raceme simple, rather spike-formed; whorls distinct, densely many-flowered; bracteas ovate, acute, adpressed, and are, as well as the calyxes, villously woolly. ♃. H. Native of Candia. Viv. fl. libyc. t. 6. f. 2. N. tomentòsa, Sieb. pl. exsic.—Alp. exot. p. 284. t. 283. Leaves scarcely an inch long: floral leaves sessile. Teeth of calyx nearly equal. Corolla glabrous, white?; tube incurved, a little exserted.

Var. β, víridis (Benth. lab. p. 473.) base of plant almost glabrous, and the top very villous; leaves green on both surfaces. ♃. H. Native of Sicily. S. hirsùta, Lin. spec. 798. but not of others. N. Scordòtis, Lin. spec. 798. N. procúmbens, Mill. dict. no. 10.—Bocc. sic. p. 48. t. 25. f. 2. Corollas white.

Scordotis Cat-mint. Fl. June, Aug. Clt. 1817. Pl. 1 to 1½ foot.

21 N. circinna'ta (Willd. enum. p. 602.) stem simple, erect; spikes ovate, solitary; leaves ovate-cordate, crenated, petiolate; bracteas ovate, acute. ♃. H. Native of Cappadocia. Leaves 3 inches long.

Circinnate Cat-mint. Pl. 1 foot.?

22 N. supi'na (Stev. in mem. soc. nat. car. mosq. 3. p. 165.) stems decumbent; leaves oval, sub-cordate, sessile, villous; bracteas subulate, about equal in length to the calyxes; whorls almost sessile, approximate. ♃. H. Native of Eastern Caucasus, in stony places at the falls of Choodgal, Steven; on Alp Tafandagh, among fragments of schistous. N. físsa, Meyer, verz. pflanz. p. 93. Meyer, in his verz. pflanz. p. 93, gives the following description of the plant: plant villous; root creeping; stem erectish, a little branched; leaves nearly sessile, ovate or oblong, bluntish, crenately toothed; cymes nearly sessile, collected into a terminal head; calyxes membranaceous, exceeding the subulate bracteas, but shorter than the tube of the corolla; lobes acuminated, mucronate. Corollas blue.

Trailing Cat-mint. Pl. decumbent.

23 N. glutinòsa (Benth. lab. p. 735.) stem erect, branched, clothed with clammy pubescence; leaves sessile, ovate or lanceolate, deeply toothed, green on both surfaces, clammy, finely pubescent; raceme simple; whorls distant, or the upper ones are sub-spicate; bracteas linear, very acute: outer ones a little shorter than the calyxes; calyx elongated, striated, with short acute teeth; tube of corolla much exserted. ♃. H. Native of the Himalaya, between Poyé and Rici, Jacquemont. Leaves rather bullate above, ½ to ¾ inch long, the nerves very prominent beneath; inflorescence almost of *N. Itálica,* and *N. distans,* but the lower cymes are, for the most part, solitary. Calyx clothed with clammy pubescence. Corolla violaceous; tube incurved, twice as long as the calyx; lips short.

Clammy Cat-mint. Pl. 1 to 1½ foot.

Sect. III. Stegione'peta (from στεγω, *stego,* to cover, and *Nepèta.*) Benth. lab. p. 474. Cymes condensed into many-flowered whorls, often pedunculate: superior ones sub-spicate. Racemes simple, rarely remote. Bracteas about equal in length to the calyxes, or exceeding them. Calyx sometimes elongated, incurved, with an oblique mouth, and lanceolate or subulate teeth, the upper teeth the largest; sometimes almost straight, with nearly equal teeth. Corolla having the tube hardly or a little exserted, and the throat inflated.

24 N. Sibthórpi (Benth. lab. p. 474.) plant ascending or erect, branched at the base, tomentose or woolly; leaves petiolate, ovate, obtuse, crenated, cordate, wrinkled, clothed with soft hoary tomentum or wool; whorls dense, many-flowered: lower ones distant: the superior ones crowded into a terminal-oblong spike; bracteas ovate or oblong, subulately awned, equalling the calyxes; calyx ovate, with nearly equal awned teeth, which are equal in length to the tube; corolla hardly twice as long as the calyx. ♃. H. Native on mountains about Athens, and near Zara in Dalmatia. N. Itálica, Sibth. et Smith, fl. græc. 6. t. 548. but not of Lin. Stems decumbent at the base, and woody;

branches erect or ascending. Leaves ½ to 1 inch long: floral leaves sessile. Corollas purplish.

Sibthorp's Cat-mint. Pl. 1 to 2 feet.

25 N. Ita'lica (Lin. spec. p. 798.) erect, tall, clothed with fine hoary pubescence; leaves petiolate, ovate, crenated, cordate, canescent on both surfaces; racemes almost simple; bracteas linear or lanceolate, stiff, rather longer than the calyxes; calyx elongated, a little incurved, with a scarcely oblique mouth, and lanceolate, acute teeth, the superior teeth the largest; corolla hardly twice as long as the calyx. ♃. H. Native of Spain, Pavon; Mogodor, Brouss.; Italy, Lin. but is now wanting in Italian, Neapolitan, and Sicilian floras. Jacq. hort. vind. 2. p. 51. t. 112.; a variety with broader, shorter bracteas. Rchb. icon. bot. eur. 5. p. 50. t. 483. N. teucrioïdes, Lam. dict. 1. p. 711. N. marrubioides, Willd. enum. 2. p. 603. N. imbricàta, Lag. ex Spreng, syst. 2. p. 729. O. orientàlis, Mill. dict. no. 9. N. calamíntha, Tausch, in bot. zeit. 1831. 1. p. 219.? Catària canéscens, Mœnch. meth. p. 388. N. macrostàchya, Jan. pl. exsic. Leaves hardly an inch long. Whorls all distinct. Corollas reddish white; tube almost inclosed.

Italian Cat-mint. Fl. June, Aug. Clt. 1640. Pl. 1½ to 2 feet.

26 N. di'stans (Royle, ex Benth. in Hook. bot. misc. 3. p. 379. lab. p. 475.) erect, tall; stem villous; leaves petiolate, ovate-lanceolate, obtuse, crenated, deeply cordate at the base, wrinkled, villous beneath; whorls dense: lower ones remote: upper ones approximate; bracteas linear-lanceolate, about equal in length to the calyxes; calyx elongated, incurved, with an oblique mouth: the superior teeth lanceolate: lower ones subulate; all setaceously acuminated; corolla about twice as long as the calyx. ♃. H. Native of the Himalaya, at Mussooree, and Syen, Royle. Allied to *N. Itálica*, but differs in the simple depauperate raceme, in the lower leaves being more wrinkled, densely villous beneath, and in the calycine teeth being all setaceous at top. Superior leaves few, remote, and smaller.

Distant-whorled Cat-mint. Pl. 2 to 3 feet.

27 N. cilia'ris (Benth. in Wall. pl. rar. asiat. 1. p. 64. lab. p. 475.) erect, clothed, with hoary pubescence; leaves petiolate, broadly-ovate, obtuse, crenated, cordate at the base, clothed with hoary tomentum beneath or on both surfaces; racemes almost simple; bracteas ovate or broadly lanceolate: outer ones almost equal in length to the calyxes; calyx elongated, pubescent, incurved, with an oblique mouth, and lanceolate-subulate rather spreading teeth; corolla about twice as long as the calyx. ♃. H. Native of Nipaul, and towards Cashmere. Habit and inflorescence of *N. ruderàlis*, from which it differs in the branches and leaves being usually canescent, &c.

Ciliated Cat-mint. Pl. 1 to 2 feet.

28 N. rudera'lis (Hamilt. ex Benth. in Wall. pl. asiat. rar. 1. p. 64.) erectish, clothed with fine pubescence; leaves petiolate, ovate, obtuse, crenated, cordate at the base, pubescent on both surfaces, rather greenish; racemes nearly sessile, secund; cymes dense: lower ones pedunculate; bracteas subulate: outer ones equalling the calyxes; calyx ovate, pubescent, with an oblique mouth and subulate teeth, the superior teeth the longest; corolla a half longer than the calyx. ♃. H. Native of Nipaul, at the foot of the mountains, Hamilt; Hurdwar and Rajemahl, Wall; Hindostan, Heyne?; Saharumpur and Deyra Dhoon, Jacquemont. Glechòma erécta, Roxb. fl. ind. 3. p. 7. Thymus nepetoïdes, D. Don. prod. fl. nep. p. 113. Glechòma Hindostàna, Roth. nov. pl. spec. p. 258. Glechòma I'ndica, Spreng. syst. 2. p. 727. Leaves 1½ inch long. Corollas small, purplish.

Rubbish Cat-mint. Pl. 1 to 2 feet.

29 N. clinopodioïdes (Royle, ex Benth. in Hook. bot. misc. p. 379. lab. p. 476.) plant ascending, clothed with fine pubescence; leaves petiolate, ovate, obtuse, crenated, broadly subcordate at the base, green on both surfaces, and finely pubescent; racemes almost simple; whorls rather loose, many-flowered, subsecund; bracteas subulate, rather shorter than the calyxes; calyx tubular, pubescent, with an oblique mouth; the superior teeth lanceolate; and the lower teeth subulate; corolla scarcely exceeding the calyx. ♃. H. Native of the banks of the river Jumna, Royle. Allied to *N. ruderàlis*, but differs in the calyxes being smaller and slenderer, in the corollas being small, scarcely exceeding the calyxes.

Clinopodium-like Cat-mint. Pl. 1 to 2 feet.?

30 N. leucophy'lla (Benth. lab. p. 476.) plant ascending or erectish; branches clothed with hoary tomentum; leaves petiolate, ovate or roundish, crenated, truncate at the base or cordate, green above, wrinkled, clothed with white tomentum beneath; racemes nearly simple, secund; cymes nearly sessile, dense, many-flowered; bracteas subulate, rather shorter than the calyxes; calyx tubular, clothed, with hoary pubescence, with an oblique mouth and lanceolate-subulate teeth: the superior teeth the longest; corollas a half longer than the calyx. ♃. H. Native of Himalaya, at Mussooree, Royle; Simlah, Jacquemont. This differs from *N. ruderàlis* in the leaves being small, wrinkled, and white beneath.

White-leaved Cat-mint. Pl. 1 to 2 feet.

31 N. floccòsa (Benth. lab. p. 736.) erect, divaricately branched, clothed with white floccose wool; leaves petiolate, roundish, cordate at the base; racemes very loose, a little branched; cymes head-formed, few, many-flowered, on long peduncles; bracteas linear-subulate, equalling the calyxes. ♃. H. Native of the North of India, between Nako and Chango, Jacquemont. This species is distinguished from *N. ruderàlis* in the wool, form of leaves, and inflorescence. Corolla small, hardly exceeding the calyx.

Floccose Cat-mint. Pl. 1 to 2 feet.?

Sect. IV. Cata'ria (from *catus*, a cat; so called because cats are fond of *N. catària*.) Benth. lab. p. 476. Cymes usually condensed into many-flowered whorls: lower cymes pedunculate. Racemes simple or panicled. Bracteas shorter than the calyxes, usually very short. Calyx elongated, incurved, with an oblique, rarely erectish mouth, and lanceolate teeth, the superior teeth generally the largest. Tube of corolla a little exserted, with an inflated throat.

32 N. graciliflòra (Benth. in Wall. pl. rar. asiat. 1. p. 65. lab. p. 476.) ascending, glabrous, or finely pubescent; leaves petiolate, ovate or lanceolate, obtuse, crenated, cordate at the base, finely pubescent on both surfaces, rather canescent beneath; racemes branched; cymes very loose, dichotomous; peduncles and branches elongated, filiform; bracteas subulate, shorter than the calyxes; calyx ovate-tubular, with an oblique mouth and subulate teeth; corolla scarcely twice as long as the calyx. ♃. H. Native of the East Indies, in the province of Hurdwar, Wall; Deyra Dhoon, Royle. Stem branched at the base; branches very slender. Leaves on long petioles, scarcely an inch long. Corollas small, blue. This is intermediate between Sect. *Catària* and Sect. *Stegionépeta*.

Slender-flowered Cat-mint. Pl. 1 to 2 feet.

33 N. micra'ntha (Bunge, in Ledeb. fl. alt. 2. p. 401.) plant ascending, humble, pubescent, or glabrous; leaves petiolate, ovate, obtuse, crenated, rounded at the base, pale on both surfaces; racemes loose, branched; bracteas scarcely longer than the pedicels; calyx tubular, incurved, pubescent, with an oblique mouth; corolla scarcely exceeding the calyx. ⊙. H. Native of Siberia in Altaia; on the mountains of Arkaul and Dolenkara. Ledeb. fl. ross. alt. ill. t. 412. Corollas blue.

Small-flowered Cat-mint. Pl. 1 foot.

34 N. Cata'ria (Lin. spec. p. 796.) plant erect, tall, clothed

with hoary pubescence; leaves petiolate, ovate, acute, deeply crenated, cordate at the base, green above, but clothed with hoary tomentum beneath; racemes a little branched; whorls dense, many-flowered; bracteas scarcely longer than the pedicels; calyx ovate, pubescent, a little incurved, with an oblique mouth and lanceolate-subulate rather spreading teeth; corolla one half longer than the calyx. ♃. H. Native almost throughout the whole of Europe, and Middle Asia, on walls, in hedges, and in waste places; plentiful in Britain. Smith, engl. bot. t. 137. Fl. dan. t. 580. Catària vulgàris, Mœnch. meth. p. 387. N. vulgàris, Lam. fl. fr. 2. p. 398. N. citriodòra, Becker, fl. francof. p. 218. N. mìnor, Mill. dict. no. 2. N. Americàna, Mœnch. ex Steud. nom. bot. p. 552. ?—Sabb. hort. rom. 3. t. 80.—Lob. icon. 511. f. 1. Pubescent or tomentosely canescent. Leaves 1½ inch long. Lower cymes on short peduncles. Corollas white, with a tinge of red, spotted with purple. The whole plant has a strong scent between mint and pennyroyal. It is called cat-mint, because cats are very fond of it, especially when it is withered, when they will roll themselves on it, tear it to pieces, and chew it with great pleasure. Ray observes, that plants, which he transplanted from the field into his garden, were always destroyed by cats, unless he protected them with thorns till they had taken root and came into flower, but that they never meddled with plants raised from seed; hence the old saying: "if you set it the cats will eat it; if you sow it the cats don't know it." Mr. Miller has confirmed this by his own experience, having frequently set a plant from another part of the garden within two feet of others which came up from seed, when the former was torn in pieces and destroyed by the cats, whilst the latter remained untouched. The true reason of this difference is assigned by Ray; that cats are fond of it in a withering state, or when the peculiar scent of the plant is excited by being handled or bruised in gathering or transplanting.

An infusion of Cat-mint is deemed a specific in chlorotic cases. Two ounces of the expressed juice may be given for a dose. Sheep are said to eat it; but all other domestic animals are said to refuse it.

Var. β, *cándida* (Benth. lab. p. 477.) leaves deeply crenated, pale above and white beneath. ♃. H.

Cat-mint, Common. Fl. July, Sept. Britain. Pl. 2 to 4 feet.

35 N. NEPETE'LLA (Lin. spec. p. 797.? Benth. lab. p. 477.) plant erect, pubescent, or clothed with hoary tomentum; leaves on short petioles, lanceolate, crenated, rounded or cordate at the base, clothed with hoary pubescence or tomentum on both surfaces; racemes many-flowered, nearly simple; bracteas scarcely longer than the pedicels; calyx tubular, incurved, with an oblique mouth; corolla twice as long as the calyx. ♃. H. Native of the South of Europe, especially on the mountains; as of Spain, Provence, Switzerland; Italy, from Piedmont and Liguria to Naples. This is a very variable plant, especially in gardens. Corollas usually twice the size of those of *N. Catària*, white, purplish, or blue.

Var. α, *màjor* (Benth. lab. p. 477.) raceme elongated, many-flowered; flowers white or purplish. ♃. H. Native of shady places. N. Nepetélla, All. ped. 1. p. 37. t. 2. f. 1. bad. Rchb. icon. bot. eur. 3. p. 35. t. 261. Catària Nepetélla, Mœnch. meth. p. 388. N. amethýstina, Desf. ex Poir. suppl. 3. p. 206. N. paniculàta, Mill. dict. no. 4. Stems 3-4 feet high. Whorls as in *N. Catària*, large and dense, many-flowered, disposed in a long raceme.

Var. β, *hùmilis* (Benth. lab. p. 478.) racemes short, dense; flowers white or purplish. ♃. H. Native in dry exposed places. N. lanceolàta, Lam. dict. 1. p. 710. Rchb. icon. bot. eur. 6. p. 20. t. 536. N. angustifòlia, Vahl, symb. 1. p. 41. N. gravèolens, Vill. dauph. 2. p. 366. N. Arragonénsis, Lam. dict. 1. p. 703. Plant humble. Racemes 2-3 inches long.

Var. γ, *incàna* (Benth. lab. p. 478.) leaves clothed with hoary tomentum, and more wrinkled. ♃. H. N. incàna, Ait. hort. kew. 2. p. 285.

Small-Nepeta Cat-mint. Fl. July, Sept. Clt. 1728. Pl. 1 to 4 feet.

36 N. CYA'NEA (Stev. in mem. soc. nat. cur. mosq. 3. p. 265. Benth. lab. p. 478.) ascending, humble, paniculately branched; branches clothed with hoary tomentum; leaves petiolate, small, ovate or oblong, crenated, wrinkled, clothed with hoary tomentum on both surfaces; racemes numerous, short, secund; bracteas very short; calyx tubular, incurved, clothed with hoary tomentum; corolla scarcely longer than the calyx: tube inclosed. ♃. H. Native of Eastern Caucasus, in gravelly places at the Falls of Chodgal, Steven; at the Falls of the Terek, and in stony places near Nartzana, C. A. Meyer. N. incàna, Bieb. fl. cauc. 2. p. 40. 3. p. 392. Rchb. icon. bot. eur. 4. t. 305. and numerous other authors, but not of Aiton. N. acinifòlia, Spreng. pug. 1. p. 41. syst. 2. p. 727. N. mollíssima, Tausch, in bot. zeit. 1831. 1. p. 219.? Stems trichotomously panicled, as in *N. Ucràn ica*, but the branches are terminated by short unilateral racemules, not corymbs. Corollas small, blue or white.

Blue-flowered Cat-mint. Pl. 1 foot.?

37 N. MEYE'RI (Benth. lab. p. 478.) plant humble, ascending; branches finely pubescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, greenish on both surfaces, pubescent beneath; racemes nearly simple, many-flowered; bracteas much shorter than the calyxes; calyx elongated, incurved, pubescent, with an oblique mouth; corollas scarcely half as long again as the calyx, with an inclosed tube. ♃. H. Native of Caucasus, in dry, stony places on the Talusch mountains near Swant. N. micrántha, Meyer, verz. pflanz. p. 91. but not of Bung. An intermediate plant between *N. Mussìni* and *N. Catària*. Cauline leaves an inch long; upper floral leaves minute. Corollas like those of *N. Catària*.

Meyer's Cat-mint. Pl. ½ to 1 foot.

38 N. AGRE'STIS (Lois. nouv. not. 25.? Benth. lab. p. 479.) erect, almost glabrous; leaves petiolate, ovate-lanceolate, deeply toothed, subcordate at the base, nervosely wrinkled, green on both surfaces; racemes elongated, nearly simple; bracteas scarcely longer than the pedicels; calyx elongated, incurved, villous, with an oblique mouth; corolla scarcely twice as long as the calyx, having the tube shortly exserted, ♃. M. Native of Corsica and Spain, on Mount Urchillo, near Orcelia. Stem a little branched, clammy. Leaves ½ to 1 inch long, rather clammy. Calyx clammy, villous. Corollas white, a little larger than those of *N. Catària*.

Field Cat-mint. Pl. 2 feet.

39 N. AZU'REA (R. Br. in append. to Salt. abyss. Benth. lab. p. 479.) plant erect; leaves sessile, ovate or ovate-oblong, crenated, subcordate at the base, wrinkled, canescent beneath; racemes simple; cymes nearly sessile; whorls dense, the upper ones subspicate; bracteas minute; calyx subovate, incurved, pubescent, with an oblique mouth; corolla twice as long as the calyx. ♃. H. Native of Abyssinia, Salt. Stems finely tomentose. Leaves green above. Corolla blue, with the tube a little exserted, and attenuated at the base.

Azure-flowered Cat-mint. Pl. 1 to 2 feet.

40 N. RACEMÒSA (Lin. spec. 1. p. 711.) plant erect, pubescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, green and wrinkled above, and canescent beneath; racemes loose, nearly simple; cymes almost sessile, or the lower ones are pedunculate, few-flowered; bracteas much shorter than the calyxes; calyx elongated, incurved, clothed with soft wool, with

an oblique mouth; corolla twice as long as the calyx, with a shortly exserted tube. ♃. H. Native of the Levant, Tournefort. Rchb. icon. bot. eur. 6. p. 19. t. 585. This species differs from *N. Mussìni* in the erect stem.

Racemose-flowered Cat-mint. Pl.

41 N. Mussi'ni (Henkel, adumb. pl. p. 15. Benth. lab. p. 480.) diffuse; branches ascending, clothed with hoary pubescence; leaves petiolate, ovate, obtuse, crenated, cordate at the base, green and wrinkled above, and canescent beneath; racemes loose, simple, secund; cymes nearly sessile, few-flowered; bracteas much shorter than the calyxes; calyx elongated, incurved, clothed with soft wool, with an oblique mouth; corolla twice as long as the calyx, with a shortly exserted tube. ♃. H. Native of Caucasus and Iberia, on stony hills. Rchb. icon. bot. eur. 6. p. 20. t. 587. N. longiflòra, Sims, bot. mag. t. 923.? bad, but not of Vent. N. salviæfòlia, Pers. ench. 2. p. 115. N. cyanótricha, Tausch, in bot. zeit. 1831. 1. p. 218.? N. argéntea, N. diffùsa, N. incàna, N. lamiifòlia, N. teucrioìdes, N. violàcea, N. Willdenoviàna, &c. &c. Hort. Corollas pale blue, a little smaller than those of *N. coloràta*. The leaves in the cultivated specimens are very like those of *N. coloràta*, but those of the wild specimens are much smaller, more wrinkled, and more woolly beneath.

Mussin's Cat-mint. Fl. May, Aug. Clt. 1804. Pl. diffuse, 2 feet.

42 N. grandiflòra (Bieb fl. cauc. 2. p. 42.) erect, almost glabrous; leaves on short petioles, ovate, obtuse, crenated, cordate at the base, green above, and pale and canescent beneath; racemes a little branched at the base; cymes pedunculate, many-flowered; bracteas much shorter than the calyxes; calyx elongated, incurved, nearly glabrous, with an oblique mouth; corolla twice as long as the calyx, with a shortly exserted tube. ♃. H. Native throughout Caucasus, in grassy mountain woods; island of Melos. Rchb. icon. bot. eur. 3. p. 68. t. 279. N. melissæfòlia, Pers. ench. 2. p. 115. and many other authors, but not of Lam. N. lamiifòlia, Hoffm. hort. mosc. ex Bieb. N. coloràta, Willd. enum. 2. p. 602. N. argéntea, N. grándis, N. incàna, N. teucrioìdes, N. violàcea, &c. Hortul. Stems many feet high, branched, glabrous or pubescent towards the tops. Corollas blue, 7 lines long, incurved. This with *N. Mussìni* have produced various hybrids in the gardens.

Great-flowered Cat-mint. Fl. June, Aug. Clt. 1806. Pl. 4 to 6 feet.

43 N. betonicæfòlia (Meyer, verz. pflanz. p. 92.) erect, almost simple, villously tomentose; lower leaves petiolate: superior ones sessile, ovate-lanceolate, crenated, cordate at the base, green on both surfaces, and clothed with soft pubescence; racemes short, simple; whorls all dense; bracteas much shorter than the calyxes; calyx elongated, villous, with a scarcely oblique dilated mouth; corolla twice as long as the calyx, with an exserted tube, which is attenuated at the base. ♃. H. Native of Caucasus, on the Talusch mountains. This differs from *N. grandiflòra*, in the superior part of the stem, leaves, calyxes, and corollas being clothed with soft tomentum; and in the racemes being short and spike-formed.

Betony-leaved Cat-mint. Pl. 2 to 4 feet.?

44. N. salviæfòlia (Royle, ex Benth. in Hook. bot. misc. 3. p. 379.) erect, clothed with hoary tomentum; leaves petiolate, ovate, or ovate-lanceolate, obtuse, crenated, wrinkled at the base, clothed with soft tomentum on both surfaces, canescent above and white beneath; racemes loose, almost simple; cymes pedunculate, elongated, many-flowered; bracteas very short; calyx oblong, erect, pubescent, with an oblique mouth; corolla more than twice as long as the calyx. ♃. H. Native of the Valley of Cashmere, Royle; on the mountains of Pyr-Pundjal and Hlamabad, Jacquemont. Leaves hardly an inch long. Corolla slender, 6-7 lines long.

Sage-leaved Cat-mint. Pl.

45 N. melissæfòlia (Lam. dict. 1. p. 711. but not of Bieb.) plant erect, pubescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, green on both surfaces, villous: the superior ones sessile, acute; racemes loose, nearly simple; bracteas shorter than the calyxes; calyx elongated, incurved, pubescent, with an oblique mouth; corolla scarcely twice as long as the calyx. ♃. H. Native of the Grecian Archipelago, on arid hills; as of Candia and Melos, &c. Desf. in ann. mus. 10. p. 301. t. 23. Allied to *N. grandiflòra*. Hairs on stem rather glandular. Leaves scarcely an inch long. Calyx coloured a little. Corollas blue or purple, a little smaller than those of *N. grandiflòra*. Perhaps this species is referrible to Sect. *Macronépeta*. Branches of root fusiform.

Balm-leaved Cat-mint. Fl, July, Aug. Clt. 1752. Pl. 1 to 2 feet.

Sect. V. Macrone'peta (from μακρος, *macros*, long, and Nepeta; in allusion to the long corollas.) Benth. lab. p. 482. Cymes pedunculate, few-flowered. Racemes terminal, very loose, a little branched. Superior floral leaves or all bractea-formed. Calyx elongated, with an oblique mouth and lanceolate or ovate teeth; the superior teeth rather the broadest. Corolla much exserted, with a slender exserted tube, and an inflated throat.

46 N. macra'ntha (Fisch. hort. gorenk. Benth. lab. p. 482.) erect, branched, nearly glabrous; leaves on short petioles, ovate-lanceolate, serrately crenated, truncate, or subcordate at the base, green on both surfaces: racemes elongated, rather loose; bracteas minute; calyx incurved, with lanceolate teeth; corolla 3 times as long as the calyx, having the tube much exserted and attenuated at the base. ♃. H. Native of Siberia, among the Altaian mountains. Dracocéphalum Sibíricum, Lin. spec. 830. Pall. fl: ross. 3. t. 13. Sims. bot. mag. 2185. Moldávica elàta, Mœnch. meth. p. 410. Moldávica Sibírica, Mœnch. ex Steud. nom. bot. p. 285. Dracocéphalum, &c. Gmel. sib. 3. p. 234. t. 51. Root creeping. Leaves 2-3 inches long. Corolla showy, 1 to 1½ inch long, blue.

Long-flowered Cat-mint. Fl. June, Aug. Clt. 1760. Pl. 1 to 2 feet.

47 N. Govania'na (Benth. lab. p. 482.) plant erect, branched, clothed with fine pubescence; leaves on short petioles, ample, oblong-elliptic, crenated, rounded at the base; racemes elongated, loose, a little branched, bracteas minute; calyx a little incurved, with lanceolate teeth; corolla 4 times as long as the calyx, with a very slender much exserted tube. ♃. H. Native of the Himalaya; as in Cashmere, Kidarkonta, and Kanaour, Royle; Sirmore and Kamaon, Wall. Dracocéphalum Govaniànum, Wall. pl. rar. asiat. 2. p. 65. Allied to the preceding. Corollas yellowish.

Gonan's Cat-mint. Pl. 2 to 3 feet.?

48 N. ere'cta (Benth. lab. p. 482.) stem erect, pubescent; leaves petiolate, ovate-lanceolate, obtuse, crenated, wrinkled, cordate at the base, rather canescent beneath; racemes elongated, rather loose; bracteas minute; calyx rather incurved; corolla more than twice as long as the calyx, having the tube much exserted and attenuated at the base. ♃. H. Native of Kanaour, on the mountains, Royle. Dracocéphalum eréctum, Royle, ex Benth. in Hook. bot. misc. 3. p. 380. Allied to *N. macrántha*, but differs in the leaves being wrinkled and canescent beneath, and in the flowers being a little smaller. Perhaps both this and the preceding are varieties of *N. macrántha*. Corolla violaceous.

Erect Cat-mint. Pl. 2 to 3 feet.?

49 N. fi'ssa (Meyer, verz. pflanz. p. 93.) erectish, quite glabrous; leaves petiolate, ovate-roundish, broadly subcordate at the base, deeply crenated, green on both surfaces; racemes very loose, few-flowered, a little branched; calyx incurved, with oblong teeth; corolla 3 times longer than the calyx, with a very slender much exserted tube. ♃. H. Native of Caucasus, in stony places on the Talusch mountains. N. láxa, Benth. lab. p. 483. Stems decumbent at the base. Leaves scarcely an inch long. Corollas blue, 10-12 lines long.

Cleft Cat-mint. Pl. 2 to 3 feet.

50 N. longiflòra (Vent. hort. cels. t. 66.) plant, ascending, rather canescent; leaves on short petioles, superior ones sessile, all ovate, crenated, cordate at the base, wrinkled, pale on both surfaces; racemes elongated, few-flowered; bracteas scarcely equalling the pedicels; calyx a little incurved, with lanceolate teeth; corolla about 3 times as long as the calyx, with a very slender much exserted tube. ♃. H. Native of Persia, between Teheran and Ispahan, and of Caucasus. Stems decumbent at the base. Calyx blue, as well as the corolla. (fig. 77.)

Fig. 77.

Long-flowered Cat-mint. Fl. June, Aug. Clt. 1802. Pl. 1 to 2 feet.

51 N. brevifòlia (Meyer, verz. pflanz. p. 93.) decumbent, pubescent; leaves on long petioles, roundish, crenated, broadly cordate, clothed with hoary pubescence on both surfaces, or only beneath; racemes few-flowered, loose; bracteas shorter than the calyxes; calyx incurved, pubescent, with lanceolate teeth; corolla more than twice as long as the calyx, with a slender much exserted tube. ♃. H. Native of Eastern Caucasus, on the Alps of Tafandagh. N. longiflòra, Fisch. ex Hortul. Habit of *N. longiflòra*, but more humble. Calyx coloured at top. Corollas blue, 8-9 lines long, form of those of *N. longiflòra*.

Short-leaved Cat-mint. Pl. decumbent.

52 N. cri'spa (Willd. spec. 3. p. 50.) erect, ? pubescent; leaves petiolate, ovate, obtuse, deeply crenated, cordate at the base, clothed with hoary pubescence on both surfaces: racemes nearly simple; bracteas scarcely longer than the pedicels; calyx elongated, incurved, villous, with an oblique mouth; corolla twice as long as the calyx, with a shortly exserted slender tube. ♃. H. Native of the Levant. Allied to *N. Catària*, but differs in the smaller stature, in the leaves being hoary on both surfaces, and in the flowers being twice as long; and from *N. Mussìni* in the racemes being scarcely secund, in the calyxes being villous, not woolly, and in the cymes being almost sessile. Corollas blue. Very nearly allied to *N. brevifòlia*, but the racemes are more dense.

Curled-leaved Cat-mint. Fl. July, Aug. Clt. 1800. Pl. 2 feet.?

53 N. septemcrena'ta (Ehrenb. mss. ex Benth. lab. p. 484.) erect, clothed with rather clammy villi; lower leaves petiolate, superior ones sessile, all roundish, obtuse, crenated, cordate at the base, green on both surfaces; racemes elongated, few-flowered; bracteas scarcely longer than the pedicels; calyx a little incurved, with lanceolate teeth; corolla more than twice as long as the calyx, with a very slender much exserted tube. ♃. H. Native of Egypt, Ehrenberg; in the desert of Sinai, Bové. Leaves like those of ground-ivy, but thinner. Corolla 7-8 lines long, blue, slender.

Septemcrenate Cat-mint. Pl. 1 foot.

54 N. teucriifòlia (Willd. enum. p. 602.) ascending; leaves ovate, cordate, obtuse, petiolate, toothed, pubescent; cymes pedunculate, few-flowered; corolla with a very long filiform tube. ♃. H. Native of Armenia. Leaves on long petioles not serrated, but furnished with 4-6 deep teeth on each side, half an inch long. Racemes composed of dense few-flowered cymes. Corollas blue or purple.

Germander-leaved Cat-mint. Fl. July, Aug. Clt. 1816. Pl. ascending, $1\frac{1}{2}$ foot.

55 N. lamiifòlia (Willd. enum. p. 602.) ascending, pubescent; leaves ovate, cordate, obtuse, petiolate, serrated; cymes pedunculate, many-flowered; tube of corolla filiform, curved. ♃. H. Native of Armenia. Habit of *Làmium amplexicaúle*. Flowers verticillately capitate at the tops of the branches.

Dead-nettle-leaved Cat-mint. Fl. July, Aug. Clt. 1806. Pl. $\frac{1}{2}$ foot.

Sect. VI. Glechòma (from γληχων, *glechon*, the Greek name of a kind of thyme.) Benth. lab. p. 484. Glechòma, Lin. and other authors. Chamæclèma, Mœnch, meth. 387. Whorls axillary, few-flowered. Floral leaves conforming to the cauline leaves. Calyx tubular, a little incurved, with an oblique mouth and lanceolate-awned teeth, the superior teeth drawn out. Corolla exserted, having the tube dilated beyond the calyx.—Creeping herbs.

56 N. Glechòma (Benth. lab. p. 485.) procumbent, creeping; leaves petiolate, roundish, crenated, cordate at the base, green on both surfaces; bracteas hardly equalling the pedicels; calyxes villous; corollas 3 times as long as the calyx. ♃. H. Native throughout Europe and the North of Asia, in hedges, ditches, in woods and waste places; plentiful in Britain. Glechòma hederàcea, Lin. spec. p. 802. Hook. fl. lond. vol. 2. with a figure. Woodv. med. bot. t. 28. Fl. dan. t. 789. Mart. fl. rust. t. 61. Smith, engl. bot. t. 853. Calamíntha hederàcea, Scop. carn. no. 730. Chamœclèma hederàcea, Mœnch. meth. p. 393. Chamœclèma vulgàre, Vaill. bot. par. t. 6. f. 4-5-6. Glechòma micrántha, Bonningh. ex Rchb. fl. germ. exc. p. 316. Stems more or less villous. Leaves about an inch long: superior ones smaller, but similar. Corollas blue, 6-7 lines long, varying to white. The leaves of ground ivy were formerly thrown into the vat with ale to clarify it and to give it a flavour. This was called gill-ale, ground ivy being named gill or gell, and creep by ground, in some places. From this use of the plant and the form of its leaves, it has also the names *ale-hoof* and *tun-hoof*, but it has gradually grown into disuse since the introduction of hops. The expressed juice, mixed with a little wine, and applied morning and evening, destroys the white specks upon horses' eyes. Ground ivy has a peculiar strong smell and a bitterish taste, somewhat aromatic. It was formerly in considerable credit for pectoral, detergent, aperient, diuretic, corroborant, and other qualities, and was recommended particularly in pulmonary and nephritic complaints. In obstinate coughs it is still a favourite remedy with the common people. It acts also as an errhine, and is consequently useful in headache. It is usually taken in the form of an infusion or tea; the expressed juice is also used with honey in coughs; a conserve or syrup is also made with it. A plant so common and so much esteemed by the multitude has, of course, many local names besides those mentioned.

Var. β, hirsùta, (Benth. lab. p. 485.) plant hairy in every part. ♃. H. Native of Germany and Hungary, in shady mountain places. Glechòma hirsùta, Waldst. et Kit. pl. rar. hung. 2. p. 124. t. 119. Glechòma mágna, Merat, fl. par. p. 225.

Var. γ, parviflòra (Benth. lab. p. 485.) all parts of the plant smaller and more glabrous than the species. ♃. H. Glechòma heterophýlla, Opiz, ex Rchb. fl. germ. exc. p. 316. Glechòma intermèdia, Schrader.

Ground Ivy, Common. Fl. April, June. Britain. Pl. creeping.

57 N. nivàlis (Benth. lab. p. 737.) root creeping; stems humble; leaves sessile, roundish, wrinkled, green on both surfaces; bracteas scarcely equalling the pedicels; corollas resupinate, with a twisted tube; superior stamens exserted. ♃. H. Native of the north-east of India, on high, gravelly mountains about Yurpo, Jacquemont. Glechòma nivàlis, Jacquem. mss. Habit, inflorescence, and scent, almost the same as that of *N. Glechòma*. Stems branched at the base; floriferous ones erectish, simple, pubescent. Superior cauline leaves and floral ones approximate, ½ to 1 inch long, hardly pubescent, cordately stem-clasping. Corollas pale blue.

Snowy Ground-ivy. Pl. ½ foot.

58 N. Thibe'tica (Benth. lab. p. 737.) stems diffuse, humble, much branched; leaves roundish, on short petioles, truncately cuneated at the base, rather coriaceous, pubescently woolly; bracteas longer than the pedicels; corollas straight, with a dilated throat; genitals shorter than the corolla. ♃. H. Native of the north-eastern parts of India, near Koo-Khio-ghang, and Lari, Jacquemont. Glechòma Thibética, Jacquem. mss. Very nearly allied to *N. nivàlis*, but differs in the corollas being larger, and in the calyxes and bracteas being clothed with soft villi.

Thibet Ground-ivy. Pl. diffuse.

59 N. longibractea'ta (Benth. lab. p. 737.) stems diffuse, humble, much branched; leaves petiolate, ovate-roundish, truncately cuneated at the base, clothed with soft villi; whorls dense, crowded at the tops of the branches; bracteas linear, equalling the corollas; calyx tubular, having the teeth equal in length to the tube; corolla straight, having the throat a little dilated; genitals inclosed. ♃. H. Native of the north-east of India, in stony places, near Kang-rang-ghan, Jacquemont. This is an intermediate plant between Sect. *Glechòma* of *Népeta*, and the genus *Marmorìtis*. Habit more loose than in *N. nivàlis* and *N. Thibética*. Corollas azure blue, pubescent outside.

Long-bractead Ground Ivy. Pl. diffuse.

Sect. VII. Orthone'peta (from *ορθος, orthos*, straight, and Népeta; in reference to the straight calyxes of the species.) Benth. lab. p. 485. Cymes of flowers dense, on short peduncles. Whorls distant, racemose. Racemes simple, but usually paniculately branched. Calyx ovate-tubular, erectish, with nearly equal, subulate, stiff, but not pungent, teeth. Corollas exserted. Tall herbs, with nearly sessile leaves.

60 N. latifòlia (D.C. fl. fr. 3. p. 528,) erect, tall, pubescent; leaves sessile, ovate, obtuse, crenated, rather cordate at the base, green on both surfaces; racemes elongated, many-flowered; bracteas lanceolate-subulate, shorter than the calyxes; calyx pubescent; corolla twice as long as the calyx. ♃. H. Native of Spain, the Eastern Pyrenees, and the Canary Islands. N. grandiflòra, Lapeyr, abr. p. 329. N. cærùlea, Ait. hort. kew. 2. p. 285. Allied to *N. nùda*. Plant pubescent, often clammy. Leaves twice the size and more wrinkled than those of *N. nùda*. Cymes dichotomous. Corollas blue, pubescent outside.

Broad-leaved Cat-mint. Fl. June, Aug. Clt. 1777. Pl. 2 to 4 feet.

61 N. nu'da (Lin. spec. p. 797.) erect tall, nearly glabrous; leaves sessile or scarcely petiolate, oblong, crenated, subcordate at the base, green on both surfaces; racemes panicled, many-flowered; bracteas scarcely longer than the pedicels; calyx pubescent; corolla half again as long as the calyx, or twice as long. ♃. H. Native of the South of Europe and Siberia, in woods; as of Spain, Provence, Piedmont, Naples, Mount Parnassus, South of Germany, Austria, Hungary, Podolia, Tauria, Caucasus, Altaian mountains, &c. Plant glabrous or pubescent. Leaves 1½ to 2 inches long, usually glabrous, but sometimes downy beneath. Corolla white or blueish, 4-6 lines long.

Var. α, grandiflòra (Benth. lab. p. 486.) corollas usually purplish or blueish. ♃. H. N. Pannónica, Jacq. fl. austr. 2. p. 18. t. 129. and other authors, and probably of Lin. spec. p. 797.? N. paniculàta, Crantz. stirp. p. 270. N. violàcea, Vill. fl. dauph. 2. p. 367. and many other authors, and probably of Lin. spec. 797.? Catària nùda, Mœnch, meth. p. 388. Catària violàcea, Mœnch, ex Steud. nom. p. 553.—Bocc. mus. 2. t. 636.

Var. β, parviflòra (Benth. lab. p. 486.) corollas usually white. ♃. H. N. Pannónica, Lin. spec. 797.? N. nùda, Jacq. austr. 1. p. 17. t. 24. N. Ucrànica, Bieb. fl. cauc. 2. p. 41. and of many other authors, but not of Lin. N. álba, Desf. ex Steud. nom. p. 552. Catària paniculàta, Mœnch, meth. ex Steud. nom. p. 553.

Naked Cat-mint. Fl. July, Oct. Clt. 1683. Pl. 2 to 4 feet.

Sect. VIII. Oxyne'peta (from *οξυς, oxys*, sharp, and Népeta; in reference to the pungent teeth of the calyx.) Benth. lab. p. 486. Flowers distinct, or collected at the tops of the branches, corymbosely panicled. Calyx tubular, erectish, with nearly equal, subulate, rather pungent teeth. Teeth of corolla equalling the calycine teeth, or scarcely exceeding them.—Humble herbs. Leaves usually petiolate. The plants contained in this section are very distinct in habit from the species of the other sections.

62 N. parviflòra (Bieb. fl. cauc. 2. p. 41.) plant erectish, panicled, villous; leaves petiolate, ovate or ovate-lanceolate, obtuse, serrately crenated, rounded at the base or cordate, green on both surfaces; cymes loose, trichotomously panicled; bracteas linear, equalling the calyxes; calyx pubescent, having the teeth exceeding the corolla. ♃. H. Native of Tauria and Caucasus; also of Iberia, on dry hills and fields, Bieb.; near Cherson, Besser. Odessa, Lang and Szovits. Lower leaves 1 to 1½ inch long, pubescent or nearly glabrous above, and villous beneath. Flowers 3-5 at the tops of the branches of the panicle. Corollas minute, blue, ? pubescent outside.

Small-flowered Cat-mint. Fl. June, Aug. Clt. 1820. Pl. 1 foot.

63 N. Ucra'nica (Lin. spec. p. 797. ex Benth. lab. p. 487. but not of other authors.) erect, panicled, nearly glabrous; cauline leaves nearly sessile, oblong-lanceolate, obtuse, a little toothed, roundly cuneated at the base, green on both surfaces; cymes loose, trichotomously panicled; bracteas linear; calyx elongated and hispid: teeth of calyx about equal in length to the corolla. ♃. H. Native of Siberia, about Orenburgh, Prescot; Kirghisean Steppe, Ledebour. Teùcrium Sibíricum, Lin. spec. p. 788. N. Sibírica, Bieb. fl. taur. 2. p. 41. in obs. Habit of *N. parviflòra*, but the leaves and stems are glabrous, or rather canescent from very fine tomentum. Corollas blue.

Ukraine Cat-mint. Fl. July, Aug. Clt. 1798. Pl. 1 to 2 feet.

64 N. heliotropifòlia (Lam. dict. 1. p. 711.) erect, panicled, canescent; leaves on very short petioles, oblong, almost quite entire, narrowed at the base, canescent on both surfaces; cymes loose, trichotomously panicled; bracteas linear; calyx elongated, hispid: the teeth about equal in length to the corolla. ♃. H. Native of the Levant, Lam.; Syria, near Aleppo, Russell. Saturèia stricta, Russ. nat. hist. alep. Very like *N. Ucrànica;* but differs in the nearly entire leaves, which are narrowed at the base; and in the whole plant being canescent from pubescence.

Turnsol-leaved Cat-mint. Pl. 1 to 2 feet.

65 N. pu'ngens (Benth. lab. p. 487.) erect, nearly glabrous; leaves petiolate, ovate, acute, narrowed at the base, rather fleshy, somewhat canescent on both surfaces; racemes nearly simple; bracteas foliaceous, rather spiny, longer than the calyxes; calyx elongated, with linear, stiff teeth; corolla scarcely exceeding the calyx. ♃. H. Native of Syria, between Bagdad and Kermancha, Olivier, and Bruguiere. Whorls 30-flowered, and more.

Pungent-bractead Cat-mint. Pl. $\frac{1}{2}$ to 1 foot.

66 N. pusi'lla (Benth. lab. p. 488.) dwarf, erect, finely pubescent; leaves small, ovate, acutely serrated; upper floral leaves and bracteas lanceolate-linear, very acute, pungent; flowers cymosely capitate, subcorymbose; calyx tubular, pubescent; teeth of calyx very acute, exceeding the corolla. ♄. H. Native of Altaia, on Mount Arkaul. Zizíphora púngens, Bunge, in Ledeb. fl. alt. 1. p. 23. fl. ross. alt. ill. t. 124. Stems filiform, almost simple. Leaves 3-4 lines long. Corollas minute, slender.

Least Cat-mint. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

† *Doubtful species.*

67 N. Japónica (Willd. spec. 3. p. 52.) stems decumbent, and naked at the base, tomentose at top; leaves petiolate, ovate, acute, serrated, tomentose on both surfaces, white beneath; panicles of flowers axillary, trifid, fastigiate. ♃. H. Native of Japan, on the tops of the mountains called Kosido. N. incàna, Thunb. jap. p. 244. Leaves $\frac{1}{2}$ an inch long.

Japan Cat-mint. Pl. decumbent.

68 N. macrou'ra (Led. ex Spreng. syst. 2. p. 729.) cymes many-flowered, spreading, panicled, almost leafless; calyx hoary, striated; leaves subcordately triangular, on long petioles, serrated, canescent: upper ones quite entire. ♃. H. Native of Siberia. Corollas whitish. The plant in the gardens under this name appears to be hardly distinct from the common form of *N. Catària*.

Long-tailed Cat-mint. Fl. July, Aug. Clt. 1820. Pl. 2 to 4 feet.

69 N. Nepale'nsis (Spreng. syst. 2. p. 730.) spikes compound, subsecund; calyxes hoary; leaves lanceolate, serrated in the middle, petiolate, a little reflexed, attenuated at both ends, and quite entire. ♃. H. Native of Nipaul.

Nepaul Cat-mint. Pl. ?

†† *Species only known by name.*

1 N. cane'scens (Ræusch. ex Steud. nom. p. 552.) Perhaps nothing but *Hýptis canéscens*.

2 N. Patavi'na (Fisch. ex Steud. l. c.) Perhaps *Melissa Patavìna*.

3 N. pauciflòra (Spreng. ex Steud. l. c.)

4 N. sidæfòlia (Ræusch. ex Steud. l. c.) Perhaps *Hýptis polyántha*.

5 N. suave'olens (Rœm. ex Steud. l. c.) Perhaps *Hýptis suavèolens*.

Cult. Some of the species are rather pretty when in blossom, and are therefore well fitted for flower borders; and others are coarse plants, without beauty. They all grow in common garden soil, but prefer one light and dry. They are increased by dividing at the root in spring or autumn, or by seeds.

LXIX. MARMORI'TIS (probably from *μαρμαρος, marmoros*, white, in allusion to the plant being clothed with white tomentum.) Benth. in Hook. bot. misc. 3. p. 377. lab. p. 480.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx 13-15-nerved, tubularly campanulate, deeply 5-toothed: teeth equal, acute. Corolla shorter than the calyx; upper lip erect, bifid, flat; lateral lobes of lower lip erect: middle lobe spreading, broad, crenulated. Stamens 4, ascending, didynamous: lower ones the shortest; anthers 2-celled: cells parallel. Style shortly bifid at apex; lobes nearly equal, subulate, stigmatiferous at apex. Achenia dry, smooth, naked.—A small Himalayan plant, very nearly allied to *Népeta*, of which, like the other genera of this tribe, it might be considered a section.

1 M. rotundifòlia (Royle, ex Benth. in Hook. bot. misc. 3. p. 377. lab. p. 490.) ♃. H. Native of Himalaya, on mountains in the province of Kanaour, Royle. Stem thick at the base, branched. Branches procumbent, nearly simple, clothed with tomentose villi, densely leafy at top. Leaves like those of *Làmium amplexicaúle*, reniform, all petiolate, wrinkled, crenated, clothed with white loose tomentum on both surfaces, but especially beneath. Whorls few-flowered, secund in the axils of the superior leaves, shorter than the petioles.

Round-leaved Marmoritis. Pl. procumbent.

Cult. For culture and propagation see *Népeta* above.

LXX. DRACOCE'PHALUM (from *δρακων, dracon*, a dragon; and *κεφαλη, kephale*, a head; in reference to the ringent corollas.) Lin. gen. no. 729. Schreb. gen. no. 984. Juss. gen. p. 116. Gærtn. fruct. t. 66. Benth. lab. p. 490. Moldávica et Zórnia, Mœnch, meth. p. 410. Ruyschiàna, Mill. dict. Dracocéphalum and Moldávica, Tourn. inst. t. 83. and t. 85.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 13-15-nerved, straight, rarely incurved, with a straight or equal 5-toothed mouth; upper tooth the broadest, usually large, the 3 upper teeth sometimes joined into an upper lip. Corolla with the tube slender at the base, inclosed, or more often exserted, with a very wide throat, and a bilabiate limb; upper lip erect, rather concave, emarginate: lower lip spreading, trifid, the middle lobe large, and rather bifid. Stamens 4, didynamous: lower ones the shortest, ascending. Anthers approximating by pairs, 2-celled; cells divaricate. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, smooth, naked.—Perennial herbs. Whorls many-flowered, axillary, or approximate into a terminal spike. Bracteas usually foliaceous, aristately toothed. Corollas generally large, blue or purplish, rarely white or yellowish. This genus is readily distinguished by the broad toothed bracteas.

Sect. I. Keimodra'con (from *κειμαι, keimai*, to lie down; and *δρακων, drakon*; in reference to the procumbent stems of the species.) Benth. lab. p. 492. Stems procumbent, much branched. Leaves nearly orbicular, deeply crenated, or somewhat palmately pinnatifid. Flowers capitate, or disposed in oblong spikes. Anthers glabrous.

1 D. palma'tum (Steph. in Willd. spec. 3. p. 151.) stems procumbent, villous; leaves petiolate, ovate-roundish, palmately pinnatifid, green on both surfaces, villous; whorls capitately spicate; bracteas small, cuneated, setaceously toothed; upper tooth of calyx broad, truncate; corolla about 3 times longer than the calyx: superior lip elongated, incurved. ♃. H. Native of Eastern Siberia, near Ishinginsk. Stems suffruticose at the base. Floriferous branches ascending. Whorls 2-6-flowered, approximate. Corollas showy, purplish, nearly glabrous.

Palmate-leaved Dragon's-head. Fl. June, Aug. Clt. 1815. Pl. procumbent.

2 D. botryoïdes (Stev. in mem. soc. nat. cur. mosq. 3. p. 266.) stems procumbent, villous; leaves petiolate, ovate-roundish, palmately pinnatifid, greenish on both surfaces, villous; whorls capitate, or in oblong spikes; bracteas cuneated, cut, villous; upper tooth of calyx ovate, acute; corolla a half again as long as the calyx: the upper lip short and straight. 4. H. Native of Eastern Caucasus. Népeta pinnatífida, Fisch. cat. hort. gorenk. 1812. p. 22. ex Bieb. This differs from *D. palmàtum*, in the larger leaves, and in the whorls being 6-10-flowered, and more densely spicate, &c. Corollas purple, villous outside.

Botrys-like Dragon's-head. Fl. July, Aug. Clt. 1822. Pl. procumbent.

3 D. di'scolor (Bunge, mss. ex Benth. lab. p. 492.) stem procumbent, branched; leaves petiolate, ovate, deeply pinnatifid, green, and nearly glabrous above, and white beneath: margins of segments revolute; whorls oblong-spicate; outer bracteas cuneated, setaceously toothed; upper tooth of calyx broad, truncate, awned; corolla twice as long as the calyx. 4. H. Native of Altaia, among chalky or schistous mountains in saltish rugged places from the river Tscharysch, to the mouth of the rivers Kerlyk and Kan, Ledebour. D. origanoïdes, Led. fl. alt. 2. p. 383. but not of Steph. Stems prostrate, rooting; floriferous branches ascending, pubescent or canescent. Leaves 3-4 lines long. Spikes 1 to 1½ inch long. Corollas blue.

Two-coloured-leaved Dragon's-head. Pl. creeping.

4 D. pinna'tum (Lin. spec. 829.) stems procumbent, branched; leaves petiolate, ovate-roundish, somewhat palmately pinnatifid, green on both surfaces, rather villous; whorls disposed in capitate spikes; outer bracteas cuneated, deeply toothed; upper tooth of calyx ovate, awned; corolla one half longer than the calyx, about equal in length to the bracteas. 4. H. Native of Siberia, in stony, rugged, alpine places of Altaia, at the river Tschuja; on Mount Tarbagutai, in the Kirghisean Steppe; and on the island called Olchon, in Lake Baical, Bunge. Ledeb. fl. ross. alt. ill. t. 445. D. pinnatífidum, Lam. dict. 2. p. 319. —Gmel. sib. 3. p. 234. t. 52. Stems prostrate, much branched. Leaves 3-4 lines long. Spikes dense, 1½ inch long, ovate. Corollas small, blue. Bracteas bluish.

Pinnate-leaved Dragon's-head. Pl. prostrate.

5 D. origanoï'des (Steph. in Willd. spec. 3. p. 151.) stems procumbent; branches villous; leaves petiolate, ovate-roundish, deeply crenated, green on both surfaces, pubescent; whorls disposed in capitate spikes; bracteas large, broad-cuneated, deeply toothed; teeth of calyx all lanceolate, membranous: the upper tooth scarcely broader than the rest; corolla scarcely exceeding the calyx. 4. H. Native of the tops of the Altaian alps, at the river Tschuja, Bunge. Leaves broader and less cut than in *D. pinnàtum*: floral leaves large. Spikes globose, nearly 1½ inch in diameter. Corollas blue, about equal in length to the bracteas.

Marjoram-like Dragon's-head. Fl. July. Clt. 1829. Pl. procumbent.

Sect. II. Calodra'con (from καλος, *kalos*, pretty; and δρακων, *dracon*; in reference to the beauty of the flowers of the species.) Benth. lab. p. 494. Stems thick at the base; floriferous branches erect, few-leaved. Leaves nearly all radical, on long petioles, crenated. Whorls disposed in capitate or oblong spikes. Anthers glabrous.

6 D. imbe'rbe (Bunge, enum. pl. alt. crit. mss. ex Benth. lab. p. 494.) nearly glabrous; stem erect, humble; radical leaves on long petioles: cauline ones few, on short petioles, all reniform, deeply crenated, green on both surfaces; whorls disposed in capitate spikes; bracteas cuneated, cut, glabrous; upper teeth of calyx oblong; corolla twice as long as the calyx. 4. H. Native of Siberia, on the tops of the Altaian mountains, at the river Tschuja, Bunge. Stems tufted. Floriferous branches erect, glabrous, or finely pubescent. Floral leaves, bracteas, and calyxes coloured. Corollas blue, an inch long: lips nearly equal. Radical leaves an inch long.

Beardless Dragon's-head. Pl. ½ foot.

7 D. grandiflòrum (Lin. spec. 830.) stems erect, pilose above; radical leaves on long petioles, oblong, obtuse, crenated, cordate at the base; cauline leaves few, on short petioles, ovate, all green, and nearly glabrous; floral leaves orbicular, pilose: the upper ones bractea-formed; whorls disposed in oblong spikes; bracteas large, orbicularly cuneated, deeply toothed; superior teeth of calyx oblong; corolla ample, 3 times as long as the calyx. 4. H. Native of Siberia, frequent, particularly in the Altaian range. Sims, bot. mag. t. 1009. D. Altaiénse, Laxm. in nov. comm. petrop. 15. p. 556. t. 29. f. 5. Rchb. icon. pl. cult. 1. t. 90. Sweet, fl. gard. n. s. 1. t. 57. Radical leaves 1-2 inches long. Petioles of the cauline leaves short, dilated, subconnate, ciliated. Spikes 2-3 inches long. Bracteas a little coloured. Corollas showy blue, nearly 2 inches long.

Great-flowered Dragon's-head. Fl. July, Aug. Clt. 1759. Pl. ½ to ¾ foot.

8 D. speciòsum (Benth. in Wall. pl. rar. asiat. 2. p. 65.) stems erect, pubescent; radical leaves on long petioles, broadly heart-shaped: cauline ones few, on short petioles, all wrinkled and green on both surfaces, and pubescent beneath; floral leaves orbicular, somewhat bractea-formed; whorls disposed in oblong spikes; bracteas orbicular, deeply crenated, much shorter than the calyxes; upper tooth of calyx ovate; corolla about twice as long as the calyx. 4. H. Native of the Himalaya, and Nipaul. Leaves scarcely an inch long, and 2 inches broad. Whorls 2-4, dense, subsecund. Corolla very villous outside, purple.

Showy Dragon's-head. Pl. 1 to 1½ foot.

9 D. fra'gile (Turcz. mss. ex Benth. lab. p. 495.) stems decumbent, articulated, rather pilose; leaves petiolate, oblong, obtuse, obscurely crenated, rounded at the base, green on both surfaces, pilose or glabrous; floral leaves and bracteas sessile, elliptic, quite entire, mucronate, membranous, pilose; whorls disposed in oblong spikes, equalling the calyxes; upper tooth of calyx large, ovate; corolla about twice as long as the calyx. 4. H. Native of Dauria, at Lake Nossogal, Turczaninow. Branches articulated at the nodi. Bracteas ciliated on the veins and edges. Calyxes purplish. Corolla yellowish? incurved.

Brittle Dragon's-head. Pl. procumbent.

10 D. lamiifòlium (Desf. pl. cor. Tourn. in ann. mus. 10. p. 305. t. 26.) stems simple, tufted; leaves petiolate, ovate, obtuse, crenated, rather pilose, as well as the stems; flowers capitate at the tops of the stems; upper lip of corolla bifid, with toothed segments. 4. F. Native of Candia, in the fissures of rocks. Calyx dilated, with 5 deep, nearly equal, acute segments. Corollas large, rose-coloured, 1½ inch long; lower lip emarginate, crenated, spotted with purple. Perhaps a species of *Népeta*.

Dead-Nettle-leaved Dragon's-head. Pl. ½ to 1 foot.

Sect. III. Cryptodra'con (from κρυπτος, *cryptos*, hidden; and δρακων, *dracon*, a dragon; so called in consequence of the corolla hardly exceeding the calyx.) Benth. lab. p. 495. Stems erect, branched, leafy. Whorls disposed in capitate spikes. Anthers glabrous.

11 D. parviflòrum (Nutt. gen. amer. 2. p. 35.) stems erect,

branched, pubescent; leaves petiolate, lanceolate, deeply crenated or serrated, green on both surfaces, pubescent beneath; whorls disposed in capitate spikes; bracteas ovate-cuneated, aristately toothed; upper tooth of calyx broad-ovate; corolla scarcely exceeding the calyx. ♃. H. Native of North America, at the river Missouri, near Fort Mandan, Nuttall; Red River, Douglas; and at Cumberland House Fort, on the Saskatschawan, Drummond. Leaves like those of *D. Moldávicum*. Spikes globose or oblong, dense. Corollas small, bluish.

Small-flowered Dragon's-head. Fl. July, Aug. Clt. 1825. Pl. ½ to 1 foot.

Sect. IV. Molda'vica (so called from the first species being originally found in Moldavia.) Benth. lab. p. 496. Stems erect or ascending, leafy. Whorls distant, subracemose. Anthers glabrous.

12 D. Molda'vicum (Lin. spec. p. 830.) stem erect, branched; leaves petiolate, lanceolate, deeply crenated; floral leaves narrower, aristately serrated at the base; whorls distinct, disposed in long racemes; bracteas lanceolate, aristately serrated; calyx bilabiate: upper lip semitrifid: lower one bipartite; corolla more than twice as long as the calyx. ⊙. H. Native of Eastern Siberia; and of the East Indies and South America, but probably escaped from gardens. Lam. ill. t. 513. f. 1.—Blackw. herb. t. 551. Moldávica punctàta, Mœnch, meth. p. 410. Herb glabrous, or finely downy. Leaves an inch long. Whorls 6-10-flowered. Corolla blue or white, with a very wide throat.

Moldavian Dragon's-head. Fl. July, Aug. Clt. 1596. Pl. 1 to 1½ foot.

13 D. heterophy'llum (Benth. lab. p. 738.) stem ascending; leaves petiolate, obtuse, crenated: lower ones rounded, rather reniform, cordate at the base: superior ones oblong; floral leaves narrowed at the base, and are, as well as the bracteas, oblong, and aristately toothed; calyx bilabiate: the upper lip broadly semitrifid, and the lower lip bipartite; raceme subspicate. ⊙.? H. Native of the North-east of India, on the mountains of Koo-khio-ghang, Jacquemont. This differs from *D. Moldávicum*, in its humble stature, nearly simple branches, dense spikes, and form of leaves. Upper leaves usually pubescent; cauline leaves never awned. Corollas pubescent, a little larger than those of *D. Moldávicum*.

Various-leaved Dragon's-head. Pl. humble.

14 D. fœ'tidum (Bunge, in Led. fl. alt. 2. p. 386.) stem humble, divaricate, much branched; leaves petiolate, ovate-oblong, obtuse, crenated; floral leaves narrower, aristately serrated at the base; whorls distinct, disposed on short racemes; bracteas oblong, aristately serrated; calyx bilabiate: upper lip broadly semitrifid: lower lip bipartite; corolla more than twice as long as the calyx. ⊙.? H. Native of Siberia, on sandy hills near the river Tschuja, Bunge. Leaves short, on long petioles. Branches and calyxes pubescent.

Fetid Dragon's-head. Pl. ⅓ foot.

15 D. pelta'tum (Lin. spec. p. 831.) stem erect; leaves petiolate, ovate, obtuse, crenated; floral leaves oblong-lanceolate, more entire; whorls distinct, many-flowered, disposed in long racemes; bracteas orbicular, aristately toothed; upper tooth of calyx ovate: lateral ones oblong: lower ones lanceolate; corollas scarcely exceeding the calyxes. ⊙. H. Native of Syria, between Bagdad and Kermancha. Lam. ill. t. 513. f. 2. D. ocymifòlium, Mill. dict. no. 4. Zórnia peltàta, Mœnch, meth. 411. Stem nearly simple, glabrous, or finely tomentose. Leaves 1½ inch long, green, glabrous, gradually becoming narrower to the top, all exceeding the flowers. Whorls 10-12-flowered. Corollas small, blue, nearly glabrous.

Peltate Dragon's-head. Pl. 1 foot.

16 D. Royle'anum (Wall. in pl. rar. asiat. 1. p. 65. Benth. lab. p. 497.) stem erect, strict; leaves petiolate, ovate, crenated; floral leaves narrower: superior ones aristately serrated at the base; whorls distinct, disposed in interrupted spikes; bracteas oblong, aristately toothed; calyx scarcely bilabiate: superior teeth the broadest; corolla hardly exceeding the calyx. ⊙.? H. Native of the East Indies, in the province of Kunawur, Royle. Stem glabrous at the base, and pubescent at top. Leaves distant, green, nearly glabrous: floral ones rather longer than the calyxes. Corolla very slender, yellowish.

Royle's Dragon's-head. Pl. ½ to 1 foot.

17 D. Ibe'ricum (Bieb. fl. cauc. 2. p. 64.) stem decumbent? leaves petiolate, ovate-oblong, narrowed a long way at the base, a little toothed; floral leaves lanceolate, nearly entire, all glabrous; whorls distinct, disposed in long racemes, about 6-flowered; bracteas linear-cuneated, aristately awned at top; calyx smoothish, having the upper tooth ovate, and the lower ones lanceolate; corollas hardly exceeding the calyxes. ⊙.? H. Native of Iberia, Steven; of Caucasus, on the Talusch mountains, near Swant, C. A. Meyer. Allied to *D. Royleànum* and *D. canéscens*; and differs from the first in the narrower, more entire, glabrous leaves, and in the calyxes being twice the size; and from the second in the smoothness, and minute corollas. Corollas blue, slender.

Iberian Dragon's-head. Fl. July, Aug. Clt. 1820. Pl. decumbent.?

18 D. cane'scens (Lin. spec. p. 831.) stem erectish, branched, clothed with fine hoary tomentum; leaves petiolate: lower ones ovate or oblong, rather deeply crenated: floral ones lanceolate, almost quite entire, all canescent from fine tomentum; whorls distinct, disposed in long racemes, usually 6-flowered; bracteas ovate-cuneated, aristately toothed; calyx hoary, having the upper tooth ovate, and the lower ones lanceolate; corolla twice as long as the calyx. ⊙. H. Native of Syria, near Aleppo, Russell. Sweet. fl. gard. 1. t. 38. Zórnia canéscens, Mœnch, meth. p. 411.—Mill. fig. t. 129.—Commel. rar. t. 28.—Volk. norib. t. 353. Bracteas shorter than the calyxes. Corollas blue.

Canescent Dragon's-head. Fl. July, Aug. Clt. 1711. Pl. 1 to 1½ foot.

19 D. peregri'num (Lin. spec. p. 829.) decumbent; branches ascending, nearly glabrous; leaves quite glabrous, on short petioles, lanceolate, for the most part few-toothed, the teeth awned; floral leaves, and sometimes all, are quite entire; whorls distinct, few-flowered, secund, disposed in short racemes; bracteas oblong or lanceolate, awned, a little toothed; calyx bilabiate: upper lip broadly tridentate: lower lip narrowly bifid; corolla ample, about 3 times as long as the calyx. ♃. H. Native throughout Siberia, Pallas. Sims, bot. mag. t. 1084. Lher. stirp. nov. 2. t. 28. Ruyschiàna verticillàta, Mill. dict. no. 3.?—Mor. hist. 364. no. 9. sect. 11. t. 5. f. 9. Stems loosely branched at the base, procumbent. Leaves an inch long. Corollas 15-18 lines long, blue: upper lip broad, emarginate.

Foreign Dragon's-head. Fl. July, Aug. Clt. 1759. Pl. ascending, a foot long.

20 D. thymiflòrum (Lin. spec. p. 498.) stem erect; leaves on short petioles, ovate-lanceolate or lanceolate, crenated; floral leaves narrower, more entire; whorls distinct, many-flowered, disposed in long racemes; bracteas ovate-oblong, almost quite entire; upper tooth of calyx broad-ovate: lower ones lanceolate; corolla scarcely exceeding the calyx. ⊙. H. Native of the East of Europe; about Upsal, Wahl; about Moscow, Klustine; South of Podolia, Besser. Gærtn. fruct. 1. p. 319. t. 66. Zórnia parviflòra, Mœnch, meth. p. 411.—Gmel. sib. 3. p. 233. t. 50.

Stems a little branched, pubescent. Floral leaves twice the size of the cauline leaves, green, scarcely pubescent. Whorls usually 10-12-flowered. Calyx a little coloured. Corollas very slender, purplish.

Thyme-flowered Dragon's-head. Fl. June, Sept. Clt. 1752. Pl. 1 to 1½ foot.

21 D. nu'tans (Lin. spec. p. 831.) stem erect; leaves petiolate, ovate, crenated; floral leaves oblong-lanceolate, more entire; whorls distinct, many-flowered, disposed in long racemes; bracteas ovate or oblong, almost quite entire; upper tooth of calyx broad-ovate: lower ones lanceolate; corolla more than twice as long as the calyx. ⊙. H. Native throughout Siberia. Ker. bot. reg. t. 841. Zórnia nùtans, Mœnch, meth. p. 411.—Gmel. sib. 3. p. 231. t. 49. Habit, leaves, and calyxes of *D. thymiflòrum*, but differs in the longer corollas, &c.

Nutant-racemed Dragon's-head. Fl. July, Aug. Clt. 1731. Pl. 1 foot.

22 D. fruticulòsum (Steph. in Willd. spec. 3. p. 152.) suffruticose, glabrous; leaves nearly sessile, elliptic, mucronate, quite entire, or the superior and floral ones are aristately toothed; whorls few-flowered, the superior ones subspicate; bracteas ovate, aristately toothed; teeth of calyx all lanceolate: the upper one the broadest; corolla scarcely twice as long as the calyx. ♄. F. Native of Siberia, Steven; about Kiachta, Sievers. Stem branched. Leaves 4 lines long. Calyx coloured. Corollas like those of *D. integrifòlium*.

Shrubby Dragon's-head. Shrub dwarf.

23 D. integrifòlium (Bunge, in Ledeb. fl. alt. 2. p. 387.) suffruticose, glabrous; branches erectish; leaves nearly sessile, lanceolate, obtuse, quite entire; floral leaves bractea-formed; whorls racemose, secund; bracteas ovate, aristately toothed; upper tooth of calyx broad-ovate: lower ones lanceolate; corolla about twice as long as the calyx. ♄. F. Native of the Altaia, on the Kurtschum mountains, near Baty, and on rocks near the ruins of Ablakit; also of Dahuria. Habit of *D. nùtans*, but the leaves are very different. Calyx purple. Corollas purplish blue.

Entire-leaved Dragon's-head. Shrub 1 foot.

Sect. V. Ruyschia'na (so named in honour of Dr. Ruysch, who was professor of anatomy and botany at Amsterdam.) Benth. lab. p. 499. Stems erect, leafy. Whorls somewhat interruptedly spicate. Anthers villous.

24 D. Argune'nse (Fisch, ex Link, enum. 2. p. 118.) glabrous; stems erect; leaves linear-lanceolate, quite entire, glabrous; whorls subspicate; bracteas cuneate-elliptic, acute; calyx quite glabrous, bilabiate: upper lip semitrifid: lower one narrowly bipartite; corolla ample, about 3 times as long as the calyx. 4. H. Native of Dahuria. Rchb. icon. pl. cult. 1. t. 1. Lodd. bot. cab. 797. Nearly allied to the following; but differs in the glabrous calyxes and larger flowers. Leaves nearly sessile, 2-3 inches long, with fascicles of small ones in the axils. Corollas pubescent, blue, showy.

Argun Dragon's-head. Fl. July, Aug. Clt. 1822. Pl. 1 to 1½ foot.

25 D. Ruyschia'num (Lin. spec. p. 830.) stems erect, finely pubescent: leaves linear-lanceolate, quite entire, glabrous; whorls subspicate; bracteas ovate-lanceolate, quite entire; calyx pubescent; upper tooth of calyx ovate: lower ones lanceolate; corollas more than twice as long as the calyxes. 4. H. Native of Europe and Asiatic Russia, on the mountains; as of Norway, Provence, Dauphiny, Switzerland, Galicia, Caucasus, Altaia, &c. Oed. fl. dan. t. 121. D. hyssopifòlium, Mart. ex Steud. nom. p. 285. Ruyschiàna spicàta, Mill. dict. no. 1. Zórnia linearifòlia, Mœnch, ex Steud. nom. p. 285.—Zanon. nov. t. 146. Ruyschiàna glàbra, Amm. ruth. p. 50. Branched from the base. Leaves 1 to 1½ inch long, nearly sessile, with revolute edges, having young ones in the axils. Whorls approximate, generally 6-flowered. Corolla purplish, an inch long.

Ruysch's Dragon's-head. Fl. June, July. Clt. 1699. Pl. 2 feet.

26 D. Austri'acum (Lin. spec. p. 829.) stems erect, rather pilose; leaves 3-5-cleft, or the rameal ones are almost entire; segments of leaves linear, with revolute edges; whorls somewhat interruptedly spicate; bracteas 3-7-cleft, awned; upper tooth of calyx ovate: lower ones lanceolate; corolla about 3 times as long as the calyx. 4. H. Native of Europe and Asiatic Russia, on the mountains; as of the Pyrenees, Dauphiny, Switzerland, South of Germany, Galicia, Transylvania, Podolia, Caucasus, &c. Jacq. icon. rar. 1. t. 112. Zórnia partìta, Mœnch, ex Steud. nom. p. 285. Ruyschiàna laciniàta, Mill. dict. no. 2. Ruyschiàna hirsùta, Amm. ruth. p. 50. Habit of *D. Ruyschiàna*, but differs in the leaves being divided. Stem hairy, nearly pinnatifid. Whorls 6-10-flowered, all usually distinct. Floral leaves and bracteas hispid. Corolla showy blue, more than 1½ inch long.

Austrian Dragon's-head. Fl. June, July. Clt. 1597. Pl. 1½ foot.

† *Doubtful species.*

27 D. odorati'ssimum (Poir. suppl. 2. p. 521.) stems slender; branches divaricate; leaves petiolate, small, ovate-oblong, quite entire, narrowed at the base, glabrous; bracteas narrow-lanceolate, ciliated, longer than the flowers; flowers sessile, approximating into a short imbricate spike; calyx striated, ciliated, with 5 very short straight teeth. 4. H. Native of the Crimea. Branches reddish-grey, with pubescent angles. Leaves 4-5 lines long. Corolla white or purplish, hairy outside; tube slender, scarcely longer than the calyx; throat wide.

Very sweet-scented Dragon's-head. Pl. ¼ to ½ foot.

28 D. Cochinchine'nse (Lour. coch. p. 371.) stem erect, villous; leaves ovate-lanceolate, quite entire, villous, few; bracteas roundish, acute, many-flowered; flowers disposed in a terminal spike. ⊙. ? H. Native of Cochinchina. Flowers violaceous; upper lip of corolla concave. Filaments pilose.

Cochinchina Dragon's-head. Pl. 1 foot.

Cult. The greater part of the species of *Dracocéphalum*, being showy when in blossom, are favourites with all lovers of flowers. They are all hardy, and will grow in any common garden soil; they are, therefore, well adapted for decorating flower borders and rockwork. The perennial species are readily increased by divisions of the root and top in spring. The seeds of annual kinds only require to be sown in the open ground in spring. The two shrubby species, *D. fruticulòsum* and *D. integrifòlium*, and all the species belonging to sect. I. *Keimodracon*, will require protection in severe weather in winter; these are all readily propagated by cuttings, under a hand-glass.

LXXI. CEDRONE'LLA (probably a dim. of κεδρος, *cedros*, the cedar; from the sweet odour of *C. triphýlla*.) Mœnch, meth. p. 411. Benth. lab. p. 501.—Dracocéphalum species, Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular or campanulate, about 15-nerved, with an equal or oblique 5-toothed mouth. Corolla with an exserted tube, naked inside, a dilated throat, and a bilabiate limb; upper lip straight, flattish, emarginately bifid; lower lip trifid: middle lobe large. Stamens 4, ascending, didynamous: lower ones the shortest. Anthers 2-

celled; cells parallel. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, smooth.—Herbs. Whorls approximate into terminal spikes or racemes. Floral leaves bractea-formed. Bracteas small, setaceous.

1 C. corda'ta (Benth. lab. p. 502.) herbaceous, stoloniferous; leaves cordate-ovate, crenated; whorls few-flowered, secund, approximating into short spikes or racemes. 4. H. Native of North America, at the river Ohio, below Pittsburgh, Nuttall. Dracocéphalum cordàtum, Nutt. gen. amer. 2. p. 35. Stems creeping, and rooting at the base. Floriferous branches erect, simple, villous. Leaves 1 to 1½ inch long, form of those of *Làmium*, quite entire, obtuse, pubescent, or nearly glabrous. Cymes on short peduncles, 1-3-flowered. Corolla showy, pale blue, 1½ inch long.

Cordate-leaved Cedronella. Fl. July, Aug. Clt. 1824. Pl. ½ foot.

2 C. Mexica'na (Benth. lab. p. 502.) tall; leaves ovate-lanceolate, cordate at the base, toothed; whorls many-flowered, approximating into a terete, interrupted spike or raceme. 4. H. Native of Mexico, among corn and in meadows, in the woody region near Valladolid, Pazcuaro, Chalco, and Tlalpuxahua. Dracocéphalum Mexicànum, H. B. et Kunth, nov. gen. amer. 2. p. 502.—Herb glabrous, or finely pubescent. Leaves on short petioles, 1½ to 2 inches long, acuminated, acute, glandular beneath. Whorls loose, 20-40-flowered. Corolla purplish, 3 times as long as the calyx. Genitals exserted.

Mexican Cedronella. Pl. 2 to 3 feet.

3 C. triphy'lla (Mœnch, meth. 411.) shrubby, tall; leaves ternate: leaflets oblong-lanceolate; whorls loose, collected into terete oblong spikes. ♄. F. Native of America, and probably of the Canary Islands. Dracocéphalum Canariénse, Lin. spec. p. 829. C. Canariénsis, &c., Comm. hort. amst. 2. p. 81. t. 41.—Volk. norib. t. 145. Lateral leaflets sessile, terminal one petiolate, larger, all nearly glabrous, or pubescent beneath. Whorls 10-12-flowered. Corolla white or pale purple, scarcely twice as long as the calyx. The plant was first brought to Europe under the name of *Permenta de Tana*. It is now known under the name of Balm of Gilead, which it has obtained from its rich odour on being gently rubbed.

Three-leaved Cedronella, or Balm of Gilead. Fl. July, Sept. Clt. 1697. Shrub 3 to 4 feet.

Cult. For culture and propagation see *Dracocéphalum*, p. 814, for the herbaceous species, and *Prostanthèra*, p. 800, for the shrubby kind.

Tribe IX.

STACHY'DEÆ (this tribe contains genera agreeing with *Stàchys*, in the characters given below.) Benth. lab. p. 503. Calyx irregularly veined or 5-10-nerved, equal, oblique, rarely sub-bilabiate, 3-10-toothed. Tube of corolla inclosed or exserted, often annulate inside; limb bilabiate: upper lip galeate or flat, entire or emarginate: lower lip variously trifid. Stamens 4, ascending, didynamous, all fertile, or the anthers of the lower ones are empty or dimidiate; superior ones short.

LXXII. MELI'TTIS (from *μελιττα, melitta*, a bee; a name used by Pliny as synonymous with Melíssa.) Lin. gen. no. 731. Schreb. gen. 985. Juss. gen. p. 116. Benth. lab. p. 503.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, membranaceous, irregularly veined, subbilabiate; upper lip broad, roundish, obscurely 2-lobed or shortly 2-3-toothed; lower lip bifid, with rounded lobes. Corolla, with an ample exserted tube, which is not annulate inside, and a bilabiate limb; superior lip orbicular, entire, rather concave, spreading: lower lip 3-lobed, spreading. Stamens 4, ascending, didynamous, lower ones the longest; filaments without any appendages; anthers approximating by pairs, 2-celled: cells distinct, diverging. Style shortly bifid at apex; lobes ovate, stigmatiferous at apex. Achenia dry, smooth, or finely reticulated.

1 M. melissophy'llum (Lin. spec. p. 832.) 4. H. Native of Europe, in shady places; as of France, Germany, Portugal, Spain, Sicily, Italy, Greece: in England; as in Devonshire, about Totness, Barnstable, &c.; Hampshire, in the New Forest; Pembrokeshire, about Haverford West, in woods and other shady places. Stems erect, simple, more or less hairy. Leaves on short petioles, 1½ to 2 inches long, ovate, crenated, cordate at the base, or the upper ones are rounded, wrinkled, villous, green on both surfaces; floral leaves narrower; all exceeding the flowers. Whorls about 6-flowered, axillary. Corolla 1½ inch long, red, or red and white. Pedicels rather shorter than the calyxes. Much honey is secreted by a gland that encircles the base of the germ; hence it is a favourite plant with bees.

Var. α, grandiflòra; plant pale green; corolla cream-coloured, with the middle of the lower lip violaceous. 4. H. M. grandiflòra, Smith, fl. brit. 2. p. 644. engl. bot. t. 636. Hook. fl. lond. vol. 2. icone. Rchb. icon. bot. eur. 3. p. 41. t. 242. M. melissophýllum, Curt. lond. no. 64. Mill. fig. t. 32.—Riv. mon. irr. t. 21. f. 1. M. álbida, Guss. prod. fl. sic. 2. p. 140. M. sylvéstris, Lam. fl. fr. 2. p. 401.

Var. β, melissophýllum; stems purplish; leaves deep green; flowers altogether purple, and sometimes white. 4. H. M. melissophýllum, Jacq. fl. austr. 1. t. 26. Smith, engl. bot. t. 577. Rchb. icon. bot. eur. 3. p. 41. t. 241.

Balm-leaved Bastard Balm. Fl. May, June. England. Pl. 1 to 1½ foot.

Cult. Both varieties are very showy when in blossom, and are, therefore, well fitted for decorating flower borders, woods, and shrubberies. They are readily increased by dividing the root in spring or autumn.

LXXIII. PHYSOSTE'GIA (from *φυσα, physa*, a bladder; and *στεγω, stego*, to cover; in allusion to the inflated calyx.) Benth. in bot. reg. vol. 15. lab. p. 504. Dracocéphalum species, Lin. and other authors.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate at the time of florescence, but afterwards becoming inflated and campanulate, with about 10 obscure veins, almost equally 5-toothed, or truncate and scarcely toothed at top. Corolla with a long exserted tube, which is exannulate inside, an inflated throat, and a bilabiate limb; upper lip erectish, rather concave, entire, or emarginate; lower lip spreading, trifid, with roundish lobes, the middle lobe large and emarginate. Stamens 4, ascending under the upper lip, somewhat didynamous; lower ones eminent; anthers approximate, 2-celled: cells parallel, distinct, naked. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, smooth. Habit peculiar.

1 P. Virginia'na (Benth. lab. p. 504.) calyx acutely 5-toothed. 4. H. Native of North America, from Canada to Texas, in rather humid places: and on the North-west coast at the Columbia river. Dracocéphalum Virginiànum, Lin. spec. 828. Curt. bot. mag. t. 467. D. lancifòlium, Mœnch. meth. p. 410. D. variegàtum, Vent. cels. t. 44. D. denticulàtum, Ait. hort. kew. 2. p. 317. Curt. bot. mag. 214. D. speciòsum, Sweet, fl. gard. 1. t. 93. D. obovàtum, Elliott, bot. car. 2. p. 86. D. intermèdium, Nutt, in amer. phil. trans. n. s. 5. p. 187. Pràsium purpùreum, Walt. fl. car. p. 166. Pràsium coccíneum, Walt. fl. car.

p. 116. Herb usually glabrous, rarely pubescent in the upper part. Stems erect. Leaves sessile, usually lanceolate, sometimes oblong-ovate or obovate, usually acute, irregularly and acutely serrated, narrowed at base, green on both surfaces; upper floral leaves bractea-formed, shorter than the calyxes. Racemes terminal, simple, or paniculately branched. Flowers nearly sessile, approximate, or distant. Corolla flesh coloured or purple, showy, 10-11 lines long, and sometimes more than an inch.

Virginian Physostegia. Fl. July, Sept. Clt. 1683. Pl. 1½ to 3 feet.

2 P. imbrica'ta (Hook. bot. mag. 3386.) tall; leaves elliptic-lanceolate, coarsely serrated; spikes panicled, tetragonal; flowers erect, densely imbricate; upper lip of corolla concave: tube scarcely inflated. ♃. H. Native of Texas. Corollas reddish purple above, pale and almost white below.

Imbricate-flowered Physostegia. Fl. July, Sept. Clt. 1834. Pl. 2 to 3 feet.

3 P. trunca'ta (Benth. lab. p. 505.) calyx truncate, obscurely 3-5-lobed; lobes very broad, denticulated. ♃. H. Native of Mexico, in the province of Texas. Stems erect, nearly simple, pubescent. Leaves and inflorescence similar to those of *P. Virginiàna*. Floral leaves broad-ovate at the base, equalling the calyxes. Corollas red.

Truncate-calyxed Physostegia. Fl. July, Sept. Pl. 1½ foot.

Cult. Elegant plants of easy culture, well fitted for decorating flower borders. Any common garden soil suits them, and they are readily propagated by dividing at the root.

LXXIV. MACBRI'DEA (named in memory of James Macbride, M.D. of South Carolina.) Elliott, bot. car. 2. p. 86. Benth. lab. p. 505.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, membranaceous, irregularly veined, 3-lobed; superior lobe oblong, lower ones roundish. Corolla with a long exserted tube, which is exannulate inside, an inflated throat, and a bilabiate limb; upper lip erect, entire, rather concave; lower lip shorter and spreading, with roundish lobes, middle lobe the broadest. Stamens 4, didynamous, ascending under the upper lip, lower ones the longest; anthers approximate by pairs, 2-celled: cells divaricate. Style shortly bifid at apex. A genus closely allied to *Physostègia*.

1 M. pulche'lla (Elliott, l. c.) ♃. H. Native of Carolina, in bogs, Elliott; near Augusta, Wray. Thýmbra Caroliniàna, Walt. fl. car. p. 162. Melíttis Caroliniàna, Spreng. syst. 2. p. 700. Pràsium incarnàtum, Walt. fl. car. p. 165. Stems erect, glabrous. Leaves petiolate, oblong-elliptic, bluntish, obscurely serrated or sinuated, rounded or cuneated at the base, thin, quite glabrous, or furnished with a few scattered hairs above. Whorls 1 or 2 at the top of the stem, about 6-flowered. Corolla 1½ inch long, glabrous, pale red. ? Filaments villous.

Neat Macbridea. Pl. 1 foot.

Cult. For culture and propagation, see *Physostègia* above.

LXXV. SYNA'NDRA (from *συν, syn*, together; and *ανηρ ανδρος, aner andros*, a male; in reference to the anthers approximating by pairs.) Nutt. gen. amer. 2. p. 29. Benth. lab. p. 506. Làmium species, Michx.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx inflately campanulate, membranaceous, irregularly veined, with 4 nearly equal teeth. Corolla with a much exserted tube, which is dilated above as well as the throat, and exannulate inside; limb bilabiate: upper lip erect, rather concave, entire: lower lip spreading, 3-lobed: lobes ovate, middle one broader and emarginate. Stamens 4, ascending, didynamous: lower pair the longest; filaments exappendiculate, hairy; anthers approximating by pairs, glabrous, 2-celled: cells distinct, divaricate; upper cells of the superior anthers connate, obtuse, empty; the rest all acute and fertile. Upper lobe of style very short; lower one longer, stigmatiferous almost from the base. Achenia dry, large, somewhat inflatedly compressed, smooth. The want of the upper lobe of the calyx is peculiar to this genus.

1 S. grandiflòra (Nutt, l. c.) ♃. ? H. Native of North America; in Kentucky, Torrey; Tenessee, in woods, Michx; in shady places, near Cincinnati, on the Ohio, Nutt. Habit of *Làmium*. Stem nearly simple, beset with long hairs. Leaves few; lower ones on long petioles, broad-ovate, subacuminated, crenated, cordate at the base, thin, green on both surfaces, furnished with a few hairs; superior leaves ovate-lanceolate, quite entire; uppermost ones hardly longer than the calyxes. Whorls few, distant, few-flowered. Corolla showy, cream-coloured, 1½ inch long.

Great-flowered Synandra. Pl. 1 foot.

Cult. For culture and propagation, see *Làmium*, below.

LXXVI. LA'MIUM (from λαιμος, *laimos*, the throat; so called from the ringent flowers.) Lin. gen. no. 716. Schreb. gen. 971. Tourn. inst. t. 85. Juss. gen. p. 113. Benth. lab. p. 507. Orvàla, Lin. gen. 715. Pàpia, Michell, gen. p. 17. Galeóbdolon, Huds. and other authors. Pollíchia, Roth, fl. germ. Erianthèra, Benth. in Hook. bot. misc. 3. p. 380. but not of Nees.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate, about 5-nerved, with an equal or often oblique mouth; teeth 5, nearly equal, or the upper ones are longer, subulate at apex. Corolla with an inclosed or exserted tube, naked or with a hairy ring inside; limb bilabiate; upper lip ovate or oblong, somewhat arched or galeate, for the most part narrowed at the base; throat dilated; lateral lobes truncate at the margins of the throat, rarely oblong, furnished with a tooth-formed appendage or mutic; middle lobe broad, emarginate, contracted at the base, substipitate. Stamens 4, didynamous, lower pair the longest; anthers approximate by pairs, 2-celled: cells at length divaricate, oblong, hairy outside or naked. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, triquetrous, with acute angles, truncate at apex, smooth or wrinkled from minute tubercles.—Herbs decumbent at the base. Lower leaves on long petioles, small; middle cauline leaves large, usually cordate at the base, wrinkled, for the most part doubly or deeply toothed; floral leaves almost similar to the rest: upper ones smaller and more sessile; all exceeding the calyxes. Whorls dense, axillary; lower ones or all remote, but the superior ones are usually approximate. Bracteas few, shorter than the calyxes, subulate, rarely lanceolate. Corollas red, purplish, white, or yellow.

Sect. I. Orva'la (Orvala is a name applied to *sálvia sclàrea* by old botanists, which is probably derived from Orval in France.) Benth. lab. p. 508. Orvàla, Lin. gen. no. 715. Tube of corolla straight, transversely annulate inside; throat very wide. Galea ovate. Anthers glabrous.

1 L. Orva'la (Lin. spec. p. 808.) stems erect; leaves large, broad-ovate, truncate or cordate at the base, rugose, rather villous; tube of corolla straight, exserted, furnished with a ring of hairs inside: throat very wide: galea ovate, entire: lateral lobes very short, mutic. ♃. H. Native of Italy, Pannonia, and Istria, Willd.; Piedmont, Allioni; France, near Nannete, Ronamy. Curt. bot. mag. t. 172. Mill. fig. t. 158. L. Pannónicum, Scop. fl. carn. t. 27. Orvàla lamioìdes, D.C. fl. fr. 3.

p. 539. L. melissæfòlium, Mill. dict. no. 5.—Mor. hist. sect. 11. t. 11. f. 7.—Till. pis. 92. t. 34. f. 1.—Clus. hist. 2. p. 35. t. 36.—Park. par. p. 387. f. 7. Stem red, hispid, or nearly glabrous. Whorls about 10-flowered. Calyx coloured, nearly glabrous. Corollas red or purple, nearly $1\frac{1}{2}$ inch long. Galea downy outside, with ciliated edges.

Var. β, leaves deeply toothed. ♃. H. Orvàla Gargánica. Lin. spec. p. 807. Pàpia Gargánica, Micheli, gen. 20. t. 17.

Orvala, or Balm-leaved Archangel. Fl. May, July. Clt. 1596. Pl. 1 to 3 feet.

Sect. II. Lamiópsis (so named by Dumort, who considers it a distinct genus, from its resemblance to the true species of Làmium.) Benth. lab. p. 509. Lamiópsis, Dumort, florul. belg. p. 45. Tube of corolla straight, naked inside, or furnished with a transverse ring of hairs; throat very wide. Anthers hairy, outside.

2 L. multi'fidum (Lin. spec. p. 809.) superior leaves deeply lobed, glabrous on both surfaces; tube of corolla straight, exserted, annulate inside?: galea oblong: throat very wide: lateral lobes very short, mutic. ♃. H. Native of the Levant. L. orientale foliis eleganter laciniatis, Tourn. cor. 11. Commel. rar. t. 26. Stems erect, pubescent. Lower leaves oval, very blunt, quite entire at top; middle leaves crenated, cuneated at the base; superior ones $1\frac{1}{2}$ inch long, obtuse, deeply and bluntly lobed; floral leaves more acute, narrower: all cut and rather shorter than the flowers. Whorls many-flowered, distant. Calyxes villous. Corolla an inch long; galea narrowed at the base, woolly outside. Anthers villous on the back.

Multifid-leaved Archangel. Fl. April, May. Clt. 1782. Pl. $\frac{1}{2}$ to 1 foot.

3 L. rhomboi'deum (Benth. lab. p. 509.) humble, simple; leaves rhomboid, wrinkled, clothed with velvety wool on both surfaces, as well as the calyxes; corolla ample, 3 times as long as the calyx: tube straight, naked inside: throat wide: galea broad: lateral lobes ovate, entire. ♃.? H. Native of the East Indies, in the province of Kamaon, Royle. Erianthèra rhomboídea, Benth. in Hook. bot. misc. 3. p. 880. Plant tomentosely villous. Leaves small; lower floral ones nearly entire; upper ones deeply crenated; all obtuse. Whorls about 2-flowered. Corollas nearly $1\frac{1}{2}$ inch long, downy outside. Very nearly allied to *L. Gargánicum*.

Rhomboid-leaved Archangel. Pl. $\frac{1}{2}$ foot.

4 L. Garga'nicum (Lin. spec. p. 808.) leaves cordate, wrinkled, clothed with soft villi on both surfaces; calyx villous; corolla 4 times as long as the calyx, with an erect tube, which is naked inside, a wide throat, a broad helmet, and the lateral lobes angular or furnished with a very short tooth. ♃. H. Native of Piedmont, on Mount Gargano; Greece, on Mount Hametto; Mountains of Laconia and Candia. Smith, exot. bot. 1. t. 48. L. Michelìanum, Tausch, in bot. zeit. 1831. 1. p. 215.—Till. pis. 93. t. 34. f. 2. act. par. 1717. p. 272. t. 9. Plant canescent or hoary. Leaves form of those of *L. vulgàtum*. Floral leaves for the most part shorter than the flowers. Whorls 10-20-flowered. Corolla 15 lines long, villous outside, red.

Gargano Archangel. Fl. June, Aug. Clt. 1729. Pl. ascending, 1 foot.

5 L. longiflòrum (Tenore, fl. nap. prod. p. 34. syll. 285.) stems nearly glabrous; leaves cordate, wrinkled a little, glabrous, or somewhat villous; whorls many-flowered; calyxes glabrous; corolla about 4 times longer than the calyx: tube straight, naked inside: throat very wide: galea broad: lateral lobes angular, or furnished with a short tooth. ♃. H. Native of the South of Europe, on the mountains; as of the Pyrenees, Provence on Mount Ventoso, Piedmont, Apennines, Naples, Sicily, Greece. L. lævigàtum, D. C. fl. fr. 3. p. 541. and many other authors, but not of Lin. L. Pedemontànum, Rchb. fl. germ. exc. p. 322.? Hardly to be distinguished from *L. Gargánicum*, unless in being glabrous, or nearly so.

Long-flowered Archangel. Pl. ascending.

6 L. glechomoi'des (Smith, in Rees' cycl. vol. 20. Benth. lab. p. 738.) plant nearly glabrous; leaves small, on long petioles, cordate, crenated, or the superior ones are a little cut; whorls 6-10-flowered; calyx nearly glabrous, with short acute teeth; corolla about 4 times longer than the calyx: tube straight, naked inside: throat very wide: galea oblong: lateral lobes angular, appendiculate by a short tooth. ♃.? H. Native of the Levant, Tournefort. This differs from *L. longiflòrum*, in the small leaves and short calycine teeth, which are broad, not elongated and subulate.

Ground-Ivy-like. Pl. ascending.

7 L. veronicæfòlium (Benth. lab. p. 510.) glabrous; leaves small, on long petioles, reniform, deeply crenated, broadly subcordate at the base; upper leaves approximate, exceeding the flowers, or hardly shorter; corolla 3 times as long as the calyx, which is glabrous: tube straight, slender: throat dilated: galea very long, bifid at apex: lateral lobes angular, furnished with a short obtuse tooth. ♃. H. Native of Greece.—A very distinct species, having the lower leaves like those of *L. amplexicaúle*, and the corolla like that of *L. longiflòrum*. Leaves almost like those of *Verónica hederàcea*. Corolla $\frac{1}{2}$ an inch long, red or purple.?

Speedwell-like Archangel. Pl. ascending.

8 L. stria'tum (Sibth. et Smith, fl. græc. 6. p. 46. t. 557.) leaves ovate, deeply crenated, broadly subcordate at the base: upper ones approximate, exceeding the flowers, or scarcely shorter; corolla 3 times as long as the calyx, which is glabrous: tube straight, slender: throat dilated: galea very long, bifid at apex: lateral lobes angular, appendiculate, by a short blunt tooth. ♃. H. Native of Greece, in waste places plentiful. Habit of *L. vulgàtum;* but the leaves are thinner, smaller, and less cordate at the base; petioles of the floral leaves shorter than the calyxes. Corollas $1\frac{1}{2}$ inch long.

Striated Archangel. Pl. ascending.

9 L. bi'fidum (Cyr. pl. rar. fasc. 1. p. 22. t. 7.) leaves ovate: superior ones acuminated, all deeply lobed, crenately toothed: upper ones approximate, exceeding the flowers, or hardly shorter; tube of corolla straight, naked inside: throat dilated: galea elongated, and divaricately bifid at apex: lateral lobes appendiculate by a short linear tooth. ⊙.? H. Native of the region of the Mediterranean; as in Corsica, Sicily, Naples. Tenore, fl. nap. t. 153. f. 2. Habit of *L. purpùreum*. Leaves green on both surfaces, or more or less lined with white, and more or less villous. Upper whorls subcapitate: lower ones remote. Corolla white, a little longer than those of *L. purpùreum*.

Var. β, clandestìnum (Benth. lab. p. 511.) corollas minute from abortion. ⊙. H. L. cryptánthum, Guss. prod. fl. sic. 2. p. 97. Rchb. icon. bot. eur. 8. p. 3. t. 707.

Bifid-helmeted Archangel. Fl. June, July. Clt.? Pl. $\frac{1}{2}$ foot.

10 L. amplexicau'le (Lin. spec. 809.) leaves orbicular: cauline ones petiolate; floral leaves stem-clasping, all deeply crenated; tube of corolla straight, slender, naked inside: throat dilated: galea oblong, entire: lateral lobes mutic. ⊙. H. Native of Europe, North of Africa, and Middle Asia, in cultivated fields and waste grounds; plentiful in Britain. Smith, engl. bot. t. 770. Hook. fl. lond. vol. 2. icone. Rchb. icon.

bot. eur. 3. p. 22. t. 224. f. 373. Curt. lond. 2. t. 109. Fl. dan. 752. L. palmàtum, Smith, in Rees' cycl. vol. 20. Galeóbdolon amplexicaúle, Mœnch, meth. p. 393. Pollíchia amplexicaúlis, Willd. fl. berol. 198. Roth, fl. germ. 1. p. 254.—Mor. hist. sect. 11. t. 11. f. 12.—Petiv. brit. t. 33. f. 4.—Rivin. mon. t. 63. Herb decumbent, branched at the base. Leaves glabrous, or rather hispid. Whorls densely many-flowered. Corolla purple or red, pubescent.

Var. β, clandestìnum (Rchb. icon. bot. eur. 8. p. 3. t. 708.) corollas minute by abortion. ⊙. H.

Stem-clasping-leaved Archangel, or Great Henbit. Fl. March, July. Britain. Pl. ½ to 1 foot.

11 L. intermedium (Fries, nov. fl. suec. ed. 1st. p. 105. and 2d. p. 192.) leaves orbicular; cauline leaves petiolate: floral ones stem-clasping, all deeply crenated; calycine teeth subulate, longer than the tube; tube of corolla straight, slender, naked inside; throat dilated: galea oblong, entire: lateral lobes appendiculate by a short tooth. ⊙. H. Native of Sweden, North of Germany, and North of Scotland. Rchb. icon. bot. eur. 3. p. 22. t. 224. f. 372. and 8, 9. t. 721. L. molucellæfòlium, Fries, nov. fl. suec. 72. ex Rchb. l. c. Habit and leaves like *L. amplexicaúle;* and scarcely differs from it, unless in the elongated calycine teeth, and lateral lobes of corolla.

Intermediate Archangel. Fl. March, July. Scotland. Pl. ½ to 1 foot.

12 L. purpureum (Lin. spec. p. 809.) lower leaves orbicular; floral leaves ovate, all crenated: uppermost ones approximate, exceeding the flowers; tube of corolla straight, slender, furnished with a pilose ring inside at the base: throat dilated: galea oblong, entire: lateral lobes appendiculate by a short linear tooth. ⊙. H. Native throughout Europe and Asia, in waste and uncultivated grounds, in a light soil; plentiful in Britain. Hook. fl. lond. 2. icone. Smith, engl. bot. t. 769. Curt. lond. 1. t. 42. Fl. dan. t. 523. Martyn, fl. rust. t. 25. L. ocymifòlium, Smith, in Rees' cycl. vol. 20. L. nùdum, Mœnch, meth. p. 393. Crantz, stirp. austr. p. 259.—Riv. mon. t. 62. f. 2. Herb decumbent at the base. Leaves on long petioles, villous on both surfaces. Whorls densely many-flowered: upper ones approximate. Corolla ½ an inch long, red. The floral leaves are usually coloured. According to Linnæus, it is boiled in Upland, a province of Sweden, as a pot-herb. The plant was formerly used medicinally, but is now disregarded.

Var. β, mólle (Benth. lab. p. 512.) leaves less wrinkled, blunter, and with fewer crenatures. ⊙.? H. Native of England, in fields; as on road sides about Croydon. Flowers white.

Purple Archangel. Fl. May, Sept. Britain. Pl. ½ to 1 foot.

13 L. incisum (Willd. spec. 3. p. 89.) lower leaves orbicular; floral leaves broad-ovate, all deeply toothed, or lobed; the uppermost leaves approximate, exceeding the flowers; tube of corolla straight, furnished with a ring of hairs inside at the base: throat dilated: galea oblong, entire: lateral lobes appendiculate by a short linear tooth. ⊙. H. Native of Europe, especially of the North, in corn-fields; France, Germany, Sweden; Britain, in many places. Smith, engl. bot. t. 1933. Rchb. icon. bot. eur. 3. p. 21. t. 223. L. hýbridum, Vill. fl. dauph. 1. p. 251. L. disséctum, With. brit. pl. p. 527. L. urticæfòlium, Weihe, ex Rchb. fl. germ. exc. p. 321. L. Westphaliànum, Weihe, ex Rchb. l. c. L. Coesféldiæ, Weihe, ex Rchb. l. c. L. purpùreum, β, Huds. angl. p. 255.—Pet. brit. t. 33. f. 3. Leaves cut, as in *L. bífidum.* Flowers similar to those of *L. purpùreum.* Whorls sometimes all approximate, and sometimes the lower ones are remote.

Cut-leaved Archangel. Fl. May, Sept. Britain. Pl. ½ to 1 foot.

Sect. III. Lamiotyˋpus (so named because the species contained in this section are the type of the genus.) Benth. lab. p. 513. Lamiotỳpus, Dumort, florul. belg. p. 45. Tube of corolla transversely annulate inside, contracted under the ring, and dilated above it, rather ventricose, and somewhat recurvedly drawn out; throat a little dilated. Anthers hairy outside.

14 L. moschatum (Mill. dict. no. 4.) leaves ovate, cordate, nearly glabrous; calycine teeth long, lanceolate-subulate; tube of corolla ample, short, furnished with a pilose ring inside: throat very wide: galea longer than the tube: lateral lobes bluntly acuminated, scarcely appendiculate. ⊙. H. Native of the Levant. Leaves blotched with white, and in dry weather have a musky scent, but in wet weather are fetid. Corollas white; galea villous.

Musky-scented Archangel. Fl. April, July. Clt. 1739. Pl. ½ foot.

15 L. calycinum (D'Urv. pl. arch. in mem. soc. Lin. par. p 323.) stem erectish, branched, quite glabrous, fistular; leaves cordate, wrinkled, woolly, pubescent: the upper ones also subpetiolate; calyxes smooth, reticulated, about equal in height to the corollas; calycine teeth very long, arched, subulate, scarcely ciliated; flowers crowded, sessile; whorls numerous: lower ones remote. ⊙. H. Native of the Grecian Islands. Corolla villous outside, white.

Large-calyxed Archangel. Pl. ½ to 1 foot.

16 L. petiolatum (Royle, ex Benth. in Hook. bot. misc. 3. p. 381. lab. p. 513.) leaves ovate-lanceolate, acuminated, scarcely cordate at the base; calycine teeth long-subulate; tube of corolla ample, furnished with a pilose ring inside: throat scarcely dilated; galea elongated: lateral lobes mutic, or with a short setaceous appendage: lip very short. ♃.? H. Native of the Himalaya, plentiful, Royle; Kamaon, Wall. Allied to *L. vulgàtum*, but the leaves and corollas are different. Hairs of stem reflexed. Lower leaves petiolate: floral ones sessile, coarsely and somewhat doubly serrated, green and hispid on both surfaces. Whorls usually many-flowered. Corolla white; galea villous outside.

Petiolate-leaved Archangel. Pl. ascending.

17 L. vulgatum (Benth. lab. p. 514.) leaves ovate, cordate, or truncate at the base, wrinkled, usually villous; calycine teeth long-subulate, glabrous or villous; tube of corolla ample, furnished with a ring of hairs inside: throat dilated a little: galea oblong: lateral lobes appendiculate by a long subulate tooth. ♃. H. Native of Europe, North of Africa, and Middle Asia, in shady mountain places, &c.; in some parts of Scotland. This is a very variable plant, but is readily distinguished from others by the form of the corolla. Leaves petiolate, crenated, doubly toothed, or a little cut, usually green, but often lined and blotched with white, more or less wrinkled, and villous. Whorls 10-20-flowered.

Var. α, rùbrum (Benth. lab. p. 514.) corollas purple or red; leaves green or blotched with white. ♃. H. This is more common in the southern regions of Europe than in the northern. L. maculàtum, Lin. spec. p. 809. Rchb. icon. bot. eur. 3. p. 12. t. 215. Sibth. et Smith, fl. græc. 6. p. 46. t. 556. with spotted leaves. Smith, engl. bot. t. 2550. with spotless leaves. L. rugòsum, Ait. hort. kew. 2. p. 296. Rchb. icon. bot. eur. 3. p. 14. t. 217. but not of Sibth. et Smith, nor Guss. nor. Tenore. L. rùbrum, Blackw. t. 183. Wallr. sched. crit. p. 300. L. mutábile, Dumort, florul. belg. p. 45.? L. hirsùtum, Lam. dict. 3. p. 410. with spotless leaves. L. stoloníferum, Lap. abr. pyr. p. 333. with spotless leaves, and many large flowers. L. grandiflòrum, Pourr. act. acad. tolos. 3. p. 322. L. lævigàtum, Lin. spec. p. 808. Rchb. icon. bot. eur. 3. p. 14. t. 216. but not of all authors—(this is a more glabrous variety.) L. melis-

sæfòlium, Mill. dict. no. 5.?—Sabb. hort. rom. 3. t. 34.—Bocc. muss. t. 23.—Colum. ecphr. 1. p. 190. t. 192.

Var. β, álbum (Benth. lab. p. 514.) flowers white; leaves spotless, villous. ♃. H. More common in the northern regions of Europe than the southern. L. álbum, Lin. spec. p. 809. Hook. fl. lond. 2. icone. Smith, engl. bot. t. 768. Curt. lond. 2. p. 45. t. 115. Fl. dan. 594. Mart. fl. rust. t. 25.—Riv. mon. t. 62. f. 1. L. níveum, Hort. L. capitàtum, Smith, in Rees' cycl. vol. 20. L. foliòsum, Crantz, stirp. austr. p. 258. This is certainly a distinct species from *L. maculàtum;* the roots of this creep like couch under ground, while the root of *L. maculàtum* is composed of fibres. Linnæus says that the leaves are eaten as a pot-herb in spring. The plant was formerly considered medicinal.

Common Archangel, or Dead-Nettle. Fl. April, Sept. Britain. Pl. 1 to 2 feet.

18 L. mólle (Ait. hort. kew. 2. p. 297.) lower leaves ovate: superior ones ovate-lanceolate, acute, truncate at the base, very rarely cordate; calycine teeth long-subulate; tube of corolla ample, furnished with a hairy ring inside, subrecurved: throat a little dilated: galea oblong: lateral lobes appendiculate by a subulate tooth; anthers hairy. ♃. H. Native country unknown, but common in gardens. L. parietariæfòlium, Benth. lab. p. 739. L. parietariæfòlio, Mor. klœs. 278. Very nearly allied to *L. vulgàtum;* but the lower leaves are rarely cordate: the upper ones much narrower, and often quite entire; and the corollas are smaller, and white.

Soft Archangel. Fl. April, June. Clt. 1683. Pl. ½ to 1 foot.

19 L. tomentòsum (Willd. spec. 3. p. 90.) leaves ovate, cordate, wrinkled, very villous; calycine teeth subulate, plumosely ciliated; tube of corolla ample, furnished with a ring of hairs inside: throat dilated a little: galea oblong: lateral lobes appendiculate by a long subulate tooth. ♃.? H. Native of the South-east of Europe, and Middle Asia; as of the South of Italy, Armenia, Caucasus. L. Colúmnæ, Tenore, ind. sem. hort. nap. 1827. syll. fl. nap. p. 286. Hardly differing from *L. vulgàtum;* except in the smaller, more villous leaves, and in the very villous calycine teeth. Flowers white.

Tomentose Archangel. Fl. May, July. Clt.? Pl. ½ to 1 foot.

Sect. IV. Galeóbdolon (from γαλη, *gale*, a weasel; and βδολος, *bdolos*, fetid smell; in allusion to the fetid smell of *L. Galeobdolon.*) Benth. lab. p. 515. Tube of corolla obliquely annulate inside, contracted under the ring, but dilated and rather ventricose above the ring, somewhat recurvedly stretched out: throat a little dilated; galea oblong, narrowed a long way at the base. Anthers glabrous.

20 L. pube'scens (Sibth. in herb. Banks, ex Benth. lab. p. 515.) leaves ovate, truncate or subcordate at the base: superior leaves acuminated, all wrinkled and villous; corolla reddish purple: galea elongated, entire: lateral lobes angular, having the angle mutic, or with a setaceous appendage. ♃. H. Native of Sicily and Naples. L. rugòsum, Sibth. et Smith, fl. græc. 6. p. 45. t. 555. Guss. fl. sic. prod. 2. p. 94. Tenore, fl. nap. 2. p. 19.? but not of Ait. This species differs from *L. flexuòsum*, in the corollas being one half larger, more villous, and purplish red; and in the leaves being more villous; and the bracteas are usually broader.

Pubescent Dead-Nettle. Pl. ascending.

21 L. flexuòsum (Tenore, fl. nap. 2. p. 19. t. 52. syll. p. 287.) leaves ovate, acuminated, truncate, or subcordate at the base, nearly glabrous, or scarcely villous; corolla white: galea elongated, entire: lateral lobes angular, having the angle mutic, or furnished with a setaceous point. ♃. H. Native of the region of the Mediterranean; as of France, Sicily, Naples, and Barbary. Rchb. icon. bot. eur. 8. p. 3. t. 706. L. Petitìnum, Gay, ined. Stems procumbent, often rooting at the base; branches ascending. Leaves coarsely and doubly toothed, green, or marked by a white line. Whorls 6-20-flowered.

Flexuous Dead-Nettle. Fl. April, July. Clt. 1824. Pl. ascending.

22 L. Galeóbdolon (Crantz, austr. p. 262. Benth. lab. p. 516.) leaves ovate, acuminated, truncate or subcordate at the base, nearly glabrous, or pilose; corolla yellow: galea elongated, entire: lateral lobes oblong, mutic, or with a very short appendage, hardly shorter than the lip. ♃. H. Native of the North of Europe, in shady places, woods, and under hedges; plentiful in some parts of Britain. Galeópsis Galeóbdolon, Lin. spec. 810. Pollíchia Galeóbdolon, Roth, fl. germ. 1. p. 254. Leonùrus Galeóbdolon, Scop. carn. no. 705. Galeóbdolon lùteum, Huds. angl. p. 258. Hook. fl. lond. 2. icone. Smith, engl. bot. t. 787. Galeóbdolon Galeópsis, Relh. cat. p. 436. Curt. fl. lond. 4. t. 40. Cardìaca sylvàtica, Lam. fl. fr. 2. p. 384. Pollíchia vulgàris et montàna, Pers. ann. bot. 14. p. 39. Galeóbdolon vulgàre, Pers. ench. 2. p. 122.—Riv. mon. irr. t. 20. f. 2.—Mor. hist. sect. 11. t. 11. f. 5, 6. Herb nearly glabrous, but sometimes, especially on the lower leaves and stems, beset with long hairs. Whorls numerous, 6-15-flowered. Leaves deeply toothed. Corolla yellow: middle segment of the lower lip tawny, marked with 3 lines, the whole lower lip beautifully spotted with tawny or deep orange dots.

Galeobdolon, or Yellow-flowered Dead-Nettle. Fl. May, July. Britain. Pl. 1 to 1½ foot.

Doubtful species.

23 L. hi'rtum (Poir. suppl. p. 296.) leaves ovate-cordate, pubescently hairy, rather hoary; stem and calyxes very hairy; corolla small, nearly glabrous. ♃.? H. Native country unknown, but cultivated in Parisian gardens. Flowers of *L. álbum*, but much smaller. Stems hairy. Leaves soft, with nearly regular, obtuse crenatures, canescent: lower ones on long petioles. Whorls few-flowered. Calycine teeth 5, very short. Corolla white.

Hairy Archangel. Pl. ascending.

24 L. micra'nthum (Weinm. in syll. pl. soc. ratisb. 1. p. 68.) lower leaves petiolate: upper ones sessile, cordate-ovate, obtuse, serrated; whorls 6-flowered. ⊙. H. Native of Brazil. Leaves beset in all parts with reflexed or spreading hairs. Calycine teeth equal, ciliated, terminated by a bristle. Corolla small, pale red, about equal in length to the calycine teeth; galea entire. Perhaps *L. purpùreum* or *Stàchys arvénsis.*

Small-flowered Archangel. Pl. 1 foot.

Cult. None of the species are worth cultivating for ornament, except *L. Orvàla* and *L. vulgàtum*, var. *maculàtum.* They are of the most easy culture, and will grow in any soil or situation, even under the drip of trees. The herbaceous perennial kinds are increased by division. The seeds of annual kinds only require to be sown in the open ground in spring.

LXXVII. LAGOCHI'LUS (from λαγος, *lagos*, a hare; and χειλος, *cheilos*, a lip; in reference to the bifid lower lip, like that of a hare's.) Bunge, mon. gen. molucc. ined. Benth. lab. p. 640.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate, somewhat 5-nerved, with an equal or oblique

mouth: teeth 5, nearly equal, or the superior ones are the longest, rather spinose at top. Corolla having the tube a little exserted, annulate inside, and the limb bilabiate; upper lip oblong, bifid at apex; lower lip erectish, with short, erect, acute, lateral lobes, and a spreading, broadly bifid middle lobe. Stamens 4, ascending: lower ones the longest. Filaments naked at the base; anthers approximate by pairs, 2-celled: cells parallel or diverging, and with the margins of the valvules ciliated. Style about equally bifid at apex: lobes subulate, stigmatiferous at apex. Achenia dry, triquetrous, with acute angles, and a truncate apex.—Herbs? quite glabrous, stiff. Leaves deeply lobed: lobes somewhat spinescent. Whorls axillary, few-flowered. Bracteas subulate, rather spinose.

1 L. diacanthophy'llus (Benth. lab. p. 641.) leaves tripartite, cut; calyxes erectish, with oblong, mucronulate teeth, which are longer than the tube. ♃. F. Native of the desert of Bucharia, Pallas. Molucélla diacanthophýlla, Pall. nov. act. petrop. 10. p. 380. t. 11. Molucélla grandiflòra, Steph. in Willd. spec. 3. p. 131. Stems numerous, erect, rising from a perennial base. Lobes of lower leaves broad, short, obtuse, mutic, those of the superior ones narrow, ending each in a spiny mucrone; middle lobe of floral leaves sometimes tridentate. Whorls 2-flowered.? Corolla villous, pale red.

Two-spined-leaved Logochilus. Pl. ½ foot.

2 L. Bu'ngei (Benth. lab. p. 641.) leaves petiolate, 3-5-parted, cut; calyx elongated, incurved, with lanceolate, spinose teeth, which are one half shorter than the tube. ♃. F. Native of Siberia, among rocks in Soongaria, at the Irtish, Bunge. L. diacanthophýlla, Bunge, mon. molucc. ined. exclusive of the syn. of Pallas. Stems woody at the base, ascending. Leaves an inch long, cuneated at the base, with spiny or mutic lobes. Corolla pale red, almost 1½ inch long. Whorls remote.

Bunge's Lagochilus. Pl. 1 foot.

3 L. ilicifòlius (Bunge, mon. molucc. ined. ex Benth. lab. p. 641.) leaves sessile, cuneiform, deeply 3-5-toothed at apex; calyxes short, erectish, with oblong, very shortly mucronulate teeth. ♃. F. Native of Mongholia, in stony saltish places, Bunge.—A dwarf, stiff herb, or under-shrub. Stem rather villous under the axils, the rest glabrous. Whorls few-flowered. Corolla 7-8 lines long, pilose outside.

Holly-leaved Lagochilus. Shrub ½ foot.

Cult. For culture and propagation see *Làmium*, p. 819.

LXXVIII. LEONU'RUS (from λεων, *leon*, a lion; and ουρα, *oura*, a tail; lion's tail.) Lin. gen. no. 722. Schreb. gen. no. 977. Juss. gen. p. 114. Benth. lab. p. 517.—Cardìaca, Tourn. inst. t. 87.—Cardìaca, Chaitùrus, et Panzèria, Mœnch. meth.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx 5-nerved, turbinate, nearly equal, with a truncate mouth, and 5 teeth, which are subulate, and rather spiny at apex, and at length spreading. Corolla with an inclosed, rarely exserted tube, which is naked, or obliquely annulate inside, and a bilabiate limb: superior lip oblong, quite entire, sometimes flattish, with a narrowed base, and sometimes arched: lower lip spreading, trifid, the lateral lobes oblong, and the middle lobe obcordate. Stamens 4, ascending, didynamous: lower 2 the longest; anthers approximate by pairs, 2-celled: cells parallel, transverse, rarely diverging, with naked valvules. Style about equally bifid at top; lobes subulate, rarely short, and obtuse, stigmatiferous at top. Achenia dry, smooth, triquetrous, truncate at apex, with acute angles.—Erect herbs. Leaves generally deeply lobed: lower ones roundish: floral ones narrower, all exceeding the flowers much. Whorls dense, axillary, distinct. Bracteas subulate. The section *Cardìaca* comes very near to the section *Galeóbdolon* of *Làmium*, and the section *Chaitùrus* to the genus *Marrùbium*, ex Benth.

Sect. I. Cardi'aca (the Latin name of motherwort, from *cardia*, the heart; in allusion to its supposed efficacy in the cure of cardialgia.) Benth. lab. p. 518. Cardìaca, Mœnch, meth. p. 401. Tube of corolla obliquely annulate inside, rather ventricose above the ring; upper lip flattish, narrowed at the base: lower lip spreading, with the middle lobe entire.

1 L. pube'scens (Benth. in Wall. pl. asiat. rar. 1. p. 63. lab. p. 518.) finely pubescent; leaves all ovate, acuminated, rather deeply toothed; corolla about 3 times as long as the calyx. ♃. or ♂. H. Native of the mountains of Kamaon, Wall.; Choor and Kanaour, Royle. Leaves more toothed than lobed. Whorls 20-30-flowered, remote. Corollas larger than those of *L. Cardìaca.*

Pubescent Motherwort. Pl.?

2 L. Royle'anus (Benth. l. c.) stem erect, finely tomentose; leaves ovate, acuminated, deeply serrated, or 3-5-lobed, villous above, and clothed with hoary tomentum beneath, as well as the calyxes. ♃. or ♂. H. Native of Mount Choor, Royle. Stem branched, with pilose axils. Whorls many-flowered: lower ones remote: upper ones spicate.

Royle's Motherwort. Pl.?

3 L. Cardi'aca (Lin. spec. p. 817.) pubescent; lower cauline leaves palmatifid: superior leaves ovate, lobate: floral leaves oblong, subtrifid, narrowed a long way at the base: lobes all ovate or lanceolate; calyxes glabrous or villous. ♃. or ♂. H. Native throughout Europe and Middle Asia, on banks or under hedges, in a gravelly or calcareous soil. In several places both in Scotland and England, in like situations. Smith, engl. bot. t. 286. Fl. dan. t. 727. L. campéstris, Andrz. ex Besser, pl. exs. with the segments of the leaves a little narrower. L. Illýricus, Hort. Cardìaca vulgàris, Mœnch, meth. p. 401. Cardìaca trilobàta, Lam. fl. fr. 2. p. 383.—Blackw. t. 171.—Mor. hist. sect. 11. t. 9. f. 18. Stems branched at the base. Whorls 6-15-flowered, distant. Corolla villous outside, pale red or white, and striped with purple veins. The herb is bitter and tonic, with no very pleasant, but pungent smell. It was formerly used in Cardialgia, whence its old name; but it has now become wholly obsolete, except, perhaps, among cowleeches and farriers. Bees are fond of the flowers. In German, Motherwort is called *Herzgeshaun* or *Herzkraut.* In Swedish, *Bonassla.* In French, *Agripaine, Cardiaque, La Cordiale.* In Italian, Spanish, and Portuguese, *Agripalma, Cardiaca,* &c.

Var. β, *villòsus* (Benth. lab. p. 518.) leaves more wrinkled, and are, as well as the stems, villous; calyxes rather villous. ♃. or ♂. L. villòsus, Desf. cat. hort. par. p. 73. D'Urv. enum. pl. arch. in mem. soc. Lin. par. p. 325. L. condensàtus, Horn. hort. hafn. L. làcerus, Lindl. hort. trans. 6. p. 296. L. canéscens, Dumort, florul. belg. p. 46. L. negléctus, Schranck, in syll. pl. soc. ratisb. 2. p. 61. Corollas red or purple.

Var. γ, *crìspus* (Benth. lab. p. 519.) margins of leaves undulately curled, and lacerately toothed. ♂. H. L. crìspus, Murr. comm. gœtt. 8. t. 4. Cardìaca crìspa, Mœnch, meth. p. 401.—Sabb. hort. rom. 3. t. 43. Mill. dict. ed. 7th. Corollas pale red or white.

Cardiac or Common Motherwort. Fl. July, Aug. Britain. Pl. 2 to 4 feet.

4 L. glauce'scens (Bunge, in Led. fl. alt. 2. p. 409.) canescent from glaucescent pubescence above; cauline leaves palmately parted, cut, with oblong-lanceolate lobes; floral leaves subtrifid, the segments and upper leaves lanceolate-linear, almost quite entire; calyxes clothed with hoary pubescence. ♂. H.

Native of the Altaia, plentiful. Ledeb. fl. ross. atl. ill. t. 179. Habit of *L. Sibíricus*, with the flowers of *L. Cardìaca*. Leaves ample, deeply toothed; floral leaves much narrower, and more deeply cut than in *L. Cardìaca*.

Glaucescent Motherwort. Pl.

5 L. Tata'ricus (Lin. spec. p. 818.) glabrous or pubescent at top; cauline leaves palmately parted, cut; floral leaves subtrifid: lobes of all, as well as the upper leaves, lanceolate-linear or linear; calyxes glabrous or villous. ♂. H. Native of Tartary, Lin.; Siberia, about the Kolyvan, Patrin; Altaia, frequent, Ledeb. Rchb. icon. bot. eur. 4. p. 31. t. 338. L. Altàicus, Spreng. syst. 2. p. 738. L. multífidus, Desf. hort. par.—Mill. fig. 53. t. 80. Nearly allied to *L. glaucéscens*, but more slender, more humble, and the leaves more finely cut, and the flowers smaller.

Tartarian Motherwort. Fl. Aug. Oct. Clt. 1756. Pl. 2 to 3 feet.

Sect. II. Chaitu'rus (from χαιτη, *chaite*, a head of hair, and ουρα, *oura*, a tail; in reference to the close whorls of flowers.) Benth. lab. p. 520. Chaitùrus, Mœnch. meth. p. 401. Tube of corolla straight, naked inside: upper lip a little arched: lower lip erectish, with nearly equal lobes, the middle lobe almost entire. Stamens scarcely longer than the tube; cells of anthers diverging. Flowers minute.

6 L. marrubia'strum (Lin. spec. 817.) branches elongated, pubescent; leaves oblong-ovate, somewhat deeply toothed, narrowed at both ends; calyxes nearly glabrous; corollas shorter than the calycine teeth. ☉. H. Native of Europe, especially in the East, and Asiatic Russia, among bushes, and in waste places; as of France, Germany, Piedmont, Hungary, Caucasus, Siberia. Jacq. fl. austr. 5. p. 3. t. 405. Chaitùrus leonuroìdes, Willd. fl. berol. p. 201. Chaitùrus marrubiástrum, Ehrh. Cardìaca marrubiástrum, Schreb.—Bocc. mus. 2. t. 98. Leaves petiolate, 1 to 1½ inch long, glabrous and green above, pale and canescent beneath, and tomentosely pubescent. Whorls dense, many-flowered, numerous, distant. Calycine teeth subulate, spiny, diverging. Corollas small, white, or pale red, smoothish.

Horehound-like Motherwort. Fl. June, Aug. Clt. 1710. Pl. 1 to 3 feet.

Sect. III. Panze'ria (named after G. Wolf. Fr. Panzer, of Nuremberg, author of several botanical works.) Benth. lab. p. 520. Panzèria, Mœnch. meth. p. 402. Tube of corolla straight, naked inside. Upper lip arched; lower lip straightish, or with the middle lobe spreading a little, obcordate or bifid. Stamens exserted from the tube.

7 L. Sibi'ricus (Lin. spec. p. 818.) erect, tall, glabrous or finely pubescent; leaves pinnately or palmately parted, a little cut: upper floral leaves almost quite entire; calyxes glabrous or clothed with fine tomentum. ♂. H. Native of Asia, Africa, and America, as of India, China, and Japan, Timor, Senegambia, Cuba, Demerara, St. Thomas, Trinidad, Brazil, &c. Rchb. icon. bot. eur. 4. p. 30. t. 337. Smith, exot. bot. 2. p. 67. t. 94. Sweet, fl. gard. 3. t. 204. L. Tatáricus, Burm. fl. ind. 127. but not of Lin. L. occidentàlis, Hortul. L. heterophýllus, Sweet, brit. fl. gard. 2. t. 197. L. occidentàlis, Colla, in mem. acad. taur. vol. 33. p. 154. L. altíssimus, Bunge, nov. gen. et spec. chin. bot. ined. L. multífidus, Desf. Panzèria multífida, Mœnch. meth. suppl. p. 137. Panzèria tripartìta, Mœnch. meth. p. 402.? Stàchys Artemísiæ, Lour. coch. p. 363.—Amm. ruth. no. 60. t. 8.? Branches usually canescent, at length glabrous and green. Leaves cut to the middle of the limb; cauline leaves usually tripartite; all green and glabrous above, but pale beneath, and pubescent while young. Lower whorls remote; upper ones approximate. Corollas red.

Siberian Motherwort. Fl. June, Aug. Clt. 1759. Pl. 2 to 6 feet.

8 L. lana'tus (Spreng. syst. 2. p. 738.) plant humble, clothed with white wool or villi; leaves all palmate-parted or palmatifid; corolla elongated. ♃. or ♂. H. Native of Siberia, in dry, sterile places, between the river Kan and Jebegan; and at the rivers Katunga and Tschuja, and near Slimon, Ledeb.; Dahuria, Patrin. Rchb. icon. bot. eur. 8. p. 15. t. 736. Ballòta lanàta, Lin. spec. 816. Panzèria lanàta, Pers. ench. 2. p. 126. Panzèria tomentòsa, Mœnch. meth. 402.—Gmel. sib. 3. t. 54. Stems rising from a thick rather woody base. Whorls dense, many-flowered, approximate. Corolla more than an inch long, yellowish.

Woolly Motherwort. Fl. June, Aug. Clt. 1752. Pl. 1 to 2 feet.

† *Species not sufficiently known.*

9 L. Java'nicus (Blum. bijdr. p. 828.) leaves ovate-oblong, unequally toothed; calyxes strigosely pubescent; calycine teeth acuminated, spreading; upper lip of corolla concave, emarginate: middle segment of the lower lip roundish, crenulated: lateral ones acutish. ♂. H. Native of the west of Java, in shady mountain places.

Java Motherwort. Pl.?

10 L. oblongifòlius (Blum. bijdr. p. 828.) leaves oblong, acuminated, unequally denticulated; calyxes very pilose; calycine teeth subulate; middle segment of the lower lip of the corolla roundish. crenulated: lateral ones acute. ♄.? H. Native of Java, on the Salak mountains, on the banks of the river Tjapus.

Oblong-leaved Motherwort. Pl.?

Cult. None of the species are very ornamental; and being generally biennial plants, the seeds of them only require to be sown in the open ground. *L. lanàta* should be grown in a dry sandy soil, or on rockwork.

LXXIX. ANISO'MELES (from ανισος, *anisos*, unequal, and μελος, *melos*, a member; in reference to the anthers of the longer stamens being dimidiate or halved.) R. Br. prod. p. 503. Benth. lab. p. 701. A'juga species, Roxb. Népeta and Ballòta species, Lin.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, tubular, erectish, 5-toothed. Corolla having the tube equalling the calyx, and furnished with a pilose ring inside, and a bilabiate limb; upper lip erect, oblong, entire; lower lip larger, spreading: lateral lobes ovate, obtuse, the middle lobe emarginately sub-bifid. Stamens 4, ascending, exserted, the lower 2 the longest; anthers approximating by pairs, those of the longer stamens dimidiate, and those of the shorter ones 2-celled: the cells parallel and transverse. Style almost equally bifid at top. Achenia dry, smooth.—Herbs and sub-shrubs, with the habit of *Stàchys*, sect. *Erióstachys*. Whorls sometimes densely many-flowered, racemose; sometimes very loose; constantly composed of cymes on long peduncles; sometimes axillary and few-flowered. Flowers purplish.

1 A. moscha'ta (R. Br. prod. p. 503.) leaves elliptic, and are, as well as the stem, clothed with cinereous pubescence; whorls few-flowered; calyx greyish-green, glanduliferous. ♄. S. Native of tropical New Holland. Corollas red or purplish.

Musky Anisomeles. Fl. July, Aug. Clt. 1824. Shrub 2 to 3 feet.

2 A. inodòra (R. Br. prod. p. 503.) leaves elliptic, nearly glabrous, dotted beneath; whorls remote; calyxes green, glanduliferous. ♄.? S. Native of tropical New Holland.

Scentless Anisomeles. Shrub.

3 A. Heynea'na (Benth. in Wall. pl. rar. asiat. 1. p. 59. lab. p. 702.) glabrous or finely pubescent; leaves remote, oblong-lanceolate, narrowed at the base; cymes of flowers on long peduncles, secund, few-flowered; calycine teeth lanceolate, acute. ♄.? S. Native of the Indian Peninsula, Heyne; Island of Salcette, on the higher mountains, in shady woods, at the temple of Kennerg, Jacquemont. Leaves serrately crenated, smaller and thinner than the rest, pale green, and usually finely pubescent.

Heyne's Anisomeles. Shrub.?

4 A. salviæfòlia (R. Br. prod. p. 503.? Benth. lab. p. 702.) villous; leaves oblong-elliptic or lanceolate; whorls dense, many-flowered; calycine teeth short, broad-lanceolate, acute. ♄.? S. Native of tropical New Holland; Island of Timor. Very nearly allied to *A. intermèdia*, and *A. ovàta*, var. *mollissima*, but differs in the smaller stature, slenderer branches, smaller calyxes, and in the teeth being 4 times shorter than the tube.

Sage-leaved Anisomeles. Shrub.?

5 A. ova'ta (R. Br. in Ait. hort. kew. ed. 2. vol. 2. p. 364.) hairy, rarely almost glabrous; leaves ovate, acuminated or roundish or truncately subcordate; whorls dense, many-flowered; calycine teeth lanceolate, acute. ⊙.? S. Native of the hotter parts of Asia, in waste and humid places in most parts. Jacq. fil. ecl. 1. t. 86. Hook. bot. misc. 2. p. 358. t. 19. A. dísticha, Heyne, ex Roth. nov. spec. p. 254. Népeta Amboínica, Lin. suppl. p. 273. Ballòta dísticha, Lin. mant. 83. A'juga dísticha, Roxb. fl. ind. 3. p. 2. Népeta dísticha, Blume, bijdr. p. 823. Marrùbium I'ndicum, Burm. fl. ind. p. 127. et thes. zeyl. t. 71. Monárda Zeylánica, Burm. fl. ind. p. 12. Ballòta Mauritiàna, Pers. ench. 2. p. 126.—Rheed. mal. 10. p. 175. t. 88. Leaves obtuse, broadly crenated. Whorls 10-40-flowered, secund, or nearly equal; lower ones distant; upper ones interruptedly spicate. Corollas purple; lower lip of a deeper colour.

Ovate-leaved Anisomeles. Fl. July, Aug. Clt. 1823. Pl. 2 to 3 feet.

6 A. ca'ndicans (Benth. in Wall. pl. rar. asiat. 1. p. 59. lab. p. 703.) canescent from pubescence; leaves ovate-oblong or lanceolate, narrowed at the base; whorls many-flowered, rather loose; calycine teeth lanceolate, acute. ♄.? S. Native of the Birman Empire, on the banks of the Irrawaddi, near Yenanghuen, Wallich. Habit of *A. Malabárica*, but the leaves are a little broader, pubescent on both surfaces, as well as the stems and calyxes. Cymes usually elongated as in *A. Malabárica*, but the flowers are fewer. Calyx elongated, having the teeth as in *A. ovàta*.

Whitish Anisomeles. Shrub.?

7 A. interme'dia (Wight, mss. ex Benth. lab. p. 703.) clothed with tomentose pubescence or subvillous; leaves ovate-lanceolate, cuneated at the base; whorls many-flowered, dense, or the cymes are at length ample and elongated; bracteas subulate; calyx hairy, having the teeth lanceolate at the base, and subulate at apex, very soft. ♄.? S. Native of the Indian Peninsula, on the mountains of Madura; and of Ceylon, at Peradenia. Habit intermediate, between *A. ovàta*, and *A. Malabárica*, but is more nearly allied to the latter, from which it differs in the broader less tomentose leaves, and broader calycine teeth.

Intermediate Anisomeles. Shrub.

8 A. Malaba'rica (R. Br. in. bot. mag. t. 2071.) tomentosely villous; leaves oblong-lanceolate, narrowed at the base; whorls many-flowered, dense, or the cymes are ample, and at length elongated: floral leaves, bracteas, and subulate calycine teeth, very soft. ♄. S. Native of the hotter parts of Asia, in humid places by the sides of rivulets; as of the Indian Peninsula, Burman Empire, Mauritius, Penang, Java, Malabar, &c. Hook. journ. bot. 1. p. 225. t. 127. Népeta Malabárica, Lin. mant. 566. A'juga fruticòsa, Roxb. fl. ind. 3. p. 1. Stàchys Malabárica, Sieb. fl. maur. exc.—Rheed. mal. 10. p. 185. t. 93.? Branches canescent from short tomentum. Leaves 2-4 inches long, obtuse, serrately crenated in the upper part, quite entire at the base. Whorls distant, disposed in simple racemes. Corolla rose-coloured or purplish: throat of corolla and filaments pilose. Odour of *Stàchys sylvàtica*.

Malabar Anisomeles. Fl. July, Aug. Clt. 1817. Shrub 2 to 5 feet.

Cult. The species are of the most easy culture and propagation. A light rich soil answers them well; and cuttings strike root readily in the same kind of soil.

LXXX. GALEO'PSIS (from γαλη, *gale*, a weasel; and οψις, *opsis*, resemblance; the mouth of the corolla gaping like that of an animal.) Lin. gen. no. 717. Schreb. gen. no. 972. Juss. gen. p. 114. Benth. lab. p. 523. Tetràhit. Dill. gen. 3-4. Mœnch. meth.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate, somewhat 5-nerved, with a nearly equal mouth and 5 nearly equal teeth, or the superior teeth are the longest, somewhat spinescent at apex. Corolla with an exserted tube, which is naked inside, a dilated throat, and a bilabiate limb; upper lip ovate, entire, arched; lower lip spreading, trifid: the lateral lobes ovate, and the middle lobe obcordate or somewhat bifid; palate furnished with an elevated tooth above, at the recess of the lobes. Stamens 4, ascending, the lower two the longest; anthers 2-celled: cells opposite, transversely and bivalvately dehiscent; inner valve roundish, with ciliated edges: outer one larger and naked. Style about equally bifid at top; lobes subulate, stigmatiferous at apex.—Annual divaricately branched erect herbs, rarely decumbent at the base. Floral leaves almost similar to the cauline leaves. Whorls numerous, many-flowered, distinct. Flowers red or cream-coloured, or variegated with both these colours. This genus is readily distinguished from all other labiate genera in the structure of the anthers.

1 G. ochroleu'ca (Lam. dict. 2. p. 600.) stem pubescent; leaves oblong or oblong-lanceolate, clothed with soft villi on both surfaces; calyx clothed with glandular villi. ⊙. H. Native of Middle Europe; as of Britain, France, and Germany, in sandy corn-fields; in England, as in Cambridgeshire, Nottinghamshire, Yorkshire, Lancashire, and about Bangor in Wales, Rchb. icon. bot. eur. 1. p. 40. t. 46. G. villòsa, Smith, fl. brit. 2. p. 629. engl. bot. t. 2353. G. grandiflòra, Gmel. syst. p. 905. G. prostràta, Vill. dauph. 2. p. 388. G. dùbia, Leers herb. no. 453. Tetràhit longiflòrum, Mœnch, meth. p. 395. G. ségetum, Rchb. ex Steud. nom. p. 351. G. Ládanum, màjus Krok. fl. siles, no. 932. Stems often decumbent at the base. The whole plant generally clothed with glandular hairs. Corollas large, cream-coloured.

Cream-coloured flowered Hemp Nettle. Fl. July, Aug. Britain. Pl. 1 foot.

2 G. La'danum (Lin. spec. p. 810.) stem glabrous or pubescent; leaves oblong-lanceolate, clothed with short tomentose pubescence on both surfaces; calyxes clothed with adpressed pubescence and glandless pili. ⊙. H. Native throughout Europe, from Sweden and Scotland to Spain, Italy, South of Russia and the Caucasus; a common weed in corn fields, plentiful in Britain, Smith, engl. bot. t. 884. G. canéscens, Schultes, obs. p. 108.? G. angustifòlia, Ehrh. Tetràhit Ládanum, Mœnch, meth. 394. —Petiv. brit. t. 33. f. 11.—Mor. hist. 3. p. 386. sect. 11. t. 12. f. 18. Plant erect. Branches purplish. Leaves remotely serrate-crenated. Whorls few at the tops of the branches, 6-10-flowered. Corolla red, having the tube and throat generally spotted with yellow: sometimes not above half again as long as the calyx, and sometimes 2 or 3 times as long, pubescent outside.

Var. β, parviflòra, (Benth. lab. p. 523.) corolla about half again as long as the calyx. ⊙. H. G. parviflòra, Lam. dict. 2. p. 600. G. intermèdia, Vill. fl. dauph. 2. p. 387. t. 9. Rchb. icon. bot. eur. 1. p. 40. t. 46. G. latifòlia, Hoffm. fl. germ. 4-8. ex D. C. fl. fr. 3. p. 544.

Var. γ, spinòsa (Benth. lab. p. 523.) calycine teeth longer and spinose. ⊙. H. G. angustifòlia, Hoffm. fl. germ. 4-8. ex D. C. fl. fr. 3. p. 543.

Ladanum Hemp Nettle. Fl. July, Sept. Britain. Pl. 1 foot.

3 G. Tetra'hit (Lin. spec. p. 810.) stem usually hairy, from stiff bristles or pili, and tumid at the nodi; leaves ovate, and are, as well as the calyxes, glabrous or hairy. ⊙. H. Native throughout Europe and Middle Asia, by way-sides, in coppice-woods; in corn-fields and on their margins; plentiful in some parts of Britain. Tetràhit nodòsum, Mœnch, meth. p. 395. Leaves 1-3 inches long, pilose. Whorls 6-30-flowered, distinct, or the upper ones approximate. Corolla sometimes shorter than the calycine teeth; sometimes 4 times as long, purplish, yellowish, or spotted with both colours.

Var. α, parviflòra, (Benth. lab. p. 524.) corolla 2-3 times as long as the calyx. ⊙. H. G. Tetràhit, Curt. fl. lond. 5. t. 191. Rchb. icon. bot. eur. 9. p. 28. t. 877. Smith, engl. bot. t. 207. G. bífida, Bonning. ex Lej. fl. belg. p. 241. Rchb. fl. germ. exc. p. 323. G. acuminàta, Rchb. fl. germ. exc. p. 323.—Riv. mon. irr. t. 31.—Petiv. herb. brit. t. 33. f. 8.—Mor. hist. t. 12. f. 13. Corolla purple or white, with a spot on the lower lip, variegated with purple and yellow.

Var. β, pubéscens (Benth. lab. p. 524.) stems scarcely hairy. ⊙. H. G. pubéscens, Besser. prim. fl. gal. 2. p. 27. Rchb. icon. bot. eur. 1. p. 40. and 41. t. 47-48. G. Walteriàna, Schlecht. fl. berol.

Var. γ, grandiflòra (Benth. lab. p. 524.) corollas 3-4 times as long as the calyxes. ⊙. H. G. versícolor, Lin. spec. p. 810. Curt. fl. lond. 6. t. 38. Rchb. icon. bot. eur. 1. p. 47. t. 57. G. cannábina, Poll. pal. no. 560. Fl. dan. 929. Willd. spec. 3. p. 393. G. speciòsa, Mill. dict. no. 3. Corolla cream-coloured; lower lip spotted with purple.

Tetrahit or Common Hemp Nettle. Fl. July, Aug. Britain. Pl. 1 to 3 feet.

Cult. All the species are common weeds in corn-fields; and are therefore only cultivated in botanical gardens.

LXXXI. STA'CHYS (from *σταχυς, stachys,* a spike, in reference to the spiked inflorescence.) Benth. lab. p. 525.—Stàchys and Betónica, Lin. and other authors.—Zietènia, Gleditsch, Pers. and other authors.—Erióstomum, Tetrahìtum and Trixàgo, Hoffm. et Link.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate, 5 or 10-nerved, with an equal or oblique 5-toothed mouth; teeth equal, or the superior ones are larger, or the 3 superior ones are combined into an upper lip. Corolla with an equal, inclosed or exserted tube, furnished with a transverse ring of hairs inside or naked, often incurved above; throat not dilated; limb balabiate; upper lip erect or spreading a little, usually arched a little, entire or scarcely emarginate, rarely elongated and flattish, emarginately bifid; lower lip usually longer, spreading, and 3-lobed; the middle segment large, entire, or emarginate. Stamens 4, ascending, exserted; lower 2 the longest; filaments naked; anthers approximate, 2-celled: cells distinct, parallel, diverging or divaricate. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, obtuse, not truncate.—Herbs or subshrubs. Whorls 2 or many-flowered, usually disposed in terminal, nearly simple racemes.

Sect. I. Alopecu'ros (from *αλωπηξ, alopex,* a fox, and *ουρα, oura,* a tail; resemblance in spikes of flowers.) Benth. lab. p. 531.—Betónica species, Lin. and other authors. A perennial villous green herb. Whorls fasciculately many-flowered, approximating into somewhat interrupted spikes. Outer bracteas about equal in length to the calyxes. Corollas yellowish; tube inclosed. Cells of anthers parallel.

1 S. alopecu'ros (Benth. lab. p. 531.) plant ascending, villous; leaves petiolate, broad-ovate, obtuse, crenated, broad-cordate at the base: lower floral leaves sessile, similar to the upper ones, but broader: upper ones and bracteas broad-ovate, acute; corolla one half longer than the calyx, which is amply campanulate. ♃. H. Native of South and Middle Europe, on the mountains; as of the Pyrenees, Cevennes, Switzerland, Austria, Provence, Piedmont, Naples, Mount Parnassus. Betónica alopecùros, Lin. spec. p. 811. Jacq. fl. austr. 1. p. 50. t. 78. Rchb. icon. bot. eur. 8. 4. t. 719. Betónica lùtea, Mill. dict. no. 7. Sideritis alopecùros, Scop. carn. no. 711. t. 28. Spikes an inch in diameter. Whorls 20-30-flowered. Corollas cream-coloured, downy outside.

Fox-tail-spiked Betony. Fl. July. Clt. 1759. Pl. 1 to 1½ foot.

Sect. II. Betónica (betonic is the Celtic name of common betony.) Benth. lab. p. 532. Betónica species of Lin. and other authors. Pilose, pubescent, or villous perennial herbs. Whorls fasciculately many-flowered, approximating into subinterrupted spikes. Outer bracteas equalling the calyxes. Corollas purplish, rarely cream-coloured; tube usually exserted; cells of anthers subparallel.

2 S. densiflòra (Benth. lab. p. 532.) erect, hairy; leaves petiolate, ovate-oblong, obtuse, crenated, cordate at the base: lower floral leaves cordate-ovate, on short petioles: superior ones bractea-formed, and are, as well as the bracteas, ovate-lanceolate, mucronate, equalling the calyxes; whorls approximating into a dense oblong spike: the lower whorls remote; corolla twice as long as the calyx. ♃. H. Native of the South of Europe in subalpine places; as of Spain, Pyrenees, Switzerland, Appennines, Naples, Hungary, Caucasus. Betónica Monnièri, Osb. p. 146. Gouan, ill. p. 36. Betónica hirsùta, Lin. mant. 248. Murr. comm. gœtt. 1779. vol. 2. p. 13. t. 3. Rchb. icon. bot. eur. 8-5. t. 714. Betónica Dánica, Mill. dict. no. 2. Betónica incàna, Ait. hort. kew. 2. p. 293. Sims. bot. mag. 2125. Rchb. icon. bot. eur. 8. p. 5. t. 713.—Barrel. icon. t. 340. Stems nearly simple. Leaves 2-3 inches long, and 1 to 1½ broad. Spikes thick, dense. Corollas villous outside, purplish, tube exannulate inside. Calycine teeth spinose; superior ones rather the largest.

Dense-flowered Betony. Fl. June, July. Clt. 1710. Pl. 1½ foot.

3 S. Betónica (Benth. lab. p. 532.) erect, rather pilose; lower leaves on long petioles, ovate-oblong, obtuse, crenated, cordate at the base: superior leaves remote, and are, as well as the lower floral leaves, sessile, oblong-lanceolate, acute, toothed: uppermost ones linear, quite entire, equalling the calyxes; whorls many-flowered, all approximate into an oblong subinterrupted spike, or the lower whorls are distinct; bracteas ovate, mucronate, equalling the calyxes; corolla twice as long as the calyx. ♃. H. Native throughout Europe and Russian Asia, in woods, heaths, and pastures, among bushes; plentiful in Britain, in like situations. Betónica officinàlis, Lin. spec. p. 810. Hook. fl. lond. vol. 2. with a figure. Smith, engl. bot. t. 1142. Fl. dan. 726. Rchb. icon. bot. eur. 8. p. 54. t. 710. Betónica hírta, Leyss. Rchb. icon. bot. eur. 8. p. 4. t. 711. Betónica legítima, Link, handb. p. 476. Betónica stricta, Ait. hort. kew. 2. p.

299. Rchb. icon. bot. eur. 8. p. 5. t. 712. Betónica alpìna, Mill. dict. no. 3. Betónica foliòsa, Presl. fl. sic. 37. ? Betónica affìnis, Wender. in bot. zeit. 1826. 1. p. 353. Betónica serótina, Host, fl. austr. vol. 2. Betónica divúlsa, Tenore, syll. fl. nap. append. p. 641. ?—Sabb. hort. rom. t. 82.—Riv. mon. irr. t. 28. —Mor. hist. sect. 11. t. 5. f. 1.—Petiv. herb. brit. t. 32. f. 6. Very like *S. densiflòra*, but differs in the more slender stems, longer petioles, remote smaller leaves, the more starved spike, &c. Corolla purple or white. Betony was formerly much used in medicine, but it is discarded from present practice. When fresh it intoxicates. The leaves and flowers, according to Lewis, have a herbaceous, roughish, and somewhat bitterish taste, with a weak aromatic flavour. An infusion of them or light decoction may be drunk as tea. The roots are bitter and very nauseous ; in small doses they act as an emetic and aperient. The plant dyes wool of a fine dark yellow colour.

Var. β, màjor (Benth. lab. p. 532.) spike elongated and thicker, and the habit more like that of *S. densiflòra*, but the superior leaves are lanceolate, not ovate. ♃. H. This is the garden variety.

Betony, Common. Fl. July, Sept. Britain. Pl. 1 to 1½ foot.

4 S. longifòlia (Benth. lab. p. 533.) erect, villous ; leaves petiolate, oblong-lanceolate, obtuse, crenated, deeply cordate at the base : lower floral leaves similar to the rest, sessile : upper floral ones bractea-formed, and are, as well as the bracteas, ovate-lanceolate, acuminated, shorter than the calyxes ; whorls many-flowered : lower ones remote : upper ones approximate into a cylindrical spike ; corolla twice as long as the calyx, which is tubular. ♃. H. Native of Caucasus. Betónica orientàlis, Lin. spec. p. 811. Lam. ill. t. 507. f. 2. ? Leaves 4-6 inches long, and ½ but scarcely 1 inch broad, deeply and hastately cordate at the base. Spike loosish, ½ foot long, interrupted at the base. Corollas reddish, purple ; tube exannulate inside.

Long-leaved Betony. Fl. June, July. Clt. 1737. Pl. 1 to 2 feet.

5 S. grandiflòra (Benth. lab. p. 533.) erect, villous ; leaves petiolate, broad-ovate, obtuse, crenated, broadly cordate at the base : floral leaves sessile, stem-clasping, almost similar to the rest, gradually becoming smaller as they ascend, till the upper ones become almost bractea-formed ; whorls many-flowered, distinct : the lower ones remote ; bracteas ovate-lanceolate, acute, longer than the calyxes ; corolla about 3 times as long as the calyx, which is tubularly campanulate : throat dilated. ♃. H. Native of Siberia, at the river Terek ; also of Caucasus. Betónica grandiflòra, Willd. spec. 3. p. 96. Curt. bot. mag. t. 700. Rchb. icon. bot. eur. 8. p. 6. t. 715. Betónica orientàlis, Thuil. fl. par. p. 293. but not of Lin. Whorls 10-20-flowered. Corolla violaceous, 12-14 lines long, glabrous ; tube exannulate inside.

Great-flowered Betony. Fl. June, July. Clt. 1803. Pl. 1 foot.

6 S. di'scolor (Benth. lab. p. 533.) ascending, villous ; leaves petiolate, oblong-lanceolate, deeply crenated, wrinkled above and hairy, but clothed with white wool beneath : lower floral leaves similar to the rest, sessile : upper floral leaves bractea-formed, lanceolate, equalling the calyxes ; whorls many-flowered, rather distinct, few ; corolla more than twice as long as the calyx, which is tubularly campanulate : throat dilated. ♃. H. Native of Eastern Caucasus, in stony places. Betónica nívea, Stev. in mem. soc. mat. car. mosq. 3. p. 266. Betónica macroùra, Otto. ? This is a very elegant species, of the size, and with the flowers of *S. grandiflòra*. Leaves form of those of *S. hirsùta*, green above. Calyx woolly. Corollas large.

Var. α, ròsea ; flowers rose-coloured. ♃. H.

Var. β, ochroleùca ; flowers cream-coloured. ♃. H.

Two-coloured-leaved Betony. Fl. June, July. Clt. 1820. Pl. 1 to 1½ foot.

Sect. II. Eriósтachys (from *ερτον, erion*, wool, and *σταχυς, stachys*, a spike ; spikes woolly.) Benth. lab. p. 534. Erióstachys species. Rchb. fl. germ. exc. p. 319. Erióstomum, Hoffm. et Link, fl. port. Perennial or biennial herbs, clothed with soft villi or wool. Whorls many-flowered. Outer bracteas alone equalling the calyxes or hardly shorter than them.

7 S. Hera'clea (All. ped. 1. p. 31. t. 84. f. 1.) erect, woolly from very long hairs ; leaves petiolate, oblong, obtuse, crenated, subcordate at the base : floral leaves very broadly ovate, quite entire, and broadly cordate at the base, scarcely exceeding the calyxes ; whorls many-flowered, distinct ; bracteas ovate or oblong : outer ones equalling the calyxes ; calyx woolly, with ovate, very acute subspinose teeth. ♃. H. Native of Europe, in the region of the Mediterranean, in dry uncultivated places ; as of Spain, Eastern Pyrenees, France about Rhodes, Provence, Piedmont, Italy, Sicily, &c. Sideritis Heráclea, Col. ecphr. 1. t. 131. ex Allion. S. intermèdia, Tenore, fl. nap. p. 34. ex. D. C. but not of Ait. S. barbàta, Lapeyr, abr. p. 336. S. phlomoìdes, Willd. enum. suppl. p. 41. Betónica Heráclea, Lin. syst. 535. mant. p. 83. Stems many, from a thick perennial base. Cauline leaves 2-5 inches long, and hardly 1 inch broad. Racemes simple. Corolla twice as long as the calyx, purple, form of that of *S. Germánica*.

Var. β, lùtea (Benth. lab. p. 534.) flowers yellow. ♃. H. Native of Croatia, Dalmatia, and near Constantinople. S. obliqua, Waldst. et Kit. hung. 2. p. 142. t. 134. S. Crética, Forsk. fl. const. p. 28. but not of Lin. S. orientàlis, Vahl. symb. 2. p. 64. Sibth. et Smith, fl. græc. 6. p. 48. t. 134. This only differs from the species in the colour of the flowers.

Heraclean Hedge Nettle. Fl. June, July. Clt. 1816. Pl. 1 foot.

8 S. molli'ssima (Willd. hort. berol. 60. t. 60.) humble, erect, clothed with soft villi ; leaves petiolate, broad-ovate, crenated. cordate at the base, wrinkled, greenish on both surfaces, very villous ; whorls many-flowered ; bracteas linear, equalling the calyxes ; calyx campanulate, villous, with acute, rather spinose teeth ; corolla pubescent outside, half again as long as the calyx. ♃. H. Native of Spain, and of the Island of Corfu. Leaves like those of *S. alpìna*, but smaller. Corollas pale purple. ?

Very soft Hedge Nettle. Fl. July, Aug. Clt. 1806. Pl. ½ to ¾ foot.

9 S. pu'mila (Russ. nat. hist. alep. 2. p. 255. t. 10.) perennial or suffruticose, humble ; leaves almost radical, petiolate, ovate, obtuse, cordate at the base, wrinkled, clothed with hoary tomentum on both surfaces ; whorls few, many-flowered ; outer bracteas about equal in length to the calyxes ; calyx nearly glabrous, with lanceolate-subulate teeth, which are about equal in length to the tube. ♃. or ♄. F. Native of Syria, near Aleppo, Russell. Stems rising from a short woody base. Radical leaves almost like those of *Sálvia pomífera*. Floriferous branches 2-4 inches high, bearing 2-4 whorls. Floral leaves roundish, wrinkled. Whorls 15-20-flowered.

Dwarf Hedge Nettle. Pl. ¼ to ½ foot.

10 S. Swainsònii (Benth. lab. p. 535.) herbaceous, ? pilosely woolly, procumbent at the base, much branched ; leaves petiolate, ovate, obtuse, crenated, rounded at the base, wrinkled, very soft ; whorls 2-10-flowered ; bracteas one half shorter than the calyxes, rarely minute ; calyx campanulate, villous, with lanceolate, very acute, rather spinose teeth ; corolla twice as long as the calyx. ♃. ? H. Native of Greece, on Mount Parnassus, Swainson ; Ithaca, P. B. Webb. Pràsium hirsùtum, Poir. dict. 5. p. 611. This species is allied to sect. *Zietènia*. Leaves about ½ an inch long. Racemes dense. Corolla villous outside. Ring of tube rather oblique.

Swainson's Hedge Nettle. Pl. ½ foot.

11 S. Zuccari'nii (Benth. lab. p. 535.) herbaceous, silky and woolly from adpressed pili; branches elongated, erect, a little branched; leaves few, linear, quite entire; whorls 2-flowered; bracteas shorter than the calyxes; calyx tubularly campanulate, with spinose teeth, which exceed the tube of the corolla. ♃.? H. Native of Greece, Zuccarini. Branches almost naked. Leaves scarcely an inch long, acutish: floral leaves small, sessile, lanceolate. Calyxes sessile.

Zuccarini's Woundwort. Pl. 2 to 3 feet.

12 S. lana'ta (Jacq. icon. rar. 1. p. 11. t. 107.) clothed with dense silky wool; leaves oblong-elliptic, narrowed at both ends, scarcely crenulated, wrinkled: floral leaves smaller: upper floral leaves shorter than the whorls; whorls many-flowered, the uppermost ones approximating into a spike; bracteas linear-lanceolate, about equal in length to the calyxes; calyx incurved, with scarcely unequal acute mutic teeth which are woolly inside; corolla woolly outside, with an inclosed tube. ♃. H. Native of Tauria, in dry exposed fields, plentiful, and throughout Caucasus. Erióstomum lanàtum, Hoffm. nachtr. 1. p. 60. Leaves thick. Whorls above, 30-flowered. Corollas purple, smaller than in *S. Germánica*.

Woolly Woundwort. Fl. June, Sept. Clt. 1782. Pl. 1 to 1½ foot.

13 S. Ita'lica (Mill. dict. no. 3.) erect, clothed with hoary tomentum; leaves nearly sessile or on short petioles, oblong-lanceolate, narrow, obtuse, crenulated, narrowed at the base, rarely subcordate, wrinkled: floral leaves ovate-lanceolate, quite entire, rather longer than the whorls; whorls many-flowered, distinct: upper ones approximate; bracteas linear-lanceolate, equalling the calyxes; calyx a little incurved, with acute spinose teeth, which are densely woolly inside; corolla woolly outside, with an inclosed tube. ♃. H. Native of Europe, in the region of the Mediterranean; as of Italy, Etruria, and near Parma. S. salviæfòlia, Tenore, fl. nap. 2. p. 23. t. 53. syll. p. 291. Erióstomum salviæfòlium, Presl. fl. sic. p. 37. This species differs from *S. Germánica* in the more humble stature, narrower leaves, which are rarely cordate at the base, and more tomentose than woolly. Corollas purplish.

Var. β, *púngens* (Benth. lab. p. 537.) plant more humble; leaves fewer; whorls few, spicate at the tops of the stems. ♃. H. Native of Dalmatia, at Zara; Syria, near Aleppo. S. púngens, Russel, nat. hist. alep. S. salviæfòlia, Vis. pl. dalm. Sideritis hirsùta, Sieb. pl. cret. exs.

Italian Woundwort. Fl. June, July. Clt.? Pl. 1 to 1½ foot.

14 S. Germa'nica (Lin. spec. 812.) herbaceous, tall, clothed with loose white wool; cauline leaves petiolate, ovate or ovate-lanceolate, obtuse, usually cordate at the base, crenated; lower floral leaves sessile, half stem-clasping, crenated, the uppermost ones lanceolate, acute, and quite entire, rather longer than the whorls; whorls many-flowered, distinct, racemose: upper whorls approximate; bracteas linear-lanceolate, equalling the calyxes; calyx a little incurved, with acute, rather spinose teeth, woolly inside, upper teeth the largest; corolla woolly outside, with an inclosed tube. ♃. H. Native of Europe, Middle Asia, and North Africa, in dry, arid, and stony places; in several parts of England, but hardly indigenous. Jacq. fl. austr. 4. p. 10. t. 319. Smith, engl. bot. t. 829. Bot. reg. t. 1289. Rchb. icon. bot. eur. 10. p. 18. t. 950. Oed. fl. dan. t. 684. S. lanàta, Crantz, austr. 267, but not of Jacq. Erióstomum Germánicum, Hoffm. et Link, fl. port. S. tomentòsa, Gat. fl. mont. p. 107. S. Crética, Lin. syst. 812.? Sibth. et Smith, fl. græc. 6. p. 47. t. 558. Walth. hort. p. 108. t. 19. S. spectábilis, Choisy, in D. C. pl. rar. hort. gen. 1. p. 27. S. dasyántha, Rafin. prec. des. decouv. p. 39. S. biénnis, Roth, Rchb. icon. bot. eur. 10. p. 17. t. 949. Pannónica, Lang. pl. exs. S. argéntea, Tausch, in bot. zeit. 1831. 1. p. 217. S. álba, Mill. dict. no. 4.? S. heterophýlla, Mœnch. ex Steud. nom. p. 806. S. cinèrea, S. elongàta, S. excélsa, S. intermèdia, S. orientàlis, S. Sibírica, S. verbascifòlia, &c. Hortul. S. montàna, Riv. mon. irr. t. 27. f. 1.—Barrel. icon. t. 297. This species is very variable in wooliness and size of flowers. Whorls 15-20-flowered. Corollas reddish purple.

German Woundwort or Hedge Nettle. Fl. July. Britain. Pl. 1 to 4 feet.

15 S. floccòsa (Benth. lab. p. 739.) herbaceous; stem tall, clothed with dense floccose wool; cauline leaves petiolate, ovate-lanceolate, obtuse, crenated, cordate at the base, clothed with soft villi above, and dense white floccose wool beneath: lower floral leaves crenulated: superior ones lanceolate, quite entire, pungent, rather shorter than the calyxes; whorls many-flowered, distinct, racemose: upper ones approximate; bracteas lanceolate, equalling the calyxes; calyx a little incurved, with acute pungent teeth, which are rather woolly inside, the upper teeth the largest; tube of corolla inclosed. ♃. H. Native of the North of India, on the mountains near Hirpur, Jacquemont. This species differs from its nearest allies, *S. Germánica* and *S. lanàta*, in the leaves being deeply cordate at the base, and in the wool of the stem and lower surfaces of the leaves being dense and floccose, not long and silky.

Floccose Woundwort. Pl. 1 to 3 feet.

16 S. alpi'na (Lin. spec. p. 812.) herbaceous, tall; stem erect, pilose, rather woolly; leaves petiolate, ovate, serrately crenated, cordate at the base, green on both surfaces, villous: floral leaves narrower, gradually becoming smaller as they ascend, acute, serrated; whorls all remote, many-flowered; bracteas linear, about equal in length to the calyxes; calyx rather pilose, with lanceolate-ovate acute spinose teeth; corolla woolly outside, about twice as long as the calyx. ♃. H. Native of the mountainous parts of Europe; as of the Pyrenees, France, Switzerland, Upper Italy, Germany, &c. Lapeyr. fl. pyr. 1. p. 14. t. 8. Erióstonum alpìnum, Hoffm. et Link, fl. port.—Sabb. hort. rom. 3. t. 41. This plant varies much in gardens, but is at all times readily distinguished from *S. Germánica* in the leaves being green on both surfaces, in the whorls being fewer and more remote, and in the raceme being much less woolly. Corollas, like those of *S. Germánica*, obscure purple, or reddish brown.

Var. β, *intermèdia* (Benth. lab. p. 537.) larger; leaves more wrinkled, rather woolly beneath. ♃. H. Native of Caucasus and Siberia. S. intermèdia, Ait. hort. kew. 2. p. 209. S. Crética, Lin. spec. p. 812. from the description. S. orientàlis, Lin. spec. p. 813. S. Sibírica, Link, enum. 2. p. 109. Sweet, fl. gard. t. 100. S. curviflòra, Tausch, in bot. zeit. 1831. 1. p. 216. S. urticæfòlia, Tausch, l. c. S. fúsca, Mœnch.?

Alpine Woundwort. Fl. July, Aug. Clt. 1597. Pl. 1 to 3 feet.

17 S. seri'cea (Wall. pl. rar. asiat. 1. p. 64. Benth. lab. p. 537.) herbaceous, tall; stem erect, very pilose; leaves petiolate, ovate or ovate-oblong, bluntish, crenated, cordate at the base, villous on both surfaces, green above, pale or hoary beneath, clothed with silky wool while young; whorls all distant, 10-15-flowered; bracteas linear, about equal in length to the calyxes; calyx woolly, with ovate-lanceolate very acute spinose teeth. ♃. H. Native of Central Asia, on the mountains; Caucasus, on the Talusch mountains, in woods; Persia, on the mountains of Gilan; Nipaul, Kamaoon, and Himalaya. S. Pérsica, Gmel. jun. ex Meyer, verz. pflanz. p. 94. Hardly distinct from *S. alpìna*, unless in being more villous, and in there being fewer flowers in

each whorl. Racemes many-flowered, woolly from long loose hairs. Leaves white from wool beneath, or green on both surfaces.

Silky Woundwort. Pl. 1 to 2 feet.?

18 S. setífera (Meyer, verz. pflanz. p. 94.) herbaceous, tall; stem erect, pilose, rather woolly; leaves on short petioles, oblong or oblong-lanceolate, rounded at the base: floral leaves gradually smaller as they ascend, all green on both surfaces, wrinkled, clothed with soft villi, aristately mucronate at apex; whorls many-flowered, distant; bracteas lanceolate, awned; calyx villous, with lanceolate, acute, spinose teeth; corolla downy outside, exceeding the calyx a little. ♃. H. Native of Caucasus, on the Talusch mountains, in rather humid places near Swant. Allied to *S. sericea*, but differs in the leaves being nearly sessile, narrow, awned, and in the corollas being more glabrous.

Bristle-bearing Woundwort. Pl. 1 to 2 feet.?

19 S. vestíta (Benth. lab. p. 538.) herbaceous, erect, clothed with soft white villi; leaves nearly sessile, ovate-lanceolate, obtuse, crenulated, cordate at the base, thick, wrinkled, densely clothed with white wool beneath: floral leaves lanceolate, acute, reflexed: upper ones scarcely exceeding the calyxes; whorls about 10-flowered, all distant; bracteas linear, one-half shorter than the calyxes; calyx villous, with lanceolate-acute rather spinose teeth; corolla pubescent outside, about twice as long as the calyx. ♃.? H. Native of Nipaul. Nearly allied to *S. oblongifòlia*, but differs from it in the thick woolly leaves and shorter bracteas. Leaves 1 to 1½ inch long, green above. Tube of corolla scarcely exserted.

Clothed Woundwort. Pl. 1 to 1½ foot.

20 S. melissæfòlia (Benth. lab. p. 538.) herbaceous; branches divaricate, pubescent from soft hairs; leaves petiolate, broad-ovate, obtuse, crenated, wrinkled, green on both surfaces, nearly glabrous or pubescent: upper floral leaves shorter than the calyxes; whorls about 10-flowered, rather remote, or the upper ones are approximate; bracteas linear, one half shorter than the calyxes; calyx ovate-campanulate, pubescent, with acute, but not spinose teeth; corolla pubescent outside, about twice as long as the calyx. ♃.? H. Native of Nipaul. Allied to *S. splèndens*, but more glabrous, and the flowers fewer, and about half the size. Leaves 1½ to 2 inches long, and about 1 inch broad, thin. Racemes branched a little. Corolla purplish: tube slender, incurved.

Balm-leaved Woundwort. Pl.

21 S. splé'ndens (Wall. pl. rar. asiat. 1. p. 64.) herbaceous, tall; stem erect, pilose; leaves petiolate, ovate, serrately crenated, cordate at the base, wrinkled, villous, green on both surfaces: floral leaves similar to the rest, sessile, gradually becoming smaller as they ascend; whorls about 10-flowered, remote; bracteas linear, shorter than the calyxes; calyx pubescent, with bluntish mutic unequal teeth; corolla more than twice as long as the calyx: tube exserted, incurved. ♃.? H. Native of Gosaingsthan, on the mountains, Wall; mountains of Mussooree, and throughout the Himalaya range, Royle. Allied to *S. alpìna*, but less villous; flowers fewer in the whorls, and the bracteas shorter.

Shining Woundwort. Pl. tall.

Sect. III. Calo'stachys (from καλος, *kalos*, beautiful; and σταχυς, *stachys*, a spike; in reference to the beauty of the flowers.) Benth. lab. p. 539.—Perennial glabrous or villous herbs. Stems often furnished with obverse pili or prickles on the angles. Whorls about 6-flowered. Bracteas minute. Calycine teeth very acute or rather spinescent. Corolla scarlet or purple, with a much exserted tube. Cells of anthers diverging or divaricate.

22 S. cocci'nea (Jacq. hort. schœnbr. 3. p. 18. t. 284.) herbaceous, erect, clothed with soft villi; leaves petiolate, ovate-lanceolate, bluntish, crenated, cordate at the base; racemes elongated; whorls 6-flowered, all distant; bracteas almost wanting; corolla pubescent, about 3 times as long as the tube. ♃. G. Native of Mexico. Curt. bot. mag. t. 666. Andr. bot. rep. t. 310. Leaves 2 inches long: floral leaves sessile, with submucronate crenatures; upper ones longer than the calyxes, ending in spinose mucrones. Corolla beautiful scarlet, pubescent, an inch long.

Scarlet-flowered Hedge Nettle. Fl. June, Aug. Clt. 1798. Pl. 2 to 3 feet.

23 S. cilia'ta (Dougl. mss. ex Benth. lab. p. 539.) herbaceous, erect, nearly glabrous; angles of stems obversely ciliated; leaves petiolate, ovate, shortly acuminated, crenated, cordate at the base, glabrous or rather hispid from a few hairs above; whorls 6-flowered, upper ones approximate; bracteas almost absent; corolla almost glabrous, 3 or 4 times longer than the calyx. ♃. H. Native of North-west America, along the banks of the Columbia, Douglas and Scouler. Leaves 2-3 inches long; petioles ciliated. Corolla smoothish, purple, nearly an inch long.

Ciliated-stemmed Hedge Nettle. Pl. 3 to 4 feet.

24 S. Thunbe'rgii (Benth. lab. p. 540.) herbaceous, erect?; angles of stem beset with obverse prickles; leaves petiolate, ovate, acuminated, crenated, cordate at the base, coriaceous, prickly on the nerves beneath, glabrous on both surfaces or hispid from long hairs; whorls 6-flowered, distant; bracteas almost wanting; corolla more than twice as long as the calyx, which is quite glabrous. ♃. G. Native of the Cape of Good Hope. Galeópsis híspida, Thunb. prod. fl. cap. p. 96. Habit of *S. boraginoìdes*. Stems procumbent or erect. Corolla glabrous, red, similar to those of *S. ciliàta*.

Thunberg's Hedge Nettle. Pl. procumbent.?

25 S. boraginoìdes (Schiede et Deppe, in Linnæa, 5. p. 100.) herbaceous, erect; angles of stem beset with obverse prickles; leaves petiolate, ovate, acute, crenated, cordate at the base, green on both surfaces, hairy and prickly on the nerves beneath; whorls 6-flowered, distant; bracteas almost wanting; calyx pilosely pubescent; corolla 4 times as long as the tube. ♃.? G. Native of Mexico, in shady places; on Mount Macultepec, and towards San Andres. Habit of *S. ciliàta*. Leaves 1-2 inches long. Corollas and calyxes form and size of those of *S. coccinea*.

Borago-like Hedge Nettle. Pl. 2 to 3 feet.

26 S. Chamissònis (Benth. in Linnæa, 6. p. 80.) herbaceous, erect; angles of stem obversely ciliated; leaves petiolate, ovate, obtuse, crenated, cordate at the base, clothed with velvety wool on both surfaces; whorls 6-flowered, distant; bracteas almost wanting; corolla villous outside, 3 times as long as the calyx. ♃.? H. Native of California, Chamisso. Allied to *S. ciliàta*, but differs from it in the leaves, and very villous corollas, and in the calyxes being longer and hispidly pilose.

Chamisso's Hedge Nettle. Pl. 2 to 3 feet.?

27 S. Riede'ri (Cham. in Linnæa. 6. p. 570.) erect, simple; angles of stem obversely ciliated; leaves on short petioles, ovate-oblong: floral leaves ovate, subcordate, nearly sessile, all acute, serrately crenated, with scabrous margins; whorls 6-flowered: flowers sessile; calyx hispid, with the nerves prickly; corolla 3 times longer than the calyx. ♃.? H. Native of Kamtschatka, Rieder. Lower leaves 2 to 2½ inches long: middle cauline leaves 4-5 inches long. Corollas red. Habit and hispidity of *S. boraginoìdes*.

Rieder's Hedge Nettle. Pl. 2½ feet.

28 S. hirsu'ta (H. B. et Kunth, nov. gen. amer. p. 541.) stems ascending, hispid; leaves petiolate, ovate-oblong, acute, cordate, hairy on both surfaces, crenated; whorls about 6-flow-

ered, distant; tube of corolla twice as long as the calyx. ♃.? G. Native of Mexico, in bushy places on the mountains between Actopan and Totonilco. Leaves nearly an inch long; petioles hispid. Calyx pilose, with subulately acuminated segments. Corolla scarlet, downy outside.

Hairy Hedge Nettle. Pl. ½ foot.

Sect. IV. Stachyoty'pus (from *σταχυς*, *stachys*, a spike; and *τυπος*, *typos*, type; because this section is supposed to be the representative type of the genus; or in other words the true species of the genus.) Benth. lab. p. 541. Stachyotỳpus, Dumort, florul. belg. p. 45.—Campanístrum and Erióstachys species, Rchb. fl. germ. exc. p. 318.—Trixàgo et Stàchys, Hoffm. et Link, fl. port.—Annual or perennial, pilosely hispid or glabrous, rarely woolly herbs. Whorls usually about 6-flowered, rarely 2-4 or 10-15-flowered. Bracteas minute. Calycine segments usually subspinescent. Corolla purplish, red, or rosy-white, never cream-coloured; tube inclosed, or very shortly exserted.

§ 1. Genui'na (this section is supposed to contain the genuine or true species of the genus.) Benth. lab. p. 541. *Stems tall, erect, having the angles usually ciliated with long spreading or obverse pili, rarely glabrous. Leaves ovate or oblong-lanceolate, rarely amply ovate. Whorls* 6-10-*flowered. Corollas rather large; tube sometimes exserted.*

29 S. Mexica'na (Benth. lab. p. 541.) herbaceous, erect, tall; stems hairy from stiff pili; leaves ample, petiolate, ovate-oblong, crenated, cordate at the base, hispid on both surfaces: floral leaves sessile, exceeding the flowers; whorls 6-8-flowered, distant; calyx campanulate, hispid, with lanceolate acute rather spinose teeth; corolla nearly glabrous, twice as long as the calyx: tube exserted. ♃. H. Native of New Spain, Moçino et Sessé. Allied to *S. sylvàtica*, but the leaves are on shorter petioles, narrower and longer. Corolla larger, and the tube more ample; upper lip emarginate.

Mexican Hedge Nettle. Pl. tall.

30 S. sylva'tica (Lin. spec. p. 811.) herbaceous, erect, hispid; leaves on long petioles, ovate, acuminated, serrated, cordate at the base: floral leaves bractea-formed, scarcely longer than the calyxes; whorls about 6-8-flowered, distant; calyx campanulate, hispid, with lanceolate acute rather spinose teeth; corolla nearly glabrous, twice as long as the calyx, with an exserted tube. ♃. H. Native of Europe and Middle Asia, in shady places and woods; from Sweden to Spain and Italy; also of Tauria and Caucasus; in Britain frequent in hedges and other shady places. Smith, engl. bot. t. 416. Curt. lond. 3. t. 34. S. Canariénsis, Jacq. icon. rar. 1. p. 11. t. 108.—Sabb. hort. rom. 3. t. 38.—Riv. mon. irr. t. 26. f. 2. Roots creeping, but not extensively. Herb branched, hispid from long spreading hairs. Leaves large, coarsely and acutely toothed, green. Corolla purple, marbled about the orifice, 6 lines long, with a pilose ring near the base of the tube inside. The herb is pungent, with a fetid smell, approaching to that of black horehound. Being one of those plants which powerfully affect the nerves it might prove no contemptible stimulant if judiciously used, ex Smith. The herb will dye yellow.

Wild Hedge Nettle. Fl. July, Aug. Britain. Pl. 2 to 3 feet.

31 S. palu'stris (Lin. spec. p. 811.) herbaceous, erect; stems pubescent or beset with retrograde hairs; leaves nearly sessile, oblong, or ovate-lanceolate, serrately crenated, rounded at the base or cordate, wrinkled, hispid, or the lower ones are nearly glabrous; whorls 6 to 10-flowered, distinct, the upper ones subapproximate; calyx campanulate, hispid, with lanceolate acute rather spinose teeth; corolla twice as long as the calyx. ♃. H. Native throughout Europe, as well as of Asia and North America, in humid places; plentiful in Britain in marshes, on the banks of rivers, in watery places, by road-sides, and in corn-fields, especially if they are moist. Smith, engl. bot. t. 1675. Hook. fl. lond. vol. 2. icone. Curt. lond. 3. t. 35. S. ségetum, Hagen ex Rchb. fl. germ. exc. 319. S. affìnis, Bunge, enum. pl. chin. bot.—Riv. mon. t. 26. f. 1.—Blackw. herb. t. 273.—Petiv. herb. brit. t. 33. f. 9. Angles of stem ciliated with spreading hairs, the rest pubescent. Leaves 2-3 and sometimes 4-6 inches long, pubescent or hispid on both surfaces; lower ones sometimes glabrous. Corollas pale purple; lower lip variegated; tube about equal in length to the calyx. It behoves many farmers to know this plant, says Mr. Curtis, as a very noxious plant in many cornfields, increasing extensively by the roots, and also by seed. Linnæus says that swine are fond of the roots.

Var. β, *angustifòlia* (Benth. lab. p. 542.) flowers smaller; calyxes rather mutic. ♃. H.

Var. γ, *hýbrida* (Benth. lab. p. 542.) leaves on long petioles; corolla subexserted. ♃. H. Native of Britain in moist places. S. ambígua, Smith, engl. bot. t. 2089. Rchb. icon. bot. eur. 3. p. 20. t. 222. Plant 1-2 feet high.

Marsh Hedge Nettle, or Clown's All-Heal. Fl. July, Aug. Britain. Pl. 2 to 4 feet.

32 S. Baicale'nsis (Fisch. ex Benth. lab. p. 543.) erect; stem beset with retrograde stiff hairs; leaves nearly sessile, oblong-linear, acutish, serrated, rounded at the base, hispid: floral leaves scarcely longer than the calyxes; whorls 6-flowered; lower ones remote: upper ones approximate into a dense thick oblong spike; calyx campanulate, hispid, with lanceolate very acute rather spinose teeth; corolla twice as long as the calyx. ♃. H. Native of Dahuria, Fischer; Eastern Siberia, Pallas. S. angustifòlia, Pall. herb. Stems nearly simple, with the sides glabrous, and the angles pilose. Leaves 2 inches long. Spikes densely hispid. Corollas like those of *S. palústris*.

Baical Hedge Nettle. Pl. 1 to 1½ foot.

33 S. a'spera (Michx. fl. bor. amer. 2. p. 5.? Benth. lab. p. 543.) erect; stem retrorsely hispid, rarely naked; leaves on short petioles, ovate-oblong or ovate-lanceolate, acute, serrated, rounded at the base, glabrous, or furnished with a few stiff hairs above: floral leaves lanceolate, acute, longer than the calyxes; whorls 6-10-flowered, distant; calyx tubularly campanulate, glabrous, ciliated, with lanceolate acute subspinose divaricate teeth; corolla about twice as long as the calyx. ♃.? H. Native of North America, in pastures by river-sides; from Canada to Carolina. S. arvénsis, Walt. fl. car. p. 162, but not of Lin. S. híspida, Pursh, fl. amer. sept. 2. p. 407. Habit of *S. palústris*. Stems glabrous on the sides, but having the angles, nerves of leaves, and petioles beset with retrograde stiff hairs. Leaves 3-4 inches long and 1½ broad. Corollas violaceous, glabrous, with a pilose ring inside.

Var. β *glabràta* (Benth. lab. p. 543.) angles of stem almost naked, or altogether glabrous. ♃. H. Native of Carolina and of China in the province of Tokeen, Reeves. *S. áspera*, Nutt. gen. amer. 2. p. 30.?

Rough Hedge Nettle. Fl. July, Aug. Clt. 1821. Pl. 2 to 3 feet.

34 S. hyssopifòlia (Michx. fl. bor. amer. 2. p. 4.? Benth. lab. p. 543.) plant ascending, quite glabrous, or the stems are beset with retrograde hairs on the angles; leaves nearly sessile, oblong-lanceolate, acutish, subserrated, narrowed a little at the base: floral leaves very acute, rather longer than the calyxes; whorls about 6-flowered, distinct, approximate into short racemes; calyx broadly campanulate, quite glabrous, with lanceolate very acute subspinose divaricate teeth; corolla glabrous, 2-3

times longer than the calyx. ♃. H. Native of North America, in humid meadows near Saint Louis, Drummond; Carolina, Walter. S. tenuifòlia, Willd. spec. p. 100.? S. palústris, Walt. fl. car. p. 162, but not of Lin. Stems procumbent at the base; branches ascending. Leaves 1-2 inches long, quite glabrous. Corolla violaceous; tube shortly exserted, with a pilose ring inside.

Hyssop-leaved Hedge Nettle. Pl. 1 to 1½ foot.

35 S. Chine'nsis (Bunge, pl. chin. bor. in mem. soc. peterb. vol. 2. p. 241.) tall, erect, nearly glabrous; angles of stem obversely pilose; leaves nearly sessile, oblong-lanceolate, subserrated, hispid above and glabrous beneath; whorls few, 6-flowered; bracteas minute; calyx elongated, campanulate, pilose, with lanceolate very acute rather spinose teeth; corolla hardly twice as long as the calyx. ♃. H. Native of the North of China, Bunge. Allied to *S. palústris*, *S. áspera*, *S. hyssopifòlia*. Leaves 3-4 inches long. Corolla red, pilose outside, with a pilose ring inside.

China Hedge Nettle. Pl. 2 to 3 feet.?

§ 2. Rudera'les (from *ruderalis*, of or belonging to rubbish; the species are generally found in waste places.) Benth. lab. p. 544. *Herbs usually perennial, erect, or ascending, rarely procumbent, hispid, villous or woolly, rarely glabrous. Whorls* 6, *rarely with so many as* 10 *flowers. Corolla rather large, with the lower lip half an inch long; having the tube always inclosed.*

36 S. albicau'lis (Lindl. in bot. reg. t. 1558.) erect, clothed with white wool at the base and viscid pubescence above; lower leaves petiolate: upper ones sessile, all lanceolate and coarsely toothed, roundly cuneated at the base or narrowed: floral leaves shorter than the calyxes; whorls 6-flowered, remote; calyx ovate-campanulate, clothed with viscid pubescence: teeth broad-lanceolate, acute, rather spinose; corolla glabrous, twice as long as the calyx. ♃. G. Native of the Andes of Chili, Macrae; in the Pampas about Buenos Ayres, Gillies. Leaves remote, 1-3 inches long. Corolla red, glabrous; tube a little exserted, furnished with a pilose ring inside.

White-stemmed Hedge Nettle. Fl. July, Aug. Clt. 1827. Pl. 2 to 3 feet.

37 S. oblongifòlia (Benth. in Wall. pl. rar. asiat. 1. p. 64. lab. p. 545.) erect or ascending, pubescent or villous; leaves on short petioles, oblong-lanceolate, acutish, serrated, subcordate at the base, villous: floral leaves longer than the calyxes; whorls about 6-flowered, distant; calyx tubularly campanulate, pubescent, with lanceolate very acute scarcely spinulose teeth; corolla one half longer than the calyx. ♃. G. Native of the mountains of Silhet. Leaves 1-2 inches long, densely villous or woolly beneath. Corolla violaceous, pubescent outside.

Oblong-leaved Hedge Nettle. Pl.?

38 S. ajugoi'des (Benth. in Linnæa. 6. p. 80. lab. 545.) erect, very hairy; leaves petiolate, oblong, obtuse, crenated, rounded at the base or cuneated, wrinkled: floral leaves conforming to the others; whorls few, 6-flowered, remote; calyx ovate-campanulate, hispid, with ovate acute rather spinose teeth; corolla glabrous, twice as long as the calyx. ♃. H. Native of California, Chamisso. Herb almost simple, and sometimes branched at the base. Leaves 1-2 inches long. Corollas like those of *S. Macræ'i*.

Ajuga-like Hedge Nettle. Pl. ¼ to ¾ foot.

39 S. sideritoi'des (Gill. mss. ex Benth. lab. p. 740.) perennial, ascending, clothed with silky pili; leaves oblong-lanceolate, serrated, narrowed a long way at the base, wrinkled, clothed with soft silky villi: floral leaves ovate-lanceolate: upper ones shorter than the calyxes; whorls 6-flowered, remote; calyx campanulate, hispid, with lanceolate-acute rather spinose teeth; corolla rather pilose, scarcely twice as long as the calyx. ♃. G. Native of Chili, on the Andes about Mendoza, Gillies. Habit of *S. arenària*, but the tube of the corolla is exannulate inside. Perhaps only a villous variety of *S. grandidentàta*.

Sideritis-like Hedge Nettle. Pl.?

40 S. grandidenta'ta (Lindl. in bot. reg. t. 1080.) perennial, erect, pilosely pubescent, hispid above; leaves petiolate, oblong-lanceolate, coarsely toothed, all roundly cuneated at the base or narrowed: upper floral leaves shorter than the calyxes; whorls 6-flowered, remote; calyx ovate-campanulate, hispid, with lanceolate-acute rather spinose teeth; corolla glabrous, twice as long as the calyx. ♃. G. Native of Chili, at Valparaiso, Macrae. Form of leaves and inflorescence that of *S. albicaúlis*. Corollas red or purple.

Large-toothed-leaved Hedge Nettle. Fl. July, Aug. Clt. 1827, Pl. 1 to 3 feet.

41 S. Macræ'i (Benth. lab. 6. p. 78. lab. p. 545.) erect or ascending, pilosely hispid; leaves petiolate, ovate or ovate-lanceolate, obtuse, crenated: lower ones cordate at the base: upper ones roundly cuneated at the base: upper floral leaves sessile, shorter than the calyxes; whorls 6-flowered, remote; calyx ovate-campanulate, hispid, with lanceolate-acute rather spinose teeth; corolla glabrous, twice as long as the calyx. ♃.? G. Native of Chili, at Valparaiso, and of California. Hook. et Arn. in Beech. voy. pt. bot. p. 155, but not of Benth. Very nearly allied to the preceding. Corolla violaceous.

Macrae's Hedge Nettle. Pl. ½ to 1 foot.?

42 S. Bridge'sii (Benth. lab. p. 546.) erect, clothed with soft white villi or wool; leaves petiolate, ovate, obtuse, crenated, subcordate at the base, wrinkled: floral leaves sessile: upper ones rather shorter than the calyxes; whorls 6-flowered, remote: calyx ovate-campanulate, clothed with very soft villi, with mutic teeth; corolla twice as long as the calyx. ♃.? G. Native of the South of Chili, Bridges. Allied to the preceding, but the leaves are smaller, thicker, and the whole plant is canescent from soft wool, not villous from stiff hairs.

Bridges's Hedge Nettle. Pl.?

43 S. Gillie'sii (Benth. lab. p. 740.) ascending, villous; leaves petiolate, obtuse, crenated, cordate at the base: lower ones rounded, nearly glabrous: superior ones ovate, pubescent; floral leaves ovate, quite entire, shorter than the calyxes, villous; racemes hispid from stiff villi; whorls 6-flowered, distant; calyx ovate-campanulate, hispid, with ovate-lanceolate acute rather spinose teeth; corolla glabrous, thrice as long as the calyx, with an exserted tube. ♃.? G. Native of the Andes of Chili, near Mendoza. Intermediate between *S. Macræ'i* and *S. circinnàta*; differing from the first in the short stiff stems, broad leaves, and larger corollas; and from the last in the stems and leaves being less hispid, leaves less crenated, and in the tube of the corolla being exserted.

Gillies's Hedge Nettle. Pl.?

44 S. circinna'ta (Lher. stirp. 1. p. 51. t. 26.) procumbent, hispid; floriferous branches erect; leaves petiolate, roundish, obtuse, crenated, broadly cordate at the base: floral leaves smaller: upper ones ovate, quite entire, rather shorter than the calyxes; whorls 6-flowered, distinct: lower ones remote; calyx campanulate, hispid, with ovate acute rather spinose teeth; corolla pubescent, scarcely twice as long as the calyx. ♃. H. Native of the South of Spain and North of Africa; Gibraltar; on the lead-hills of Tunis, Vahl.; Mount Atlas, in the fissures of rocks, Desf. S. velutìna, Willd. enum. suppl. p. 41. S. latifòlia, Ait. hort. kew. 2. p. 303. Sterile branches procumbent, creeping a little. Corolla 7-8 lines long, pale or dark purple or white.

Circinnate-leaved Hedge Nettle. Fl. June, July. Clt. 1777. Pl. 1 to 2 feet.

45 S. nepetæfòlia (Desf. cat. hort. par. p. 58. Benth. lab. p. 546.) ascending, canescent; leaves petiolate, ovate, obtuse, crenated, cordate at the base, wrinkled; whorls distant, 6-flowered; calyx tubular, canescent, with lanceolate acute rather spinose teeth; corollas pubescent, half again as long as the calyxes. ♃.? H. Native of Spain, Pavon. Plant canescent from short tomentum. Leaves from ½ to 1 inch long, almost like those of *Népeta Mussìni*. Corolla purple; tube equalling the calyx. Habit different from other species of the genus.

Catmint-leaved Hedge Nettle. Fl. June, Aug. Clt. 1805. Pl. 1 to 2 feet.

46 S. Ara'bica (Horn. hort. hafn. p. 554.) erect, divaricately branched; branches glabrous or beset with spreading hairs; leaves petiolate, ovate-lanceolate, acutish, serrately crenated, rounded at the base or cuneated, glabrous or pubescent: floral leaves sessile, ovate, acute, cordate at the base; whorls 6-flowered, remote; calyx large, campanulate, pilose, with ovate acute rather spinose teeth; corolla pubescent, one half longer than the calyx. ⊙.? H. Native of Arabia. This species is distinguished from all others in the large calyx, which is 6-8 lines long. Corolla violaceous; tube shorter than the calyx.

Arabian Hedge Nettle. Fl. June, Aug. Clt. 1819. Pl. 1 foot.

47 S. bulla'ta (Benth. lab. p. 547.) erect, villous; leaves on short petioles, broad-ovate, coarsely crenated, bullately wrinkled, rather canescent beneath, hispidly villous on both surfaces; floral leaves shorter than the calyxes; whorls 6-flowered; calyx turbinately campanulate, hispid, with ovate acute rather pungent teeth; corolla about twice as long as the calyx. ♃.? H. Native of California, Beechey. S. coccínea, Hook. et Arn. in Beech. voy. pt. bot. p. 156. but not of Jacq. Leaves 1½ to 2 inches long; floral leaves sessile. Whorls approximate. Corolla pubescent: tube equalling the calyx, furnished with a ring of hairs inside.

Blistered-leaved Hedge Nettle. Pl.?

48 S. brachia'ta (Bojer, mss. ex Benth. lab. p. 547.) procumbent? clothed with fine tomentose pubescence; leaves sessile, oblong-lanceolate, bluntish, toothed, roundish at the base, wrinkled; whorls about 6-flowered, remote; calyx ovate-campanulate, pubescent, with ovate very acute rather spinose teeth; corollas small, downy outside, about twice as long as the calyx. ♃. S. Native of Madagascar, Lyall. Stems rather woody. Leaves 1 to 1½ inches long. Corolla almost like that of *S. Grahàmii*, scarcely 3 lines long.

Armed Hedge Nettle. Pl. procumbent.

49? S. ca'ndida (Benth. lab. p. 547.) procumbent? clothed with white wool; leaves nearly sessile, oblong-lanceolate, coarsely toothed, or crenated, narrowed at the base; floral leaves rather shorter than the calyxes; whorls 6-flowered, remote; calyx ovate, campanulate, woolly, with lanceolate very acute rather spinose teeth; corolla woolly outside, one half longer than the calyx. ♃.? F. Native of the Levant, ex Hort. par.; Macedonia, ex Herb. Lamb. The whole plant clothed with dirty white wool. Leaves half, or hardly an inch long.

White Hedge Nettle. Pl. procumbent.

50 S. humifu'sa (Burch. cat. geogr. no. 3794.) procumbent, glabrous; leaves nearly sessile, oblong-lanceolate, cordate at the base; whorls about 6-flowered; calyxes glabrous, with rather spinose teeth; corollas twice as long as the calyx. ♃.? G. Native of the Cape of Good Hope. Habit of *S. Æthiópica*, but larger. Leaves about an inch long, with crenulated edges.

Trailing Hedge Nettle. Pl. trailing.

§ 3. Oliga'nthæ (from ολιγος, *oligos*, few; and ανθος, *anthos*, a flower; in reference to the few-flowered whorls.) Benth. lab. p. 548. *Annual, rarely perennial, weak herbs, which are procumbent at the base. Whorls 2-4, rarely 6-flowered.*

51 S. Æthiópica (Lin. mant. p. 82.) villous, procumbent; leaves petiolate, rigid, ovate-deltoid, crenated, deeply and broadly cordate at the base; floral leaves narrowed at the base, rather shorter than the calyxes; whorls 2-4 flowered, racemose; calyx campanulate, hispid, with equal, acute, rather spinose teeth; corolla twice as long as the calyx. ♃. G. Native of the Cape of Good Hope. Jacq. obs. 4. p. 2. t. 77. Lher. stirp. nov. 2. t. 27. Lower leaves ½ an inch long: superior ones smaller: floral ones quite entire. Corolla purple.? This species varies much in hairiness and size of flowers.

Æthiopian Hedge Nettle. Fl. April, June. Clt. 1770. Pl. procumbent.

52 S. subse'ssilis (Burch. cat. geogr. no. 4326.) decumbent; stems nearly glabrous; leaves nearly sessile, ovate, almost quite entire, deeply cordate, pilosely hispid on the margins and nerves; floral leaves nearly glabrous, shorter than the calyxes; whorls 2-flowered, racemose; calyx campanulate, hispid, with equal lanceolate very acute subspinose teeth; corolla nearly glabrous, with the tube rather exserted. ♃.? G. Native of the Cape of Good Hope, and Algoa Bay. Leaves scarcely 2 lines long. Corolla twice as long as the calyx.

Almost-sessile-leaved Hedge Nettle. Pl. procumbent.

53 S. Lya'llii (Benth. lab. p. 548.) annual, diffuse, hispid; leaves petiolate, small, orbicular, rounded at the base, or cordate, wrinkled; floral leaves similar to the rest; whorls 2-flowered; calyx campanulate, with an oblique mouth, and lanceolate, acute teeth, the upper teeth the longest; corolla one half longer than the calyx. ⊙. S. Native of Madagascar. A small plant, with the habit of *Verónica agréstis*. Calyxes secund, subreflexed. Corollas rosy-white, form of those of *S. Córsica*, but much smaller.

Lyall's Hedge Nettle. Pl. diffuse.

54 S. rotundifòlia (Moç. et Sessé, mss. ex Benth. lab. p. 548.) annual, ascending; leaves petiolate, ovate-rounded, crenated, cordate at the base: floral ones similar to the rest; whorls axillary, 2-flowered; calyx campanulate, very pilose, with nearly equal lanceolate acute scarcely spinescent teeth; corolla 3 times as long as the calyx; tube shortly exserted: lower lip large. ⊙. S. Native of New Spain. Allied to *S. Córsica*. Stems nearly simple, villous. Flowers nearly sessile. Corollas almost like those of *S. Córsica*, but larger.

Round-leaved Hedge Nettle. Pl. ½ foot.

55 S. Córsica (Pers. ench. 2. p. 36.) procumbent, pilose; leaves petiolate, ovate, very blunt, broadly crenated, rounded at the base, or subcordate; floral leaves smaller: upper ones shorter than the calyxes; whorls 2-4-flowered, remote; calyx campanulate, hispid, with nearly equal lanceolate acute rather spinescent teeth; corolla more than twice as long as the calyx: tube a little exserted: lower lip large. ♃.? H. Native of Corsica and Sardinia, in corn-fields. Rchb. icon. bot. eur. 7. p. 24. t. 646. Glechòma grandiflòra, D. C. fl. fr. 3. p. 538. Herb diffuse. Corolla downy outside, 7-8 lines long, rosy-white or pink, large for the size of the plant.

Corsican Hedge Nettle. Fl. July, Aug. Clt. 1823. Pl. ¼ to ½ foot.

56 S. serrula'ta (Burch. cat. geogr. no. 5155.) annual, decumbent, pilose; leaves petiolate, broad-ovate, acutish, broadly cordate at the base; upper floral leaves sessile, shorter than the calyxes; whorls about 4-flowered; calyx tubularly campanulate, hispid, with nearly equal lanceolate acute rather spinose teeth; corolla twice as long as the calyx. ⊙. H. Native of

the Cape of Good Hope. Nearly allied to *S. arvénsis;* but the corollas are twice the size; the leaves broader and more acute, and the flowers fewer.

Serrulated-leaved Hedge Nettle. Pl. decumbent.

57 S. marrubiifòlia (Viv. fl. cors. app. 2. ex Benth. lab. p. 740.) annual, erectish, pilose; leaves petiolate, broad-ovate, obtuse, crenated, broadly cordate at the base; upper floral leaves sessile, shorter than the calyxes; whorls 6-flowered; calyx tubularly campanulate, pilose, with lanceolate acute teeth, the upper teeth the largest; corolla twice as long as the calyx: tube inclosed, equalling the calyx: lips nearly equal. ⊙. H. Native of Barbary, Corsica, Naples. S. arvénsis purpùrea, Poir. dict. 7. p. 373. S. Poirètii, Tenore, syll. fl. nap. app. p. 538. Habit of *S. arvénsis;* but the calyxes are broadly campanulate, oblique, and the corollas are much larger. Leaves very like those of a species of *Marrùbium*.

Horehound-leaved Hedge Nettle. Pl. ½ foot.?

§ 4. Agre'stes (from *agrestis*, wild.) *Weak annual herbs. Whorls* 6, *rarely* 10-15-*flowered.*

58 S. eria'ntha (Benth. lab. p. 549.) annual, prostrate, rather creeping; leaves petiolate, ovate-oblong, obtuse, crenated, truncate at the base, or rounded, rather villous; upper floral leaves sessile, scarcely longer than the calyxes; whorls 6-flowered; calyx campanulate, clothed with soft rufous villi, with short acutish mutic teeth; corolla exceeding the calyx a little. ⊙. H. Native of Mexico, Moçino et Sessé. Allied to *S. arvénsis*, and the leaves very like those of *S. Grahàmi*, but differs from both in habit and calyxes. Leaves 6-9 lines long, rather rufescent beneath. Corollas like those of *S. arvénsis*.

Woolly-flowered Hedge Nettle. Pl. prostrate.

59 S. arve'nsis (Lin. spec. p. 814.) annual, decumbent, pilose; leaves petiolate, ovate, obtuse, crenated, cordate at the base; floral leaves narrower: upper ones cuneated at the base, sessile, rather shorter than the calyxes; whorls 4-6-flowered, distant; calyx tubularly campanulate, hispid, with nearly equal lanceolate acute scarcely spinose teeth; corolla scarcely exceeding the calyx, with an inclosed tube and short lips. ⊙. H. Native throughout Europe, North of Africa, and Middle Asia, in corn-fields; also of South America, but probably imported from Europe; plentiful in some parts of Britain, in corn-fields, in gravelly or calcareous soil. Smith, engl. bot. t. 1154. Hook. fl. lond. vol. 2. icone. Oed. fl. dan. t. 587. Rchb. icon. bot. eur. 10. p. 24. t. 967. Curt. fl. lond. 4. t. 41. Sabb. hort. rom. 3. t. 51. Glechòma marrubiástrum, Vill. dauph. 2. p. 371. Cardìaca arvénsis, Lam. fl. fr. 2. p. 383. Trixàgo arvénsis, Hoffm. et Link, fl. port. Trixàgo cordifòlia, Mœnch, meth. p. 398. Trixàgo coloràta, Presl, fl. sic. p. 37. Stàchys Brasiliénsis, Hortul.—Riv. mon. t. 27. f. 2. Glechòma arvénsis, Lin. spec. ed. 1st. p. 578. Plant erectish or decumbent. Leaves ½ to 1 inch long. Corolla pilose outside, pale purple: tube shorter than the calyx, with a ring of hairs inside near the base.

Corn-field Hedge Nettle. Fl. July, Aug. Britain. Pl. ¼ to ½ foot.

60 S. agra'ria (Schiede et Deppe, in Linnæa, 5. p. 100.) annual, erectish, pilose; leaves petiolate, oval, obtuse, crenated, cordate at the base; floral leaves narrower, all longer than the calyxes; whorls about 6-flowered, distant; calyx campanulate, pubescent, with nearly equal very acute rather spinose teeth; corolla hardly exceeding the calyx. ⊙. H. Native of Mexico, near Jalapa; and Texas, at Rio Brazos. Flowers smaller than those of *S. arvénsis*. Corolla pale violet.

Field Hedge Nettle. Pl. ½ foot.?

61 S. trunca'ta (Kunze, in pl. Poppig, mss. ex Benth. lab. p. 550.) annual, erect, pubescent; leaves petiolate, ovate, obtuse, crenated, rounded at the base; floral leaves acute, cuneated at the base, longer than the whorls; whorls 4-6-flowered, distant; calyx broad-campanulate, with equal broad-ovate very acute rather spinose teeth, which are much shorter than the tube; corolla scarcely exceeding the calyx, with an inclosed tube, and very short lips. ⊙. H. Native of Chili, near Valparaiso. Habit of *S. arvénsis*, but more erect and less pilose. Corollas red, glabrous.

Truncate-flowered Hedge Nettle. Pl. ½ foot.?

62 S. Peruvia'na (Domb. in herb. Smith, ex Benth. lab. p. 551.) annual, decumbent; branches pilose; leaves petiolate, ovate-rounded, obtuse, crenated, cordate at the base, glabrous or pilose; floral leaves sessile, exceeding the calyxes; whorls about 6-flowered, distant; calyx broadly campanulate, hispid: teeth shorter than the tube, broad, acute, rather spinose; corolla scarcely exceeding the calyx, having the upper lip very short, and the lower lip 3 times as long as the upper. ⊙. H. Native of Peru, in boggy places near Lima. Larger than *S. arvénsis*. Leaves broader, and more glabrous. Calyx larger. Corolla twice as long, with an inclosed tube.

Peruvian Hedge Nettle. Pl. decumbent.

63 S. Kee'rlii (Benth. lab. p. 551.) annual? erect, villous; leaves petiolate, ovate, crenated, cordate at the base, pilose: superior ones oblong; floral leaves cuneated, narrow, reflexed, hardly longer than the calyxes; racemes elongated; whorls 6-flowered; fructiferous calyx campanulate, spreading: teeth acute, spinescent, rather shorter than the tube; corollas twice as long as the calyx: upper lip short: lower lip 3 times as long as the upper lip. ⊙. H. Native of Mexico, near Tlalpuxahua, Keerl. Habit of *S. Grahàmii*, but more pilose, &c.

Keerl's Hedge Nettle. Pl. ½ to 1 foot.?

64 S. Graha'mii (Benth. lab. p. 551.) herbaceous, procumbent? pilosely pubescent; leaves petiolate, ovate-oblong, obtuse, crenated, subcordate at the base, rather hispid, or at length glabrous; whorls 10-15-flowered, remote; calyx globosely campanulate, nearly glabrous: teeth ovate, acute, rather spinose; corolla small, glabrous, about twice as long as the calyx. ⊙. H. Native of Mexico, near Tlalpuxahua, G. J. Graham. Corollas 3 lines long, almost like those of *S. arvénsis*.

Graham's Hedge Nettle. Pl. procumbent.

65 S. Drummóndi (Benth. lab. p. 551.) annual, erect, pilosely hispid; leaves petiolate, oval, obtuse, broadly cordate at the base, or rounded; floral leaves lanceolate: upper ones rather shorter than the calyxes; whorls 6-flowered; calyx campanulate: teeth linear, or lanceolate-subulate, equalling the tube; corolla twice as long as the calyx: upper lip short: lower one 3 times as long as the upper. ⊙. H. Native of Texas, at Rio Brazos, Drummond. Habit of *S. agrària*.

Drummond's Hedge Nettle. Pl. 1 to 2 feet.

66 S. Bogote'nsis (H. B. et Kunth, nov. gen. amer. 2. p. 309.) erect, pilose; leaves petiolate, ovate, rounded at apex, obsoletely cordate at the base, crenated, rather canescent beneath; whorls 4-6-flowered; calyx turbinately campanulate, 5-cleft, with ovate-oblong mucronate nearly equal teeth; corolla exceeding the calyx: upper lip entire, shorter than the lower one. ⊙. H. Native near Santa Fe de Bogota. Leaves an inch long, and 9 lines broad. Corolla violaceous. This appears only to differ from *S. Drummóndi*, in the form of the calyx, and more villous leaves, which are canescent beneath.

Bogota Hedge Nettle. Pl. 1 foot.?

67 S. de'bilis (H. B. et Kunth, l. c.) erect, puberulous; leaves petiolate, ovate, obtuse, deeply cordate, crenated, nearly glabrous, with the veins and margins hairy; whorls about 10-flowered; calyx turbinately campanulate, with lanceolate aristately subulate nearly equal teeth; corolla with the tube a

little longer than the calyx: upper lip bifid: lower lip 3 times as long as the upper lip. ⊙.? H. Native of Quito, between Cachapamba and Chillo. Leaves 10-11 lines long, and 7 lines broad, paler beneath. Corolla pale violet. Allied to *S. arvénsis*.

Weak Hedge Nettle. Pl.?

68 S. elli'ptica (H. B. et Kunth, l. c. p. 308.) erect, hairy; leaves petiolate, elliptic, rounded at apex, cordate at the base, crenated; whorls 6-flowered; calyx turbinately campanulate, with ovate acuminately mucronate unequal teeth; corolla twice as long as the calyx: upper lip entire, rather concave. ⊙.? H. Native of Quito, near Tumbamba and Chillo. Leaves ½ an inch long, and 4 lines broad. Whorls approximate. Corolla rose-coloured, downy outside, middle segment of lower lip marked by two purple spots at the base.

Elliptic-leaved Hedge Nettle. Pl. 1 foot.

Sect. V. Oli'sia (meaning unknown to us.) Benth. lab. p. 553.—Olìsia species, Dumort, florul. belg.—Tetrahìtum and Stàchys species, Hoffm. et Link, fl. port.—Herbs, annual or perennial, glabrous, pubescent, or pilose, but never woolly. Leaves ovate. Whorls about 6-flowered. Bracteas minute. Calyxes usually spinescent, sometimes bilabiate. Corollas cream-coloured.

69 S. hi'rta (Lin. spec. p. 813.) erect or ascending, branched, pilosely hairy; leaves petiolate, ovate, crenated, truncately cordate at the base; floral leaves sessile, roundly cuneated at the base: upper ones ovate, acute, quite entire; whorls 6-flowered, distant, or the upper ones are approximate; calyx campanulate, pilose, with lanceolate-subulate very acute spinescent teeth; corolla pubescent outside, scarcely a half again as long as the calyx, with an inclosed tube, and an emarginately bifid upper lip. ⊙. H. Native of the South-west of Europe, and the North of Africa, in dry stony places near the sea; as of Spain, Portugal, Italy, Tunis; as well as of the Canary Islands. All. ped. 1. p. 31. t. 2. f. 3. bad. Sideritis ocymástrum, Gouan, hort. monsp. p. 278. Galeópsis hirsùta, Lin. spec. ed. 1st. p. 580. Tetrahìtum hírtum, Hoffm. et Link, fl. port. Stàchys divaricàta, Viv. fl. cors. append. 2. Stàchys inscrípta, Rchb. icon. bot. exot. 1. p. 28. t. 40.—Lob. icon. 519.? Galeópsis Hispánica, Mill. ex Steud. nom. p. 351. Leaves ½ to 1½ inch long. Plant pale green. Corollas cream-coloured.

Hairy Hedge Nettle. Fl. June, Aug. Clt. 1725. Pl. ¼ to ½ foot.

70 S. a'nnua (Lin. spec. p. 813.) annual, erect, nearly glabrous, or pubescent at top; leaves petiolate, ovate, bluntish, crenated, rounded at the base, or cuneated; floral leaves lanceolate, longer than the calyxes, acute, almost quite entire; whorls about 6-flowered, distinct: upper whorls approximate; calyx tubularly campanulate, villous, a little incurved, with lanceolate very acute rather spinose teeth; corollas pubescent, about twice as long as the calyx. ⊙. H. Native of Europe, in corn-fields, and by way sides; as of France, Germany, Italy, Caucasus, &c. Jacq. fl. austr. 4. p. 31. t. 360. Betónica ánnua, Lin. spec. ed. 1st. p. 573. Mœnch, meth. p. 396. Stàchys nervòsa, Gat. fl. mont. p. 107. Stàchys Betónica, Crantz, stirp. austr. p. 265.—Riv. mon. irr. t. 69. Plant branched. Cauline leaves glabrous, 1½ inch long, and 8-10 lines broad; upper floral leaves smaller, pubescent. Corollas yellow, or cream-coloured.

Annual Hedge Nettle. Fl. July, Aug. Clt. 1713. Pl. ½ to 1 foot.

71 S. pube'scens (Tenor. fl. nap. prod. p. 34.) perennial, ascending, almost glabrous, but pubescent above; leaves petiolate, ovate, obtuse, crenated, cuneated at the base; floral leaves ovate, longer than the calyxes, acutish, nearly entire; whorls about 6-flowered, distant; calyx tubularly campanulate, villous, a little incurved, with lanceolate very acute rather spinose teeth; corolla pubescent, about twice as long as the calyx. ♃. H. Native of Europe, in the region of the Mediterranean, in dry fields; as of Spain, Lucania, Dalmatia. S. decúmbens, Willd. enum. suppl. p. 41.? S. Balbìsii, Link, enum. 2. p. 110. S. frágilis, Vis. pl. rar. dalm. ex Rchb. fl. germ. p. 319.? Calycine teeth equalling the tube of the corolla. Corolla yellowish, or cream-coloured, sometimes spotted with red in the throat.

Pubescent Hedge Nettle. Fl. May, July. Clt. 1816. Pl. ½ to 1 foot.

72 S. mari'tima (Lin. mant. p. 82.) perennial, tomentosely hairy, ascending; leaves on short petioles, oblong-lanceolate, obtuse, narrowed at the base, rather wrinkled; floral leaves sessile, ovate, obtuse: upper ones rather shorter than the calyxes; whorls about 6-flowered: lower ones distant: superior ones approximating into a spike; calyx tubularly campanulate, villous, with lanceolate acute mutic teeth; corolla pubescent, about a half again as long as the calyx. ♃. H. Native in the region of the Mediterranean, in sandy places by the sea side; as near Valentia, Montpelier, Nice, &c. Jacq. hort. vind. 1. p. 29. t. 70. Rchb. icon. bot. eur. 5. p. 51. t. 484. S. betonicæfòlia, Pers. ench. 2. p. 124.? but not of Desf.—Dill. elth. 50. t. 42. f. 50.—Bocc. mus. 2. p. 164. t. 127. Stems numerous. Leaves about an inch long, wrinkled and tomentose. Corolla pale yellow or cream-coloured, the lower lip spotted with purple at the base.

Sea-side Hedge Nettle. Fl. July. Clt. 1714. Pl. ½ to 1½ foot.

73 S. spinulòsa (Sibth. et Smith, fl. græc. prod. 1. p. 410.) annual?; angles of branches hispid; leaves petiolate, broad-ovate; lower leaves cordate at the base; floral leaves sessile, ovate-lanceolate; whorls 6-10-flowered, distinct; bracteas minute; calyx ample, campanulate, with broad acute rather spinose equal teeth, which are about equal in length to the corolla; upper lip of corolla very large. ⊙.? H. Native of Dalmatia, Istria, Candia, Corfu, about Constantinople, &c. Galeópsis orientàlis, Mill. Plant erect or ascending. Angles of stems ciliated with obverse hairs. Leaves crenated, 1-2 inches long, green, pilose. Corollas pale yellow, like those of *S. menthæfòlia*, but a little longer.

Spinulose Hedge Nettle. Fl. July, Aug. Clt.? Pl. 1 to 1½ foot.

74? S. menthæfòlia (Vis. pl. rar. dalm. in bot. zeit. 1829. erglb. p. 14. Benth. lab. p. 555.) plant ascending or erect, hairy; leaves on short petioles, oblong-ovate, serrated, rounded at the base, or subcordate; floral leaves sessile, acute, hardly exceeding the calyxes; whorls 6-10-flowered: superior ones approximate; calyx amply campanulate, bilabiate, with broad, very acute, submutic teeth; lower lip of corolla very large. ♃.? H. Native of Dalmatia. S. grandiflòra, Host, fl. austr. 2. p. 169. Leaves 2 to 3 inches long, hispid. Lower whorls distant. Corolla cream-coloured. This differs from the other species of this section in the bilabiate calyx.

Mint-leaved Hedge Nettle. Pl.?

Sect. VI. Chamæsideri'tis (from χαμαι, *chamai*, on the ground; and Σιδηριτις, *Sideritis*; in reference to the smallness of the species.) Rchb. fl. germ. exc. p. 318. Benth. lab. p. 556. Perennial, glabrous, or pilose herbs, never woolly. Leaves oblong, lanceolate, or linear. Whorls 2-6-flowered. Bracteas minute, subspinescent. Corolla cream-coloured or purple.

75 S. subcrena'ta (Vis. pl. rar. dalm. in bot. zeit. 1829.

1 erglb. p. 15.) ascending, pilosely pubescent; leaves nearly sessile, oblong-lanceolate, obtuse, scarcely crenated, narrowed, and quite entire at the base; floral leaves ovate-lanceolate, acute: upper ones shorter than the calyxes; whorls densely 6-10-flowered, distant; calyx tubularly campanulate, rather pilose, with ovate very acute rather spinose nearly equal teeth; corolla nearly glabrous, twice as long as the tube of the calyx. ♃. H. Native of Dalmatia, on hills. S. récta, β, Bertol. amœm. ital. p. 378. Allied to *S. récta*, but differs in the leaves being narrower, more entire. Corolla yellow.?

Subcrenated-leaved Hedge Nettle. Pl. 1 to 2 feet.

76 S. re'cta (Lin. mant. p. 82.) erect or ascending, pilosely hairy; leaves on short petioles, oblong-ovate or lanceolate, obtuse, crenated, rounded or narrowed at the base, wrinkled, hairy; floral leaves sessile, acute: upper ones shorter than the calyxes; whorls about 10-flowered, distant; calyx ovate-campanulate, hairy, with ovate very acute rather spinose equal teeth; corolla glabrous, twice as long as the calyx. ♃. H. Native of Europe, especially in the south, in dry places and by way sides; as of Spain, Germany, Italy, South of Russia, Tauria, Caucasus, Candia, &c. Jacq. fl. austr. 4. p. 31. t. 359. Sideritis hirsùta, Gouan, fl. monsp. p. 85. Betónica hírta, Gouan, hort. monsp. p. 276. Betónica decúmbens, Mœnch, meth. p. 396. Tetràhit herbariòrum, Ger. fl. gallopr. p. 272. S. Betónica, Crantz, stirp. austr. p. 264. S. bufònia, Thuill. fl. par. 1. p. 295. S. procúmbens, Lam. fl. fr. 2. p. 385. S. Sideritis, Vill. fl. dauph. 2. p. 375. S. sylvéstris, Forsk. fl. const. p. 28. S. ánnua, Smith, prod. fl. græc. 1. p. 410. but not of Lin. S. glutinòsa, Smith, prod. fl. græc. 1. p. 409. but not of Lin. S. decúmbens, Rchb. fl. germ. p. 318. but scarcely of Willd.—Riv. mon. irr. t. 70. Leaves 1 to 1½ inch long, very variable in breadth and hairiness. Corolla pale yellow or cream-coloured, with a purplish throat.

Upright Hedge Nettle. Fl. June, Aug. Clt. 1683. Pl. 1 to 1½ foot.

77 S. arena'ria (Vahl, symb. 2. p. 64.) decumbent, canescent from pubescence; leaves nearly sessile, oblong-linear or lanceolate, acute, subserrated, narrow a long way at the base, and quite entire; floral leaves smaller: upper ones shorter than the calyxes; whorls loosely 6-10-flowered, remote; calyx tubularly campanulate, pilose, with lanceolate very acute rather spinose teeth, the upper tooth rather the broadest; corolla pubescent outside, twice as long as the calyx. ♃. H. Native of the region of the Mediterranean; as of Tunis, Sicily, Naples, about Trebezond, Iberia, &c., in dry, rugged, exposed places. Sims, bot. mag. t. 1959. Desf. fl. atl. 2. p. 21. t. 126.? S. Ibérica, Bieb. fl. cauc. 2. p. 51. Rchb. icon. bot. exot. 1. p. 43. t. 58. S. prostràta, Lag. cat. hort. madr. S. diffùsa, Schw. S. scordifòlia, Willd. enum. 2. p. 616. S. purpùrea, Poir. dict. suppl. 2. p. 616. S. congésta, D'Urv. enum. pl. arch. in mem. soc. Lin. par. p. 324. S. rùbra, Donn, hort. cantab. Branches more or less canescent from long soft hairs, as well as the leaves. Leaves 1 to 1½ inch long: upper floral ones quite entire. Corolla purplish, pilose outside.

Sand Hedge Nettle. Fl. July. Clt. 1804. Pl. 1 foot.

78 S. angustifòlia (Bieb. fl. cauc. 2. p. 51.) glabrous; branches twiggy, diffuse; leaves linear, quite entire, serrated, or the lower ones are pinnatifid; racemes elongated; whorls remote, 2-flowered; calyx tubularly campanulate, glabrous, with nearly equal very acute rather spinose teeth; corolla pubescent outside, with a shortly exserted tube. ♃. H. Native of the South of Tauria, in woods, among stones at Femirdschi, and near Cherson. Sweet, fl. gard. 2. t. 180. S. tenuifòlia, Pall. ex Link, enum. 2. p. 109. Rchb. icon. bot. exot. 1. p. 20. t. 28. but not of Willd. S. récta, D'Urv. enum. pl. arch.? but not of Lin. Corollas purplish.

Narrow-leaved Hedge Nettle. Fl. June, Aug. Clt. 1823. Pl. 1 to 3 feet.

Sect. VII. Amble'ia (meaning unknown to us.) Benth. lab. p. 558. Shrubs or under-shrubs, usually tomentose, rarely glabrous, but never pilose. Whorls 2-6-flowered, rarely so much as 10-flowered. Bracteas small, or few. Calyx tomentose or woolly, with soft mutic teeth.

79 S. hyssopoi'des (Burch. cat. georg. no. 2653.) suffruticose?; branches elongated, loosely sub-tomentose; leaves linear or oblong, quite entire, or denticulated at apex, narrowed a long way at the base, glabrous on both surfaces, or scarcely tomentose; upper floral leaves shorter than the calyxes; whorls 2-flowered; calyx clothed with hoary tomentum, with broad lanceolate mutic teeth; corolla about twice as long as the calyx. ♄. G. Native of South Africa. Leaves an inch long, bluntish, green: floral ones gradually broader and shorter. Calyx clothed with very thin tomentum. Corolla silky outside.

Hyssop-like Hedge Nettle. Shrub.

80 S. cæru'lea (Burch. cat. geogr. no. 1775. ex Benth. lab. p. 558.) suffruticose? quite glabrous; branches elongated, loosely tomentose; leaves linear or oblong, quite entire, or somewhat denticulated at apex, narrowed a long way at the base, glabrous, or scarcely tomentose; upper floral leaves shorter than the calyxes; whorls 2-flowered; calyx clothed with hoary tomentum: teeth broad-lanceolate, mutic; corolla about twice as long as the calyx. ♄. G. Native of South Africa. Leaves 2-4 inches long, greenish or tomentose. Flowers few, remote. Corolla silky outside.

Blue-flowered Hedge Nettle. Shrub.

81 S. spatula'ta (Burch. cat. geogr. no. 1738. ex Benth. lab. p. 559.) suffruticose, clothed with hoary tomentum; leaves linear-spatulate, quite entire; superior floral leaves scarcely exceeding the calyxes; whorls 2-flowered; bracteas small; calyx tubularly campanulate, with broad-lanceolate teeth, which are equal in length to the tube of the corolla. ♄. G. Native of South Africa. Very nearly allied to *S. lineàris*; but differs in the form of the leaves, subracemose flowers, small upper leaves, and inclosed tube of corolla, &c.

Spatulate-leaved Hedge Nettle. Shrub.

82 S. linea'ris (Burch. cat. geogr. no. 2717. ex Benth. lab. p. 559.) suffruticose, clothed with hoary tomentum; leaves linear, sessile, quite entire; floral leaves exceeding the flowers; whorls about 2-flowered; bracteas minute; calyx tubularly campanulate, with lanceolate acute mutic teeth, shorter than the tube of the corolla. ♄. G. Native of South Africa. Densely clothed with floccose tomentum. Leaves 1 inch long. Corolla about twice as long as the calyx, silky outside.

Linear-leaved Hedge Nettle. Shrub.

83 S. rosmarinifòlia (Benth. lab. p. 559.) suffruticose, clothed with hoary tomentum; leaves nearly sessile, oblong-linear, quite entire, rounded as the base, tomentose on both surfaces, and white beneath; whorls about 6-flowered, distant; bracteas subulate, shorter than the calyxes; calyx campanulate, clothed with hoary tomentum: teeth lanceolate, acute, mutic; corolla scarcely exceeding the calycine teeth, tomentose outside. ♄. G. Native of the Cape of Good Hope. S. hyssopifòlia, Vahl, herb. but not of Michx. Sideritis pállida, Thunb. prod. fl. cap. 95. Leaves similar to those of Lavender or Hyssop, about an inch long, acutish. Upper whorls sometimes approximate.

Rosemary-leaved Hedge Nettle. Shrub humble.

84 S. rugòsa (Ait. hort. kew. 2. p. 303.) suffruticose, clothed with hoary tomentum; leaves sessile, oblong-linear or lanceolate, narrowed a long way at the base, quite entire, wrinkled; whorls 6-10-flowered, distant; bracteas subulate: outer ones

about equal in length to the calyxes; calyx campanulate, with lanceolate subulate acute mutic teeth; corolla about twice as long as the calyx. ♄. G. Native of the Cape of Good Hope. Jacq. icon. rar. 3. p. 7. t. 493. Corollas pale yellow. ?

Wrinkled-leaved Hedge Nettle. Fl. July, Aug. Clt. 1774. Shrub 1 to 2 feet.

85 S. DENTICULA'TA (Burch. cat. geogr. no. 1369. ex Benth. lab p. 560.) suffruticose; branches clothed with hoary tomentum; leaves petiolate, obovate or oblong, obtuse, crenated, undulately curled, much wrinkled, clothed with sub-floccose tomentum beneath; whorls 2-flowered; bracteas small, subulate; calyx tubularly campanulate, loosely tomentose, with ovate-lanceolate acute mutic teeth; corolla scarcely twice as long as the calyx. ♄. G. Native of South Africa. Branches and leaves almost like those of *Marrùbium vulgàre*. Leaves $\frac{1}{2}$ to $\frac{3}{4}$ of an inch long: floral leaves about twice as long as the calyx. Corolla silky outside.

Denticulated-leaved Hedge Nettle. Shrub.

86 S. CUNEA'TA (Banks, herb. mss. ex Benth. lab. p. 560.) suffruticose, clothed with tomentose wool; leaves petiolate, obovate-cuneated, roundish, obtuse, crenated, undulately curled, much wrinkled, clothed with sub-floccose tomentum on both surfaces; whorls 2-flowered; bracteas small, subulate; calyx campanulate, densely tomentose, with ovate-lanceolate acutish mutic teeth; corolla exceeding the calyx a little. ♄. G. Native of the Cape of Good Hope, Masson. Branches and leaves like those of *Marrùbium Alýssum*. Leaves hardly $\frac{1}{2}$ an inch long: floral ones exceeding the calyxes. Whorls approximate at the tops of the branches. Corolla small, silky outside.

Wedge-leaved Hedge Nettle. Shrub.

87 S. PAUCIFLÒRA (Benth. lab. p. 560.) suffruticose, clothed with floccose wool; leaves nearly sessile, oblong-lanceolate, obtuse, quite entire, narrowed at the base, wrinkled; whorls 2-flowered, rarely 4-flowered, distant; calyx tubularly campanulate, with lanceolate acute mutic teeth; corolla exceeding the calyx a little. ♄. G. Native of Egypt, near Mount Sinai, N. Bové. S. orientàlis, Forsk. fl. ægypt. p. 68. but not of Lin. S. Palæstìna, Vahl, symb. 2. p. 64. but not of Lin. S. affìnis, Fres. mus. senkenb. p. 91. Stems shrubby at the base, branched. Lower leaves 1 to $1\frac{1}{2}$ inch long; floral leaves usually shorter than the calyxes. Corollas small, silky outside. Tomentum white or yellowish.

Few-flowered Hedge Nettle. Fl. ? Clt. 1834. ? Shrub 1 to $1\frac{1}{2}$ foot.

88 S. NI'VEA (Labill. pl. syr. dec. 3. p. 5. t. 3.) suffruticose, clothed with tomentose wool; leaves nearly sessile, oblong, obtuse, quite entire, narrowed at the base, thick; whorls 2-4-flowered, few, distant; calyx tubularly campanulate, white, with ovate obtuse mutic teeth; corolla a half again as long as the calyx, pubescent outside. ♄. G. Native of Syria, near Damascus. Tomentum white, floccose. Leaves $1\frac{1}{2}$ inch long. Calycine teeth equalling the tube of the corolla.

Snowy Hedge Nettle. Shrub $\frac{1}{2}$ to 1 foot.

89 S. BURCHE'LLII (Benth. lab. p. 561.) suffruticose, clothed with floccose tomentum; leaves nearly sessile, oblong or oblong-lanceolate, serrately crenated, narrowed at the base, wrinkled; whorls 6-10-flowered, distinct; bracteas very minute; calyx tubularly campanulate, with lanceolate obtuse mutic spreading teeth: upper teeth the largest. ♄. G. Native of the Cape of Good Hope. Phlòmis micrántha, Burch. cat. geogr. no. 1672. trav. 310. Siderìtis rugòsa, Thunb. prod. p. 95. Habit of *Marrùbium peregrìnum*. Lower leaves 2-3 inches long; floral leaves whiter. Corolla small.

Burchell's Hedge Nettle. Shrub.

90 S. *Æ*GYPTI'ACA (Pers. ench. 2. p. 124.) hoary; flowers spicate; leaves ovate, wrinkled; bracteas broadly ovate, acuminated; calyx campanulate, smooth. ♄. G. Native of Egypt. This differs from *S. Palæstìna* in the calyx and dense spike.

Egyptian Hedge Nettle. Shrub.

91 S. PALÆSTI'NA (Lin. spec. p. 1674.) suffruticose, canescent, tomentose; leaves sessile, oblong-lanceolate, obtuse, or aristately mucronate, quite entire, narrowed a little at the base, stem-clasping, wrinkled; whorls about 6-flowered, at length remote, or the upper ones are approximate; calyx tubularly campanulate, clothed with hoary tomentum: teeth obtuse, mutic; corolla scarcely twice as long as the calyx. ♄. G. Native of Palestine, on the mountains between Gaza and Jerusalem. S. lanàta, Mœnch, p. 397. but not of Jacq.—Barr. icon. t. 279.?—Bocc. mus. 2. t. 109—112.? Leaves 1-2 inches long, whitest beneath. Corolla white or purple, clothed with silky pubescence outside.

Palestine Hedge Nettle. Fl. July, Aug. Clt. 1820. Shrub.

92 S. NU'TANS (Benth. lab. p. 561.) suffruticose, pubescent; leaves sessile, ovate, obtuse, crenated, narrowed at the base, wrinkled, villous above, and clothed with white wool beneath; whorls 2-6-flowered; flowers pedicellate, densely clothed with white wool, reflexed in the fructiferous state: teeth lanceolate, obtuse, mutic; corolla exceeding the calyx a little, pubescent outside. ♄. G. Native of the Cape of Good Hope, Dahl. This differs from *S. Lamárckii*, in the broader leaves, which are green above, and clothed with long white pili beneath, not clothed with white wool, &c.

Nutant-flowered Hedge Nettle. Shrub.

93 S. LAMA'RCKII (Benth. lab. p. 562.) suffruticose, clothed with woolly tomentum; leaves nearly sessile, oblong, obtuse, crenated, narrowly rounded at the base, thick, much wrinkled; whorls about 6-flowered, few, distant; calyx tubular, densely clothed with white wool: teeth ovate, obtuse, mutic; corolla exceeding the calyx a little, clothed with white tomentum outside. ♄. G. Native of the Cape of Good Hope. S. rugòsa, Lam. ill. t. 509. f. 3. but not of Ait. Siderìtis decúmbens, Thunb. prod. p. 95. Habit of *Marrùbium*. Branches at length nearly glabrous. Leaves 6-12 lines long. Corollas yellow. ?

Lamarck's Hedge Nettle. Shrub.

94 S. JUGA'LIS (Burch. cat. geogr. no. 1233. ex Benth. lab. p. 562.) suffruticose, clothed with rather floccose tomentum; leaves nearly sessile, oblong-lanceolate, subcrenated at top, wrinkled; whorls 6-10-flowered, distant; calyx woolly, with broad-lanceolate acute mutic teeth; corolla twice as long as the calyx. ♄. G. Native of South Africa. Leaves 1 to $1\frac{1}{2}$ inch long, the tomentum rather velvety above, and canescent beneath. Corolla clothed with silky villi outside.

Coupled Hedge Nettle. Shrub 1 to 2 feet.

95 S. INFLA'TA (Benth. lab. p. 562.) suffruticose; branches clothed with white tomentum; leaves nearly sessile, oblong, obtuse, quite entire, a little wrinkled, clothed with white tomentum beneath; whorls about 6-flowered, distant; bracteas linear, short; flowers sessile; calyx inflately campanulate, with ovate bluntish mutic teeth; corolla one half longer than the calyx. ♄. G. Native of the North of Africa, and probably of Egypt; in Persia, between Kermancha and Amadan, Olivier. Leaves scarcely an inch long. Corolla silky outside. Tomentum floccose.

Inflated-calyxed Hedge Nettle. Shrub.

96 S. INTEGRIFÒLIA (Vahl, herb. ex Benth. lab. p. 562.) suffruticose; branches tomentosely woolly; leaves nearly sessile, oblong, bluntish, quite entire, or with a few crenatures at apex, narrowed at the base, green; whorls 6-10-flowered, distinct; bracteas linear, shorter than the calyxes; calyx ovate-tubular, sessile, densely clothed with wool, having linear obtuse mutic teeth; corolla one half longer than the calyx. ♄. G. Native of the Cape of Good Hope. Betónica Heraclèa, Lin. mant. p.

83. Phlòmis parvifòlia, Burch. cat. geogr. no. 1232. trav. p. 225. Siderìtis, Thunb. prod. p. 95. Leaves ½ an inch long, beset with rather stellate wool while young, but the adult ones are nearly glabrous; floral leaves longer, and more densely tomentose. Corolla pubescent.

Entire-leaved Hedge Nettle. Shrub.

Sect. VIII. Ziete'nia (probably so named after some obscure botanist.) Benth. lab. p. 562. Zietènia and Stàchys species of authors. Under-shrubs, woolly from white soft hairs, rarely glabrous. Bracteas small or few. Whorls 2-6-flowered. Calyxes woolly or glabrous, with subulate usually spinose teeth.

97 S. lavandulæfòlia (Vahl, symb. 1. p. 42.) suffruticose, pilose; cauline leaves petiolate, oblong-lanceolate, quite entire, narrowed at both ends; floral leaves sessile, ovate-lanceolate; whorls 2-6-flowered: teeth of calyx linear, mutic, longer than the tube, exceeding the corolla. ♄. H. Native of Caucasus, in dry stony places. Zietènia orientàlis, Gled. act. berol. 1766. p. 3. Siderìtis calycántha, Bieb. fl. cauc. 3. p. 393. Rchb. icon. bot. eur. 1. p. 17. t. 15.—A humble, spreading, procumbent, canescent shrub. Sterile branches erect, leafy. Leaves bluntish. Corolla purple, shorter than the calycine teeth.

Lavender-leaved Hedge Nettle. Fl. July, Aug. Clt. 1820. Shrub procumbent.

98 S. mucrona'ta (Sieb. pl. cret. exs. ex Benth. lab. p. 563.) suffruticose, much branched, woolly from long loose hairs; leaves petiolate, oblong, crenated, wrinkled; whorls 2-4-flowered; calyx campanulate, with long, rather spinose teeth, which exceed the corolla. ♄. H. Native of Candia. Leaves 1 inch long: floral ones sessile. Whorls distinct. Limb of corolla very villous.

Mucronate Hedge Nettle. Shrub ½ foot.

99 S. spinòsa (Lin. syst. 3. p. 58.) suffruticose, hoary from silky adpressed hairs, much branched: branches spinescent at apex; leaves sessile, linear, quite entire; whorls 2-flowered; calyx campanulate, with lanceolate spinose teeth, which are equal in length to the corolla. ♄. H. Native of Candia. This differs from *S. glutinòsa*, in the leaves, branches, and calyxes being clothed with silky wool; in the branches being spinescent, and in the larger corollas.—Park. theatr. 476. t. 48. f. 6.—Mor. hist. 3. p. 382. sect. 11. t. 10. f. 9.

Spinose-branched Hedge Nettle. Fl. July. Clt. 1640. Shrub 1 foot. ?

100 S. glutinòsa (Lin. spec. p. 813.) suffruticose, glabrous, much branched; leaves oblong-linear, acute, almost quite entire, narrowed at the base; whorls about 2-flowered; calyx campanulate, glabrous, with equal ovate very acute rather spinose teeth; corolla clothed with silky pubescence outside: tube about equal in length to the calycine teeth. ♄. H. Native of Corsica, on hills; and of Candia, &c.—Mor. hist. 3. p. 389. sect. 11. t. 4. f. 17.? Leaves of the spinescent branches an inch long, on short petioles, furnished with a few scattered hairs, the rest glabrous: superior ones sessile. Flowers on short pedicels. Corolla almost white.

Clammy Hedge Nettle. Fl. June, July. Clt. 1729. Shrub 1 foot.

101 S. fruticulòsa (Bieb. fl. cauc. 2. p. 51.) suffruticose, divaricately branched at the base; branches rather pilose; leaves sessile, oblong-lanceolate, or linear, subdenticulated, green on both surfaces, glabrous: floral ones conforming to the others; whorls 2-flowered; calycine teeth lanceolate, very acute, somewhat spinose, rather shorter than the tube; corolla about twice as long as the calyx. ♄. H. Native of Eastern Caucasus and Iberia, in stony places of mountains. Leaves ½ to 1 inch long, with remote short toothlets. Corolla pale purple.

Fruticulose Hedge Nettle. Fl. June, Aug. Clt. 1818. Shrub 1 foot. ?

† *Species not sufficiently known.*

102 S. betonicæfòlia (Desf. cor. in ann. mus. 10. p. 304. t. 25.) villous; leaves cordate, crenated; whorls about 6-flowered; calyxes mutic. ☉. H. Native of Candia, Tournefort. Stem erect, branched. Leaves petiolate, wrinkled, obtuse, crenated, very like those of *Betónica officinàlis*. Whorls distinct, 2-6-flowered; floral leaves ovate, a little longer than the calyxes. Corolla large, white. Perhaps the same as *S. spinulòsa*.

Betony-leaved Hedge Nettle. Fl. June, July. Clt. 1812. Pl. 2 feet.

103 S. scordioi'des (Poir. dict. 7. p. 373.) suffruticose; leaves lanceolate-linear, almost entire: floral ones spiny-toothed; calycine teeth straight, subulate, spinose. ♄. F. Native of the North of Africa. Branches numerous, divaricate, stiff, villous. Floral leaves sessile, half stem-clasping, all glabrous. Whorls interrupted, terminal, 6-9-flowered. Corolla yellowish, a little longer than the calyx: upper lip flattish, emarginate; lobes of lower lip roundish, unequal, subcrenulated. Perhaps a species of *Siderìtis*.

Scordium-like Hedge Nettle. Shrub humble.

104 S. Oly'mpica (Poir. suppl. 5. p. 226.) villous; stem simple, straight, stoloniferous; leaves elliptic, sharply serrated, ciliated with wool; cauline leaves distant, spreading at the top of straight petioles; spike dense, woolly. ♃.? H. Native of Mount Olympus, Toscan. Allied to *S. nivea*. Stem woolly. Leaves an inch long, obtuse at both ends, whitish-green above, and woolly beneath. Whorls dense. Teeth of calyx spinose. Corolla pale yellow, villous outside.

Olympic Hedge Nettle. Pl. 1 foot.

105 S. Tournefórtii (Poir. suppl. 5. p. 227.) leaves cordate-ovate, subcrenated, obtuse; petioles connate at the base; whorls many-flowered; corolla large, villous outside: tube length of calyx; stem tomentose. ♃.? H. Native of Candia, near Canea, Tournefort. S. Crética latifòlia, Tourn. inst. p. 186. itin. 1. p. 33. t. 1. This is a beautiful species, with large rose-coloured flowers. Leaves wrinkled, whitish-green, finely crenulated, 2-3 inches long, and an inch broad. Corolla with a whitish tube and a rose-coloured lip.

Tournefort's Hedge Nettle. Pl. 2 feet.

106 S. pilòsa (Nutt. journ. acad. nat. sc. phil. 7. p. 48.) hairy from pili; leaves nearly sessile, oblong-ovate, acute, serrated; calyx very pilose, with elongated teeth; whorls about 6-flowered. ♃.? H. Native of North America, in the valleys of the Rocky Mountains. Plant humble, robust. Leaves soft beneath. Flowers rather large, purplish.

Pilose Hedge Nettle. Pl. humble.

† † *Doubtful species.*

107 S. decu'mbens (Pers. ench. 2. p. 123.) whorls many-flowered, approximate; bracteas filiform; leaves cordate, toothed; stem decumbent, villous. ♃.? H. Native country unknown. Habit of *S. circinnàta*. Corolla yellowish. Stem branched.

Decumbent Hedge Nettle. Pl. decumbent.

108 S. venòsa (Pers. l. c.) lower leaves spatulate, obtuse, crenated, petiolate, veined with red; cauline leaves sub-rhomboid; stem very villous; calyx smooth. ♃.? H. Native country unknown.

Veiny-leaved Hedge Nettle. Pl.

109 S. betæfòlia (Pers. l. c. p. 124.) leaves petiolate, cor-

date, deeply crenated; spike compact, villous. ↄ. ? H. Native country unknown.

Beet-leaved Hedge Nettle. Pl.

110 S. BARBI'GERA (Viv. fl. cors. append. 2. p. 4.) hairy; stem ascending; leaves cordate-elliptic, crenulated; floral leaves ovate, acute, equalling the calyxes; bracteas ovate-linear; whorls 6-10-flowered; calyxes regular, spinulose; corolla woolly outside; middle segment of the beard obovate, acute: lateral segments linear, obtuse, and twice as long as the middle lobe. ↄ. ? H. Native of Corsica. This differs from *S. lasiántha*, in habit, shape, and length of the floral leaves, corolla, &c.

Beard-bearing Hedge Nettle. Pl.

111 S. MARRUBIIFÒLIA (Viv. fl. cors. app. l. c.) hairy from spreading pili; stem brachiate; leaves cordate, roundish-ovate, crenated; floral leaves ovate and elliptic, spinulose at apex; whorls 6-flowered; corolla purple; lateral lobes of lower lip short, the middle lobe and upper lip emarginate. ↄ. ? H. Native of Corsica.

Horehound-leaved Hedge Nettle. Pl.

112 S. VALENTI'NA (Lag. nov. gen. et spec. p. 18.) leaves oblong-lanceolate, subcordate, hairy; whorls 6-7-flowered: upper ones sterile. ↄ. ? H. Native of Spain, on hills in the province of Valentia, near Enguera.

Valentia Hedge Nettle. Pl.

113 S. STENOPHY'LLA (Spreng. syst. 2. p. 734.) suffruticose, rather hairy; branches twiggy; leaves linear, 3-nerved: lower ones sub-lanceolate, unidentate on both sides; whorls leafy; calyxes pungent. ♄. H. Native of the South of Spain. Siderìtis linearifòlia, Lam.?

Narrow-leaved Hedge Nettle. Fl. July, Aug. Clt. 1823. Shrub 1 foot.

114 S. GLAUCE'SCENS (Mussin. ex Spreng. syst. 2. p. 736.) stem erect, villous; leaves cordate, acuminated, serrated, hairy on both surfaces; whorls leafless, spicate; segments of calyx divaricate, pungent. ↄ. ? H. Native of Caucasus.

Glaucescent Hedge Nettle. Pl.

115 S. BIFLÒRA (Hook. et Arn. in Beech. voy. pt. bot. p. 155.) Nothing is hardly known of this plant.

Two-flowered Hedge Nettle. Pl.

Cult. Very few of the species are worth cultivating for ornament, most of them having a weedy appearance. They will all grow in any common garden soil; the herbaceous perennial species are readily increased by dividing at the root in spring or autumn. The seeds of annual kinds only require to be sown in spring, in the open border. Some of the smaller species, as *S. Córsica*, do well in pots among other alpine plants. The hardy shrubby species, as *S. lavandulæfòlia*, are well fitted for decorating rockwork; these are readily increased by cuttings, under a hand-glass, or by seeds. The greenhouse species require the treatment of other greenhouse plants.

LXXXII. SPHA'CELE (from *σφακος*, *sphakos*, sage; similarity.) Benth. in bot. reg. under no. 1289. lab. p. 567.—Phytóxys, Molina.—Siderìtis species, H. B. et Kunth, nov. gen. amer. 2. p. 307.

LIN. SYST. *Didynàmia*, *Gymnospérmia*. Calyx campanulate, usually widened in the fructiferous state, irregularly somewhat 10-nerved, and reticulately veined, with an equal mouth, which is naked inside, deeply 5-toothed: teeth nearly equal, or scarcely somewhat dejected into two lips. Corolla with an ample, inclosed, or exserted tube, which is furnished with a pilose ring inside at the base: limb short, scarcely bilabiate; lobes broad-roundish, erectly spreading: upper ones sub-bifid: lateral ones entire: lower one larger, and emarginate. Stamens 4, ascending, nearly equal, or didynamous: lower ones the longest; filaments glabrous, naked; anthers sub-approximate, 2-celled: cells linear, distinct, diverging. Style somewhat equally bifid at top: lobes subulate, stigmatiferous at apex. Achenia dry, smooth.—Subshrubs or shrubs. Leaves bullately wrinkled, often canescent beneath: floral ones bractea-formed, rarely nearly similar to the cauline leaves. Whorls 2-6-flowered. Racemes simple or branched, terminal. This genus is allied to *Stàchys*, with the leaves of *Sálvia*.

1 S. SALVIÆFÒLIA (Benth. lab. p. 567.) shrubby; leaves oblong-lanceolate, rounded at the base, bullate above, and canescent beneath, as well as the branches; whorls many-flowered, secund, crowded into a terminal, rather branched, spike-formed raceme; corolla rather shorter than the calyx. ♄. G. Native of South America. Siderìtis salviæfòlia, H. B. et Kunth, nov. gen. 2. p. 307. Leaves 2-4 inches long. Whorls 6-10-flowered. Corolla whitish-blue, equalling the calyx. Calyx hispid, with lanceolate, subulate teeth. Bracteas very minute.

Sage-leaved Sphacele. Shrub.

2 S. BULLA'TA (Benth. lab. p. 568.) shrubby; branches and under sides of leaves clothed with hoary tomentum, glabrous above, and rugosely blistered, oblong, obtuse, cordate, crenulated; flowers about 5-6 in a whorl, crowded into a dense spike; bracteas ovate, bidentate at apex; calycine teeth acuminately subulate; tube of corolla exceeding the calyx a little. ♄. S. Native of New Granada, on the Andes between Pasto and Teindala. Siderìtis bullàta, H. B. et Kunth, nov. gen. amer. 2. p. 306. Shrub much branched, strong-scented. Leaves 2 inches long. Corollas white.

Blistered-leaved Sphacele. Shrub.

3 S. PANICULA'TA (Benth. lab. p. 568.) suffruticose; branches clothed with hairy tomentum; leaves oblong, sagittately cordate, acute, crenately toothed, rugosely blistered above, and glabrous, but clothed with fine hoary pubescence beneath; spikes panicled; whorls 6-flowered, approximate; bracteas ovate, and are, as well as the calycine teeth, acute. ♄. S. Native of Quito, on the mountains near Tarqui. Siderìtis paniculàta, H. B. et Kunth, nov. gen. 2. p. 307. Shrub strong-scented. Leaves 3 inches long, and 16 lines broad. Calyx hispid. Corollas white, similar to those of *S. bullàta*.

Panicled Sphacele. Shrub 3 to 4 feet.

4 S. CALYCI'NA (Benth. lab. p. 568.) suffruticose?; branches clothed with soft villi; leaves petiolate, ovate-oblong, rounded at the base, a little wrinkled, villous; racemes nearly simple, secund; whorls 2-flowered, remote; calyx ample, very villous; corolla ample, exceeding the calyx a little. ♄. F. Native of California, Douglas. Leaves 2-3 inches long, irregularly toothed. Calycine teeth broad-ovate, acute. Corolla white. Upper floral leaves sessile, bractea-formed, lanceolate, quite entire.

Large-calyxed Sphacele. Shrub.?

5 S. TOMENTÒSA (Benth. lab. p. 569.) suffruticose, prostrate; branches ascending, tomentosely villous; leaves small, oblong, roundly subdilated at the base, wrinkled, tomentose on both surfaces; racemes loose, secund; whorls 2-flowered; corolla scarcely exceeding the calyx. ♄. G. Native of Peru, at Cheuchin, Dombey. Leaves ½ inch long, irregularly and deeply crenated. Upper floral leaves sessile. Corolla inflated a little, pale.

Tomentose Sphacele. Shrub prostrate.

6 S. CAMPANULA'TA (Benth. in bot. reg. under no. 1289. lab. p. 569.) shrubby; branches divaricate; leaves small, oblong-lanceolate, narrowed at the base, bullately wrinkled above, and green, but clothed with hoary tomentum beneath; racemes loose, secund; whorls 2-flowered; corollas ample, about twice as long as the calyx. ♄. G. Native of Chili, near Valparaiso and Conception. Rosmarìnus Chilénsis, Molina, hist. nat. chil. p. 13.? Dracocéphalum chamædryoìdes, Balb. misc. p. 29.

Algue Laguen, Feuill. chil. 3. t. 1. Phytóxys acidíssima, Molina ex Spreng. syst. 2. p. 716. Branchlets tomentosely pubescent. Leaves on short petioles, ½ to 1 inch long. Corollas pale blue.

Campanulate-calyxed Sphacele. Fl. July. Clt. 1795. Shrub 2 to 3 feet.

7 S. subhasta'ta (Benth. l. c.) shrubby; branches tomentose; leaves oblong-lanceolate, truncately subhastate at the base, green, and bullately wrinkled above, but clothed with white tomentum beneath; racemes loose, nearly simple; whorls many-flowered; corolla about twice as long as the calyx. ♄. G. Native of Chili, near Valparaiso. Leaves scarcely an inch long, obtuse, crenulated. Whorls 4-6-flowered. Calycine teeth linear-subulate. Corolla blue. Stamens a little exserted.

Subhastate-leaved Sphacele. Shrub.

8 S. Lindle'yi (Benth. l. c. lab. p. 570.) shrubby; branches clothed with floccose wool; leaves ovate, cordate at the base, bullately wrinkled, clothed with white wool beneath; racemes simple, dense; whorls many-flowered; corolla twice as long as the calyx. ♄. G. Native of Chili, near Valparaiso. Hook. bot. mag. t. 2993. Stàchys Sálviæ, Lindl. in bot. reg. t. 1226. Leaves 1½ to 3 inches long. Corollas purplish-violet, more than an inch long, pubescent outside.

Lindley's Sphacele. Fl. Aug. Clt. 1825. Shrub 3 to 4 feet.

9 S. lamiifòlia (Benth. lab. p. 570.) shrubby; branches clothed with rufous tomentum; leaves on short petioles, ovate, cordate at the base, villous, wrinkled, of nearly the same colour on both surfaces; racemes loose, a little branched; whorls many-flowered; corolla much exserted. ♄. G. Native of Peru, Dombey. Leaves obtuse, crenated, glandular beneath: floral ones sessile. Whorls 4-6-flowered. Calyx sub-bilabiate, with setaceously acuminated teeth. Corolla scarlet, almost 1½ inch long.

Dead Nettle-leaved Sphacele. Shrub.

10 S. speciòsa (St. Hil. mss. ex Benth. lab. p. 570.) shrubby; branches clothed with rufous tomentum; leaves petiolate, ovate, or oblong-lanceolate, truncately subcordate at the base, bullately much wrinkled above, and rather woolly beneath, but at length nearly glabrous; racemes loose, paniculately branched; whorls 2-flowered; corolla much exserted. ♄. G. Native of Brazil, in shady rocky places on Serra do Papagaio, in the province of Minas Geraes. Leaves doubly crenulated: floral leaves small, bractea-formed, acuminated, nearly entire. Corolla reddish-violet, more than an inch long.

Showy Sphacele. Shrub 3 to 5 feet.

Cult. The species are free growers, and flowerers. Any light rich earth will answer them; and cuttings readily strike root, with a hand-glass placed over them.

LXXXIII. LEPECHI'NIA (named after John Lepechin, a Russian botanist.) Willd. hort. berol. 1. p. 21. t. 21. Benth. lab. p. 415.—Hormìnum species, Ortega.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx inflately campanulate, reticulately veined, truncate at apex, sub-bilabiate; upper lip bidentate; lower lip tridentate: teeth all awned; throat naked inside. Corolla equal in length to the calyx; tube naked inside; limb bilabiate; upper lip erect, flattish, emarginate; lower lip trifid, with flat, entire, rather spreading lobes. Stamens 4, didynamous, ascending: lower 2 the longest; anthers approximate: cells rather parallel. Style glabrous, almost equally bifid at apex. Achenia dry, smooth, black.—Herbs. Whorls many-flowered, remote, or spicate.

1 L. spica'ta (Willd. hort. berol. 1. p. 21. t. 21.) stem erect; whorls crowded into a terminal spike; fructiferous calyx closed. ♃. F. Native of Mexico, near Ario and Santa Rosa de la Sierra; and near Xalapa. Bot. reg. t. 1292. Hormìnum caulèscens, Orteg. dec. p. 68. Ulrícia pyramidàta, Jacq. ex Steud. nom. p. 413. Stem rather hairy. Leaves nearly sessile, 2-6-inches long, ovate, obtuse, crenulated, cuneated at the base, wrinkled, pubescent, green on both surfaces; floral leaves under the spike similar to the others, but smaller; those in the spike bractea-formed, equalling the calyxes. Spikes oblong or sub-globose 1 to 1½ inch long. Calyx pubescent. Corolla small, yellow.

Spike-flowered Lepechínia. Fl. July, Aug. Clt. 1800. Pl. 1 to 1½ foot.

2 L. procu'mbens (Benth. lab. p. 415.) stems procumbent; whorls secund, remote; fructiferous calyx spreading. ♃. F. Native of Mexico, Karwinski. Branches nearly simple, villous. Leaves petiolate: lower ones ovate: superior ones oblong; all obtuse, crenated, sub-cordate at the base; lower floral leaves almost similar to the others, sessile: the upper ones small and bractea-formed. Whorls 6-10-flowered. Corolla like *L. spicàta*, but a little longer.

Procumbent Lepechínia. Pl. procumbent.

Cult. The species of *Lepechínia* should be grown in pots in a rich open earth, or one composed of equal parts of peat sand and loam. They require the protection of a frame or greenhouse in winter, and are readily increased by division and seeds, and even by cuttings.

LXXXIV. CRANIO'TOME (from *κρανειον, kraneion,* a helmet; and *τομη, tome,* a section; probably in reference to the short galea or helmet.) Rchb. icon. bot. exot. 1. p. 39. Benth. lab. p. 704.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate, somewhat globose after florescence, equal, 5-toothed; throat contracted, villous inside. Corolla with an exserted tube, and a bilabiate limb: the upper lip very short and concave, entire: the lower lip longer, spreading, and trifid; the lateral segments short. Stamens 4, ascending, didynamous, shorter than the corolla: lower ones longest. Anthers 2-celled; cells at length divaricate. Style about equally bifid at top. Stigmas minute. Achenia dry, smooth.

1 C. versi'color (Rchb. l. c. t. 54.) ♃. H. Native of Nipaul, Kamaon, and Silhet, &c. Népeta versícolor, Trev. in nov. act. acad. nat. cur. 13. p. 183. Anisómeles Nepalénsis, Spreng. syst. 2. p. 706. A'juga furcàta, Link, enum. 2. p. 99. Herb erect, branched. Branches pilose. Leaves petiolate, ovate, acuminated, crenated, cordate at the base, hispid from pili on both surfaces. Uppermost floral leaves bractea-formed. Cymes loose, many-flowered, pedunculate, racemose. Racemes slender, panicled. Flowers minute, elegantly variegated with white, red, and purple. Calyx pubescent.

Party-coloured-flowered Craniotome. Fl. July, Aug. Clt. 1824. Pl. 4 to 6 feet. ?

Cult. For culture and propagation see *Lepechínia*, above.

LXXXV. SIDERI'TIS (of Pliny, and Σιδηριτις of Dioscorides; from *σιδηρος, sideros,* iron; so named on account of its fancied property of healing flesh wounds.) Tourn. inst. t. 90. Lin. gen. no. 712. Schreb. gen. no. 966. Juss. gen. p. 113. Benth. lab. p. 570.—Hesiòdia, Burgsdórffia, and Marrubiástrum, Mœnch.—Empedóclea, Rafin.—Naviculària, Fabr.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 5-10-nerved: teeth erect, rather spinose, sometimes equal, and sometimes the upper one is very broad, or the 3 upper ones are almost joined into an upper lip. Corolla with an inclosed tube,

which is naked or annulate inside, and a bilabiate limb; upper lip erect, flattish, entire, or emarginately bifid; lower lip spreading, trifid, the middle lobe the broadest, and usually emarginate. Stamens 4, didynamous, inclosed; the upper 2 very short, bearing 2-celled anthers: the cells divaricate; the 2 lower ones longer, bearing dimidiate or difformed empty anthers, rarely conforming to the superior anthers. Style inclosed, bifid at top; upper lobe terete, truncate, stigmatiferous at top: lower lobe dilated, clasping the superior one at the base, stigmatiferous on the top and edges. Achenia dry, obtuse at apex, not truncate.—Herbs, shrubs, and under-shrubs. Whorls 6, or many-flowered, axillary, racemose or spicate. Floral leaves sometimes almost similar to the cauline leaves: upper ones minute, sometimes bractea-formed, dilated, and clasping the flowers, with quite entire or spiny-toothed margins. Corollas small, usually yellowish.

Sect. I. Marrubia'strum (from *Marrubium*, horehound; and *astrum*, an affixed signification, like; plants with the habit of *Marrùbium*.) Mœnch, meth. 391. Benth. lab. p. 573. Shrubs clothed with soft wool, generally white. Floral leaves green, quite entire or crenated, nearly similar to the lower cauline ones, but much smaller; uppermost ones minute.

1 S. Massonia'na (Benth. lab. p. 573.) clothed with white dense adpressed wool; leaves oblong, subcordate at the base, thick, clothed with white wool on both surfaces or only beneath; racemes panicled; whorls few-flowered. ♄. G. Native of Madeira, Masson. Allied to *S. Crética*, but the leaves are narrower and scarcely crenated, and the upper surfaces of the leaves less woolly. Whorls 4-10-flowered, interruptedly racemose. Corollas yellow.?

Masson's Ironwort. Shrub.

2 S. ca'ndicans (Ait. hort. kew. 2. p. 289.) clothed with adpressed dense white wool; leaves ovate, crenated, a little truncate at the base, cordate, thick, clothed with adpressed wool on both surfaces, white beneath; racemes simple; whorls few-flowered. ♄. G. Native of Teneriffe. S. Crética, Lin. spec. p. 801.—Comm. hort. 2. p. 197. t. 99. Habit of *S. Canariénsis*, but the wool is white. Leaves 1-2 inches long. Whorls usually 10-flowered; lower ones distant. Corolla yellow, scarcely exceeding the calyx, pale yellow, or dirty white.

Whitened Ironwort. Fl. April, July. Clt. 1714. Shrub 2 to 3 feet.?

3 S. macrosta'chyos (Poir. suppl. 2. p. 381.) clothed with dense white adpressed wool; leaves ovate, subcordate at the base, green above, and very white beneath; whorls many-flowered, imbricated into a thick very dense spike. ♄. G. Native of the Canary Islands, Poiret, Masson. Corollas exceeding the calyx a little. Upper surfaces of leaves nearly glabrous.

Long-spiked Ironwort. Shrub.

4 S. Canarie'nsis (Lin. spec. p. 573.) clothed with villous wool; leaves ovate, crenated, cordate at the base, thick, wrinkled, veiny beneath, and clothed with velvety wool on both surfaces; racemes simple; whorls many-flowered, distinct. ♄. G. Native of the Canary Islands. Jacq. hort. vind. 3. p. 18. t. 30. Marrubiástrum tomentòsum, Mœnch, meth. p. 391.—Pluk. phyt. t. 322. f. 4. Plant clothed with rather floccose yellowish white dense wool. Leaves 2-4 inches long. Whorls dense, 20-30-flowered. Corolla yellowish, scarcely exceeding the calyx. Style often 4-5 cleft, and the ovarium 8-10 parted, in the gardens.

Canary Island Ironwort. Fl. May, Aug. Clt. 1697. Shrub 3-6 feet.

Sect. II. Empedóclea (the name of an ancient philosopher.) Benth. lab. p. 574.—Empedóclea, Rafin. Caratt. ex Guss. Small shrubs or perennial herbs, woolly at the base. Floral leaves quite entire, clasping the sessile flowers.

5 S. Syri'aca (Lin. spec. p. 801.) suffruticose, clothed with white wool; leaves thick, oblong-lanceolate, narrowed at the base: lower ones crenulated: floral leaves cordate at the base, quite entire, equalling the calyxes. ♄. F. Native of Candia and Palestine. Rchb. icon. bot. exot. 1. p. 42. t. 57. Sibth. et Smith, fl. græc. 6. p. 41. t. 550.—Sabb. hort. rom. 3. t. 40. The whole plant is clothed with white wool. Whorls 6-10-flowered. Corolla twice as long as the calyx, yellow, clothed with silky villi outside.

Syrian Ironwort. Fl. June, Sept. Clt. 1597. Shrub 1 to 1½ foot.

6 S. Tau'rica (Bieb. fl. cauc. 2. p. 43.) suffruticose, clothed with white wool; leaves thick, oblong-lanceolate, or spatulate, narrowed at the base: lower ones crenulated, clothed with dense white wool on both surfaces: floral leaves very broadly cordate, acuminated, quite entire, reticulately veined, clothed with loose wool, greenish; calycine teeth lanceolate, mutic. ♄. H. Native of Tauria, on calcareous mountains. Bieb. cent. pl. rar. ross. 1. t. 39. Rchb. icon. bot. eur. 4. p. 61. t. 384. S. Syrìaca, Pall. ind. taur. but not of Lin. S. incàna, Habliz, taur. p. 148, but not of Lin. Nearly allied to *S. Syrìaca*. Corollas yellow.

Taurian Ironwort. Fl. June, Sept. Clt. 1822. Shrub 1 to 1½ foot.

7 S. Si'cula (Ucria, ex Guss. prod. fl. sic. 2. p. 85.) suffruticose, clothed with white wool; leaves thick, oblong-spatulate, narrowed at the base: lower leaves crenulated, woolly on both surfaces: floral ones very broadly cordate, acuminated, quite entire, reticulately veined, clothed with loose wool, green, about twice as long as the calyxes; calycine teeth lanceolate-subulate, very acute, rather spinescent. ♄. F. Native of the South of Europe; as of Spain, Italy, Sicily. S. Brùtia, Tenore, fl. nap. 2. p. 16. Empedóclea montàna, Rafin. Caratt. p. 78. S. decúmbens, Mœnch, meth. p. 390.? Naviculària Heistèri, Fabric. Very nearly allied to *S. Syrìaca*. Corollas yellow.

Sicilian Ironwort. Shrub 1½ to 2 feet.

8 S. Libanótica (Labill. icon. pl. syr. rar. 4. p. 13. t. 8.) suffruticose; branches simple, glabrous; leaves obovate-oblong, serrated, tomentose; whorls distant; bracteas ovate, acuminated, reticulately veined; calycine segments mucronate. ♄. F. Native of Mount Lebanon. Floral leaves sessile. Whorls 4-8-flowered. Bracteas length of calyxes. Calyx pilose. Corolla pale yellow, pilose, the tube length of calyx.

Lebanon Ironwort. Shrub 1 to 1½ foot.

9 S. pu'llulans (Vent. hort. cels. t. 98.) suffruticose; stem rather woolly at the base, green and pubescent above, divaricately branched; leaves ovate-lanceolate, half stem-clasping, stiff, reticulately veined, green on both surfaces, pubescent or canescent from loose wool: floral leaves broadly cordate, acuminated, twice as long as the flowers; calyx green, with subulate spinose teeth. ♄. F. Native of Syria, on mountains near Jerusalem and Nazareth, Bové. Leaves 2-3 inches long; floral ones 1 to 1½ inch long. Whorls 6-10-flowered. Corolla pubescent outside. Perhaps only a variety of *S. Libanótica*.

Sprouting Ironwort. Shrub.

10 S. du'ra (Benth. lab. p. 576.) suffruticose; stem clothed with white wool; leaves sessile, half stem-clasping, lanceolate, acute, quite entire, stiff, rather woolly from hoary villi on both surfaces: floral leaves broad-cordate, equalling the calyxes, quite entire, acuminated; calyx clothed with soft villi, with soft mutic teeth. ♄. F. Native country unknown. Habit of *S. Syrìaca*, but the form of the leaves is different, the whole plant is less woolly, and the whorls more numerous and more remote. Whorls about 6-flowered. Floral leaves very concave.

Hard Ironwort. Shrub.

11 S. PERFOLIA'TA (Lin. spec. p. 802.) suffruticose, hardly woolly at the base; stem pilose, green; leaves half stem-clasping, ovate-oblong or lanceolate, greenish on both surfaces, and furnished with soft villi, rather veiny: floral leaves very broadly cordate, acuminated, reticulately veined, green on both surfaces, twice as long as the leaves; calyx green, pilose, with lanceolate-subulate very acute scarcely spinose teeth. ♄. F. Native of the South of Europe; as of Spain, Sicily, and the Levant. Leaves 1½ to 2 inches long, quite entire or few-toothed, often connate at the base; floral leaves very much dilated, boat-shaped at the base. Corolla yellow, hardly exceeding the calycine teeth.

Perfoliate-leaved Ironwort. Fl. Aug. Nov. Clt. 1731. Shrub 1 to 1½ foot.

12 S. DI'STANS (Willd. spec. 3. p. 66.) suffruticose, hoary; leaves lanceolate, quite entire, acute; whorls distant; floral leaves cordate, acuminated, mucronate, reticulated, nerved. ♄. F. Native of the Levant. Very nearly allied to *S. Taúrica*, from which it differs in the acute, less tomentose, quite entire, leaves, very remote whorls, and glabrous, mucronate bracteas, &c. Tube of corolla longer than the calyx; middle lobe of lower lip obtuse, not emarginate as in *S. Taúrica*.

Distant-whorled Ironwort. Shrub ½ to 1 foot.

13 S. RUGO'SA (Poir. suppl, 2. p. 383.) suffruticose; leaves ovate-lanceolate, obtuse, wrinkled, a little toothed, clothed with hoary tomentum; whorls distant; floral leaves entire, and are, as well as the calyxes acuminated and tomentosely pilose at apex; branches strict. ♄. F. Native of Syria, Labillardière. S. rytídea, Spreng. syst. 5. p. 644. Stems slender. Leaves distant, about an inch long. Calyxes longer than the floral leaves; teeth spinose. Corollas yellow. ?

Wrinkled Ironwort. Shrub ½ to 1 foot.

14 S. ÆGYPTI'ACA (Pers. ench. 2. p. 117.) leaves ovate, serrated, hoary, the veins beneath rather prominent; stem terete, clothed with white tomentum; whorls clasped by the floral leaves. ♄. ? F. Native of Egypt. Stem tall.

Egyptian Ironwort. Shrub tall.

SECT. III. EUSIDERI'TIS (from *ευ, eu*, well, and *Sideritis;* so named from this section being supposed to contain the true or legitimate species of the genus.) Benth. lab. p. 577. Small shrubs, villous or rather woolly from soft hairs or pili; rarely nearly glabrous. Floral leaves bractea-formed, sessile, very broadly cordate, clasping the flowers, reticulately veined, with spiny-toothed margins. Teeth of calyx equal, spiny. Corolla exceeding the calycine teeth a little. The species of this section are closely allied to each other.

15 S. GRANDIFLO'RA (Salzm. pl. tang. exs. ex Benth. lab. p. 577.) suffruticose; stem loosely woolly; leaves oblong, obtuse, crenated, narrowed a long way at the base, clothed with soft villi: floral leaves very broad, exceeding the flowers, clothed with soft villi, bluntly acuminated at top, somewhat spinosely denticulated on the margins at the base. ♄. F. Native on hills about Tangiers. Leaves green on both surfaces. Corollas pale yellow, size of those of *Stàchys récta;* tube annulate inside.

Great-flowered Ironwort. Shrub 1 to 1½ foot.

16 S. OVA'TA (Cav. icon. 1. p. 36. t. 48.) suffruticose, ? green, glabrous or subvillous; leaves oblong-ovate, obtuse, subserrated: floral leaves very broad, exceeding the flowers, glabrous or with villous margins, few-veined, with spiny-toothed margins; whorls approximate, spicate. ♄. F. Native of Spain. Leaves 1 to 1½ inch long. Whorls 6-flowered. Corolla cream-coloured; middle segment of the lower lip crenated.

Ovate-leaved Ironwort. Shrub.

17 S. SPINO'SA (Lam. dict. 2. p. 169.) suffruticose, clothed with soft villi, greenish; leaves oblong-lanceolate, mucronate, with serrated subspinose margins: floral leaves broad, acuminated, exceeding the flowers, with spiny-toothed edges, all clothed with silky villi; whorls approximate, spicate. ♄. F. Native of Spain and Barbary. S. serràta, Lag. nov. gen. et spec. p. 18. Stems branched at the base. Corollas pale yellow.

Spinose Ironwort. Fl. June, Sept. Clt.? Shrub 1 to 1½ foot.

18 S. ILICIFO'LIA (Willd. enum. p. 606.) suffruticose, nearly glabrous; leaves oblong-lanceolate, with spinosely serrated edges, a little cut: floral leaves broad, acuminated, exceeding the flowers, with spiny-toothed margins, all nearly glabrous; whorls all remote. ♄. F. Native of the Levant and Spain. Leaves 1-2 inches long. Corollas small. Whorls many-flowered, dense. Lower leaves petiolate; upper ones sessile.

Holly-leaved Ironwort. Fl. June, Sept. Clt.? Shrub 1 to 1½ foot.

19 S. SCORDIOI'DES (Lin. spec. p. 803.) suffruticose; branches decumbent, ascending or erectish, usually loosely villous, rarely glabrous; leaves ovate, oblong or oblong-linear, narrowed at the base, deeply toothed, mutic or rarely almost entire, pilosely woolly or glabrous: floral leaves very broad, equalling the calyxes or hardly longer, with spiny-toothed margins; whorls rather villous, rarely glabrous, interruptedly or densely spicate. ♄. H. Native of Europe, in the region of the Mediterranean; as of Spain, South of France, Piedmont, South of Switzerland. —Barr. icon. 343.—Lob. icon. 528. Very variable in stature and form of leaves. Corollas pale yellow.

Var. α, grandiflòra (Benth. lab. p. 578.) branches erectish, stiff; leaves oblong, green, villous, deeply toothed; whorls large, subinterruptedly spicate. ♄. H. Native among rocks in the Eastern Pyrenees, near Bagnols, and of Spain. S. subspinòsa, Cav. icon. rar. 3. p. 5. t. 209. S. spinòsa, Benth. cat. pl. pyr. p. 121. but not of Lin.

Var. β, commùnis (Benth. lab. p. 578.) branches erectish or ascending; leaves obovate-oblong, deeply toothed, villous, canescent while young; whorls very spinose, interruptedly spicate. ♄. H. Native of the South of France and Spain in dry, arid places.

Var. γ, elongàta (Benth. lab. p. 578.) branches elongated, ascending or erect; leaves oblong or oblong-lanceolate, deeply toothed, nearly glabrous, green; whorls interruptedly rarely densely spicate. ♄. F. Common in gardens; and probably a native of Spain. S. hyssopifòlia, of many authors. S. fœ'tida, Poir. dict. suppl. 2. p. 382. S. hírta, Roth, catal. 1. p. 67. S. hirsùta, Brot. fl. lus. 1. p. 161. S. fruticulòsa, Pourr. act. tol. 3. p. 328.

Var. δ, alpìna (Benth. lab. p. 578.) branches short, decumbent; leaves oblong-ovate, few-toothed, clothed with hoary villi or at length glabrous; whorls densely or subinterruptedly spicate. ♄. H. Native of the higher Pyrenees and Piedmont. S. alpìna, Vill. fl. dauph. 2. p. 373. S. Pyrenàica, Poir. suppl. 2. p. 383. S. crenàta, Lapeyr. hist. abr. pl. pyr. p. 331.

Var. ε, glabràta (Benth. lab. p. 578.) branches ascending; leaves oblong-ovate, few-toothed or quite entire, nearly glabrous; whorls densely or subinterruptedly spicate. ♄. H. Native along with var. δ. S. hyssopifòlia, of many authors.

Var. ζ, angustifòlia, (Benth. lab. p. 578.) leaves oblong-linear, nearly glabrous. ♄. H. Native of the Eastern Pyrenees. S. hyssopifòlia, Lin. spec. 803. Schkuhr, handb. 2. t. 158.—Barrel. icon. t. 171.

Var. η, incàna, (Benth. cat. pyr. 121. lab. p. 579.) leaves oblong-linear, clothed with hoary villi. ♄. H. Native of the Eastern Pyrenees. S. Pyrenàica, Endress. pl. exs. un. itin. Wurtemb.

Scordium-like Ironwort. Fl. Aug. Nov. Clt. 1597. Shrub ½ to 1 foot.

20 S. LEUCA'NTHA (Cav. icon. 4. p. 2. t. 304.) suffruticose; branches erect, strict, tomentose; leaves linear, a little toothed, nearly glabrous, fascicled in the axils; spikes interrupted, slender, nearly glabrous: floral leaves very broad, equalling the calyxes, with spiny-toothed margins. ♄. F. Native of Spain, in calcareous places, on the mountains. Corollas white or pale yellow.

White-flowered Ironwort. Fl. July, Aug. Clt. 1823. Shrub 1 foot.

21 S. PU'NGENS (Benth. lab. p. 579.) suffruticose; branches erect, strict, pubescent; leaves linear, very acute, pungent, quite entire, glabrous; spikes dense, tetragonal: floral leaves very broad, about twice as long as the calyxes, with deep spiny-toothed margins. ♄. F. Native of Spain. Spikes almost as in *S. serràta*, and the habit is that of *S. fœ'tens;* but the floral leaves are different. Leaves an inch long; lower ones hardly pungent.

Pungent Ironwort. Shrub.

22 S. ARBORE'SCENS (Salzm. pl. exs. ex Benth. lab. p. 579.) suffruticose; branches erect, somewhat bifariously woolly; leaves oblong-lanceolate, deeply toothed, glabrous: floral leaves very broad, equalling the calyxes, reticulately veined, rather woolly, with subspinosely toothed margins; whorls many-flowered, hairy, distinct, approximate, subspicate. ♄. F. Native of Gibraltar, Broussonet and Salzmann. Leaves nearly sessile, scarcely an inch long. Whorls 6-10-flowered, globose. Bracteas orbicular. Corollas pale yellow.

Arborescent Ironwort. Shrub 4 to 5 feet.

23 S. CAVANILLE'SII (Lag. nov. gen. et spec. p. 18.) rather hoary; leaves lanceolate, dentately serrated; spike elongated; whorls distinct; bracteas cordately orbicular, spiny-toothed. ♄. F. Native of Spain, in mountainous places about Madrid and Old Castile. S. scordioìdes, Cav. icon. 4. p. 2. t. 303, but not of Lin. ex Lag. Stems and under surfaces of leaves tomentose, more or less hoary. Corollas yellow.

Cavanilles's Ironwort. Shrub ½ to 1 foot.

24 S. HIRSU'TA (Lin. spec. p. 803.) suffruticose; branches decumbent, very hairy; leaves oblong-ovate or cuneated, deeply toothed, narrowed at the base, hairy: floral leaves very broad, equalling the calyxes, with subspinosely toothed margins; whorls globose, very hairy, all remote. ♄. F. Native of Spain, France, Provence, Piedmont. Cav. icon. 4. p. 1. t. 302. S. scordioìdes, var. lanàta et latifòlia, Benth. cat. pyr. p. 121. S. tomentòsa, Pourr. act. acad. tol. 3. p. 328. S. Hispánica, Mill. dict. no. 7.—Sabb. hort. 3. t. 58. Whorls usually more than 10-flowered, an inch distant. Floral leaves scarcely spinose. Corollas pale yellow.

Hairy Ironwort. Fl. June, July. Clt. 1731. Shrub decumbent.

25 S. CHAMÆDRYFÒLIA (Cav. icon. 4. p. 1. t. 301.) suffruticose; branches ascending, rather villous; leaves oblong or cuneated, deeply toothed, narrowed at the base, rather villous: floral leaves very broad, equalling the calyxes, with subspinosely toothed margins; whorls almost glabrous or villous, all remote. ♄. F. Native of Spain. Hardly differing from *S. hirsùta*, unless in being more glabrous. Whorls usually smaller, and the floral leaves larger. Corollas yellow.

Germander-leaved Ironwort. Fl. June, Aug. Clt. 1816. Shrub 1 foot.

26 S. ANGUSTIFÒLIA (Lam. dict. 2. p. 168.) suffruticose; branches ascending or erectish, strict, tomentosely pubescent; leaves oblong-linear, quite entire, rarely few-toothed, narrowed at the base: floral leaves very broad, equalling the calyxes, with spiny-toothed margins; whorls rather villous, all distant. ♄. F. Native of Spain, in the region of the Mediterranean, and North of Africa, in sandy places near Mascar. S. incàna, Cav. icon. rar. 2. p. 69. t. 186. S. angustifòlia, Lam. dict. 2. p. 168. Lag. nov. gen. et. spec. p. 18. S. linearifòlia, Lag. nov. gen. et spec. p. 18.? Allied to *S. scordioìdes*, var. *angustifòlia* and *S. incàna*. Leaves always sessile. Corollas yellow.

Narrow-leaved Ironwort. Fl. July, Aug. Clt. 1820. Shb. 1 ft.

27 S. TRAGORI'GANUM (Lag. nov. gen. et spec. p. 18.) suffruticose; branches ascending or erectish, tomentosely woolly; leaves oblong-linear, obtuse, quite entire, narrowed at the base, rather woolly: floral leaves very broad, equalling the calyxes, spiny-toothed; whorls rather villous, interruptedly spicate. ♄. F. Native of Spain, in the kingdoms of Murcia and Valentia. S. suffruticòsa, Mill. dict. no. 4.? Calyxes glabrous or villous, not woolly. Corollas yellow.

Goat-marjoram Ironwort. Shrub 1 foot.?

28 S. INCA'NA (Lin. spec. p. 802.) suffruticose; branches clothed with white wool or tomentum; leaves oblong-linear, obtuse, quite entire, clothed with white wool on both surfaces, especially while young: floral leaves very broad, somewhat palmatifid, shorter than the calyxes, rather spinose; whorls distant; calyxes clothed with white wool. ♄. F. Native of Spain. S. virgàta, Desf. fl. atl. 2. p. 15. t. 126.—Bocc. mus. 2. p. 77. t. 67. f. 2.? Habit of *Lavándula spìca*. Leaves ½ to 1½ inch long. Whorls about 6-flowered. Corollas yellow.

Hoary Ironwort. Fl. July, Aug. Clt. 1752. Shrub 1 to 2 feet.

29 S. SERI'CEA (Pers. ench. 2. p. 118. Benth. lab. p. 741.) suffruticose, clothed with white wool; leaves oblong-linear or spatulate, obtuse, quite entire, densely clothed with white wool on both surfaces: floral leaves subpalmatifid, shorter than the calyxes, subspinose; whorls distant; calyx clothed with white wool. ♄. F. Native of Spain. Nearly allied to *S. incàna*, but the wool is much more dense, and the floral leaves shorter, and scarcely toothed.

Silky Ironwort. Shrub.

30 S. GLAU'CA (Cav. icon. 2. p. 68. t. 185.) suffruticose, glabrous, glaucescent; leaves oblong-linear, obtuse, quite entire: floral leaves broad, obtuse, quite entire or a little toothed, rather shorter than the calyxes; whorls distant; calyxes glabrous, with obtuse teeth. ♄. F. Native of Spain, on the mountains. Habit of *S. incàna*, but differs from it in being glabrous and glaucescent, &c. Corollas pale rose-coloured.

Glaucous Ironwort. Shrub.

31 S. FŒ'TENS (Lag. nov. gen. et spec. p. 18.) suffruticose; leaves linear, glabrous, acute; spikes dense; fructiferous calyx with a bearded throat. ♄. F. Native of Spain. Stem and branches twiggy, rush-formed, glabrous. Peduncles villous. Spikes cylindrical, 1½ to 5 inches long; whorls 12-24-flowered. Corolla white, length of calyx.

Stinking Ironwort. Shrub 2 to 3 feet.

32 S. LASIA'NTHA (Pers. ench. 2. p. 117.) leaves ovate, with spinulose teeth; whorls very villous. ♄. H. Native of Spain. S. Hispanica fœtidissima, flore purpurascente, et coma canescente, Tourn. inst. p. 192.

Woolly-flowered Ironwort. Shrub.

33 S. CRISPA'TA (Willd. enum. p. 606. in a note.) hairy; leaves oblong-cuneated, toothed, undulated, tomentose beneath; bracteas orbicular, spiny-toothed; whorls distant. ♄.? F. Native of Gibraltar. Leaves small, undulated.

Curled-leaved Ironwort. Fl. June, Sept. Clt. 1816. Shrub 1½ foot.

Sect. IV. Hesiòdia (probably from Hesiodus, the name of an ancient poet.) Benth. lab. p. 582. Hesiòdia, Burgsdórffia and Marrubiástrum species, Mœnch, meth. Greenish annual herbs, rather woolly from soft pili. Floral leaves almost similar to the cauline ones, but smaller, a little toothed; teeth mutic. Teeth of calyx sometimes all nearly equal, the 3 upper ones somewhat connected at the base, obscurely bilabiate; sometimes the upper tooth is very large, with the lower ones all narrow, and about equal. Corolla usually shorter than the calycine teeth.

34. S. lana'ta (Lin. spec. p. 804.) annual, clothed with soft wool-like hairs; leaves ovate, rounded at the base: floral leaves ovate, crenulated; calyx woolly, greenish, sub-bilabiate, with lanceolate-subulate acuminately subspinose teeth, the upper tooth twice the size of the lower ones. ⊙. H. Native of the region of the Mediterranean, as of Candia, Leri, Syria, &c. S. élegans, Murr. nov. comm. gœtt. 1778. t. 4. S. nígricans, Pers. ench. 2. p. 117. Lam. dict. 2. p. 167. Marrubiástrum élegans, Mœnch, meth. p. 391. Habit of *Stàchys ánnua*. Plant densely pilose. Leaves 1 to 1½ inch long. Corolla yellowish at the base; lips black at apex.

Woolly Ironwort. Fl. July. Clt. 1787. Pl. ½ to 1 foot.

35 S. purpu'rea (H. F. Talbot, fl. corf. ined. ex Benth. lab. p. 742.) annual, very villous, green; leaves oblong-ovate: lower floral leaves toothed: upper ones ovate-lanceolate, acute, almost quite entire; calyx pilose, with aristately mucronate teeth, the upper tooth very large, ovate, the lower ones lanceolate-subulate; galea of corolla oblong, purplish. ⊙. H. Native of the islands, Corfu and Zante, Talbot. Sideritis Cretica, maxima, Ocimi Valentini facie, Tourn. This differs from *S. Romàna* in being more densely beset with long hairs, and particularly in the purple, not yellow, corollas; and the galea is longer and much narrower.

Purple-flowered Ironwort. Pl. ½ foot.

36 S. Roma'na (Lin. spec. p. 802.) annual, clothed with soft rather woolly pili, green; leaves oblong-ovate: floral leaves ovate-lanceolate, toothed; calyx nearly glabrous, with aristately mucronate teeth, the upper tooth large and ovate, and the lower teeth lanceolate-subulate. ⊙. H. Native of the region of the Mediterranean, in cultivated and waste places; as of Spain, France, Italy, Sicily, Grecian Islands, Syria, &c. Cav. icon. 2. p. 69. t. 187. Sibth. et Smith, fl. græc. 6. p. 43. t. 552. S. spatulàta, Lam. fl. fr. 2. p. 377. Burgsdórffia rígida, Mœnch, meth. p. 392. Burgsdórffia, Hoffm. et Link, fl. port. Stems branched at the base, ascending, clothed with long soft villi like the rest of the plant. Whorls 6-flowered, distant. Corolla yellowish.

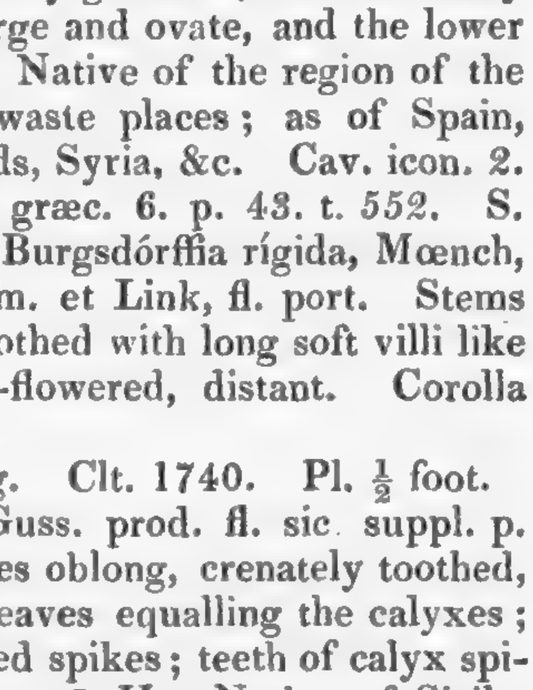
Roman Ironwort. Fl. June, Aug. Clt. 1740. Pl. ½ foot.

37 S. approxima'ta (Gasp. in Guss. prod. fl. sic. suppl. p. 191.) bractless, very villous; leaves oblong, crenately toothed, tapering into the petioles: floral leaves equalling the calyxes; whorls all approximate into elongated spikes; teeth of calyx spinose, pungent: upper tooth ovate. ⊙ H. Native of Sicily, near Seceiara, in maritime pastures, Gasparini. Habit of *S. Romàna*.

Approximate-flowered Ironwort. Pl. ½ foot.?

38 S. monta'na (Lin. spec. p. 802.) annual, ascending; stem hairy; leaves oblong-lanceolate, narrowed at the base: floral leaves awned, a little toothed; calyx green, nearly glabrous, sub-bilabiate; teeth all ovate, aristately mucronate, at length spreading. ⊙. H. Native of the South of Europe and Middle Asia, in cultivated fields; as of the South of France, Italy, Sicily, Dalmatia, Syria, Tauria, Caucasus, Altaia, &c. Jacq. fl. austr. 5. p. 16. t. 434. Hesiòdia bícolor, Mœnch, meth. 392. Hesiòdia montàna, Dumort, fl. belg. p. 44.—Colum. ecphr. 1. p. 198. t. 196. Habit of *S. Romàna*, but taller, the whorls more numerous, the calycine teeth all nearly equal; the 3 superior teeth less deeply cut than the lower ones. Corollas yellow, with a ferruginous margin; upper lip entire, rather concave (fig. 83.)

FIG. 83.



Mountain Ironwort. Fl. July, Aug. Clt. 1752. Pl. ½ to 1 foot.

39 S. remòta (D'Urv. enum. pl. arch. in mem. soc. Lin. par. p. 322.) annual; branches elongated, divaricate, rather villous or woolly; leaves oblong-lanceolate, narrowed at the base: floral leaves obtuse, mutic, a little toothed; calyx clothed with loose wool, sub-bilabiate: teeth all ovate-lanceolate, aristately mucronate, at length spreading. ⊙. H. Native of the Grecian Islands and Syria. S. lanàta, Hochst. et Steud. pl. exs. but not of Lin. S. montàna, Sibth. et Smith, fl. græc. 6. p. 42. t. 551, but not of Lin. Very nearly allied to *S. montàna*, but the habit is stronger, and the calyxes are clothed with white loose wool, not with long pili as in it.

Remote Ironwort. Pl. ½ to 1 foot.

† *Species not sufficiently known.*

40 S. tomentòsa (Ucria, pl. ad Lin. Opus. add. no. 15. ex Guss. prod. fl. sic. suppl. 192.) leaves ovate-lanceolate, toothed, hoary; flowers verticillately spicate; spikes leafy. ⊙.? H. Native of Sicily.

Tomentose Ironwort. Pl.?

41 S. ròsea (Desf. cor. Tourn. in ann. mus. 10. p. 302. t. 24.) villous; leaves ovate-oblong, obtuse, sessile, crenated; flowers twin, axillary; calyxes mutic. ⊙.? H. Native of Egypt. Plant canescent from adpressed tomentum, with the habit and leaves of *Teùcrium Scórdium*. Leaves 6-10 lines long, and 4-5 broad. Flowers nearly sessile. Corolla pale red; tube equalling the calyx; upper lip arched, entire.

Rose-coloured-flowered Ironwort. Pl. ¾ to 1 foot.

† † *Doubtful species.*

42 S. cilia'ta (Thunb. fl. jap. 245.) leaves ovate, serrated; bracteas ciliated. ♃.? H. Native of Japan, Thunb. Plant villous. Leaves petiolate, dotted above, hardly an inch long. Spikes terminal, lanceolate, erect. Bracteas nearly orbicular, acuminated, nerved, ciliated, imbricated.

Ciliated Ironwort. Pl. 1 to 1½ foot.

43 S. parvifòlia (Lam. ill. t. 505. f. 2.) This can hardly be enumerated as a species.

44 S. prostra'ta (Zucc. ex Steud. nom. p. 776.)

45 S. teucriifòlia (Juss. ex Steud. nom. p. 776.)

Cult. All the shrubby species are well fitted for decorating rockwork; they prefer a dry chalky or gravelly soil, and are readily increased by cuttings, seeds, or by division. Those species belonging to the first section being natives of the Canary Islands are properly greenhouse plants. The seeds of annual kinds only require to be sown in the open ground in Spring in dry light soil.

LXXXVI. MARRU'BIUM (of Pliny, from the Hebrew *marrob*, a bitter juice, the species being extremely bitter.) Tourn. inst. t. 91. Lin. gen. no. 721. Schreb. gen. no. 976. Juss. gen. p. 114. Benth. lab. p. 585. Lagópsis, Bunge.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 5-10-nerved, equal; teeth 5-10, acute, rather spinose, nearly equal, erect or often spreading at maturity. Corolla with an inclosed tube, which is naked inside or somewhat annulated, and a bilabiate limb; upper lip erect, flattish or concave, entire or shortly bifid; lower lip spreading, trifid, the middle lobe the broadest, and usually emarginate. Stamens 4, didynamous, the lower ones the longest, inclosed within the tube of the corolla; anthers 2-celled: cells divaricate, sub-confluent, all nearly similar. Style bifid at

top; lobes short, obtuse, stigmatiferous at apex. Achenia dry, obtuse, not truncate at apex.—Perennial, usually tomentose or woolly herbs. Leaves wrinkled, rarely cordate at the base, usually cut; floral leaves similar, exceeding the flowers. Whorls axillary, usually many rarely few-flowered. Bracteas subulate, exceeding the calyxes, rarely very short, and almost wanting.

SECT. I. LAGÓPSIS (from λαγος, *lagos*, a hare; and οψις, *opsis*, resemblance; application not evident.) Benth. lab. p. 586. Lagópsis, Bunge, mon. gen. molucc. Teeth of calyx 5. Tube of corolla exannulate; upper lip quite entire. Leaves roundish, palmatifid.

1 M. INCI'SUM (Benth. lab. p. 586.) leaves roundish, subpalmately-lobed, cut, greenish on both surfaces; bracteas setaceous; calyx glabrous or scarcely tomentose, with 5 setaceous teeth; upper lip of corolla oblong, entire. ♃. H. Native of Siberia, Dauria, and China, near Pekin. Leonùrus supìnus, Willd. spec. 3. p. 116. Plant ascending, pubescent. Whorls 6-10-flowered. Corollas whitish, villous outside.

Cut-leaved Horehound. Pl. ¼ to ½ foot.

2 M. ERIOSTA'CHYUM (Benth. lab. p. 586.) leaves roundish, palmately lobed, cut, green on both surfaces; bracteas stiff, subulate; calyx densely woolly, with 5 subulate spinescent teeth; upper lip of corolla short, entire. ♃. H. Native of Siberia. Leonùrus erióstachys, Turcz. mss. Lagópsis vîridis, Bunge, mon. gen. molucc. ined. Plant ascending, pubescent, but the tops of the stems are woolly. Leaves 5-7-parted; lobes cut. Whorls about 10-flowered. Corollas like those of *M. lanàta*.

Woolly-spiked Horehound. Pl. ½ foot.

3 M. LANA'TUM (Benth. lab. p. 587.) leaves roundish, deeply lobed, clothed with white wool on both surfaces; bracteas setaceous; calyx densely woolly, with 5 subulate subspinescent teeth; upper lip of corolla short, entire. ♃. H. Native of Altaia, in exposed stony places at the river Tschuja. Molucélla marrubiástrum, Steph. in mem. soc. mosc. 2. p. 8. Ledeb. fl. ross. alt. ill. t. 150. Lagópsis incàna, Bunge, mon. gen. molucc. ined. Stems numerous, decumbent, rising from a thick base, ascending at top. Whorls approximate into oblong, woolly spikes. Corolla blackish brown, villous outside.

Woolly horehound. Pl. decumbent.

SECT. II. MARRU'BIUM (see genus for derivation.) Benth. lab. p. 587. Teeth of calyx 5-10. Tube of corolla subannulate inside; upper lip emarginate or bifid. Leaves roundish or ovate, crenated, rarely cut.

4 M. ALY'SSON (Lin. spec. p. 815.) leaves roundish, cuneated at the base, deeply crenated or lobed, clothed with soft white villi on both surfaces; bracteas almost wanting; calyx woolly, with 5 stiff spreading teeth; upper lip of corolla short, emarginately bifid. ♃. H. Native of the region of the Mediterranean; as of Spain, Sardinia, Apulia, Egypt, &c. M. plicàtum, Forsk. fl. ægypt. arab. p. 213.—Mor. hist. 3. p. 377. sect. 11. t. 10. f. 12. Stems thick, ascending, woolly. Whorls distant, 10-15-flowered. Corollas minute, dark purple.

Alysson or Plaited-leaved Horehound. Fl. July, Aug. Clt. 1597. Pl. ½ to 1 foot.

5 M. PE'RSICUM (Meyer, verz. pflanz. p. 95.) leaves orbicular, crenated, clothed with white wool on both surfaces; bracteas almost wanting; calyx woolly, with 5 stiff spreading teeth; upper lip of corolla oblong. ♃. H. Native of Persia, in dry stony places on the Talusch mountains near Swant. Habit, leaves, and inflorescence nearly of *M. vulgàre*, but is clothed with white wool in all parts. Flowers more numerous in the whorls than in *M. Alysson*. Corolla a little larger.

Persian Horehound. Pl. ½ to 1 foot.

6 M. CÆRULE'SCENS (Desf. cat. hort. par. ed. 3. p. 395.) stems tall, clothed with white wool; leaves ovate, crenated at apex, scarcely wrinkled, green above, canescent beneath; outer bracteas shorter than the calyxes; calyx clothed with white wool, with 5 subulate straight spreading teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of Persia. Leaves form of those of *M. Astracánicum*, clothed with white tomentum or wool beneath while young, but almost glabrous in the adult state. Corollas blue.

Blueish-flowered Horehound. Pl. 2 to 3 feet.

7 M. CATARIÆFÒLIUM (Desr. in Lam. dict. 3. p. 717.) stems clothed with hoary tomentum; leaves ovate, crenated, a little wrinkled, pubescent, canescent beneath; outer bracteas shorter than the calyxes; calyx clothed with hoary tomentum, with 5 short stiff spreading recurved teeth; galea oblong, bifid at apex. ♃. H. Native of Cappadocia. Nearly allied to *M. Astracánicum*, but more erect, more branched, and clothed with hoary tomentum, never woolly nor villous. Whorls more numerous and smaller, as well as the flowers. Corollas white.

Cat-mint-leaved Horehound. Fl. July, Aug. Clt. 1819. Pl. 1 to 2 feet.

8 M. ASTRACA'NICUM (Jacq. icon. rar. 1. p. 11. t. 109.) stems loosely villous, rather woolly; leaves ovate, crenated at top, bullately wrinkled, green and villous on both surfaces, or scarcely canescent beneath; outer bracteas shorter than the calyxes; calyx pubescent, with 5 short acute straight or subrecurved teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of the Levant; Persia, on the higher Talusch mountains; and Cashmere, but not about Astracan. Rchb. icon. bot. eur. 3. p. 61. t. 270. Intermediate between *M. candidissimum* and *M. leonuroìdes*. Lower parts of stems and lower leaves clothed with long soft hairs. Whorls dense, many-flowered. Corolla blue or white.

Astracan Horehound. Fl. July, Aug. Clt. 1816. Pl. 1½ to 2 feet.

9 M. LEONUROI'DES (Desr. in Lam. dict. 3. p. 715.) stems rather woolly; leaves ovate or roundish, coarsely and deeply crenated, clothed with soft pubescence, canescent beneath or on both surfaces; outer bracteas scarcely shorter than the calyxes; calyx clothed with white wool, with 5 subulate recurvedly spreading teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of Caucasus and near Astracan. Rchb. icon. bot. eur. 3. p. 84. t. 299. M. Astracánicum, Bieb. fl. taur. 2. p. 52.? and of many other authors. M. affîne, Horn. hort. hafn. p. 556. Lower leaves roundish; superior ones ovate. Whorls size of those of *M. vulgàre*. Corollas blueish purple.

Leonurus-like Horehound. Fl. July, Sept. Clt. 1819. Pl. 1 to 2 feet.

10 M. PLUMÒSUM (Meyer. verz. pflanz. p. 96.) leaves roundish, deeply lobed, clothed with short villi on both surfaces, rather canescent; calyx clothed with soft villi, with 5 teeth, which are, as well as the bracteas subulate and plumose; galea of corolla bifid at apex. ♃. H. Native of Caucasus. Whorls distant, many-flowered, nearly an inch in diameter. Corolla scarcely longer than the calycine teeth.

Feathery-bractead Horehound. Pl. ascending.

11 M. VELUTI'NUM (Sibth. et Smith, fl. græc. 6. p. 49. t. 561.) branches elongated, tomentose, woolly at the base; leaves orbicular, crenated, subcuneated at the base, clothed with velvety villi on both surfaces; whorls ample, many-flowered; calyx clothed with tomentose pubescence, with 5 teeth, which are subulate, stiff, straight, or at length spreading, as well as the bracteas; galea of corolla oblong, bifid. ♃. H. Native of Mount Parnassus. Allied to *M. candidissimum*, but differs in the colour of the whole plant, and in the form of the leaves. Corollas white.?

Velvety Horehound. Pl. 1½ foot.

12 M. candidi'ssimum (Lin. spec. p. 816.) branches elongated, a little branched, clothed with white wool; leaves ovate, crenated, clothed with soft white villi or white wool; whorls large, many-flowered; calyx clothed with white villi or wool, usually with 5 subulate stiff spreading teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of the South of Europe; as of Spain, South of France, Italy, Dalmatia, Carinthia, Persia, &c. M. peregrìnum, Rchb. icon. bot. eur. 4. p. 10. t. 312, but not of Lin. M. catariæfòlium, Rchb. icon. bot. eur. 4. p. 10. t. 313, but not of Desr. M. setàceum, Desr. in Lam. dict. 3. p. 717.? M. incànum, Desr. in Lam. dict. 3. p. 716. M. uncinàtum, Horn. hort. hafn. p. 968.? M. flexuòsum, Mœnch, meth. p. 399.? M. odoratíssimum, Pourr. ex Steud. nom. bot. p. 510.—Dill. elth. 218. t. 174. f. 214. Stems procumbent at the base and ascending at apex. Whorls remote, 20-50-flowered. Corollas whitish.

Very white Horehound. Fl. July, Sept. Clt. 1732. Pl. 1 to 2 feet.

13 M. supi'num (Lin. spec. p. 816.) branches clothed with white wool; leaves ovate-roundish, clothed with soft villi, greenish, or clothed with white wool beneath, crenated, bullately wrinkled; whorls many-flowered; calyx villous, with 5-10-subulate stiff, erect, or at length spreading teeth; galea of corolla oblong, bifid at apex. ♃. H. Native of the South of Europe.?—Bocc. mus. 2. p. 78. t. 69.—Barrel. icon. 685.? Intermediate between *M. candidissimum* and *M. vulgàre*, having the flowers of the first and the leaves of the latter. Perhaps a garden hybrid.

Trailing Horehound. Fl. Aug. Sept. Clt. 1714. Pl. trailing.

14 M. peregri'num (Lin. spec. p. 815.) dwarf, divaricately branched; leaves oblong, clothed with hoary tomentum; whorls few-flowered; calyx tomentose, with 5 lanceolate-subulate erect or scarcely spreading teeth; galea of corolla oblong, bifid. ♃. H. Native of Europe and Middle Asia; as of Germany, Austria, Transylvania, Grecian Islands, Syria, Tauria, &c. Jacq. austr. t. 160. M. Créticum, Mill. dict. no. 3. Rchb. icon. bot. eur. 3. p. 74. t. 288. M. pauciflòrum, Wallr. sched. crit. p. 295. M. angustifòlium, Mœnch, ex Steud. nom. p. 510.—Dill. elth. 219. t. 174. f. 215.—Mor. hist. t. 9. f. 8. Plant clothed with short, hoary tomentum. Whorls 4-6 rarely 10-flowered. Corollas whitish.

Foreign Horehound. Fl. July, Sept. Clt. 1640. Pl. 1 to 1½ foot.

15 M. Pannónicum (Clus. ex Rchb. fl. germ. exc. p. 325.) branches divaricately branched; leaves ovate or oblong, clothed with hoary tomentum or soft villi; floral leaves all twice as long as the flowers; whorls many-flowered, all distant; calyx clothed with hoary tomentum, with 6-10 subulate teeth which at length spread; galea of corolla oblong, bifid at apex. ♃. H. Native of Germany, near Halle, Hungary, Moravia, Austria, and Transylvania. M. paniculàtum, Desr. in. Lam. dict. 3. p. 716.? Rchb. icon. bot. eur. 3. p. 86. t. 300. M. peregrìnum, Spreng. fl. hal. t. 6. but not of Lin. M. remòtum, Kit. in Schultes, œstr. fl. 2. p. 161. M. rùbrum, Roth, nov. spec. p. 259. Whorls distant, 12-15-flowered. Corolla of *M. peregrìnum*. Allied to *M. peregrìnum* and *M. vulgàre*.

Pannonian Horehound. Pl. 1 to 1½ foot.

16 M. radia'tum (Delile, mss. ex Benth. lab. p. 591.) branches divaricate, a little branched, clothed with hoary tomentum; leaves ovate or oblong, clothed with hoary tomentum or soft villi: upper floral leaves scarcely exceeding the calyxes; whorls many-flowered, rather loose: upper ones approximate; calyx small, tomentose, with 6-10 elongated subulate straight stellately spreading subspinescent teeth. ♃. H. Native of the region of the Mediterranean. Allied to *M. Pannónicum*, but the leaves and calyxes are smaller, &c.

Radiate-calyxed Horehound. Pl. 1 to 1½ foot.?

17 M. cunea'tum (Russ. nat. hist. alepp. 2. p. 255.) stem clothed with white tomentum at the base and pubescence at top; leaves ovate-cuneated, much wrinkled, green above and canescent beneath: floral leaves small, scarcely exceeding the calyxes; calyx small, tomentose, with 10 short somewhat recurvedly spreading mutic teeth. ♃. H. Native of Syria, near Aleppo, and between Bagdad and Kermancha. Stems more slender than in other species. Whorls numerous, lower ones remote, upper ones approximate. Corollas small, white.

Cuneate-leaved Horehound. Pl. 1 foot.

18 M. vulga're (Lin. spec. p. 816.) branches clothed with white wool; leaves ovate or roundish, clothed with soft villi, greenish or clothed with white wool beneath, crenated; whorls many-flowered; calyx clothed with woolly villi: teeth 10, recurvedly spreading; galea of corolla oblong, bifid at apex. ♃. H. Native throughout Europe and Middle Asia, among rubbish and by way-sides; plentiful in some parts of Britain, but probably not indigenous. Woodv. med. bot. 265. t. 97. Smith, engl. bot. t. 410.—Sabb. hort. rom. 3. t. 59. Fl. dan. 1036. M. hamàtum, H. B. et Kunth, nov. gen. amer. 2. p. 310. M. Germánicum, Schranck ex Steud. nom. p. 510. Stems ascending, rarely decumbent. Whorls distant, 20-50-flowered. Corollas small, white. This, the common horehound, has a strong penetrating smell, not altogether unpleasant. It was a favourite medicine in obstructions of the viscera. In large doses it proves aperient. Bees much frequent the flowers.

Var. β, lanàtum (Benth. lab. p. 591.) leaves densely clothed with white wool. ♃. H. Native of Naples. M. A'pulum, Tenore, fl. nap. t. 154. syll. p. 292.

Common Horehound. Fl. June, Sept. Britain. Pl. 1½ to 2 feet.

† *Species not sufficiently known.*

19 M. circinna'tum (Desr. in Lam. dict. 3. p. 717.) leaves circinnate, crenated, much wrinkled; calycine teeth subulate, erect, villous. ♃. H. Native of the Levant. Stems tomentose. Leaves clothed with shining soft tomentum. Flowers white. Calyx tubular, tomentose. Tube of corolla exceeding the tube of the calyx; upper lip deeply bifid.

Circinnate-leaved Horehound. Pl. ?

20 M. parviflòrum (Fisch. et Meyer, ind. sem. hort. petrop. 1835. p. 33.) leaves pubescent, wrinkled, ovate-oblong, crenated, clothed with white tomentum beneath, as well as the base of the erect branched stems; bracteas setaceous, equalling the calyxes; calycine teeth 10, setaceous, mucronate, straight, spreading much, rather shorter than the tube; corolla scarcely exceeding the calyx. ♃. H. Native of Caucasus, on the Talusch mountains. M. peregrìnum, Meyer, verz. pflanz. no. 820. This differs from *M. peregrìnum* of Lin. in not being silky, and in the calycine teeth being 10. Corolla white; galea bifid.

Small-flowered Horehound. Pl. 1 to 1½ foot.

21 M. propi'nquum (Fisch. et Meyer, l. c.) clothed with canescent villi; stem branched, erectish; leaves wrinkled, petiolate, coarsely crenated: lower leaves almost orbicular: middle ones obovate: upper ones cuneated; bracteas setaceous, rather shorter than the calyxes; calycine teeth villous, setaceous, mucronate, spreading much, straight, not half so long as the tube; tube of corolla exserted; galea short. ♃. H. Native of Caucasus, on the Talusch mountains. Allied to *M. leonuroìdes*. Flowers violaceous.

Allied Horehound. Pl. 1 to 2 feet.?

Cult. All the species of *Marrùbium* grow freely in any common garden soil, and are readily increased by division and by seed.

LXXXVII. BALLO'TA (βαλλωτη, *ballote*, the Greek name

of *Ballòta nìgra*, or Black Horehound, which is derived from *βαλλω*, *ballo*, to emit; rejected by cattle on account of the offensive smell.) Benth. lab. p. 592. Ballòta and Marrùbium, species of Lin. and other authors. Beringèria, Necker. Pseudodictámnus, Tourn. and Mœnch.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx somewhat funnel shaped; tube 10-nerved; teeth 5-10, dilated at the base or combined into an orbicular spreading limb. Corolla having the tube a little inclosed, with a transverse pilose ring inside, and a bilabiate limb; upper lip erect, oblong or subconcave, emarginate at apex; lower lip spreading, trifid, middle lobe emarginate. Stamens 4, ascending, didynamous; lower ones the longest; anthers exserted from the tube of the corolla, approximating by pairs, 2-celled: cells at length divaricate, and nearly distinct. Style bifid at apex, with subulate lobes, which are stigmatiferous at apex. Achenia dry, obtuse at apex, not truncate.—Perennial, hairy, woolly, or tomentose herbs. Leaves wrinkled, usually cordate at the base, entire or crenated, never cut; floral ones almost similar. Whorls axillary, many rarely few-flowered. Bracteas numerous, oblong, subulate, spine-formed, but sometimes very short.

Sect. I. Beringe'ria (probably named after some botanist of the name of Beringer, of whom we know nothing.) Benth. lab. p. 594. Bracteas oblong or subulate, soft. Limb of calyx 6-20-toothed or crenated.

1 B. Africa'na (Benth. lab. p. 594.) hairy; leaves orbicular, irregularly crenated, green on both surfaces; limb of calyx spreading, orbicular, dilated, with about 10 short setaceous teeth; galea of corolla ovate; stamens scarcely exserted from the tube. ♃. G. Native of the Cape of Good Hope. Marrùbium Africànum, Lin. spec. p. 816. Pseudodictámnus emarginàtus, Mœnch, ex Steud. Marrùbium críspum, Lin. spec. 1674. Marrùbium Thouíni, Schultes, ex syll. pl. soc. ratisb. 2. p. 23.—Comm. hort. 2. p. 179. t. 90. Whorls globose, many-flowered, distant. Corollas nearly glabrous, white or purple.?

African Stinking Horehound. Fl. July, Sept. Clt. 1710. Pl. 1 foot.

2 B. pseudodicta'mnus (Benth. lab. p. 594.) clothed with white wool; leaves orbicular, quite entire or obscurely crenated, thick, woolly; limb of calyx spreading, dilated, woolly, with 5-10 crenatures. ♄. F. Native of Candia. Marrùbium pseudodictámnus, Lin. spec. 817. Sibth. et Smith, fl. græc. 6. p. 50. t. 562. Lam. ill. t. 508. f. 2. Beringèria pseudodictámnus, Necker, Link, handb. 478.—Sabb. hort. rom. 3. t. 47.—Park. theatr. 28. f. 2. Whorls dense, many-flowered, distant. Corollas white, spotted with red.

Bastard Dittany of Crete. Fl. July, Aug. Clt. 1596. Shrub 1 to 2 feet.

3 B. undula'ta (Benth. lab. p. 595.) hairy; leaves orbicular, crenated, villous on both surfaces, rugosely curled; limb of calyx spreading, orbicular, rather shorter than the tube, thick, villous, with an undulately curled 10-20 crenated margin: crenatures mutic. ♃. H. Native of Arabia, in the desert of Sinai, N. Bové. Marrùbium umbellàtum, Fres. pl. ægypt. in mus. senk. p. 92. Some of the hairs glanduliferous. Whorls many-flowered, less dense than those of *B. pseudodictámnus*.

Undulated-calyxed Stinking Horehound. Pl. ?

4 B. acetabulòsa (Benth. lab. p. 595.) hairy or somewhat woolly; leaves orbicular, crenated, villous above, and clothed with white wool beneath; limb of calyx spreading, with a 20-crenated margin: crenatures mutic. ♃. or ♄. F. Native of the Grecian islands and Syria. Marrùbium acetabulòsum, Lin. spec. p. 817. Marrùbium pseudodictámnus, Steud. et Hochst. pl. exs. un. itin. but not of Lin. Beringèria acetabulòsa, Necker, Link, handb. p. 478. Marrùbium suffruticòsum, Mill. dict. no. 9. —Park. theatr. 28. f. 3.?—Barrel. icon. t. 129. Calyx woolly or villous at the base. Corolla small, pale purple; galea scarcely emarginate.

Saucer-leaved Stinking Horehound. Fl. June, Aug. Clt. 1676. Pl. 2 feet.

5 B. molli'ssima (Benth. lab. p. 595.) stems clothed with white wool; leaves broad-ovate, obtuse, canescent or white on both surfaces, floccosely woolly beneath; limb of calyx spreading, about equal in length to the tube, villously tomentose, with a shortly 10-toothed margin: teeth broad, acute, scarcely mucronate. ♄. F. Native of Spain.? Marrùbium Hispánicum, Lin. herb, but scarcely of his spec. pl. 816. but not of other authors. Marrùbium cinèreum. M. scrophulariæfòlium Hortul. —Herm. par. 201.?—Bocc. mus. 2. p. 167. t. 122.? Leaves more broad than long, regularly crenated, very soft. Whorls dense, many-flowered. Bracteas spatulate. Corolla whitish. Perhaps only a variety of *B. hirsùta*.

Very soft Stinking Horehound. Fl. July, Aug. Clt. 1714. Pl. 1 foot.

6 B. hirsu'ta (Benth. lab. p. 595.) hairy or somewhat woolly; leaves orbicular, crenated, hairy above, green on both surfaces, or clothed with white wool beneath; limb of calyx spreading, about equal to the tube, hairy, with a shortly 10-toothed margin: teeth broad acute or mucronate. ♃. F. Native of the North of Africa, near Mogodor. Marrùbium hirsùtum, Willd. spec. 3. p. 113.? Marrùbium críspum, Desv. in Lam. dict. 3. p. 719.? and of many other authors, but not of Lin. Habit and leaves of *B. acetabulòsa*, but differs in the limb of the calyx being 10 not 20-toothed, smaller, and in the plant being more hairy. Corollas pale purple.?

Var. β, híspida (Benth. lab. p. 596.) greener and more hairy. ♃. H. Native of Spain.

Hairy Stinking Horehound. Fl. June, Aug. Clt.? Pl. 1½ foot?

7 B. microphy'lla (Benth. lab. p. 596.) tomentose; leaves subcordately ovate, finely crenulated; calyx funnel-shaped: limb spreading, with 10 acute unequal teeth; bracteas spatulate, acute. ♃.? F. Native of the Levant. Marrùbium microphýllum, Desr. in Lam. dict. 3. p. 720. Leaves nearly sessile, soft; thick, 7-9 lines long, and 4 lines broad. Whorls numerous, many-flowered.

Small-leaved Stinking Horehound. Pl.

8 B. rugòsa (Benth. lab. p. 596.) stem pubescent, rather woolly; leaves ovate, obtuse, crenated, wrinkled, clothed with hoary tomentum on both surfaces; whorls few-flowered; limb of calyx short, spreading a little, with 10 short mucronulate teeth. ♃. F. Native of the Levant. Marrùbium rugòsum, Desf. cat. hort. par. ed. 3. p. 395. Marrùbium hùmile, Desf. l. c.? Leaves scarcely ½ an inch long, usually clothed with white wool beneath. Whorls 4-6 rarely 10-flowered. Corolla of *B. acetabulòsa*, but more glabrous.

Wrinkled-leaved Stinking Horehound. Pl. humble.

9 B. obli'qua (Benth. lab. p. 596.) stems clothed with hoary pubescence; leaves ovate, crenated, wrinkled, canescent above, and clothed with white wool beneath; whorls few-flowered; limb of calyx short, unequally dilated, with 10 mucronate teeth. ♃. F. Native of Syria, on mountains about Aleppo and Antioch, P. Russell. Marrùbium rugòsum, var. Russell, herb. All parts as in *B. saxátilis*, but twice the size.

Oblique-calyxed Stinking Horehound. Shrub. ?

10 B. saxa'tilis (Sieb. pl. exs. ex Benth. lab. p. 596.) hairy; leaves ovate or orbicular, crenated, thick, wrinkled, green on both surfaces or white beneath, hairy on both surfaces; whorls few-flowered; limb of calyx short, spreading a little, with 10 mucronate teeth. ♄. F. Native of Syria, near Aleppo and of Palestine. Marrùbium rugòsum, Russel, nat. hist. alep. 2. p.

255. Molucélla microphýlla, Delile, fragm. fl. arab. petr. 10. f. 2. Stems woody at the base. Branches divaricate or procumbent. Corollas smaller than in *B. rugòsa*.

Rock Stinking Horehound. Shrub procumbent.

11 B. Russellia'na (Benth. lab. p. 597.) stems scarcely pubescent; leaves ovate, obtuse, quite entire, wrinkled, green above, and white beneath; whorls few-flowered; limb of calyx short, spreading a little, with 6-10 acute or shortly mucronate teeth. ♄. ? F. Native of Syria, Near Aleppo, Russell. Allied to *B. saxátilis*, but the leaves are all quite entire, and the branches less hairy. Leaves hardly half an inch long, cordate at the base, pubescent above.

Russell's Stinking Horehound. Shrub.

12 B. Hispa'nicum (Benth. lab. p. 597.) hairy; leaves ovate-cordate: upper ones usually acute, or all are obtuse, rarely rounded, hairy on both surfaces, green or canescent beneath; limb of calyx short, spreading a little, with 10 setaceously mucronate teeth. ♃. ? H. Native of Spain, Sicily, and South of Italy. Marrùbium Hispánicum, Lin. spec. 816. Marrùbium rupéstre, Biv. manip. 2. t. 1. Marrùbium scrophulariæfòlium, Lag. Pseudodictámnus acùtus, Mœnch, meth. p. 399. Marrùbium saxátile, Rafn.—Bocc. mus. 2. p. 167. t. 122.—Barrel. icon. t. 797.—Herm. par. t. 201. Leaves usually 2 inches long, exactly cordate, crenated. Whorls 20-50-flowered, dense. Bracteas and calyxes very hairy. Corollas like those of *B. acetabulòsa*.

Spanish Stinking Horehound. Fl. July, Aug. Clt. 1714. Pl. 2 feet.

Sect. II. Ballòta (see genus for derivation.) Benth. lab. p. 597. Bracteas linear-subulate, soft. Limb of calyx 5-toothed.

13 B. nìgra (Lin. spec. 814.) hairy or glabrous; leaves ovate, truncate at the base, green on both surfaces, more or less hairy; limb of calyx erectish: teeth dilated at the base and subulately mucronate at the apex. ♃. H. Native throughout the whole of Europe, in waste places, in hedges, and by waysides; also of Tauria and Caucasus; plentiful in Britain. Rchb. icon. bot. eur. 8. p. 30. t. 1773. Smith, engl. bot. t. 46. B. álba, Lin. spec. 814. B. fœ'tida, Lam. fl. fr. 2. p. 281. Rchb. icon. bot. eur. 8. p. 30. t. 775. B. vulgàris, Link. B. boreàlis, Schweigg. Rchb. icon. bot. eur. 8. p. 30. t. 776. B. ruderàlis, Spreng. fl. hal. p. 101. B. sèpium, Paulet, in Pers. ench. 2. p. 125. B. rùbra, Schrad. Marrùbium nìgrum, Ger. emac. 701. f. 1. Crantz, stirp. austr. p. 272. Marrubiástrum, Riv. mon. irr. t. 65.—Sabb. hort. rom. 3. t. 35.—Blackw. 136.—Mor. hist. 3. p. 377. sect. 11. t. 9. f. 14. Stems, leaves, and calyxes green, sometimes nearly glabrous, but usually pubescent, rarely hairy. Whorls many-flowered, rather loose, the lower cymes on short peduncles. Limb of calyx very variable in form. In the species the stems are brown, and corollas purple; but in that variety called *B. álba* the whole plant is pale green, and the corollas white. The plant is recommended in hysterical cases. In Gotland it is an universal remedy in disorders incident to cattle.

Black or Common Stinking Horehound. Fl. July, Sept. Britain. Pl. 2 to 3 feet.

14 B. urticæfòlia (Ostm. ex Rchb. icon. bot. eur. 8. p. 30. t. 774.) slender; leaves ovate, sharply and deeply serrated; teeth of calyx erect, linear-setaceous, equalling the tube. ♃. H. Native of Bohemia and Saxony, in waste places and on walls. Plant slender, green, less pubescent than *B. nìgra*. Leaves exactly of *Urtìca ùrens*, the first ones cordate, ex Rchb. fl. germ. exc. p. 325. Perhaps only a variety of *B. nìgra*.

Nettle-leaved Stinking Horehound. Pl. 3 to 4 feet.

Sect. III. Acanthopra'sium (from *ακανθος, acanthos*, a spine; and *πρασιον, prasion*, one of the Greek names of Horehound; so called in allusion to the subulate spine-formed bracteas.) Benth. lab. p. 598. Bracteas subulate, stiff, spine-formed. Limb of calyx 5-10-toothed.

15 B. Pe'rsica (Benth. lab. p. 598.) leaves cuneiform, toothed; bracteas spine-formed; limb of calyx membranous, dilated, shortly 5-10-toothed. ♄. G. Native of Persia. Molucélla Pérsica, Burm. fl. ind. p. 128. t. 38. f. 2. Branches simple, glabrous, whitish, with a single spine at each joint. Serratures of leaves spiny. Calyx regular, 5 cleft; segments obovate, scarious, with 3 mucrones. Corolla flattish, glabrous.

Persian Stinking Horehound. Shrub.

16 B. limba'ta (Benth. lab. p. 743.) canescent; leaves oblong, quite entire, cuneated at the base; bracteas spine-formed; limb of calyx unequally and membranaceously dilated, somewhat 5-toothed. ♄. G. Native of the North East of India, on the mountains, in gravelly places near Pindaden Khan. Shrub much branched, younger branches villous. Leaves ½ to 1 inch long. Whorls distant, 6-flowered. Calyx very villous; limb with 5 angles, and as many teeth between the angles.

Limbate-calyxed Stinking Horehound. Shrub 2 feet.

17 B. spinòsa (Link, handb. p. 475.) leaves ovate, quite entire or deeply toothed, green on both surfaces; whorls few-flowered; bracteas spine-formed, straight; calyxes hairy: limb erectish, with 5-10 teeth, which are dilated at the base, subulate, and subspinose; galea of corolla very hairy. ♄. F. Native of Piedmont and Provence. Molucélla frutéscens, Lin. spec. p. 821. Beringèria frutéscens, Rchb. fl. germ. exc. p. 325. Shrub branched; branches villous. Leaves scarcely an inch long. Whorls about 6-flowered, distant.

Spinose Stinking Horehound. Shrub 1 foot.

18 B. integrifòlia (Benth. lab. p. 599.) shrubby, pubescent; leaves ovate, quite entire, rarely with a few crenatures, green on both surfaces; bracteas spine-formed, spreadingly reflexed; limb of calyx dilated, spreading a little, 5-toothed; galea of corolla nearly glabrous. ♄. F. Native of the island of Cyprus. Molucélla frutéscens, Sibth. et Smith, fl. græc. 6. p. 568. Habit of *B. spinòsa*, but the branches are longer, and the leaves usually entire, the spines stronger and usually recurved. Corolla white, lined with purple.

Entire-leaved Stinking Horehound. Shrub 1 to 2 feet.

19 B. Forska'hlei (Benth. lab. p. 599.) leaves ovate, serrated; calyx campanulate, pubescent, with 5 subulate unequal unarmed teeth; whorls remote, 10-12-flowered, involucra quadrifid, with setaceous segments. ♄. F. Native of Arabia Felix. Phlòmis álba, Forsk. fl. ægypt. p. 107. Corolla white; upper lip hairy. Habit of *B. spinòsa*.

Forskahl's Stinking Horehound. Shrub.

† *Doubtful species.*

20 B. orienta'lis (Presl. del. prag. p. 80.) stem branched; villous; leaves cordate-roundish, toothed, wrinkled, clothed with hoary tomentum beneath; bracteas linear; calyx stiff, with 10 spinose teeth; galea of corolla arched, crenulated. ♃. H. Native of Asia Minor. Marrùbium orientàle, Spreng. syst.

Eastern Stinking Horehound. Pl.

21 B. pilòsa (Lour. coch. p. 364.) leaves ovate, crenated, tomentose; whorls pilose; calyx 10-toothed. ♃. H. Native of Cochinchina. Stem pilose, branched. Corolla white. Teeth of calyx reflexed. Upper lip of corolla entire, arched. Perhaps a species of *Leùcas*.

Pilose Stinking Horehound. Pl. ?

22 B. díscolor (Desf. ex Steud. nom. p. 99.) and 23. B. parvifòlia (Desf. l. c.) Nothing is known of these two plants but the names.

Cult. See *Marrùbium* for the culture of the perennial herbaceous kinds; and *Lasiócorys* for that of the shrubby species.

LXXXVIII. LASIO'CORYS (from λασιος, *lasios*, wool; and κορυς, *korys*, a helmet; in reference to the outside of the galea of the corolla being very hairy.) Benth. lab. p. 600.—Leùcas species, R. Br.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx subcampanulate, equal, 10-nerved: teeth 5, ovate, rarely furnished with minute teeth in the sinuses. Corolla with an inclosed tube, which is annulate inside, and a bilabiate limb; upper lip entire, concave, erect, very hairy outside: lower lip spreading, scarcely longer, trifid; the middle segment hardly broader than the lateral ones, emarginate. Stamens 4, didynamous: lower 2 the longest, ascending; filaments naked at the base; anthers approximating by pairs under the upper lip, 2-celled: cells divaricate. Lobes of style subulate: lower one the shortest, and sometimes very short, stigmatiferous towards the apex. Achenia dry, triquetrous, obtuse at top.—Branched shrubs. Leaves entire or toothed.

1 L. Cape'nsis (Benth. lab. p. 600.) leaves almost quite entire; whorls 2-4-flowered; calycine teeth one half shorter than the tube. ♄. G. Native of the Cape of Good Hope. Young branches clothed with white tomentum: adult ones canescent, or nearly glabrous. Leaves fasciculate, nearly sessile, oblong or cuneiform, obtuse, canescent from tomentum, as well as the calyxes, &c. Corolla whitish. Upper lobe of style usually very short.

Cape Lasiocorys. Shrub.

2 L. Abyssi'nica (Benth. lab. p. 600.) leaves toothed at apex; whorls 6-10-flowered; calycine teeth subulately acuminated, about equal in length to the tube. ♄. G. Native of Abyssinia. Leùcas quinquedentàta, R. Br. append. to Salt. abyss. Habit of *L. integrifòlia*. Branches pubescent. Leaves longer and greener. Calyx scarcely tomentose. Upper lobe of style one half shorter than the lower one.

Abyssinian Lasiocorys. Shrub.

Cult. A light rich soil will suit the species of this genus; and cuttings will strike root readily in the same kind of earth, with a hand-glass placed over them; but if seeds ripen, this will be unnecessary.

LXXXIX. RO'YLEA (named in honour of John Forbes Royle, M.D. surgeon in the East India Company's Service; late superintendent of the botanic garden at Saharumpur; now Professor of Materia Medica in King's College, London; author of "Illústrations of Indian Botany, &c.") Wall. pl. rar. asiat. 1. p. 57. t. 74. Benth. lab. p. 601.—Ballòta species, D. Don, prod. fl. nep. p. 111.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular at the base, 10-nerved; limb 5-cleft; segments erect, oblong, membranaceous, reticulately veined, equal. Corolla shorter than the calyx; tube inclosed, annulate inside; limb bilabiate; upper lip erect, entire, arched: lower lip spreading, trifid, having the middle lobe entire. Stamens 4, didynamous, ascending under the upper lip: lower 2 the longest; anthers approximate by pairs, 2-celled: cells divaricate, at length sub-confluent. Style almost equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, obtuse at apex.—Allied to *Ballòta* and *Otostègia*, from which it differs only in the calyx.

1 R. e'legans (Wall. l. c.) ♄. G. Native of Sirmore and Deyra Dhoon, Wall.; Hurdwar and Sirinaghur, Hardwick; Himalaya, Royle. Phlòmis calycìna, Roxb. fl. ind. 3. p. 11. Ballòta cinèrea, D. Don, prod. fl. nep. p. 111.—A much branched, erect shrub. Branches cinereous from tomentum. Leaves numerous, petiolate, ovate, acute, subcordate, coarsely and bluntly serrated, 1 to 1½ inches long, pilose on both surfaces, green above and hoary beneath; floral leaves conforming to the others, but gradually smaller. Whorls 6-10-flowered; cymes on short peduncles. Calyxes tomentosely pubescent. Corollas from white to pale red, or rose-coloured.

Elegant Roylea. Fl. July, Aug. Clt. 1824. Shrub 2 to 3 feet.

Cult. For culture and propagation see *Lasiócorys*, above.

XC. OTOSTE'GIA (from ους ωτος, *ous otos*, an ear; and στεγος, *stegos*, a covering; in reference to the lips of the calyx being prolonged.) Benth. lab. p. 601.—Phlòmis species, Vahl. —Molucélla species, R. Br.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular at the base, 10-nerved; limb sub-bilabiately and membranaceously prolonged: upper lip short, entire, or triangular: lower lip large, ovate, obtuse. Corolla with an inclosed tube, which is annulate inside, and a bilabiate limb; upper lip oblong, concave, entire, erect, very hairy outside: lower lip spreading, trifid: middle lobe broader, emarginate. Stamens 4, ascending, didynamous, the lower ones the longest; filaments naked at the base; anthers approximate by pairs under the superior lip, 2-celled: cells divaricate. Style somewhat equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, obtuse at apex.—Shrubs. Whorls loosely many-flowered. Corollas white.? This genus differs from *Ròylea*, *Ballòta*, and *Leùcas*, in the calyx; and from the latter genus in the divisions of the style.

1 O. integrifòlia (Benth. lab. p. 602.) leaves oblong, quite entire, clothed with rather silky tomentum on both surfaces; upper lip of calyx ovate, entire. ♄. G. Native of Abyssinia, Salt. Molucélla integrifòlia, R. Br. Append. to Salt's Abyssinia. Shrub clothed with silky tomentum or pubescence. Leaves narrowed at the base and blunt at apex, canescent on both surfaces as in *A'triplex Hálimus*; young leaves fascicled, with 2 short straight spines in each axil. Whorls numerous, disposed in a terminal raceme.

Entire-leaved Otostegia. Shrub.

2 O. scariòsa (Benth. lab. p. 602.) leaves ovate, toothed, wrinkled, green on both surfaces; upper lip of calyx ovate, entire. ♄. G. Native of Arabia Felix, Forsk; Abyssinia, Salt. Molucélla scariòsa, R. Br. append. to Salt's Abyss. Clinopòdium fruticòsum, Forsk. fl. ægypt. p. 107. Phlòmis moluccoìdes, Vahl. symb. 1. p. 42. t. 14. Habit of *Ròylea*. Branches pubescent. Leaves an inch long, roundly cuneated at the base, green above and pubescent beneath. Whorls few; cymes on short peduncles. Bracteas canescent, pubescent. Calyx villous.

Scarious Otostegia. Shrub.

3 O. repa'nda (Benth. lab. p. 602.) leaves ovate, toothed, wrinkled, clothed with hoary tomentum beneath; upper lip of calyx short, triangular. ♄. G. Native of Abyssinia, Salt. Molucélla repánda, R. Br. Append. to Salt's Abyss. Allied to *O. scariòsa*, but differs in the branches and leaves being villous, and in the calyxes being more villous, and in the form of the upper lip of the corolla.

Repand-leaved Otostegia. Shrub.

Cult. For culture and propagation, see *Lasiócorys*, above.

XCI. LEU'CAS (from λευκος, *leucos*, white; in allusion to the downy whiteness of the flowers.) R. Br. prod. p. 504. Benth. lab. p. 602.—Phlòmis species, Lin.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular or tubularly campanulate, striated, straight or incurved at apex;

mouth equal or drawn out obliquely above or beneath, 8-10-toothed. Corolla with an inclosed tube, which is annulate, or naked inside, and a bilabiate limb; upper lip concave, erect, entire, rarely emarginate, very hairy outside; lower lip longer, spreading, trifid, the middle segment the largest. Stamens 4, didynamous, ascending, the lower ones the longest; filaments naked at the base; anthers approximate by pairs under the upper lip, sub-bilocular: cells divaricate, confluent. Upper lobe of style very short, lower one subulate and stigmatiferous towards the apex. Achenia dry, triquetrous, obtuse at apex.—Herbs or under shrubs. Leaves quite entire or usually toothed; floral ones nearly similar. Whorls sometimes few-flowered and sometimes densely many-flowered. Corollas usually white, rarely purplish.—Scarcely differing from *Ballòta*, except in the unequally lobed stigma, but the calyx, corolla, and the general habit mark it out as a good genus.

Sect. I. Hemi'stoma (from *ἡμι*, *hemi*, half, and *στομα*, *stoma*, a mouth; the lower side of the calyx is alone drawn out.) Benth. lab. p. 605. Hemístoma, Ehrenb. Calyx tubular, with an oblique mouth; lower side drawn out, cleft above. Whorls globose, many-flowered. Bracteas numerous, equalling the calyxes.

1 L. I'ndica (R. Br. prod. p. 504.) herbaceous; stems and under sides of leaves clothed with silky tomentum; whorls many-flowered, globose; calyx rather villous, membranaceous, having the 3 lower teeth short and setaceous, the upper ones having disappeared. ⊙. S. Native of Madagascar. Phlòmis I'ndica, Lin. spec. 820. Leaves broad-ovate, acutish, coarsely and serrately crenated. Corollas exceeding the calyx a little, densely clothed with white hairs or villi.

Indian Leucas. Fl. July, Aug. Clt. 1789. Pl. 1 foot.

2 L. urticæfòlia (R. Br. prod. p. 504.) herbaceous, clothed with fine canescent tomentum; whorls many-flowered, globose; calyx rather villous, membranaceous, with 8-10 very short setaceous teeth. ⊙. S. Native of the East Indies, Abyssinia, and Arabia. Phlòmis urticæfòlia, Vahl, symb. 3. p. 76. Leùcas affìnis, R. Br. in append. to Salt, abyss. Hemístoma ovàta, Ehrenb. mss. Habit and inflorescence of *L. I'ndica*. Stems decumbent or ascending at the base. Leaves broad, ovate, coarsely and serrately crenated. Corollas white.

Nettle-leaved Leucas. Fl. July, Sept. Clt. 1810. Pl. ½ to 1 foot.

Sect. II. Loxo'stoma (from *λοξος*, *loxos*, oblique; and *στομα*, *stoma*, a mouth; mouth of calyx oblique.) Benth. lab. p. 606. Calyx tubular, with an oblique mouth, the lower side more drawn out than the upper, and hardly cleft above. Whorls few-flowered. Bracteas minute.

3 L. glabra'ta (R. Br. prod. p. 504.) herbaceous, glabrous; whorls 2-4-flowered, secund; calyx glabrous, with 10 subulate teeth. ⊙. S. Native of Delagoa Bay, and Arabia Felix. Phlòmis glabràta, Vahl, symb. 1. p. 42. Plant often purplish. Stems elongated, decumbent. Leaves ovate or oblong, few-toothed. Corolla purplish.

Glabrous Leucas. Pl. decumbent.

Sect. III. Physoca'lyx (from *φυσα*, *physa*, a bladder; and *καλυξ*, *calyx*, a calyx; calyx inflated.) Benth. lab. p. 744. Calyx inflated, with a contracted equal mouth. Whorls 6-10-flowered. Bracteas minute.

4 L. infla'ta (Benth. lab. p. 744.) shrubby; leaves sessile, orbicular, subcordate at the base, hairy on both surfaces, and green; whorls subspicate; calyx with 10 short erect teeth: throat nearly naked inside. ♄. G. Native of Arabia, in the desert of Suez, N. Bove.

Inflated-calyxed Leucas. Shrub.

Sect. IV. Ortholeu'cas (from *ορθος*, *orthos*, straight; and *Leucos*; in reference to the equal mouth of the calyx.) Benth. lab. p. 606. Ortholeùcas, Benth. in Wall. pl. rar. asiat. 1. p. 61. Whorls rather loose, usually few-flowered. Bracteas minute or few, setaceous, rarely almost equalling the calyxes. Calyx tubular or sub-campanulate, striated, with an equal or scarcely oblique mouth, a nearly naked throat, and 10 erect, subulate, or very short setaceous teeth.

5 L. Chine'nsis (R. Br. prod. p. 504.) suffruticose?; branches clothed with silky tomentum; leaves broad-ovate, coarsely toothed, wrinkled, villous, white beneath; whorls few-flowered; calyx funnel-shaped, tomentose, with an equal acutely 10-toothed limb. ♄. G. Native of China and the Indian peninsula. Phlòmis Chinénsis, Retz, obs. 2. p. 19. Habit of *L. montàna* and *L. lanàta*. Whorls 6-10-flowered. Corollas white.

China Leucas. Fl. June, Oct. Clt. 1820. Shrub procumbent.

6 L. monta'na (Spreng. syst. 2. p. 742.) perennial or suffruticose; branches clothed with silky tomentum; leaves ovate, serrately crenated, wrinkled, green above and pubescently hairy, but clothed with white wool beneath; whorls many-flowered; calyx clothed with silky villi, with an equal mouth, and very short setaceous erect teeth. ♄.? S. Native of India, near Madras. Phlòmis montàna, Roth, nov. spec. p. 263. Branches ascending, rising from a woody base. Leaves roundly truncate, or broadly cordate at the base. Whorls 15-20-flowered. Corollas white; tube annulate inside.

Mountain Leucas. Shrub ascending.

7 L. ova'ta (Benth. in Wall. pl. rar. asiat. 1. p. 61. lab. p. 607.) perennial or suffruticose; branches clothed with silky tomentum; leaves ovate, obscurely crenated, wrinkled, green and pubescently hairy above, but clothed with white wool beneath; whorls many-flowered; calyx pubescent, with an equal mouth, and very short setaceous straight teeth. ♄.? S. Native of Ava, on the banks of the Irawaddi. Allied to *L. montàna*; but the leaves are larger and blunter, scarcely broadly crenated, or almost quite entire.

Ovate-leaved Leucas. Shrub 2 feet.

8 L. lana'ta (Benth. l. c.) perennial or suffruticose; branches clothed with white wool; leaves ovate, sub-crenated, thick, wrinkled, clothed with very soft white wool on both surfaces; whorls many-flowered; calyx clothed with white wool, with an equal truncate mouth, and very short setaceous erect teeth. ♄.? G. Native of the East Indies, in the valleys of the provinces of Kamaon, Sirmore, and Deyra Dhoon, Wall. and Royle. Marrùbium mollíssimum, D. Don, prod. fl. nep. p. 112. Allied to *L. montàna*; but the plant is clothed with white wool; the leaves narrower, and less deeply crenated. Corollas white.

Woolly Leucas. Pl. 1 to 1½ foot.

9 L. molli'ssima (Wall. pl. rar. asiat. 1. p. 62.) perennial or suffruticose; branches tetragonal, clothed with adpressed tomentose villi; leaves ovate, crenated, wrinkled, clothed with soft villi, pale or canescent beneath; whorls many-flowered; calyx pubescent, with an equal mouth, and very short setaceous erect teeth. ♄.? S. Native of the East Indies, in the valleys of Nipaul, and on the Pundua mountains; also of China, Sir G. Staunton. Habit of *L. montàna*, but usually taller, and more branched. Leaves ½ to 1 inch, roundly truncate or broadly cordate at the base. Whorls 10-30-flowered. Corollas white? or usually purplish; tube annulate inside.

Very-soft Leucas. Shrub 1 to 2 feet.?

10 L. HAMILTONIA'NA (Benth. l. c.) perennial; branches clothed with adpressed tomentose villi; leaves ovate, serrately crenated, wrinkled, clothed with soft villi, canescent or rufescent beneath; whorls few-flowered; calyx pubescent, a little incurved, with an oblique mouth, and very short setaceous erect teeth. ♃. S. Native of the East Indies, at Monghyr, Hamilton. Differs from *L. mollissima*, in the larger more acute leaves, and few-flowered whorls, and in the calyx.

Hamilton's Leucas. Pl. 1 to 1½ foot.

11 L. TE'RES (Benth. l. c.) perennial or suffruticose; branches tomentose, terete; leaves ovate, subcrenated, green and pubescent above, and canescent beneath, hardly wrinkled; whorls 6-10-flowered; calyx pubescent, with an equal mouth and very short setaceous erect teeth. ♄.? S. Native of the Birman Empire, on the banks of the Irawaddi. Allied to *L. mollissima*; but differs in the branches being terete; in the leaves being smaller, and flowers fewer; in the whorls being smaller, &c.

Terete-stemmed Leucas. Pl.

12 L. STRIGÒSA (Benth. l. c.) herbaceous; branches tetragonal, clothed with adpressed pubescence; leaves oblong-lanceolate, scarcely serrated, green and strigosely hairy above, but clothed with rufous canescent adpressed tomentum beneath; whorls few-flowered; calyx pubescent, with an equal mouth, and very short teeth. ⊙. S. Native of the East Indies, near Prome, Wall. Branches ascending. Leaves nearly sessile. Whorls remote, 2-6-flowered, rarely about 10-flowered. Flowers of *L. pilòsa*.

Strigose Leucas. Pl. ascending.

13 L. ANGULA'RIS (Benth. l. c.) herbaceous, procumbent; branches acutely tetragonal; angles ciliated, subalate; leaves on short petioles, ovate, crenated, wrinkled, strigosely hispid on both surfaces; whorls few-flowered; calyx tubularly campanulate, villous, with an equal mouth and setaceous teeth. ⊙.? S. Native of Ceylon, Macrae. Allied to *L. strigòsa* and *L. pilòsa*, but differs in the form of the leaves, and especially in the calyxes.

Angular-stemmed Leucas. Pl. procumbent.

14 L. PILÒSA (Benth. l. c.) perennial, erect; branches pilosely pubescent; leaves ovate, serrately crenated, green on both surfaces, pilose or canescently pubescent beneath; whorls many-flowered; calyx pubescent, with an equal mouth, and very short setaceously erect teeth. ♃. S. Native of Bengal, and the banks of the Irawaddi. Phlòmis pilòsa, Roxb. fl. ind. 3. p. 12.? Corollas white or pale purple. Whorls 2-20-flowered.

Var. β, pubéscens (Benth. l. c.) leaves canescent from pubescence beneath. ♃. S. Native of Deyra Dhoun, Royle; Rajemahl, Wall.

Pilose Leucas. Pl. 1½ foot.

15 L. DECEMDENTA'TA (Smith, in Rees' cycl. Benth. lab. p. 609.) annual? pubescent; leaves ovate, crenated, clothed with fine tomentum, green on both surfaces, or sub-canescent beneath; whorls many-flowered: lower ones or all are shorter than the petioles; calyx pubescent, striated, with an equal mouth, and short setaceous teeth. ⊙.? S. Native of the Islands of the Pacific; as of Timor, Otaheite, Corollines, Malden, &c. Stàchys decemdentàta, Forst. prod. no. 526. Phlòmis decemdentàta, Willd. spec. 3. p. 124. Leùcas stachyoìdes, Spreng. syst. 2. p. 743. Floral leaves ½ an inch long, twice as long as the flowers. Allied to *L. mollissima*.

Ten-toothed Leucas. Pl. 1 to 1½ foot.?

16 L. FLA'CCIDA (R. Br. prod. 505.) annual, nearly glabrous; leaves ovate, crenated, membranaceous, green on both surfaces, and nearly glabrous; whorls many-flowered, shorter than the petioles; calyx nearly glabrous, with an equal mouth, and setaceous teeth. ⊙. S. Native of tropical New Holland, Moluccas, banks of the Irawaddi. Phlòmis Moluccàna, Roxb. fl. ind. 3. p. 11. Leùcas melissæfòlia, Benth. in Wall. pl. rar. asiat. 1. p. 62. L. parviflòra, Benth. in Wall. l. c. Hardly distinct from *L. decemdentàta*, except in the smoothness, and thinner blunter leaves. Corollas white.

Flaccid Leucas. Fl. July, Sept. Clt. 1823. Pl. 1 to 2 feet.

17 L. NEPETÆFÒLIA (Benth. l. c.) herbaceous? clothed with fine pubescence; leaves numerous, petiolate, ovate-roundish, crenated, green on both surfaces, or scarcely canescent; whorls few-flowered; calyx tubularly campanulate, nearly glabrous, with an equal mouth, and short acute teeth. ⊙.? S. Native of the Indian peninsula. Leaves an inch long, obtuse, truncate or subcordate at the base, pubescent on both surfaces.

Catmint-leaved Leucas. Pl.?

18 L. LONGIFÒLIA (Benth. lab. p. 744.) stem herbaceous, erect, villous; leaves linear, almost quite entire, nearly glabrous; whorls 6-10-flowered; calyx turbinately tubular, with an equal mouth, and very short setaceous teeth. ⊙.? S. Native of the North-east of India, at Pounah, Jacquemont. Allied to *L. hyssopifòlia*.

Long-leaved Leucas. Pl. erect.

19 L. ANGUSTIFÒLIA (Wall. pl. asiat. rar. 1. p. 62. Benth. lab. p. 610.) herbaceous, diffuse; leaves oblong-lanceolate or linear, narrowed at the base, nearly glabrous; whorls 6-20-flowered; calyx tubular, with an equal mouth, and very short setaceous erect teeth. ⊙.? S. Native of Nipaul. Habit of *L. procúmbens*; but differs in the much longer leaves, which are narrowed at both ends; and in the flowers being more numerous; in the whorls, &c.

Narrow-leaved Leucas. Pl. diffuse.

20 L. PROCU'MBENS (Desf. mem. mus. par. 11. p. 7. t. 3. f. 2.) herbaceous, diffuse; leaves ovate-lanceolate, subserrated, nearly glabrous; whorls 2-6-flowered; calyx tubular, with an equal mouth, and lanceolate-subulate erect teeth. ♃. S. Native of the East Indies, Bengal, Ceylon, Peninsula, Bundelgund, &c. Phlòmis biflòra, Roxb. fl. ind. 2. p. 12. and of many other authors, but not of Vahl. Népeta I'ndica, Burm. fl. ind. p. 126. The whole plant nearly glabrous. Stems rising from a thick perennial base. Corollas as in *L. biflòra*.

Procumbent Leucas. Pl. procumbent.

21 L. BIFLÒRA (R. Br. prod. p. 504.) herbaceous, diffuse; leaves ovate, coarsely toothed, pubescent on both surfaces; whorls 2-flowered; calyx tubular, with an equal mouth, and subulate teeth. ⊙.? S. Native of the peninsula of India and Ceylon. Phlòmis biflòra, Vahl, symb. 3. p. 77.—Burm. thes. zeyl. p. 140. t. 63. f. 1. Leaves pale beneath, ½ an inch long. Corolla white; tube obscurely annulate inside.

Two-flowered Leucas. Fl. July, Sept. Clt. 1819. Pl. diffuse.

22 L. PUBE'SCENS (Benth. lab. p. 610.) herbaceous; branches clothed with fine pubescence; leaves ovate, crenated, truncate at the base, thin, green on both surfaces, or pale and pubescent beneath; whorls densely many-flowered; bracteas subulate, shorter than the calyxes; calyx tubular, with an equal mouth, and straight subulate teeth. ⊙.? S. Native of the peninsula of India. L. marrubioìdes, β, glàbrior, Benth. in Wall. pl. asiat. rar. 1. p. 61. This differs from *L. marrubioìdes*, in the leaves and calyxes being finely pubescent, not clothed with white wool, &c.

Pubescent Leucas. Pl.

23 L. MARRUBIOI'DES (Desf. mem. mus. par. 11. p. 6. t. 3. f. 1.) herbaceous; branches clothed with woolly pubescence; leaves broad-ovate, crenated, subcordate at the base, wrinkled, hispid above, but clothed with white wool beneath; whorls densely many-flowered; bracteas subulate, about equal in length to the calyxes; calyx tubular, with an equal mouth, and straight

subulate teeth. ⊙.? S. Native of the Indian peninsula and Ceylon. Stems procumbent at the base. Whorls above 30-flowered. Corollas white.

Horehound-like Leucas. Pl. procumbent.

24 L. Java'nica (Benth. lab. p. 611.) stem branched, scandent; branches obversely pilose on the angles; leaves ovate, bluntly serrated, acutish at the base, and quite entire, pubescent on both surfaces; whorls 6-10-flowered; calyx oblong, pubescent, 10-toothed: teeth subulate, the alternate ones shorter. ⊙.? S. Native of Java, among bushes on the banks of rivers. Phlòmis Chinénsis, Blum. bijdr. p. 829. but not of Retz.

Var. β; leaves smaller, clothed with soft pubescence on both surfaces. ⊙.? S. Native of Java, on declivities between Mount Burangrang and Tankuwan Paku.

Java Leucas. Pl. climbing.

Sect. V. A'strodon (from *αστηρ, aster*, a star; and *οδους οδοντος, odous odontos*, a tooth; in allusion to the teeth of the calyx spreading in a stellate manner.) Benth. lab. p. 611. A'strodon, Benth. in Wall. pl. asiat. rar. 1. p. 61. Calyx tubular, with an equal mouth, and a usually very villous throat, and 10 teeth, which usually spread in a stellate manner at the time of maturity. Whorls usually globose, many-flowered, solitary or few, the upper ones sometimes capitate. Bracteas scarcely shorter than the calyxes.

25 L. suffruticòsa (Benth. lab. p. 611.) branches clothed with rufous villi, leafy at the base; leaves sessile, oblong-lanceolate, linear, quite entire, green and hispid above, and clothed with white tomentum beneath; bracteas subulate; calyx clothed with rufous villi, with a truncate villous mouth, and very short rather spreading teeth. ♄. S. Native of the Indian peninsula, on the Nielgherry mountains. Stems numerous, rising from a woody base. Leaves 8-10 lines long. Whorls about 10-flowered. Corollas as in *L. ternifòlia;* tube exannulate inside.

Suffruticose Leucas. Shrub ½ to 1 foot.

26 L. rosmarinifòlia (Benth. l. c.) suffruticose; branches clothed with adpressed villi; leaves sessile, linear, quite entire, scabrous from hairs above, but clothed with white tomentum beneath; bracteas lanceolate-linear; calyx villous, with a truncate villous mouth, and very short rather spreading teeth. ♄. S. Native of the Indian peninsula, Wight. Allied to the preceding, but the hairs are hardly rufescent. Leaves an inch long, much narrower. Bracteas broader, very acute, equalling the calyxes.

Rosmary-leaved Leucas, Shrub dwarf.

27 L. helianthemifòlia (Desf. mem. mus. par. 11. p. 2. t. 1.) stems shrubby at the base; branches clothed with silky subrufescent wool; leaves opposite, sessile, oblong-elliptic or lanceolate, quite entire, silky on both surfaces, but greener above, and very white beneath; bracteas linear, shorter than the calyxes; calyx clothed with silky villi, with a truncate villous mouth, and very short rather spreading teeth. ♄. S. Native of the Indian peninsula, on the Nielgherry mountains, Leschenault and Wight. Differs from *L. ternifòlia*, in the leaves being opposite, shorter, less white; and in the branches being usually rufescent.

Sun-rose-leaved Leucas. Shrub dwarf.

28 L. ternifòlia (Desf. mem. mus. par. 11. p. 4. t. 1. f. 2.) stem shrubby at the base; branches densely tomentose; leaves 3 in a whorl, sessile, oblong-lanceolate, quite entire, silky on both surfaces, very white beneath; bracteas linear; calyx clothed with silky wool, with a truncate villous mouth, and very short, rather spreading teeth. ♄. S. Native of the Indian peninsula, on the Nielgherry mountains. Branches clothed with dense white or rufescent wool. Leaves 1 to 1½ inch long. Whorls 10-20-flowered. Galea of corolla densely clothed with white hairs; tube exannulate inside.

Tern-leaved Leucas. Shrub dwarf.

29 L. lanceæfòlia (Desf. mem. mus. 11. p. 5. t. 2. f. 2.) stem erect, clothed with rufous tomentum; leaves oblong-lanceolate, almost quite entire, green and pubescent above, but canescent and clothed with tomentose pubescence beneath; bracteas equalling the calyxes; calyx clothed with rufous villi, with a truncate pubescent mouth, very short teeth, which are, as well as the bracteas, stiffly mucronulate. ♃. S. Native of the Indian peninsula, on the Nielgherry mountains. Leaves 3-4 inches long. Galea of corolla densely clothed with white villi; tube finely pubescent inside, but exannulate.

Lance-leaved Leucas. Pl. 7 to 8 feet.

30 L. stelli'gera (Wall. pl. rar. asiat. 1. p. 61. Benth. lab. p. 613.) herbaceous, erect, pubescent and sub-canescent; leaves oblong-lanceolate, bluntly serrated, glabrous or finely pubescent; calyx tomentose, with a truncate mouth, which is villous inside; teeth 10, and are, as well as the bracteas, subulate, soft, spreading, revolute at top. ⊙.? S. Native of the East Indies, at Aurungabad, Wall. Habit of *L. linifòlia.* Leaves 2-3 inches long. Whorls usually solitary, or 2-3 approximate at the tops of the branches. Corolla white; tube annulate inside.

Star-bearing Leucas. Pl. 1½ foot.

31 L. lamiifòlia (Desf. mem. mus. 11. p. 4. t. 2. f. 1.) herbaceous, clothed with rufous villi; leaves cordate-ovate, clothed with rufous villi above, and hoary tomentum beneath; bracteas lanceolate-linear, equalling the calyxes; calyx silky, with a truncate equal mouth, which is villous inside, and subulate teeth, which at length spread in a stellate manner. ⊙.? S. Native of the Indian peninsula, on the Nielgherry mountains. Leaves crenated, 2 to 2½ inches long. Whorls few, towards the tops of the branches, densely many-flowered. Flowers like those of *L. lanceæfòlia.*

Dead Nettle-leaved Leucas. Pl. 2 feet.

32 L. hi'rta (Spreng. syst. 2. p. 743.? Benth. lab. p. 613.) suffruticose?; branches clothed with rufescent villi; leaves ovate or oblong, sub-crenated, green and hairy on both surfaces; bracteas equalling the calyxes; calyx villous, with a truncate very villous mouth, and 10 short subulate stellately spreading mutic teeth. ♄.? S. Native of the peninsula of India, Heyne. Phlòmis hírta, Heyne, and perhaps of Roth, nov. spec. pl. p. 264.? Leùcas helianthemifòlia, Benth. in Wall. pl. asiat. rar. 1. p. 61. but not of Desf. Plant divaricately branched. Leaves scarcely an inch long. Whorls usually solitary, on the tops of the branches. Galea of corolla densely clothed with white hairs.

Hairy Leucas. Shrub ½ foot.

33 L. vesti'ta (Benth. in Wall. pl. rar. asiat. 1. p. 61. lab. p. 613.) herbaceous, erect; stem clothed with rufescent hairs; leaves ovate-oblong, crenated, hairy, green, or scarcely canescent beneath; bracteas linear, ciliately hairy; calyx hairy, with a truncate nearly equal mouth, which is very hairy inside, and hardly equal subulate teeth, which spread in a stellate manner. ⊙.? S. Native of the peninsula of India, on the Madura mountains; and of Silhet. Stem more robust than in *L. ciliàta.* Tube of corolla annulate inside.

Clothed Leucas. Pl. 2 to 3 feet.?

34 L. cilia'ta (Benth. l. c.) herbaceous, erect, clothed with adpressed pubescence; leaves ovate-lanceolate or oblong, serrately crenated, green on both surfaces; bracteas linear, ciliately hairy; calyx tubular, with a truncate equal mouth, which is rather pilose inside or naked, with elongated subulate hairy stellately spreading teeth. ⊙.? S. Native of Nipaul. Leaves

2-3 inches long. Whorls few, distant, towards the tops of the branches. Corollas as in *L. Zeylánica;* tube annulate inside.

Ciliated Leucas. Pl. 1 to 2 feet.

Sect. VI. Plagióstoma (from πλαγιος, *plagios*, transverse; and στομα, *stoma*, a mouth; in reference to the oblique mouth of the calyx.) Benth. lab. p. 614. Plagióstoma, Benth. in Wall. pl. rar. asiat. 1. p. 60. Calyx turbinate or tubular, with an oblique mouth, which is drawn out above. Whorls usually globose, many-flowered, solitary or few: upper ones sometimes capitate. Bracteas equal to, or a little shorter than the calyxes.

35 L. strí'cta (Benth. l. c.) herbaceous, erect, strict, pubescently hairy; leaves oblong-lanceolate or linear, almost quite entire; whorls many-flowered, solitary, terminal; bracteas subulate, hairy; calyx hairy, sub-striated, with an oblique mouth, and subulate striated teeth, which spread at length in a stellate manner. ⊙.? S. Native of the Indian peninsula. Leaves remote, 1 to 1½ inch long. Whorls 1-2 together, forming a head, 15-30-flowered. Corollas as in *L. Zeylánica.*

Strict Leucas. Pl.?

36 L. Zeyla'nica (R. Br. prod. p. 504.) herbaceous, erect, pubescently hairy; leaves oblong-lanceolate or linear, quite entire, or few-crenate; whorls dense, many-flowered, dimidiate or nearly equal; bracteas linear, hairy; calyx glabrous at the base, almost veinless, striated at top, a little incurved, with an oblique mouth, and short teeth, the upper teeth the largest. ⊙. S. Native of Ceylon; also of Pegu, near Rangoon. Phlòmis Zeylánica, Lin. spec. p. 820. but not of Roxb. Leonùrus marrubiástrum, Burm. fl. ind. 127. but not of Lin.—Rumph. amb. 6. p. 39. t. 16. f. 1. Leaves distant, green. Whorls 10-20-flowered, 1 or 2 together at the tops of the branches. Corollas white.

Ceylon Leucas. Fl. June, Oct. Clt. 1777. Pl. 1 foot.

37 L. diffu'sa (Benth. lab. p. 615.) herbaceous, diffuse, pubescently hairy; leaves oblong or linear, quite entire; whorls few-flowered, dimidiate, remote; bracteas linear, hairy; calyx glabrous at the base, almost veinless, striated at top, hairy, a little incurved, with an oblique mouth, and short hardly unequal teeth. ⊙. S. Native of the Indian peninsula. L. dimidiàta, Benth. in Wall. pl. rar. asiat. but not of Roth. Leaves nearly sessile, remote, ½ an inch long. Whorls remote, secund, 4-12-flowered. Very nearly allied to *L. áspera.*

Diffuse Leucas. Pl. 1 to 1½ foot, diffuse.

38 L. hyssopifòlia (Benth. l. c.) herbaceous, perennial, many-stemmed, ascending, hairy; leaves oblong-linear, quite entire; whorls dense, nearly equal; bracteas linear, scarcely pilose; calyx glabrous, almost veinless, or scarcely striated at apex, rather hairy, with an oblique truncate mouth, and minute setaceous hairy teeth. ♃. S. Native of Nipaul and Kamaon, Wall.; Deyra Dhoon, Royle. Stems numerous, rising from a thick woody base, ascending. Leaves 1 to 1½ inch long. Whorls 10-20-flowered, distant. Calyx shortly 10-toothed. Corollas white.

Hyssop-leaved Leucas. Pl. ½ to 1 foot.

39 L. a'spera (Spreng. syst. 2. p. 743.) herbaceous, pubescently hairy; leaves oblong or linear, sub-crenated, green; whorls dense, equal; bracteas oblong-linear, or subulate, hairy; calyx glabrous at the base, almost veinless, striated at top, and a little incurved, with an oblique mouth, and short, scarcely unequal teeth. ⊙. S. Native of the Himalaya, along the river Jumna, even to Allahabad, Royle; Indian peninsula, Wight; Mauritius, Bourbon, Java, and the Philippines, &c. Phlòmis áspera, Willd. enum. 2. p. 621. Phlòmis Plukenètii, Roth, nov. pl. spec. 261.? Leùcas Plukenètii, Spreng. syst. 2. p. 743.? Phlòmis esculénta, Roxb. fl. ind. 3. p. 10. Phlòmis cephalòtis, var. Blum. bijdr. p. 830.? Tumba, Rheed. mal. 10. p. 181. t. 91.? Stems hispid, or tomentosely pubescent, rarely glabrous. Leaves entire or few-toothed. Whorls usually 10-20-flowered. Corollas white; tube annulate inside.

Var. β, Wightiàna (Benth. lab. p. 616.) whorls small, numerous, approximate. ⊙. S. L. Wightiàna, Benth. in Wall. pl. rar. asiat. 1. p. 60.

Rough Leucas. Fl. July, Aug. Clt. 1818. Pl. 1 to 3 feet.

40 L. nu'tans (Spreng. syst. 2. p. 743.) herbaceous, pubescent; leaves ovate-oblong, crenated a little, green; whorls many-flowered, distant; bracteas oblong or lanceolate; calyx pubescent, striated, much elongated in the fructiferous state, incurved, nutant, with an oblique mouth, and short, linear, scarcely unequal teeth. ⊙.? S. Native of the Indian peninsula; and near Segain, and on the banks of the Irawaddi. Leaves broader than in *L. áspera*, with the crenatures fewer and more obscure. Corollas small.

Nodding-calyxed Leucas. Pl.?

41 L. dimidia'ta (Spreng. syst. 2. p. 743. Benth. lab. p. 616. but not of Benth. in Wall. pl. rar. asiat.) herbaceous, pubescently hairy; leaves ovate-oblong, subcrenated, green; whorls many-flowered, usually solitary, terminal; bracteas linear-subulate, hairy; calyx glabrous at the base, almost veinless, striated at top, incurvedly reflexed, with an oblique mouth, and short scarcely unequal teeth. ⊙.? S. Native of the Burman Empire, on the banks of the Irawaddi. Nearly allied to *L. nùtans*, but differs in the shorter calyxes, minute bracteas, solitary whorls; and with the habit and leaves of *L. Zeylánica.*

Dimidiate Leucas. Pl.?

42 L. cephalòtis (Spreng. syst. 2. p. 743.) herbaceous, pubescently hairy; leaves ovate or oblong, subserrated, green; whorls usually solitary, large, globose, densely many-flowered; bracteas ovate-lanceolate, acute, imbricated; calyx striated at top, rather villous, with an oblique mouth, and short, scarcely unequal teeth. ⊙. S. Native of the East Indies, common; Nipaul, Bengal, and the Peninsula. L. capitàta, Desf. mem. mus. 11. p. 8. t. 4. Phlòmis cephalòtes, Roth, nov. pl. spec. 262. Leaves 2-4 inches long. Whorls terminal. Corollas white; lower lip large, obcordate.

Headed Leucas. Fl. July, Sept. Clt. 1818. Pl. 1 foot.

43 L. Martinice'nsis (R. Br. prod. p. 617.) herbaceous, pubescent, scarcely canescent; whorls distant, large, globose, many-flowered; bracteas lanceolate-subulate; calyx membranous, incurved, with an oblique mouth, which is drawn out above, and with about 10 subulate teeth, the upper tooth very long. ⊙. S. Native of the tropics in both hemispheres; as of the East Indies, Madagascar, west coast of Africa, West Indies, Brazil, &c. Clinopòdium Martinicénsis, Jacq. amer. p. 173. t. 177. f. 75. Phlòmis Martinicénsis, Swartz, prod. fl. ind. occ. p. 88. Phlòmis Caribæ'a, Jacq. icon. rar. 1. p. 11. t. 110. Leonùrus parviflòrus, Mœnch, meth. p. 401. Phlòmis móllis, Schum. pl. guin. 263. Leaves ovate, crenated, rounded at the base, but more often cuneated: upper ones lanceolate. Bracteas subspinescent. Corollas small, white; tube exannulate inside.

Martinico Leucas. Fl. July, Sept. Clt. 1781. Pl. 1 to 2 feet.

44 L. linifo'lia (Spreng. syst. 2. p. 743.) herbaceous, erect, clothed with fine canescent pubescence or tomentum; leaves oblong-linear, quite entire, or remotely serrated; whorls dense, nearly equal, many-flowered; bracteas linear, canescent; calyx canescent or glabrous, almost veinless, elongated above, with a very oblique mouth, the lower teeth very short, and the upper tooth very large. ⊙. S. Native of the East Indies, Bengal, and the Peninsula, very common; Madagascar, Mauritius,

Bourbon, Moluccas, Philippines, &c. Phlòmis linifòlia, Roth, nov. spec. pl. p. 260. Phlòmis Zeylánica, Roxb. fl. ind. 3. p. 9. Lin. syst. 450. Jacq. icon. rar. 1. p. 11. t. 111. but not of Lin. spec. L. lavandulæfòlia, Smith, in Rees' cycl. vol. 2. Leonùrus I'ndicus, Burm. fl. ind. p. 127. Herba admiratiònis, Rumph. amb. 6. p. 39. t. 16. f. 1. Leaves 2-3 inches long. Whorls distinct, 2-4 towards the tops of the branches. Corollas like those of *L. Zeylánica*, white.

Flax-leaved Leucas. Fl. July, Sept. Clt. 1816. Pl. 1 to 1½ foot.

Cult. Most of the species of *Leùcas*, being annual, the seed should be reared on a hot-bed early in spring; and when the plants are about 1 inch in height, they should be planted into separate small pots, and afterwards shifted from size to size of pots, as they increase in size; and in the summer they may be placed in the greenhouse, where they will flower and seed freely, if plenty of air be given through the day. The suffruticose species should be treated like other stove plants, and they will be readily increased by cuttings or seeds.

XCII. LEONO'TIS (from λεων, *leon*, a lion; and ους ωτος, *ous otos*, an ear; lion's ear; fanciful likeness in the corollas.) R. Br. prod. p. 504. Benth. lab. p. 618.—Phlòmis species of Lin. and other authors.

Lin. syst. *Didynamia, Gymnospérmia.* Calyx ovate-tubular, 10-nerved, incurved at apex, with an oblique sub-10-toothed mouth; the upper tooth the largest. Corolla having the tube usually exserted, naked, or incompletely annulate inside, and a bilabiate limb; upper lip concave, erect, elongated, entire: lower lip short, spreading, trifid, the middle segment hardly larger than the lateral ones. Stamens 4, ascending, didynamous, the lower 2 the longest; filaments naked at the base; anthers approximating by pairs under the lower lip, 2-celled: cells divaricate, acute. Upper lobe of style very short. Achenia dry, obtuse at apex.—Herbs or sub-shrubs. Whorls many-flowered, usually very dense. Bracteas numerous, linear-subulate. Corollas showy, scarlet or yellowish.

1 L. nepetæfòlia (R. Br. prod. p. 504.) herbaceous; leaves ovate, crenated; teeth of calyx all spiny: upper one large; corollas scarlet, scarcely twice as long as the calyx. ⊙. S. Native of Asia and Africa, within the tropics; West Indies, and Brazil, in moist places. Ker. bot. reg. 4. t. 281. Phlòmis nepetæfòlia, Lin. spec. 820. Leonùrus globòsus, Mœnch, meth. 400. Leonùrus nepetæfòlius, Mill. dict. no. 2.—Herm. lugdb. 115. t. 117.? Stem pubescent or tomentose. Leaves 2-4 inches long, obtuse, rarely acutish, truncate or subcordate at the base, green on both surfaces, clothed with hoary tomentum beneath or glabrous. Whorls few, distant. Corolla villous, scarlet.

Cat-mint-leaved Lion's-Ear. Fl. Sept. Oct. Clt. 1778. Pl. 2 to 7 feet.

2 L. pa'llida (Benth. lab. p. 619.) herbaceous; leaves ovate, acute, bluntly serrated; calycine teeth all spinose: upper one large, ovate; corollas yellowish, scarcely exceeding the calyxes. ⊙. S. Native of Guinea. Phlòmis pállida, Schum. pl. guin. p. 262. Phlòmis Africàna, Beauv. fl. d'ow. 2. p. 82. t. 111. Very nearly allied to *L. nepetæfòlia;* but differs in the leaves being more acute, on shorter petioles, and especially in the corollas being smaller, and yellowish.

Pale-flowered Lion's-Ear. Pl. 2 to 4 feet.

3 L. ova'ta (Spreng. syst. 2. p. 744.) herbaceous; leaves ovate, deeply crenated; calycine teeth all spinose; upper tooth large, ovate; corolla about 3 times as long as the calyx. ⊙.? S. Native of South Africa, without the tropic, Burchell. Phlòmis Leonòtis, Lin. mant. p. 83. Mill. fig. t. 162. f. 1. Stems tomentosely pubescent. Leaves scarcely an inch long, broadly truncate or subcordate at the base, pubescent above, and tomentosely pubescent beneath. Whorls size of those of *L. nepetæfòlia.* Corollas orange-coloured, size of those of *L. Leonùrus.*

Ovate-leaved Lion's-Ear. Fl. June, July. Clt. 1713. Pl. 2 to 7 feet.

4 L. interme'dia (Lindl. bot. reg. 10. t. 1850.) herbaceous or suffruticose; leaves ovate-lanceolate, deeply toothed; whorls very dense, globose; calyx villous, with mutic teeth; corolla about 3 times as long as the calyx. ♄.? or ♃.? Native of Algoa Bay. Habit of *L. ovàta;* but the leaves are 2 or 3 times as long, bluntly acuminated, and the tomentum on the lower surfaces of the leaves, as well as on the petioles and branches, is more dense. Corollas orange-coloured, a little shorter than those of *L. Leonùrus.*

Intermediate Lion's-Ear. Fl. Sept. Oct. Clt. 1822. Shrub? 3 to 4 feet.

5 L. parvifo'lia (Benth. lab. p. 619.) shrubby; leaves ovate, wrinkled, and are, as well as the branches, canescent; upper tooth of calyx ovate, spinescent: lower ones all very short and mutic; corolla about 3 times as long as the calyx. ♄. G. Native of the Cape of Good Hope, Masson. This species differs from *L. ovàta,* in the leaves being smaller, more wrinkled, canescent, and in the form of the mouth of the calyx. Stems woody and humble. Corollas of *L. Leonùrus.*

Small-leaved Lion's-Ear. Shrub humble.

6 Leonu'rus (R. Br. prod. p. 504.) shrubby; leaves oblong-lanceolate, bluntly serrated; whorls rather loose; calyx clothed with fine pubescent tomentum, with mutic teeth; corolla more than 3 times as long as the calyx. ♄. G. Native of the Cape of Good Hope. Phlòmis Leonùrus, Lin. spec. p. 820. Curt. bot. mag. t. 478. Leonùrus grandiflòrus, Mœnch, meth. 400. Leonùrus Africànus, Mill. dict. no. 1.—Knor. del. 2. t. 50.—Sabb. hort. rom. 3. t. 44.—Breyn. cent. 171. t. 86.—Seba, mus. 1. p. 22. t. 14. f. 1. Branches tomentose. Leaves 2 inches long, obtuse, tomentose beneath and pubescent above. Whorls distant or approximate. Corollas 2 inches long, scarlet, villous.

Lion's-tail Lion's-Ear. Fl. Oct. Dec. Clt. 1712. Shrub 3 to 6 feet.

Cult. The species are all very showy when in blossom. Any light rich earth will suit them; and young cuttings of the shrubby kinds strike root readily in sand, with a hand-glass over them. The annual kinds should be treated in the manner recommended for the species of *Leùcas,* see above.

XCIII. PHLO'MIS (φλομος, of Dioscorides; from φλοξ, *phlox*, φλογος, *phlogos*, a flame; the down of some species was used formerly as wicks.) R. Br. prod. p. 504. Benth. lab. p. 620.—Phlòmis species of Lin. and other authors. Phlomidópsis, Link, handb. p. 479.—Phlomoìdes, Mœnch, meth. p. 403.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular, 5 or 10-striped, usually plicate, with an equal, truncate, or tridentate mouth. Corolla with an inclosed or scarcely exserted tube, usually annulate inside, and a bilabiate limb; upper lip galeate, keeled, compressed, broad, entire or emarginate, incumbent or erectish: lower lip spreading, trifid. Stamens 4, ascending, didynamous: the lower 2 the longest; upper filaments adnate, usually drawn out into an appendage at the base: lower ones naked; anthers approximate by pairs under the galea, somewhat 2-celled: cells divaricate, obtuse, confluent. Superior lobe of style very short, the lower lobe subulate, stigmatiferous at apex. Achenia dry, triquetrous, obtuse at apex, rarely trun-

cate, glabrous or pubescent at apex.—Herbs, under-shrubs, and shrubs; in the first section clothed with floccose wool, and in the second section green. Leaves wrinkled. Whorls many-flowered, axillary, propped by bracteas, rarely naked. Corollas in the first section yellow or purple; but in the second section purple or white.

SECT. I. EUPHLO'MIS (from *ευ, eu*, well; and *phlomis;* so called because this section is supposed to contain the true species of the genus.) Benth. lab. p. 622. Galea of corolla large, incumbent, tomentose, rarely villous, shortly somewhat bearded inside and along the margins; lateral segments of the lower lip small, furnished each with a lanceolate, or ovate, truncate, small appendage; the middle lobe large, very broad, rounded, emarginate, or somewhat 2-lobed.

§ 1. LYCHNI'TIS (from λυχνος, *lychnos*, a lamp; down used for making wicks.) Benth. lab. p. 623. *Plant suffruticose. Floral leaves broadly dilated at the base, clasping the flowers.*

1 P. LYCHNI'TIS (Lin. spec. p. 819.) suffruticose, clothed with hoary tomentum; leaves sessile, oblong-linear, narrowed at both ends, stem-clasping, wrinkled; floral leaves very broad at the base; bracteas subulate, and are, as well as the calyxes, clothed with silky pili, with short subulate teeth. ♄. H. Native of Europe, in the region of the Mediterranean, in dry places; as of Spain, South of France, North of Italy.? Sims. bot. mag. 999. Mill. fig. 203.—Lob. icon. 558.—Barrel. icon. 1321. Stems numerous, simple, rising from a woody base. Cauline leaves 2-3 inches long, and scarcely 4 lines broad, green or canescent above, very veiny, and clothed with white tomentum beneath. Corolla yellow, twice as long as the calyx. The dry leaves of this sort are used for wicks; hence its specific name, and its Spanish one of *Candelera*.

Link Phlomis. Fl. June, Aug. Clt. 1658. Shrub 2 feet.

§ 2. GYMNOPHLÒMIS (from *γυμνος, gymnos*, naked; and *φλομος, phlomos*, the Greek name of Mullien; so called from the whorls being almost destitute of bracteas.) Benth. lab. p. 623. *Perennial herbs or undershrubs. Floral leaves narrowed at the base. Whorls few-flowered. Bracteas few, loose or wanting. Calycine teeth soft, mutic.*

2 P. BRUGUIE'RI (Desf. mem. mus. 11. p. 9. t. 5.) perennial or suffruticose, very white from floccose tomentum; leaves ovate-oblong, roundly cuneated at the base, densely woolly; whorls about 6-flowered; bracteas linear, loose; calyx very pilose, with lanceolate soft plumose teeth, which exceed the corolla. ♃. F. Native of Persia, near Kermanchan. Stems almost simple. Leaves 2-3 inches long, acutish, a little crenated, and a little wrinkled. Whorls approximate. Corollas deep red, a little smaller than those of *P. lychnìtis*. Superior filaments thickened at the base, scarcely appendiculate.

Bruguier's Phlomis. Pl. 1 to 1½ foot.

3 P. CRINI'TA (Cav. icon. rar. 3. p. 25. t. 247.) perennial or suffruticose, clothed with very white floccose wool; leaves ovate-oblong, roundedly truncate at the base, the radical leaves subcordate, very thick, densely woolly on both surfaces; floral leaves narrowly rounded at the base; whorls 6-10-flowered; bracteas linear, loose; calyx very pilose, with linear plumose mutic teeth, which are shorter than the corolla. ♃. F. Native of Spain. Stems rising from a woody base. Radical leaves 2-3 inches long, almost quite entire. Whorls disposed in a paniculately branched raceme. Corolla like those of *P. lychnìtis*, yellow or pale orange.

Long-haired Phlomis. Fl. June, Aug. Clt. 1820. Pl. 1 to 1½ foot.

4 P. BI'LOBA (Desf. fl. atl. 2. p. 25. t. 127.) perennial or suffruticose, woolly; leaves ovate-oblong, rounded at the base, clothed with sub-floccose tomentum on both surfaces; whorls 4-6-flowered; bracteas linear, loose; calyx pilose, with linear soft acute mutic teeth. ♃. F. Native of Algiers, near Mayane. Lower leaves petiolate: upper ones sessile, scarcely crenated. Corollas size of those of *P. hérba-vénti*, purple, villously tomentose outside; upper lip bipartite.?

Two-lobed-lipped Phlomis. Pl. 2 to 3 feet.

5 P. ORIENTA'LIS (Mill. dict. no. 9.) perennial or suffruticose, clothed with floccose wool; leaves ovate: lower ones cordate at the base, much wrinkled, villous or woolly on both surfaces; floral leaves narrowed at the base; whorls 6-10-flowered; calyx elongated, pilose, with linear, soft, acute, plumose teeth. ♃. F. Native of Syria, near Aleppo, and about Smyrna. Habit of *P. Nissòlii*, but the calyx is very different. Corollas pale brown or yellow.

Eastern Phlomis. Fl. July, Aug. Clt.? Pl. 1 to 2 feet.

6 P. OLIVIE'RI (Benth. lab. p. 624.) shrubby, woolly; leaves petiolate, ovate, narrowed at the base: lower ones cordate, wrinkled, densely clothed with wool in the young state; whorls few-flowered; bracteas short, linear; calyx hispidly woolly, with lanceolate-linear obtuse teeth. ♄. F. Native of Persia, between Bagdad and Kermanchan, and between Kermanchan and Armadan. Bracteas as in *P. Armenìaca*, but more hispid; but the calyxes are less pilose, and the stems more simple than in *P. orientàlis*.

Olivier's Phlomis. Shrub.

7 P. ARMENI'ACA (Willd. spec. 3. p. 119.) perennial, clothed with floccose wool; radical leaves on long petioles, cordate-oblong, obtuse, crenated; cauline leaves lanceolate, attenuated at the base; whorls 6-flowered; bracteas loose, subulate, mucronulate; calyx clothed with tomentose wool, contracted at the apex in the fructiferous state, with subulate mucronate straight teeth. ♃. F. Native of Armenia; and of Caucasus, in dry stony places among the Talusch mountains, near Perimbal and Swant. D. Don, in Sweet, fl. gard. n. s. 4. t. 364. P. orientàlis, angusto et lineare folio, flore luteo, Tourn. cor. p. 10. Stems simple. Leaves obscurely crenated. Whorls distinct, usually 6-flowered. Corollas yellow, similar to those of *P. lychnìtis*, twice the length of the calyx, clothed with stellate pubescence outside.

Armenian Phlomis. Fl. June, July. Clt. 1834. Pl. ½ to 1 foot.

8 P. NISSÒLII (Lin. spec. p. 819.) perennial or suffruticose, densely clothed with sub-floccose wool; leaves petiolate, ovate-oblong, deeply cordate at the base, much wrinkled; whorls few-flowered; bracteas very short; calyx densely woolly, with ovate acuminated soft mutic teeth. ♃. F. Native of Syria, near Smyrna and Aleppo. Mill. fig. 204. Stems rising from a woody base. Lower leaves petiolate, 4-5 inches long, crenulated. Whorls distant. Corolla yellow, similar to that of *P. lychnìtis;* but the upper lip is a little acuminated, and the middle lobe of the lower lip more deeply emarginate.

Nissole's Phlomis. Fl. June, July. Clt. 1757. Pl. 1 to 1½ foot.

§ 3. DENDROPHLÒMIS (from *δενδρον, dendron*, a tree; and *φλομος, phlomos*, the Greek name of Mullien; in allusion to the species being woody). Benth. lab. p. 625. *Shrubs, rarely subshrubs. Whorls dense. Bracteas adpressed, numerous, about equal in length to the calyxes. Calyxes usually truncate, mucronate.*

9 P. PURPU'REA (Lin. spec. p. 818.) shrubby; branches

clothed with floccose tomentum; leaves oblong, obtuse, crenated, truncate or subcordate at the base, greenish above, and clothed with white tomentum beneath; bracteas oblong-lanceolate, and are, as well as the calyxes, clothed with white tomentum; calycine segments lanceolate, softly acuminated. ♄. H. Native of Spain, near Malaga. Smith, spicil. 6. t. 7. P. ferrugínea, Mill. dict. no. 12. P. salviæfòlia, Jacq. hort. schœnbr. 3. p. 58. t. 359. Floral leaves ovate-lanceolate, much longer than the whorls. Corollas reddish-purple; upper lip tomentosely villous outside. Appendages of upper filaments subulate.

Purple-flowered Phlomis. Fl. June, Aug. Clt. 1661. Shrub 2 to 3 feet.

10 P. Ita'lica (Smith, spicil. 1. t. 6.) shrubby, clothed with floccose tomentum; leaves oblong-lanceolate, obtuse, truncate at the base, wrinkled; whorls dense; bracteas linear, obtuse, adpressed, about equalling the calyxes, clothed with floccose tomentum; calyx truncate, with very short obtuse mutic teeth. ♄. H. Native of Spain, Italy, and Balearic Islands. P. rotundifòlia, Mill. dict. no. 13. fig. 202. Wool subferruginous or white. Leaves all petiolate, 2-3 inches long, velvety on the upper surface, a little crenated. Corollas purple. Upper filaments thickened a little under the insertion. This differs from *P. purpùrea* in the calyxes and bracteas.

Italian Phlomis. Fl. June, Aug. Clt. 1661. Shrub 1 to 2 feet.

11 P. elli'ptica (Benth. lab. p. 626.) shrubby, clothed with subfloccose tomentum; leaves ovate-elliptic, truncate at the base, much wrinkled, clothed with floccose tomentum beneath, or on both surfaces: whorls dense, many-flowered; bracteas lanceolate, linear, bluntish, stiff, clothed with floccose wool; calyx truncate, with linear stiff pungent teeth. ♄. F. Native of Persia. Branches at length glabrous towards the tops. Leaves an inch long, at length naked above, but clothed with floccose tomentum on both surfaces while young. Whorls about 10-flowered. Corolla purplish.

Elliptic-leaved Phlomis. Shrub.

12 P. lana'ta (Willd. enum. suppl. p. 41.) shrubby; branches divaricate, clothed with subfloccose wool; leaves small, ovate-roundish, very blunt, roundly cuneated at the base, much wrinkled, green above, and clothed with white wool beneath; bracteas ovate-lanceolate, obtuse, shorter than the calyxes, and are, as well as them, clothed with white wool; calycine teeth very short, obtuse, or stiffly mucronulate. ♄. H. Native of Calabria and Candia. P. parvifòlia, Presl. del. prag. p. 86. P. microphýlla, Sieb. in bot. zeit. 1823. 2. p. 598. Shrub divaricately much branched. Branches clothed with rusty wool. Whorls solitary on the branches, or twin and remote, 6-8-flowered. Corolla yellow; upper lip clothed with velvety tomentum.

Woolly Phlomis. Fl. June, July. Clt. 1696. Shrub 1 to 2 feet.

13 P. angustifòlia (Mill. dict. no. 2.) shrubby; branches clothed with floccose tomentum; leaves ovate or oblong, obtuse, truncate at the base, much wrinkled, canescent above, and clothed with white tomentum beneath; bracteas lanceolate, clothed with soft white tomentum, mutic; calyx clothed with white tomentum; calycine teeth truncate, mucronate, very short and stiff. ♄. F. Native among rocks in the desert of Sinai, Bove; and in the Grecian Archipelago. P. flavéscens, Mill. dict. no. 10. This species differs from *P. purpùrea*, in the stem being taller; in the calyxes being truncate, &c. Corolla cream-coloured, size of those of *P. purpùrea*.

Narrow-leaved Phlomis. Fl. June, Aug. Clt. 1596. Shrub.

14 P. fruticòsa (Lin. spec. p. 818.) shrubby; branches clothed with floccose tomentum; leaves ovate or oblong, roundly cuneated at the base, wrinkled, green above, and clothed with white tomentum beneath; whorls densely many-flowered; bracteas broad-ovate or ovate-lanceolate, acute, greenish, ciliated, villous; calyx villous, with truncate teeth, which end each in a subrecurved, or spreading, subulate, stiff acumen. ♄. H. Native of the region of the Mediterranean, in dry exposed places of mountains; as of Sicily, Abruzzo, Greece, Levant, &c. Sims, bot. mag, 1843. Sibth. et Smith, fl. græc. 6. p. 51. t. 563. P. ferrugínea, Hortul. but not of Tenore nor Mill. P. latifòlia, Mill. dict. no 3.—Sabb. hort. rom. 3. t. 15. Shrub branched. Tomentum of branches usually yellowish. Leaves 2-3 inches long, quite entire, or more or less crenated, villous above. Whorls solitary or twin at the tops of the branches, 20-30-flowered. Corollas yellow or dusky yellow, showy. Appendages of upper filaments recurved.

Shrubby Phlomis, or Jerusalem Sage. Fl. June, July. Clt. 1596. Shrub 2 to 4 feet.

15 P. ferrugi'nea (Tenore, fl. nap. 2. p. 36. t. 57.) shrubby; branches clothed with loose floccose tomentum; leaves oblong-lanceolate, obtuse, crenulated, cordate at the base, much wrinkled, villous and green above, but clothed with loose floccose tomentum beneath; bracteas lanceolate, hispid; calyx villous, with a long-haired throat, and short stiff subulate teeth. ♄. H. Native of Lucania and Japygia, Tenore. Branches clothed with rusty purple loose wool. Leaves 2-3 inches long, green above, and canescent beneath. Whorls 12-20-flowered. Corollas yellow, densely tomentose outside. Appendages of upper filaments short, acute.

Var. β, Crética (Benth. lab. p. 627.) leaves lanately villous, canescent; bracteas linear-subulate. ♄. H. Native of Candia. P. fruticòsa, Sieb. pl. cret. exs. P. Crética, Presl. del prag.

Rusty Phlomis. Fl. June, July. Clt. 1823. Shrub 2 to 3 feet.

16 P. visco'sa (Poir. dict. 5. p. 271.) shrubby; branches scarcely tomentose; leaves petiolate, ovate, obtuse, crenated, truncate or subcordate at the base, green above, and scarcely tomentose beneath; whorls many-flowered; bracteas lanceolate-linear, ciliated; calyx hispid, with truncate, subulately acuminated, stiff, rather spreading teeth, 2 of the teeth longer than the rest. ♄. H. Native of the Levant. P. vìrens, D. C. cat. hort. monsp. p. 132. Nearly allied to *P. ferrugínea;* but the leaves are broader, greenish, and scarcely wrinkled; and the calyx is distinct. Leaves form of those of *P. fruticòsa*, rather villous above. Whorls about 16-flowered. Corollas yellow, villous outside.

Clammy Phlomis. Fl. June, July. Clt.? Shrub 2 to 3 feet.?

§ 4. Oxyphlòmis (from οξυς, *oxys*, sharp; and φλομος, *phlomos*, the Greek name of Mullien; in reference to the very acute, stiff, sub-pungent bracteas.) Benth. lab. p. 628. *Herbs or under-shrubs. Whorls usually many-flowered, rarely so low as 6-flowered. Bracteas very acute, with stiff, rather pungent tops.*

17 P. flocco'sa (D. Don, in bot. reg. t. 1300.) suffruticose; branches clothed with white floccose wool; leaves ovate-oblong, cordate at the base, greenish above, and much wrinkled, and clothed with floccose wool beneath; whorls densely many-flowered; bracteas linear, clothed with white wool, and are, as well as the calycine teeth, subulate, stiff, glabrous, and hooked at apex. ♄. F. Native of Egypt. Leaves with the auricles closed at the base, covered with canescent villi above. Whorls few, distant, large, 20-30-flowered. Corollas yellow, size of those of *P. Sàmia*.

Floccose Phlomis. Fl. July, Oct. Clt. 1828. Shrub 2 feet.

18 P. bi'color (Benth. lab. p. 629.) corolla deep yellow outside; lower lip purplish above; bracteas entire; calyxes mucro-

nate; mucrones blackish, glabrous, hooked. ♄. H. Native of Lybia, in the mountains of Cyrenaica Viviani. P. Sàmia, Sims, bot. mag. t. 1891. S. Sàmia, β, bícolor, Viv. fl. lib. spec. 30. t. 15. f. 2. Habit almost of *P. fruticòsa*. Bracteas not joined at the base, as in *P. Sàmia*. Calyxes and bracteas hairy, not woolly as represented in Viviani's figure.

Two-coloured-flowered Phlomis. Fl. June, July. Clt. 1714. Pl. 2 to 3 feet.

19 P. RUSSELLIA'NA (Lag. mss. Benth. lab. p. 629.) herbaceous; branches tall, almost simple; radical leaves very ample, ovate, deeply cordate at the base, and are, as well as the cauline leaves, wrinkled, green above, and canescent from tomentum beneath; whorls large, many-flowered; bracteas linear, very acute, and are, as well as the calyxes, green and pubescent; calyx truncate, with long stiff subulate spreading teeth. ♃. H. Native of Syria, near Aleppo. P. hérba-vénti, var. Russ. nat. hist. alep. 2. p. 269. t. 16. P. lunarifòlia, β, Russelliàna, Sims, bot. mag. 2542. Branches clothed with loose white tomentum. Leaves 6-8 inches long. Whorls 40-50-flowered. Corollas yellow or brownish? tomentose outside. Appendages of superior filaments subulate.

Russell's Phlomis. Fl. June, July. Clt. 1821. Pl. *3 to 5* feet.

20 P. LUNARIFO'LIA (Sibth. et Smith, prod. fl. græc. p. 414.) stems herbaceous, tall, pubescent; leaves ovate, wrinkled above, canescently tomentose beneath; whorls many-flowered; bracteas broad-lanceolate or oblong, acute, subciliated, and are, as well as the calyxes, green; calyx truncate at apex, rather membranous, with subulate stiff pungent teeth. ♃. H. Native of the Peloponnesus, in various places; and on Mount Athos. Bracteas 3 times as broad as those of *P. Russelliàna*. Corollas yellow.

Honesty-leaved Phlomis. Fl. June, July. Clt. 1818. Pl. 3 to 4 feet.

21 P. SA'MIA (Lin. spec. 819.) stems herbaceous, tall, pubescent; leaves ovate, wrinkled above, and clothed with canescent tomentum beneath; whorls many-flowered; bracteas linear, very acute, pungent, and are, as well as the calyxes, green and pubescent; calyx elongated, plicate, with lanceolate-subulate stiff pungent teeth. ♃. H. Native of Eubœa, Samos, Ceramania, &c. Vent. choix. t. 4. Sibth. et Smith, fl. græc. 6. p. 52. t. 564. Allied to *P. Russelliàna;* but the stems are less tomentose, the whorls sometimes 10-15-flowered. Calyx 9-10 lines long, pubescent and clammy. Corollas purple. "Leaves ovate-cordate, crenated," ex Desf.

Samos Phlomis. Fl. June, July. Clt. 1714. Pl. 2 to 3 feet.

22 P. RI'GIDA (Labill. icon. pl. syr. rar. 3. p. 15. t. 10.) herbaceous; leaves oblong-lanceolate, wrinkled, clothed with subfloccose tomentum, having the nerves and petioles pilose; whorls many-flowered; bracteas subulate, stiff, pungent; calyx hairy, with subulate stiff teeth. ♃. H. Native of Syria, near Damascus, in sandy places. Stems woolly from short hairs, intermixed with long hairs. Leaves obtuse, crenulated, cordate at the base, but the cauline ones are roundly cuneated at the base. Corollas yellow, almost like those of *P. Lychnìtis*. Filaments not appendiculate, ex Labill.

Stiff Phlomis. Pl. 2 feet.

23 P. CASHMERIA'NA (Royle, ex Benth. in Hook. bot. misc. 3. p. 382. lab. p. 630.) herbaceous, erect: stem densely clothed with floccose tomentum; leaves ovate-lanceolate, obtuse, crenated towards the apex, broadly rounded at the base, wrinkled, pubescent or villous above, and clothed with dense white tomentum beneath; bracteas subulate, ciliated, longer than the calyxes; calyx clothed with floccose wool, with subulate stiff spreading teeth. ♃. H. Native in the valley of Cashmere, Royle. Corollas larger than in *P. hérba-vénti* and *P. púngens*, to which species it comes nearest. Galea densely villous.

Cashmere Phlomis. Pl. 1 to 1½ foot.?

24 P. HE'RBA-VE'NTI (Lin. spec. 819.) herbaceous, erect, divaricately much branched; branches beset with long hairs; leaves oblong-lanceolate, crenated, rounded at the base, coriaceous, green on both surfaces, or canescent beneath, always shining and rather scabrous above; bracteas subulate, ciliated, longer than the calyxes; calyx hairy, with subulate stiff rather spreading teeth. ♃. H. Native of the region of the Mediterranean, in dry places; as of Spain, Sicily, Italy, Tauria. Sims, bot. mag. t. 2449. Sibth. et Smith, fl. græc. t. 564.—Sabb. hort. rom. 3. t. 17. Branches green or purplish. Leaves often 6-8 inches long: floral ones sessile, all much exceeding the whorls. Whorls 10-20-flowered. Corollas purplish-violet, tomentose outside. Appendages of upper filaments acute, sub-recurved. In autumn, after the substance of the leaves has decayed, the veins remain perfect, showing the complete skeletons of them; hence the specific name. We believe this is also the case in *P. púngens*.

Var. β, *tomentòsa* (Benth. lab. p. 631.) leaves tomentose beneath.

Wind-herb Phlomis. Fl. July, Sept. Clt. 1596. Pl. 1 to 1½ foot.

25 P. PU'NGENS (Willd. spec. 3. p. 121.) herbaceous, divaricately branched; branches clothed with hoary tomentum; leaves on short petioles, ovate-lanceolate, quite entire or serrated, rounded at the base, shining and green above, and rather scabrous, but clothed with hoary tomentum beneath; bracteas subulate, ciliated, rather longer than the calyxes; calyx hairy, with subulate stiff rather spreading teeth. ♃. H. Native of the south-east of Europe, and west of Asia, in dry mountain places; as of Galicia, Greece, Tauria, Caucasus, Persia, &c. Sweet, fl. gard. n. s. t. 33. Nearly allied to *P. hérba-vénti;* but is distinguished from it in the tomentosely pubescent, not pilose, stem; in its narrower, quite entire, or serrated, not crenated, leaves, which are constantly tomentose beneath; and the whorls are more numerous, usually 6-10-flowered, &c. Corolla purplish-violet.

Pungent Phlomis. Fl. July. Clt. 1820. Pl. 1½ to 2 feet.

SECT. II. PHLOMIDÓPSIS (from φλομος, *phlomos*, the Greek name of Mullien; and οψις, *opsis*, resemblance; so called because it has been considered a distinct genus allied to *Phlomis* by some authors.) Benth. lab. p. 631. Phlomidópsis, Link, handb. p. 479. Phlomoìdes, Mœnch, meth. p. 403. Galea of corolla erectish, pilose, bearded inside and on the margins with long pili; middle lobe of lower lip hardly larger than the lateral ones.—Green, hairy, or pilose herbs, rarely rather woolly. Whorls dense. Bracteas adpressed. Corollas purple or white.

26 P. BREVIFLO'RA (Benth. in Wall. pl. rar. 1. p. 62.) herbaceous, erect, nearly glabrous; leaves petiolate, broad-ovate, acuminated, crenated, truncate or subcordate at the base, rather hispid above, and glabrous beneath; bracteas linear, and are, as well as the calyxes, nearly glabrous; galea of corolla pubescent, erect. ♃. H. Native of Nipaul, on Gosainsthan, Wall. Leaves all petiolate. Whorls 15-20-flowered. Calyx truncate, with very short emarginate or acuminated teeth. Filaments scarcely drawn out at the base. Corolla hardly a half again as long as the calyx, white.?

Short-flowered Phlomis. Pl.

27 P. MACROPHY'LLA (Wall. pl. rar. asiat. 1. p. 62. Benth. lab. p. 631.) herbaceous, tall, nearly glabrous. Leaves on long petioles, very ample, hastately cordate; floral leaves ovate, narrowed at the base; bracteas subulate, and are, as well as the

calyxes, a little ciliated; galea of corolla erect, very pilose inside. ♃. H. Native along with the preceding. Herb many feet high, branched. Allied to *P. tuberòsa*. Branches furnished with short reflexed rufescent pili at top. Petioles ciliated with long rufous hairs. Leaves 6 inches long, hispid above, and tomentose beneath. Whorls numerous, remote, 30-40-flowered. Corollas white.

Long-leaved Phlomis. Pl. 3 to 6 feet.

28 P. tuberòsa (Lin. spec. p. 819.) herbaceous, tall, nearly glabrous; leaves ample, ovate, obtuse, crenated, deeply cordate at the base: floral leaves oblong-lanceolate; bracteas subulate, and are, as well as the calyxes, subciliated; galea of corolla erectish, very pilose inside. ♃. H. Native of the East of Europe and Middle Asia, in exposed fields; as of Bohemia, Moravia, Austria, Hungary, Podolia, South of Russia, Siberia, Tauria, Caucasus, &c. Sims. bot. mag. t. 1555. Hall. comm. gœtt. 1751. t. 11. Phlomoìdes tuberòsa, Mœnch, meth. p. 404. Phlomidópsis tuberòsus, Link, handb. p. 480. Root tuberous in this, and probably in many other species of the present section. Branches and stems purplish. Lower leaves ½ foot long; floral ones 2-3 inches long, usually hastately dilated at the base or a little cut, all green and glabrous. Whorls remote, 30-40-flowered. Corollas purple; galea crenulated. Appendages of upper filaments recurved. Several varieties of this species occur in the gardens.

Tuberous-rooted Phlomis. Fl. June, July. Clt. 1759. Pl. 3 to 5 feet.

29 P. agra`ria (Bunge, in Ledeb. fl. alt. 3. p. 411.) stem herbaceous, simple or a little branched, hispid; lower leaves on long petioles, hastately cordate; upper floral leaves shorter than the calyxes; bracteas subulate, and are, as well as the calyxes ciliated and tomentosely pubescent; galea of corolla erect, very pilose inside. ♃. H. Native of Altaia, in cultivated fields near Semipalatinsk. Led. fl. ross. alt. ill. t. 364. Stems many, generally simple. Leaves deeply toothed, pubescent, green above, and subcanescent beneath; floral leaves sessile. Whorls about 10-flowered. Corollas purplish, almost similar to those of *P. tuberòsa*. Appendages of upper filaments long, subulate.

Field Phlomis. Fl. June, Aug. Clt. 1830. Pl. 1½ to 3 foot.

30 P. alpi`na (Pall. in act. petrop. 1779. 2. p. 265. t. 13.) stems herbaceous, simple, hispid; radical leaves very ample, deeply cordate; cauline leaves ovate-lanceolate: upper floral ones linear-lanceolate, elongated, quite entire, soft; bracteas subulate, and are, as well as the calyxes, hairy; galea of corolla very pilose, erect. ♃. H. Native of the Altaian mountains, in subalpine shady places. Stems numerous, green. Radical leaves 8 inches long and 6 broad, rather hispid on both surfaces. Whorls 20-30-flowered. Corollas purple, similar to those of *P. tuberòsa*.

Alpine Phlomis. Fl. June, Sept. Clt. 1802. Pl. 1 to 1½ foot.

31 P. bracteòsa (Royle, ex Benth. in Hook. bot. misc. 3. p. 383. lab. p. 633.) herbaceous, tall, erect, a little branched; stems obversely villous; leaves petiolate, ovate, obtuse, coarsely crenated, broadly cordate at the base, wrinkled, clothed with adpressed pili above and pale short tomentum beneath: floral leaves almost similar to the rest; bracteas oblong: outer ones large, foliaceous; calycine teeth truncate, subulate, acuminated at top; galea of corolla very pilose. ♃. F. Native of the Himalaya, on Mount Choor, and at Kidarkonta, Royle; Simla, Countess of Dalhousie. Outer bracteas almost similar to the leaves, an inch long; sometimes oblong, quite entire, all green like the leaves. Filaments exappendiculate. Root probably tuberous.

Bracteate Phlomis. Pl. 1 to 1½ foot.

32 P. lamiifòlia (Royle, ex Benth. in Hook. bot. misc. 3. p. 383. lab. p. 633.) herbaceous, humble, simple; stems obversely villous; leaves petiolate, broad-ovate, crenated, deeply cordate at the base, wrinkled, villous on both surfaces, pale beneath: floral leaves oblong-lanceolate; bracteas lanceolate or subulate, ciliated, equalling the calyxes; calyx nearly glabrous, with truncate subulately acuminated teeth; galea of corolla villous. ♃. F. Native of Cashmere, on Mount Choor, and in Mussooree, Royle; and the mountains of Kamaon, Wall. P. latifòlia, Royle, ex Benth. in Hook. bot. misc. 3. p. 383. Upper floral leaves scarcely exceeding the flowers. Whorls 15-20-flowered. Corollas like those of *P. tuberòsa*. Filaments exappendiculate. Root probably tuberous.

Archangel-leaved Phlomis. Pl. ½ to 1 foot.

33 P. sìmplex (Royle, ex Benth. in Hook. bot. misc. 3. p. 382. lab. p. 634.) herbaceous, humble, erect, nearly simple; stem obversely pilose; leaves petiolate, broad-ovate, obtuse, crenated, cordate at the base, wrinkled, green on both surfaces, villous: floral leaves nearly sessile, oblong, narrowed at both ends; bracteas linear, ciliated, equalling the calyxes; calyx membranous, rather coloured, ciliated at apex, with truncate subulately acuminated teeth; galea of corolla very pilose. ♃. F. Native of Cashmere, on the mountains of Kanaour, and at Peer Punjale, Royle. This species differs from *P. lamiifòlia* in the leaves being narrower, more villous, in the corollas being larger, and in the tube being exserted.

Simple Phlomis. Pl. ½ to 1 foot.?

34 P. corda`ta (Royle, ex Benth. l. c.) herbaceous, humble, erect, nearly simple; stem obversely pilose; leaves on long petioles, ovate-roundish, obtuse, crenated, cordate at the base, wrinkled, densely clothed with silky villi on both surfaces: floral leaves oblong-lanceolate; bracteas linear, subulate, rather shorter than the calyxes, villous; calyx rather villous, with roundish subulately acuminated teeth; galea of corolla very pilose. ♃. F. Native of Cashmere, on the mountains of Kanaour, Royle. This differs from the two preceding species in the leaves being densely clothed with soft silky villi on both surfaces, but is perhaps only a variety of one of them.

Cordate-leaved Phlomis. Pl. ½ to 1 foot.?

35 P. rugòsa (Benth. in Wall. pl. rar. 1. p. 62. lab. p. 634.) suffruticose, erect, simple, rather fleshy, finely tomentose; leaves on long petioles, ovate-oblong, acute, serrated, narrowed or rounded at the base; whorls much shorter than the petioles; bracteas subulate, and are, as well as the calyxes glabrous; calycine teeth lanceolate-subulate; corollas nearly glabrous. ♄. S. Native of Silhet, among the mountains. Different in habit from the other species of this section, but it is allied in characters to *P. breviflòra*. Leaves all petiolate, green, rather fleshy,? nearly glabrous, 4-6 inches long. Corollas yellowish, ex Wall. similar to those of *P. breviflòra*. Stamens a little exserted. Filaments all naked at the base.

Wrinkled-leaved Phlomis. Shrub.

N.B. P. condensàta, Mart. ex. Steud. nom. and P. scariòsa, Presl. ex Steud. nom. are only known by name.

Cult. All the species of *Phlòmis* prefer a light dry soil, in which even the more tender kinds will endure our winters. The shrubby kinds are readily increased by young cuttings in spring; and the herbaceous perennial species by division and seeds. Those marked frame should be protected in winter from frosts. Being all ornamental, they are worth cultivating in every collection.

XCIV. NOTOCHÆ`TE (from *νωτος, notos*, the back; and *χαιτη, chaite*, a bristle or beard; in reference to the nerves of the calyx being drawn out into stiff hooked bristles under the apex of the calyx.) Benth. in Wall. pl. rar. 1. p. 63. lab. p. 635.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx tubular, equal,

membranaceous at apex, shortly 5-toothed, 5-nerved; nerves drawn out into subulate, stiff, uncinately revolute awns under the top of the calyx. Corolla with an inclosed, exannulate tube; upper lip galeate, very pilose; lower lip spreading, somewhat equally trifid. Stamens 4, ascending, didynamous; lower 2 the longest. Filaments naked at the base; anthers approximate by pairs, 2-celled; cells at length divaricate. Lobes of style short, equal. Achenia dry, truncate at apex, naked. This genus is allied to section *A. Phlomidópsis* of *Phlòmis*, and particularly to *Phlòmis breviflòra*, but differs in the structure of the calyx and that of the anthers.

1 N. hamòsa (Benth. l. c.) ♃. ? F. Native of Nipaul, Wall. Stems herbaceous, branched, erect, pubescent. Leaves on long petioles, 3-5 inches long, ovate, acuminated, serrately crenated, obliquely and roundly cuneated at the base, nerved, green on both surfaces and nearly glabrous, but tomentose beneath while young. Whorls remote, globose, densely many-flowered, much shorter than the petioles. Bracteas subulate, stiff, revolute, exceeding the corolla. Corollas small, purplish.

Hooked-calyxed Notochaite. Pl. 2 feet.

Cult. For culture and propagation, see *Phlòmis*, p. 854.

XCV. EREMO'STACHYS (from *ερημος, eremos*, deserted; and *σταχυς, stachys*, a spike; in reference to the species being inhabitants of desert places, and from the flowers growing in verticillate spikes.) Bunge, in Ledeb. fl. alt. 2. p. 414. Benth. lab. p. 636.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx amply tubular, subcampanulate or funnel-shaped, with 5 spinose or mucrone-formed teeth; limb large and membranaceous. Corolla with an inclosed tube, which is annulate or naked inside, and a gaping bilabiate limb; upper lip elongated, galeate, somewhat compressed, attenuated at the base, pubescent outside, and bearded inside and on the margins; lower lip spreading, trifid, the lobes all rounded, but the middle one is the broadest. Stamens 4, ascending, didynamous, the lower 2 the longest. Superior filaments thickened into an obtuse or fringed appendage at the base; anthers approximate by pairs, 2-celled: cells divaricate. Style bifid at top; lobes subulate, equal, or the upper one is scarcely a half shorter than the lower. Achenia dry, densely pilose at apex.—Rather branched herbs. Radical leaves larger than the cauline ones, entire or dissected. Whorls many-flowered, usually approximate at the tops of stem or branches. Bracteas adpressed. Corollas usually yellow or cream-coloured, rarely purple.

1 E. lacinia'ta (Bunge, in Led. fl. alt. 2. p. 416.) leaves pinnate; leaflets oblong-lanceolate or linear, deeply pinnatifid; calyx amply tubular, campanulate, hardly dilated at apex. ♃. H. Native of the Levant, Eastern Caucasus, and Siberia, Persia, &c. Phlòmis laciniàta, Lin. spec. 819. Sweet fl. gard. 1. t. 24. Stems nearly simple. Radical leaves ½ foot long: floral leaves scarcely exceeding the calyxes. Petioles, stems, and nerves of leaves clothed with loose wool. Whorls 10-20-flowered, upper ones approximate. Calycine teeth spinosely mucronate. Corollas purplish; tube annulate. Appendages of upper filaments obtuse, nearly entire. Lobes of style unequal.

Jagged-leaved Eremostachys. Fl. July. Clt. 1731. Pl. 1 to 1½ foot.

2 E. supe'rba (Royle, ex Benth. in Hook. bot. misc. 3. p. 281. lab. p. 637.) radical leaves large, pinnate; leaflets 2-3 pairs: lower ones petiolulate: outer one very long: all broad and coarsely crenate-lobed, green on both surfaces: floral leaves ovate, acute, almost quite entire; calyx amply tubular, scarcely dilated at apex. ♃. H. Native of the East Indies, at Kheere Pass, and Deyra Dhoon, Royle. Royle, ill. pl. himal. t. 74. Radical leaves 1½ foot long, the ultimate leaflet 10 inches long; petioles and petiolates villous; but the limb is almost glabrous. Stems woolly towards the top. Whorls 6-flowered, disposed in dense racemes. Calycine teeth ending in spiny mucrones. Corollas almost as in *E. laciniàta*, but yellow; tube exannulate. Appendages of upper filaments obtuse, scarcely fringed. Lobes of style equal.

Superb Eremostachys. Pl. 1 to 2 feet.

3 E. phlomoi'des (Bunge, in Ledeb. fl. alt. 1. p. 414. fl. ross. alt. ill. t. 122.) leaves ovate, toothed; calyx tubular, scarcely dilated at apex, with spreading spinose teeth. ♃. H. Native of Altaia, in saltish places, adjacent to the Arkaul and Dolenkara mountains. Stems branched, hairy from long soft white pili, as well as calyxes and bracteas. Radical leaves petiolate, obtuse; and floral leaves sessile, acute, spiny-toothed, narrowed at the base. Whorls 6-flowered, distinct. Bracteas subulate, spinose. Corolla pale yellow, one half smaller than in *E. laciniàta*. Appendages of upper filaments short, fringed.

Phlomis-like Eremostachys. Pl. 1 foot.

4 E. tuberòsa (Bunge, in Ledeb. fl. alt. 2. p. 415.) leaves ovate, toothed; calyx glabrous, tubular at the base, with a membranaceous rather spreading limb, which is shorter than the tube, and ending in 5 spinose teeth. ♃. H. Native of Siberia, at Lake Inderio. Molucélla tuberòsa, Pall. itin. 3. append. no. 101. t. 1. Leaves clothed with loose wool, and the petioles with dense wool, the rest of the plant glabrous; radical leaves petiolate; cauline ones sessile. Whorls 6-flowered, rather distant. Corolla cream-coloured, about twice as long as the calyx. Appendages of upper filaments, shortly fringed.

Tuberous-rooted Eremostachys. Pl. ½ to 1 foot.

5 E. molucelloi'des (Bunge, in Ledeb. fl. atl. 2. p. 416.) leaves ovate, toothed; base of calyx tubular, pubescent, and with the limb large and membranaceously dilated, furnished with 5 short mucrones. ♃. H. Native of the Kirghisean Steppe, in dry sandy places. Ledeb. fl. ross. alt. ill. t. 437. Phlòmis lanígera, Sievers in Pall. beytr. 7. ex Bunge. Root thick, tuberous. Stems usually almost simple, clothed with white wool at the knees and base, the rest with spreading white hairs. Radical leaves wrinkled, rather hispid above, and clothed with villous wool beneath. Whorls 6-flowered. Corolla cream-coloured, like that of *E. tuberòsa*. Genitals and achenia like those of *E. tuberòsa*.

Molucella-like Eremostachys. Pl. 1 to 2 feet.

Cult. For culture and propagation, see *Phlòmis*, p. 854.

XCVI. ERIOPHY'TON (from *εριον, erion*, wool; and *φυτον, phyton*, a plant; in allusion to the plant, which is clothed with long white wool.) Benth. in Wall. pl. rar. asiat. 1. p. 63. lab. p. 638.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx membranous, amply campanulate, equal, 5-toothed. Corolla with an inclosed tube and a bilabiate limb; upper lip large, galeate, compressed, incumbent; lower lip small, trifid, with rounded lobes. Stamens 4, ascending, didynamous, the lower ones the longest; superior filaments appendiculately thickened at the base; anthers approximate by pairs, 2-celled: cells divaricate. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia dry, naked. This genus is nearly allied to *Eremóstachys*, but differs in the form of the calyx and corolla, as well as in habit, which is nearly that of *Phlòmis*.

1 E. Wallichia'num (Benth. in Wall. l. c.) ♃. F. Native of Nipaul, on Gosainsthan. Wall. Stems rising from a tuberous root, ? simple. Lower leaves small; superior and floral ones rhomboid or orbicular, subcuneated at base, sessile, crenated, very soft. Whorls 6-flowered. Calycine teeth rather

spiny at top. Corollas yellow; galea large, orbicular. The upper parts of the stems, leaves, calyxes, and galea of corolla clothed with very long loose white wool.

Wallich's Eriophytum. Pl.

Cult. For culture and propagation, see *Phlòmis*, p. 854.

XCVII. MOLUCE'LLA (a dim. from Molucca Islands, of which one of the species was supposed to be a native.) Lin. gen. no. 724. Schreb. gen. 979. Gærtn. fruct. 1. p. 320. t. 66. Juss. gen. p. 115. Benth. lab. p. 639.—Molúcca, Tourn. Mœnch.—Chasmònia, Presl.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx obliquely campanulate at the base, striated; limb ample, dilated, reticulately veined, with 5-10 mucrones or spines. Corolla with an inclosed tube, which is obliquely annulate inside; limb bilabiate; upper lip erect, entire or emarginately bifid; lateral lobes of lower lip erectish; middle lobe spreading broad, obcordate. Stamens 4, didynamous, ascending, lower ones the longest; filaments naked at the base; anthers laterally pedicellate at the tops of the filaments, 2 celled: cells almost distinct, divaricate. Style about equally bifid at apex; stigmas nearly terminal. Achenia dry, acutely triquetrous, truncate at apex.—Annual quite glabrous herbs. Leaves petiolate, deeply crenated or cut; floral leaves similar to the cauline ones. Whorls axillary, many-flowered. Bracteas subulate, spinose.

1 M. læ'vis (Lin. spec. 821.) limb of calyx large, membranaceous, subpentagonal, with 5 very short mucrones or teeth. ⊙. H. Native of Syria and Palestine. Sibth. et Smith, fl. græc. 6. p. 53. t. 566. Sims, bot. mag. t. 1852. Molúcca læ'vis. Riv. mon. t. 64. Mœnch, meth. p. 404.—Sabb. hort. rom. 3. t. 45. Plant quite glabrous in every part, smooth. Stem a little branched, floriferous almost from the base. Leaves on long petioles, roundish, coarsely crenated, rounded or cuneated at the base. Whorls usually 6-flowered, distant. Corolla white, shorter than the limb of the calyx, furnished with an almost complete membranaceous not pilose ring inside the throat.

Smooth Molucca Balm. Fl. July, Aug. Clt. 1570. Pl. 1 to 1½ foot.

2 M. spinòsa (Lin. spec. 821.) limb of calyx short, coriaceous, sub-bilabiate, with 8 spines. ⊙. H. Native of the region of the Mediterranean; as of Sicily, Naples, Palestine, Mount Parnassus, &c. Sibth. et Smith, fl. græc. 6. p. 54. t. 567. Lam. ill. t. 510.—Sabb. hort. rom. 3. t. 46. Chasmònia incìsa, Presl. fl. sic. 37. Bot. reg. 1244. M. armàta, Sieb. pl. exs. Molúcca spinòsa, Mœnch, meth. p. 404. Habit of *M. læ'vis*, but more rigid. Leaves smaller, with mucronulate teeth. Inflorescence and bracteas like those of *M. læ'vis*. Corolla exceeding the calyx a little, furnished with a pilose ring inside, cream-coloured.

Spiny Molucca Balm. Fl. July, Aug. Clt. 1596. Pl. 1½ to 2 feet.

Cult. The seeds of these plants should be reared on a hot-bed early in autumn or spring; and when the plants are of sufficient size they should be planted in separate pots, and kept under glass, until the middle of May, when they may be planted out of doors in any warm dry situation, where they will flower and seed freely; for if the seeds are sown out in the open ground in spring, the plants in this case come into flower so late that they seldom, if ever, ripen seed.

XCVIII. HOLMSKIO'LDIA (named in memory of Theodore Holmskiold; author of Coriphæi clavarias Ramarias complectentes, 1 vol. fol.; Copenhagen, 1790, and other works.) Retz, obs. 6. p. 31. Benth. lab. p. 642. Hastíngia, Smith, exot. bot. 2. t. 80.—Platùnium, Juss. ann. mus. 7. p. 76.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx with a very short tube and a large subrotately campanulate, membranaceous, veiny, almost entire limb. Corolla with an elongated, incurved tube, which is naked inside, a subdilated throat, and a sub-bilabiate limb; upper lip bifid, with erectly spreading segments; lateral segments of the lower lip small, reflexed: middle one ovate, spreading. Stamens 4, ascending, didynamous, lower ones the longest and exserted; upper filaments dilated a little at the base; anthers 2-celled: cells parallel. Style nearly entire, or the upper lobe is very short, stigmatiferous at apex. Ovarium bipartite, with deeply bifid, scarcely bipartite lobes. Achenia rugose, rather fleshy.? Shrub with the habit of *Verbenàceæ*. Allied to *Molucélla* by the calyx; and to *Melissíneæ* in the corolla; and to the tribes *Prasièæ* and *Ajugoídeæ*.

1 H. sanguí'nea (Retz. l. c.) ♄. S. Native of Hindostan and Silhet, &c. Hastíngia coccínea, Smith, l. c. Platùnium rùbrum, Juss. l. c. Shrub with divaricate, tetragonal, glabrous, often tubercled branches. Leaves petiolate, ovate, acuminated, hardly toothed, somewhat truncate at the base, 2-4 inches long, glabrous, green on both surfaces. Racemules axillary, scarcely longer than the petioles, constantly composed of a few 2-4-flowered whorls. Calyx red or blood coloured. Corolla red. Genitals exserted. (fig. 87.)

FIG. 87.

Bloody-calyxed Holmskioldia. Fl.? Clt. 1796. Shrub.

Cult. Any light rich earth, or a mixture of equal parts of loam, sand, and peat, will suit this shrub; and young cuttings will be readily rooted in the same kind of soil in heat, with a hand-glass placed over them.

XCIX. HYMENOCRA'TER (from ὑμην, *hymen*, a membrane; and κρατηρ, *krater*, a cup; in allusion to the large membranous calyx.) Fisch. et Meyer, ind. sem. hort. petrop. 1835. p. 39.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx with a short 13-nerved tube, and a large membranous spreading 5-cleft limb; lobes ovate. Corolla with an exserted tube and a sub-bilabiate limb; upper lip bipartite; lower lip tripartite, having the middle segment large and emarginate. Stamens inclosed, didynamous, ascending under the upper lip; cells of anthers divaricate. Stigma bilabiate. Achenia dry, subovate, glabrous, tubercled. This genus comes near to *Róylea* and *Holmskióldia*, but differs from the first in the quinquefid limb of the calyx, bipartite upper lip of corolla, as well as in the divaricate cells of anthers; and from the latter in the spreading limb of calyx, exserted corolla, bipartite upper lip and tubercled achenia; and from *Molucélla* in the form of the corolla.

1 H. bituminòsus (Fisch. et Meyer, l. c.) ♄. F. Native of the North of Persia, on arid hills. A humble glabrous shrub, having leaves much like those of *Népeta Pannónica*, viscid, and smelling of bitumen. Cymes axillary, 5-7-flowered, crowded, furnished with oblong, almost quite entire floral leaves. Throat of calyx closed by villi. Corollas violaceous, painted with white lines. Achenia black.

Bituminous Hymenocrater. Shrub humble.

Cult. For culture and propagation, see *Phlòmis*, p. 854.

C. ACHYROSPE'RMUM (from αχυρον, *achyron*, chaff; and σπερμα, *sperma*, a seed; so called because the achenia are

crowned by a paleaceous arillus.) Blum. bijdr. p. 840. Benth. lab. p. 643.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx larger than the corolla, sub-bilabiate; upper lip erect, trifid; lower one a little shorter, spreading, bifid. Corolla longer than the calyx, tubular; limb bilabiate; upper lip short, erect, emarginate; lower lip semitrifid, the middle lobe large and concave. Stamens 4, nearly equal, ascending; anthers 1-celled. Achenia 4, inclosed in the permanent calyx, crowned by a paleaceous aril above. —Herbs with opposite toothed leaves, which are clothed with soft pubescence. Flowers verticillately spicate, terminal.

1 A. densiflòrum (Blum. bijdr. p. 841.) spike cylindrical, dense-flowered; bracteas many-flowered; leaves obovate-oblong, acute, quite entire at the base. ♃.? S. Native of Java, on the edges of rivulets about Linga Jattie in the province of Cheribon.

Dense-flowered Achyrospermum. Pl. ½ to 1 foot.

2 A. phlomoi'des (Blum. bijdr. 841.) spike loose; bracteas 1-flowered, biglandular at the base inside; leaves obovate, obtuse, quite entire at the base. ♃.? S. Native of Java, in the higher woods, in humid places on Mount Burangrang.

Phlomis-like Achyrospermum. Pl. ½ to 1 foot.?

3 A. fruticòsum (Benth. lab. p. 643.) shrubby, with pubescent branches; leaves ovate, obtuse, broadly crenated, rounded at the base, minutely glandular beneath, on cuneated winged petioles; whorls 6-flowered, disposed in loose terminal spikes. ♄. S. Native of Madagascar, Lyall, Bojer. Siphotáxis ròsea, Bojer, mss. Ovarium densely beset with pubescent scales at apex. Calyx pubescent, with an oblique 5-toothed mouth. Corolla of *Holmskióldia*, twice as long as the calyx, of a splendent rose colour.

Shrubby Achyrospermum. Shrub.

Cult. For culture and propagation, see *Holmskióldia*, p. 856.

CI. COLQUHOU'NIA (named in honour of Sir Robert Colquhoun, Bart., resident at Kamaon.) Wall. in Lin. trans. 13. p. 608. tent. fl. nep. 1. p. 13-14. Benth. lab. p. 644.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubularly campanulate, 10-nerved, subincurved, almost equally 5-toothed, and having the throat naked inside. Corolla with an exserted incurved tube, which is naked inside, a dilated throat, and a bilabiate limb; upper lip erect, entire, flattish; lower one rather spreading, with 3 short ovate entire lobes. Stamens 4, ascending, didynamous, lower ones the longest; filaments naked at the base; anthers approximate, 2-celled: cells at length divaricate. Style about equally bifid at top; lobes subulate, stigmatiferous at apex. Achenia oblong, dry, smooth, drawn out into a membrane at top.—Twining or scandent, usually tomentose, not pilose shrubs. Whorls loose, axillary, or approximating into a terminal spike. Bracteas minute. Corollas scarlet.

1 C. cocci'nea (Wall. l. c. tent. fl. nap. 1. p. 13. t. 6.) leaves nearly glabrous, roughish, canescent from fine tomentum while young, as well as the calyxes; calycine teeth ovate, obtuse; upper lip of corolla ovate. ♄. ⌒ G. Native of Nipaul. Hastingia scándens, Roxb.? Holmskióldia scándens, Sweet.? Leaves ovate, acuminated, 3-4 inches long. Whorls few-flowered, approximating into a spike, which is leafy at the base, and sometimes disposed in short axillary racemules. Calyxes tomentose. Corolla scarlet, twice the length of the calyx.

Var. β, parviflòra (Benth. lab. p. 644.) young leaves and calyxes hardly tomentose. ♄. ⌒ S. Native of Gosainsthan.

Scarlet-flowered Colquhounia. Shrub twining.

2 C. vesti'ta (Wall. tent. fl. nap. 1. p. 14. pl. asiat. rar. 3. p. 43. t. 267.) under surfaces of leaves, stems, and calyxes clothed with white tomentum; calycine teeth ovate, obtuse; upper lip of corolla ovate. ♄. ⌒ G. Native of Kamaon, Wall. Corollas a little smaller than those of *C. coccínea*, but the habit is similar.

Clothed Colquhounia. Shrub twining.

3 C. e'legans (Wall. pl. rar. asiat. 1. p. 65. and 3. p. 43. t. 268.) stems, leaves, and calyxes clothed with velvety pubescence; calycine teeth broad-lanceolate, acutish; upper lip of corolla oblong. ♄. ⌒ S. Native of Ava, on Mount Taong Dong. This differs from both the preceding by the calyx being one half smaller, in the corolla being more exserted, with a wider throat, and in the colour being orange, dotted with blood red, not scarlet.

Elegant Colquhounia. Shrub twining.

Cult. These elegant and curious shrubs are well fitted for ornamenting rafters in greenhouses or stoves. A light rich soil will answer them well, or one composed of equal parts of loam, sand, and peat; and young cuttings will strike root readily in the same kind of earth under a hand-glass in a little bottom heat.

Tribe X.

PRASIE'Æ (the genera contained in this tribe agree with *Pràsium* in the characters given below.) Benth. lab. p. 646. Calyx nearly equal. Corolla bilabiate. Stamens 4, ascending, didynamous; lower ones the longest. Achenia fleshy, rather baccate.

CII. GOMPHOSTE'MMA (from γομφος, *gomphos*, a club; and στεμμα, *stemma*, a crown; in reference to the tube of corolla being inflated above the middle.) Wall. pl. rar. asiat. 2. p. 12. Benth. lab. p. 646.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate-campanulate or tubular, nearly equal, 5-toothed, with the throat naked inside. Corolla with a straight usually exserted tube, which is exannulate inside, and inflated above the middle, bilabiate; lips nearly equal; upper one erect, entire, arched; lower lip spreading trifid. Stamens 4, ascending under the upper lip, lower ones the longest. Anthers approximate by pairs; cells parallel, transverse. Style about equally bifid at top, with subulate lobes; stigmas minute. Achenia fleshy.—Perennial herbs with usually simple erect stems, or with the stems procumbent and rooting at the base. Leaves generally ample, thick, villous or tomentose. Flowers rather large. Whorls sometimes spicate, and sometimes axillary and remote.

1 G. strobili'num (Wall. l. c. Benth. lab. p. 647.) stem erect; leaves elliptic-ovate, wrinkled, hispid above, and tomentose beneath; whorls crowded into a terminal spike or the lower ones are remote and axillary: floral leaves bractea-formed, broad ovate, exceeding the calyxes; calyx campanulate, clothed with soft tomentum, with ovate-lanceolate teeth; corolla about 3 times as long as the calyx. ♃. S. Native of the Burman Empire, at Meong, Prome, and on Mount Taong Dong. Stems tomentose, erect. Cauline leaves 6-10 inches long, and 3-6 broad. Corollas yellow, pubescent outside; tube exceeding the calyx, hardly incurved.

Strobile-spiked Gomphostemma. Pl. 1 to 3 feet.

2 G. vi'ride (Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, flaccid, rather hispid above and pubescent beneath; whorls few-flowered, crowded into a short terminal spike; floral leaves bractea-formed, broad-ovate, exceeding the calyxes; calyx campanulate, clothed with soft villi: teeth lanceolate; corollas twice as long as the calyx. ♃. S. Native of the Burman Empire, in the province of Tavoy. Very nearly allied to *G. strobilìnum*, but of more humble stature. Leaves pale green. Spike few-flowered. Calyx large.

Green Gomphostemma. Pl. 1 foot.?

3 G. Heynea'num (Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, wrinkled, clothed with soft tomentum above and dense floccose tomentum beneath; whorls crowded into a terminal spike, or the lower ones are rather remote and axillary: floral leaves bractea-formed, broad-ovate, exceeding the calyxes; calyx campanulâte, clothed with soft tomentum, with ovate-lanceolate teeth, which are hardly shorter than the corolla. ♃. S. Native of the Indian Peninsula, on mountains near Courtallum. Habit and stature of *G. strobilìnum*, but differs in the tomentum being floccose, in the floral leaves being wrinkled above and tomentose, not glabrous, in the corollas being smaller, inclosed tube, &c.

Heyne's Gomphostemma. Pl. 1 to 3 feet.

4 G. oblóngum (Wall. l. c. Benth. lab. p. 648.) stem erect; leaves oblong-elliptic, wrinkled, rather hispid above, and clothed with dense tomentum beneath: floral leaves similar to the rest; whorls axillary, remote, few-flowered; calyx campanulate, tomentose, with lanceolate-linear elongated acute teeth; corolla 3 times as long as the calyx. ♄. G. Native of the Burman Empire in the province of Tavoy. Leaves smaller and narrower than in *G. strobilìnum*. Whorls 2-4-axillary, 6-10-flowered. Corolla pubescent outside.

Oblong-leaved Gomphostemma. Pl. 1 to 2 feet.

5 G. lu'cidum Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, shining above and pilosely hispid, and densely clothed with rufous tomentum beneath: floral leaves similar to the rest; whorls axillary, remote; calyx tubularly campanulate, tomentose, with short lanceolate teeth; corolla 3 times as long as the calyx. ♃. S. Native of the East Indies at Choppedong. on the Tenasserim coast; and in Pundua. Habit of the preceding, but more robust. Stems clothed with dense rufous tomentum. Leaves toothed or quite entire. Whorls 10-30-flowered. Corollas yellow, tomentose outside.

Shining Gomphostemma. Pl. 2 to 3 feet.

6 G. parviflòrum (Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, pubescent above and tomentose beneath: floral ones conform to the rest; whorls axillary, remote, loosely many-flowered; bracteas lanceolate or linear, exceeding the calyxes; calyx campanulate, with lanceolate linear teeth, which are subulate at apex; corolla slender, twice as long as the calyx. ♃. S. Native of Nipaul, Silhet, and Penang. Habit of preceding, but the flowers are more numerous in the axils, loosely fasciculate. Corolla yellow, pubescent outside; throat less inflated.

Small-flowered Gomphostemma. Pl. 2 to 3 feet.?

7 G. multiflòrum (Benth. lab. p. 648.) stem erect; leaves elliptic, scarcely pubescent above, and tomentose beneath: floral leaves similar to the rest; whorls axillary, remote, loosely many-flowered; bracteas ovate, foliaceous, exceeding the calyxes; calycine teeth lanceolate-linear; corolla slender, many times longer than the calyx. ♃. S. Native of Silhet. This and *G. parviflòrum* differ from the other specimens in the form of the bracteas, &c.

Many-flowered Gomphostemma. Pl. 2 to 3 feet.?

8 G. crinìtum (Wall. l. c. Benth. l. c.) stem erect; leaves elliptic-ovate, pubescent above, and tomentose beneath: floral leaves similar to the rest; whorls axillary, remote, loosely many-flowered; bracteas linear-setaceous, about equalling the calyxes; calyx tubularly campanulate, inflated in the fructiferous state, quite glabrous at the base, with elongated setaceous hispid teeth; corolla slender, twice as long as the calyx. ♃. H. Native of the Burman Empire, in the province of Tavoy. Habit, inflorescence, and corollas of *G. parviflòrum*, but the bracteas and calyxes are very distinct, and the leaves are more ample and less wrinkled.

Long-haired Gomphostemma. Pl. 2 to 3 feet.?

9 G. erioca'rpum (Benth. in Wall. pl. rar. asiat. 2. p. 12. lab. p. 649.) stem ascending; leaves elliptic-oblong, coarsely toothed, rather hispid above and tomentose beneath; floral leaves similar to the others; whorls remote, few-flowered; bracteas ovate, denticulated; calyx campanulate, at length inflated, tomentose, with linear setaceous teeth; corolla villous, twice as long as the calyx; achenia tomentose. ♃. S. Native of the Indian Peninsula, near Courtallum. Stems elongated, slenderer than the preceding species. Leaves 3-4 inches long, and 1½ broad. Whorls few, about 10-flowered.

Woolly-fruited Gomphostemma. Pl. ascending.

10 G. ova'tum (Wall. l. c. Benth. l. c.) stem erectish, rooting at the base; leaves broad-ovate, shining and hispid above, but clothed with soft tomentum beneath: floral leaves similar to the rest; whorls axillary, remote, many-flowered; bracteas broad-ovate, outer ones about equalling the calyxes; calyx campanulate, villously tomentose, with lanceolate-linear teeth; corolla 3 times as long as the calyx. ♃. S. Native of Nipaul, Wall. Leaves smaller and broader than in the preceding. Corolla yellow, pubescent, nearly 1½ inch long.

Ovate-leaved Gomphostemma. Pl. 1 foot. ?

11 G. melissæfòlium (Wall. l. c. Benth. l. c.) stem creeping at the base, radicant; branches ascending; leaves ovate, nearly glabrous or rather hispid above, and sparingly tomentose beneath: floral leaves similar to the rest; whorls axillary, remote, loosely many-flowered; bracteas ovate: outer ones equalling the calyxes; calyx hispid, with lanceolate-linear teeth; corolla about 3 times as long as the calyx. ♃. S. Native of Silhet. Pràsium melissæfòlium, Roxb. hort. beng. p. 45. fl. ind. 3. p. 26. Very nearly allied to *G. ovàtum*, but differs in the creeping stems, in the leaves being scarcely tomentose beneath, and in the flowers being smaller.

Balm-leaved Gomphostemma. Pl. creeping.

12 G. veluti'num (Benth. in Wall. pl. rar. asiat. 1. p. 13. lab. p. 649.) stem creeping at the base, rooting; branches ascending; leaves ovate, thick, densely clothed with velvety pubescence on both surfaces: floral leaves similar to the rest; whorls axillary, remote, few-flowered; bracteas oblong, equalling the calyxes; calyx tomentose, with ovate-lanceolate teeth; corolla about twice as long as the calyx. ♃. S. Native of Silhet, Wall. Allied to *G. melissæfòlium*. Leaves 12-18 lines long, 8-15 lines broad. Corolla yellow, 11-12 lines long, with a slender tube, which is much dilated at top.

Velvety Gomphostemma. Pl. creeping.

13 G. phlomoi'des (Benth. lab. p. 649.) leaves oblong, acute at both ends, denticulated, pilose above, and densely clothed with stellate tomentum beneath; flowers fascicled, axillary. ♃. S. Native of Java, in the higher mountain woods. Pràsium phlomoìdes, Reinw. herb. ex Blume, bijdr. p. 840.

Phlomis-like Gomphostemma. Pl.?

14 G. Java'nicum (Benth. lab. p. 650.) leaves rather large, oblong, acuminated at both ends, denticulated, hairy above, and clothed with stellate tomentum beneath; flowers subfasciculate, axillary. ♃. S. Native of Java, in humid mountain woods. Pràsium Javánicum, Blum. bijdr. p. 840.

Java Gomphostemma. Pl.?

Cult. Plants of easy culture. Any light rich soil will suit the species; and they will be readily increased by cuttings and seeds.

CIII. PHYLLOSTE'GIA (from φυλλον, *phyllon*, a leaf; and στεγος, *stegos*, a covering; in allusion to the foliaceous lobes of the calyx.) Benth. in bot. reg. vol. 15. under no. 1292. lab. p. 650. Pràsium species, Gaud. in Freyc. voy. pt. bot. p. 452.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, ovate or tubular, 10-nerved, nearly equal, sometimes quinquefid, with foliaceous lobes, and sometimes shortly 5-toothed. Corolla

having the tube exceeding the calyx, sometimes much exserted, usually incurved, exannulate inside, with a nearly equal throat and a bilabiate limb; upper lip spreading a little, entire, flattish: lower lip longer, spreading, trifid, with ovate lobes, the middle lobe larger and entire. Stamens 4, ascending under the upper lip; anthers 2-celled: cells diverging, at length divaricate. Style nearly entire, clavate at top or shortly bifid, with clavately divaricate or arched lobes; stigmas terminal, usually thickening into heads. Achenia fleshy.—Erect or ascending, almost simple herbs. Leaves petiolate, ovate, usually toothed. Whorls 6-10-flowered, disposed into a terminal loose raceme, or the lower whorls are axillary. Upper floral leaves small, bractea-formed. Bracteas small, subulate, or wanting.

1 P. dentàta (Benth. in bot. reg. vol. 15. lab. p. 651.) very hairy; leaves rounded at the base; racemes dense; calyx ample, with foliaceous toothed segments; lobes of style clavate. ♃.? G. Native of Owhyhee, on Mount Raah, and Byron's Bay, Macrae. Stem herbaceous, erect, nearly simple, beset with long stiff hairs like the rest of the plant. Leaves on long petioles, 3-4 inches long; upper floral leaves nearly sessile, shorter than the fructiferous calyxes. Whorls about 10-flowered. Corolla small.

Toothed-calyxed Phyllostegia. Pl. 1 foot.

2 P. vestìta (Benth. l. c.) very hairy; leaves roundly truncate at the base: floral leaves similar to the others; whorls axillary, distant; calyx ample, with foliaceous quite entire segments; lobes of style clavate. ♃.? G. Native of Owhyhee, in Byron's Bay. This differs from *P. dentàta*, in the leaves being smaller, and in the other characters given.

Clothed Phyllostegia. Pl. 1 foot.

3 P. grandiflòra (Benth. l. c.) nearly glabrous or clothed with adpressed pubescence; leaves rounded at the base; raceme loose; calycine teeth broad-ovate, foliaceous, quite entire, spreading; corolla incurved, more than thrice as long as the calyx; lobes of style arched. ♃.? G. Native of the Island Oahu. Pràsium grandiflòrum, Gaud. in Freyc. voy. pt. bot. p. 453. t. 65. f. 2. Stems hard, procumbent or ascending. Leaves petiolate, 1-2 inches long, or the lower ones are 3 inches long, crenulated; upper ones small, bractea-formed. Whorls 6-flowered.

Great-flowered Phyllostegia. Pl. ascending.

4 P. Chamissònis (Benth. in Linnæa. 6. p. 79.) quite glabrous, rounded at the base; racemes loose; peduncles elongated, trifid; calyx shortly 5-toothed; corolla incurved, 4 times as long as the calyx. ♃.? G. Native of the Islands of Oahu and Mowee. Pràsium glàbrum, Gaud. in Freyc. voy. pt. bot. p. 452. t. 64. Stem branched. Leaves almost the form of those of *P. grandiflòra*. Peduncles trifid towards the middle. Corollas size of those of *P. grandiflòra*.

Chamisso's Phyllostegia. Pl. 1 foot.

5 P. glàbra (Benth. in bot. reg. vol. 15. lab. p. 652.) quite glabrous; leaves roundly cuneated at the base; racemes short, loose, leafy; lower peduncles elongated, trifid; calyx shortly 5-toothed; corolla erectish, scarcely 3 times the length of the calyx; lobes of style clavate. ♃.? G. Native of the Island of Oahu. Allied to the preceding, but differs in the stem being more branched, in the racemes being irregularly branched, and in the flowers being one half smaller.

Glabrous Phyllostegia. Pl. 1 to 2 feet.

6 P. macrophýlla (Benth. l. c.) nearly glabrous or pubescent at top; leaves oblong, rounded at the base; raceme short, loose; calyx shortly 5-toothed; corolla straight, about 3 times as long as the calyx; lobes of style arched. ♃.? G. Native of several of the Sandwich Islands. Pràsium macrophýllum, Gaud. in Freyc. voy. pt. bot. p. 453. t. 65. f. 3. Leaves nearly like those of *P. grandiflòra*, but narrower and longer. Inflorescence of *P. grandiflòra*. Corolla pubescent.

Long-leaved Phyllostegia. Pl. 2 to 3 feet.

7 P. parviflòra (Benth. in Linnæa. 6. p. 79.) pubescently villous; leaves rounded or cordate at the base, clothed with soft villi beneath; pedicels longer than the calyxes; calycine teeth short, acute; tube of corolla about 3 times as long as the calyx; lobes of style clavate, recurvedly divaricate. ♃. G. Native of the Island of Oahu. Pràsium parviflòrum, Gaud. in Freyc. voy. pt. bot. p. 453. t. 65. f. 1. Phyllostègia leptóstachys, Benth. in bot. reg. vol. 15. Leaves broad-ovate, crenated, 3-4 inches long, canescent beneath. Corolla half an inch long, glabrous; tube a little incurved.

Small-flowered Phyllostegia. Pl. 1 to 2 feet.

8 P. móllis (Benth. in Linnæa. 2. p. 79.) clothed with soft velvety pubescence; leaves cordate at the base; pedicels shorter than the calyxes; calycine teeth short, obtuse; tube of corolla exceeding the calyx a little; lobes of style clavate, recurvedly divaricate. ♃.? G. Native of the Sandwich islands. Whorls 6-flowered. Allied to *P. parviflòra* and *P. clavàta*.

Soft Phyllostegia. Pl. 1 to 2 feet.

9 P. clavàta (Benth. in bot. reg. vol. 15. lab. p. 658.) pubescent; leaves roundly truncate at the base or subcordate; pedicels rather shorter than the calyxes; calycine teeth short, obtuse; tube of corolla exceeding the calyx a little; style clavate at apex, with flattened recurved stigmas. ♃.? G. Native of Owhyhee. Leaves form and size of those of *P. grandiflòra*, but less coriaceous and more villous. Whorls 6-10-flowered. Corollas small, pubescent.

Clavate-styled Phyllostegia. Pl. 1 to 2 feet.

10 P. racemòsa (Benth. l. c.) villous; leaves ovate-lanceolate, cordate at the base; whorls many-flowered; pedicels very short; corolla one half longer than the calyx; lobes of style clavate. ♃.? G. Native of Owhyhee, on Mount Raah, Macrae. Habit of *Stàchys grandidentàta*. Pubescence rather clammy. Leaves 1½ inch long. Whorls about 10-12-flowered. Corollas small, form of those of *P. clavàta*.

Racemose Phyllostegia. Pl. 1 foot.

11 P.? hirsùta (Benth. l. c.) very hairy; leaves ample, cordate at the base; racemes branched; calyx glabrous, shortly 5-toothed. ♃.? G. Native of the island of Oahu, Macrae. Stem as in *P. dentàta*. Calyxes as in *P. móllis*.

Hairy Phyllostegia. Pl. 1 to 2 feet.

12 P. floribúnda (Benth. lab. p. 653.) pubescent or hairy; leaves elliptic, ample, rounded at the base or narrowed; cymes axillary, loosely much branched, many-flowered, very hairy; calyx hairy, with linear teeth, which are about equal in length to the tube of the corolla; corolla exceeding the calyx a little. ♃.? G. Native of the Sandwich islands, Nelson. Branches hard, woody.? Leaves on long petioles, 2-5 inches long. Corymbs or cymes as in *Bystropògon*. Corollas small, almost like those of *P. racemòsa*, but more slender.

Bundle-flowered Phyllostegia. Pl. 1 to 2 feet.

Cult. For culture and propagation, see *Gomphostémma*, p. 858.

CIV. STENO'GYNE (from στενος, *stenos*, narrow; and γυνη, *gyne*, a female; so called in reference to the subulate lobes of the style.) Benth. in bot. reg. vol. 15. lab. p. 654.

Lin. syst. *Didynàmia, Gymnospérmia*. Calyx ovate-campanulate, 10-nerved, nearly equal or obliquely bilabiate; sometimes 5-cleft, with ovate foliaceous lobes; and sometimes 5-toothed, having the 3 upper teeth less deeply cleft than the lower ones. Corolla with the tube exceeding the calyx, and incurved, and usually furnished with a pilose ring inside; a dilated throat, and a bilabiate limb; upper lip erect, emarginate; lower lip spreading trifid, with nearly equal entire segments. Stamens 4, ascending under the upper lip; anthers 2-celled: cells at

length divaricate. Style almost equally bifid at top, with subulate lobes; stigmas minute. Achenia fleshy.—Branched, procumbent, ascending or erect herbs, with divaricate subscandent? branches. Leaves usually coriaceous, crenated. Whorls 6-flowered, axillary, distant, or approximate at the tops of the branches. Floral leaves similar to the cauline ones. Bracteas small, subulate, or almost wanting. This genus differs chiefly from *Phyllostègia* in the form of the style and corolla, and in the axillary inflorescence.

1 S. macra'ntha (Benth. l. c.) very hairy; leaves petiolate, ovate, cordate at the base; whorls axillary, distant; pedicels equalling the calyxes. ♃.? G. Native of Owhyhee, on Mount Raah, Macrae.

Large-flowered Stenogyne. Pl.

2 S. se'ssilis (Benth. lab. p. 654.) glabrous; leaves sessile, roundish, cordate at the base, coriaceous; whorls approximate at the tops of the branches. ♃.? G. Native of the Sandwich islands, Menzies. Stem glabrous or pilose at the nodi. Whorls few, secund. Corolla villous, twice as long as the calyx. Genitals exserted a little.

Sessile-leaved Stenogyne. Pl. ascending.

3 S. corda'ta (Benth. lab. p. 654.) glabrous; lower leaves on short petioles: upper ones sessile, all ovate and cordate at the base, coriaceous; whorls axillary, distant. ♃.? G. Native of the Sandwich islands, Nelson. Allied to *S. séssilis*, but differs in the more slender branches, smaller narrower leaves, inflorescence, and smaller flowers.

Cordate-leaved Stenogyne. Pl.

4 S. rugòsa (Benth. in bot. reg. vol. 15. lab. p. 655.) glabrous; leaves on short petioles, oblong, coriaceous, roundly truncate at the base; whorls axillary, distant; pedicels shorter than the calyxes. ♃.? G. Native of Owhyhee, on Mount Raah, Menzies. Stems erect.? Leaves 1½ to 2 inches long, rough. Whorls about 6-flowered; corolla scarcely twice as long as the calyx, nearly glabrous.

Wrinkled-leaved Stenogyne. Pl. erect.

5 S. microphy'lla (Benth. lab. p. 655.) glabrous; leaves small, petiolate, acute, narrowed at the base; whorls few, 2-flowered, secund; calyxes on short pedicels, equalling the leaves in length. ♃.? G. Native of Owhyhee, at Mount Raah, Macrae. Branches subscandent. Leaves scarcely 3-4 lines long, acutely serrated. Pedicels bibracteate under the calyxes. Corolla twice as long as the calyx.

Small-leaved Stenogyne. Pl. scandent.?

6 S. scrophularioi'des (Benth. in bot. reg. vol. 15. lab. 655.) quite glabrous; leaves petiolate, ovate, flaccid; whorls axillary, distant; fructiferous pedicels longer than the calyxes; corolla pubescent, twice as long as the calyx. ♃.? G. Native of the Sandwich islands, Menzies. Branches subscandent.? Leaves 1 to 1½ inch long, roundly truncate at the base. Whorls 6-flowered. Corollas pubescent.

Figwort-leaved Stenogyne. Pl. scandent.?

7 S. Nelsòni (Benth. lab. p. 655.) glabrous; leaves petiolate, ovate, rather flaccid; whorls axillary, distant; fructiferous pedicels longer than the calyxes; corolla nearly glabrous, 3-4 times longer than the calyx. ♃.? G. Native of the Sandwich islands, Nelson. Allied to *S. scrophularioìdes*, but differs in the larger subcoriaceous leaves, many-flowered whorls, longer calyxes, longer corollas, and much exserted stamens.

Nelson's Stenogyne. Pl.

Cult. For culture and propagation, see *Gomphostémma*, p. 858.

CV. PRA'SIUM (from πρασιον, a name given by Dioscorides to a plant resembling Horehound or Marjoram, and called by Pliny *Pràsium.*) Lin. gen. no. 737. Schreb. gen. no. 992. Gærtn. fruct. 1. p. 321. t. 66. Juss. gen. p. 117. Benth. lab. p. 655.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx campanulate, 10-nerved, irregularly bilabiate; upper lip shortly trifid; lower lip deeply bifid; all the segments ovate and foliaceous. Corolla with an inclosed tube, furnished with a ring of scale-like hairs inside, and a bilabiate limb; the upper lip ovate, entire, and the lower lip trifid: the middle segment the largest and entire. Stamens 4, ascending under the upper lip; anthers 2-celled: cells at length divaricate. Style about equally bifid at top, with subulate lobes; stigmas minute. Achenia fleshy.

1 P. ma'jus (Lin. spec. 838.) ♄. F. Native of Europe and the North of Africa, in the region of the Mediterranean, and of Madeira. Sibth. et Smith, fl. græc. t. 584. P. mìnus, Lin. spec. p. 838.—Sabb. hort. rom. 3. t. 37.—Zan. hist. t. 80.—Mor. hist. 3. p. 408. sect. 11. t. 21. f. 3.—Barrel. icon. t. 895. A divaricately branched, usually glabrous evergreen shrub, rarely with some of the young leaves hispid. Leaves ½ to 1 inch long, ovate, acute, roundly truncate at the base or subcordate, irregularly serrate crenated; floral leaves similar, or the upper ones are smaller and more entire, all exceeding the calyxes. Whorls 2-flowered, distant, axillary. Flowers on short pedicels. Corollas white or pale purple, glabrous. Stamens inclosed.

Greater Prasium. Fl. June, Aug. Clt. 1699. Shrub 1 to 2 feet.

Cult. This is a curious evergreen small shrub, which will survive our milder winters in the open air if grown in a dry sandy or gravelly soil, in a sheltered situation; but in moist strong ground it is sure to perish. A reserve plant or two should be grown in pots, that they may be sheltered by placing under a frame in winter. The plant is readily increased by cuttings and seeds.

Tribe XI.

AJUGOI'DEÆ (from *Ajuga*, Bugle; and *idea*, similar; this tribe contains genera agreeing with *A'juga* in the characters given below.) Benth. lab. p. 657. Upper lip of corolla sometimes very short, sometimes cleft, with cast down, rarely erect, arched segments; lower lip elongated. Stamens 2-4, ascending, usually exserted, opposite the lip. Achenia more or less reticulately wrinkled. In many *Ajugoìdeæ*, especially in some *Teùcria*, *A'juga*, *Cymària*, &c., the ovarium is less deeply cleft than in other *Labiàtæ;* and in *Cymària* it is very evidently bipartite, with bifid divisions, instead of being equally 4-parted; thus connecting the tribe with the closely allied order of *Verbenàceæ*, ex Benth.

CVI. AMETHY'STEA (so called from the amethystine colour of the flowers.) Lin. gen. no. 34. Schreb. gen. no. 45. Gærtn. fruct. 1. p. 315. t. 66. Juss. gen. 111. Benth. lab. p. 657.

Lin. syst. *Diándria, Monogýnia.* Calyx sub-globose, campanulate, erect, equal, 5-toothed. Corolla having the tube shorter than the calyx, exannulate inside, and a declinate limb; the 4 upper lobes nearly equal, and cast down, and the lower lobe larger. Stamens 2, (inferior,) ascending, exserted between the upper segments of the corolla; the rudiments of the 2 upper ones minute and filiform; anthers 2-celled: cells at length divaricate and sub-confluent. Style almost equal, bifid at apex. Achenia reticulately wrinkled.—This genus only differs from *Teùcrium* in the abortion of the upper stamens. In habit it closely resembles *Teùcrium corymbòsum.*

1 A. cæru'lea (Lin. spec. p. 30.) ⊙. H. Native of Asiatic Russia; as of Altaia, Dahuria, &c., Pallas; and of

China, Sir G. Staunton. Sims, bot. mag. t. 2448.—Hall. in comm. gœtt. 1751. t. 10. act. ups. 1742. p. 51. f. 1. Herb erect, branched, glabrous, often bluish. Leaves petiolate, 3-5-parted; segments oblong-lanceolate, deeply toothed; floral leaves smaller: upper ones minute. Cymes peduncled, loose, racemosely panicled. Bracteas minute. Calyxes erect, bluish, quite glabrous, with lanceolate acute teeth. Corolla blue, scarcely exceeding the calyx.

Blue-flowered Amethystea. Fl. June, July. Clt. 1759. Pl. 1 to 1½ foot.

Cult. This being a hardy annual, the seeds of it should be sown in the open ground, where the plants are intended to remain.

CVII. TRICHOSTE'MA (from *θριξ τριχος, thrix trichos*, a hair; and *στημων, stemon*, a stamen; in reference to the capillary filaments.) Lin. gen. no. 733. Schreb. gen. no. 988. Juss. gen. no. 116. Benth. lab. p. 658.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx sometimes campanulate, nearly equal, deeply 5-cleft, sometimes depressedly campanulate, very oblique, with the 3 upper teeth (from the twisting of the pedicel inferior) elongated and connate; and the 2 lower ones (superior) very short. Corolla with a slender, usually exserted tube, which is exannulate inside, and a somewhat equally 5-cleft limb; segments oblong, declinate: lower ones scarcely larger. Stamens 4, didynamous: lower ones the longest, and much exserted; filaments sometimes monadelphous; anthers about 2-celled: cells divaricate or diverging. Style bifid at apex; lobes subulate; stigmas minute.—Herbs, with quite entire leaves, and axillary or racemose inflorescence. Very nearly allied in character to *Teùcrium*, but differs in habit. *Isánthus* ought probably to be placed near this genus.

Sect. I. Streptopòdium (from *στρεπτος, streptos*, twisted; and *πους ποδος, pous podos*, a foot; in allusion to the pedicels being twisted.) Benth. lab. p. 658. Calyx very oblique, reversed from the twisted pedicel. Pedicels solitary, opposite, 1-flowered.

1 T. linea're (Nutt. gen. amer. 2. p. 39.) glabrous; leaves linear; flowers reversed. ⊙. H. Native of North America, from Philadelphia and New Jersey to Louisiana. T. dichótomum, Roth, nov. pl. spec. p. 280. T. brachiàtum, Lam. ill. 3. t. 515. but not of Lin.—Dill. elth. t. 285. f. 369.? Hardly differing from *T. dichótomum*, unless in being constantly glabrous, taller in stature, larger corollas, &c. Flowers purple or blue.

Linear-leaved Trichostema. Fl. June, Aug. Clt. 1759. Pl. 1 foot.

2 T. dicho'tomum (Lin. spec. p. 834.) glabrous or pubescent; leaves petiolate, oblong; flowers reversed. ⊙. H. Native of North America, from Canada to Carolina. T. pilòsum, Roth, nov. pl. spec. p. 280. Herb paniculately branched at top. Lower leaves about an inch long: upper floral ones bractea-formed, shorter than the pedicels. Flowers secund. Corollas small, blue or purple.

Dichotomous-branched Trichostema. Fl. June, Aug. Clt. 1759. Pl. ½ to 1 foot.

Sect. II. Orthopo'dium (from *ορθος, orthos*, straight; and *πους ποδος, pous podos*, a foot; in reference to the straight pedicels.) Benth. lab. p. 659. Calyx straight, equal. Cymes many-flowered.

3 F. oblóngum (Benth. lab. p. 659.) pubescent or villous; leaves oblong, narrowed at the base; cymes axillary; calyx about 5-cleft; tube of corolla inclosed. ⊙. H. Native of North-west America, in grassy places about Fort Vancouver, Douglas. Leaves green, distant, about an inch long, obtuse. Whorls remote. Corolla small, blue or purple.? Genitals exserted, free.

Oblong-leaved Trichostema. Pl. ½ to 1 foot.

4 T. lanceola'tum (Benth. lab. p. 659.) villous; leaves lanceolate; cymes axillary; calyx equally 5-cleft; tube of corolla exserted. ⊙.? H. Native of North-west America, near Fort Vancouver, in dry places at the river Multnomah; and of New California. Herb branched, hard at the base, and probably perennial. Leaves sessile, an inch long, stem-clasping at the base. Whorls secund, distant. Corollas pubescent. Genitals exserted. Filaments connate at the base.

Lanceolate-leaved Trichostema. Pl. ½ to ¾ foot.

5 T. lana'tum (Benth. lab. p. 659.) leaves linear, with revolute edges; flowers racemose, woolly; calyx about equally 5-cleft; tube of corolla much exserted. ⊙.? H. Native of California, Douglas. Perennial or shrubby.? Branches clothed with hoary tomentum. Leaves numerous, fasciculated, form of those of rosemary, 1-2 inches long, glabrous above, and tomentose beneath. Upper floral leaves bractea-formed. Whorls sub-secund, rather loose, 10-20-flowered. Corolla woolly. Genitals exserted. Filaments free.

Woolly Trichostema. Pl. 1½ foot.

Cult. The seeds of these annual plants should be sown in autumn, in pots filled with light earth; and in winter the pots should be placed under a frame, to shelter them from frosts, but expose them at all times to the open air when the weather is mild. In the spring transplant them on to a bed of light earth, shading them from the sun until they have taken root.

CVIII. TEU'CRIUM (so named from Teucer, son of Scamander, and father-in-law of Dardanus, king of Troy.) Lin. gen. no. 706. Schreb. gen. no. 960. Juss. gen. p. 112. Benth. lab. p. 660.—Chamæ'drys, Scorodònia, Scórdium, and Pòlium, Tourn. inst. t. 93. 97. and 98. and Mœnch. Leucoscéptrum, Smith.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx tubular or campanulate, rarely inflated, 5-toothed; teeth equal, or the superior one is broadest. Corolla with a short tube, which is exannulate inside; the 4 upper segments of the limb nearly equal, or the uppermost one is broader or longer, sometimes oblong and declinate, and sometimes very short, and erectish; lower segment very large, roundish or oblong, usually concave. Stamens 4, exserted between the upper segments, didynamous: the lower ones the longest; cells of anthers confluent. Style about equally bifid at apex; stigmas minute. Achenia more or less wrinkled.—Herbs and shrubs, variable in habit and inflorescence.

Sect. I. Leucosce'ptrum (from *λευκος, leucos*, white; and *σκηπτρον, sceptron*, a sceptre; in allusion to the long verticillate spikes of white flowers.) Benth. lab. p. 663.—Leucoscéptrum, Smith, exot. bot. p. 113. Whorls many-flowered, densely spicate. Calyx turbinate, incurved, with nearly equal teeth. Corolla incurved, reflexed; the upper segments very short, broad, truncate, erect.—An Indian shrub, clothed with hoary tomentum.

1 T. macrosta'chyum (Wall. mss. ex Benth. lab. p. 663.) shrubby; branches hoary; leaves oblong, clothed with dense white tomentum beneath; whorls many-flowered, densely spicate; calyx almost equally toothed; upper segments of corolla

very short and erect. ♄. G. Native of Nipaul and Silhet. Leucoscéptrum cànum, Smith, exot. bot. p. 113. t. 116. Clerodéndron Leucoscéptrum, D. Don, prod. fl. nep. p. 103. Leaves crowded at the tops of the branches, 6-8 inches long. Spikes 3-6 inches long. Corollas white, hardly exceeding the calyxes. Genitals much exserted.

Long-spiked Germander. Fl.? Clt. 1826. Shrub 6 feet.?

Sect. II. Teucrópsis (an alteration of the generic name.) Benth. lab. p. 664. Teucrópsis, Ging. in herb. D. C. mss. Whorls 2-flowered, axillary, or disposed in terminal racemes. Calyx campanulate, declinate; the upper tooth broader, and spreading. Corolla tomentose outside; the upper segments very short, broad, truncate, erect, or hardly declinate.—Hoary shrubs, natives of the Canary Islands.

2 T. heterophy'llum (Lher. stirp. 1. p. 84.) shrubby; branches hoary; leaves ovate-elliptic, hoary beneath, or on both surfaces: floral ones similar to the rest; whorls 2-flowered, axillary, remote; calyx straight, with equal teeth; superior segments of corolla very short, erect; ovaria very villous. ♄. G. Native of the Canary Islands. T. Canariénse, Lam. dict. 2. p. 692. Leaves petiolate, 1-2 inches long, obtuse, quite entire, or crenated towards the top. Corolla dark purple, twice as long as the calyx. Genitals much exserted. Whorls 2-4 flowered.

Various-leaved Germander. Fl. June, July. Clt. 1759. Shrub 4 to 6 feet.

3 T. Betónicum (Lher. stirp. 1. p. 83. t. 49.) shrubby; branches clothed with hoary tomentum; leaves ovate-oblong, hoary beneath or on both surfaces; whorls 2-flowered, secund, loosely racemose; floral leaves bractea-formed; calyx declinate, with the upper tooth very large; superior segments of corolla very short: uppermost one broad, erect: lateral ones sub-declinate, tomentose; achenia very villous. ♄. G. Native of Madeira, among rocks. Sims, bot. mag. t. 1114. T. betonicæfòlium, Jacq. coll. 1. p. 145. t. 17. f. 2. T. canéscens, Forst. comm. gœtt. 9. p. 58. ex Willd. T. Maderénse, Lam. dict. 2. p. 692. Scorodònia betonicæfòlia, Link, handb. p. 458. Leaves 1 to 1½ inch long, crenated. Racemes loose, 3-6 inches long. Corolla purple or lilac, pubescent; tube a little exserted. Genitals much exserted.

Betony Germander. Fl. May, Aug. Clt. 1775. Shrub 2 to 3 feet.

Sect. III. Teu'cris (see genus for derivation.) Benth. lab. p. 668. Teùcris, Ging. in herb. D. C. mss. Peduncles axillary, opposite, 1-flowered: or loosely cymose, many-flowered. Calyx campanulate, erect, equal, 5-toothed or 5-cleft. Four upper segments of corolla oblong, declinate, but the lower one is oblong and concave. Achenia reticulately wrinkled, glabrous, rarely very villous.—Herbs, under-shrubs, or shrubs, with quite entire or cut, rarely crenated leaves.

4 T. fruti'cans (Lin. spec. 787.) shrubby; leaves ovate, quite entire, flat, clothed with white tomentum beneath; peduncles 1-flowered; calyx tomentose, campanulate, equal, with ovate obtuse teeth. ♄. F. Native of Europe and Africa, in the region of the Mediterranean; as of Barbary, Spain, Italy, Naples, Corsica, Melita. Sibth. et Smith, fl. græc. 6. p. 23. t. 572. Dill. hort. elth. t. 284. f. 368. T. latifòlium, Lin. spec. p. 788. Curt. bot. mag. t. 245. T. tomentòsum, Mœnch, meth. p. 382. Zan. hist. t. 163.—Sabb. hort. rom. 3. t. 96. —Barrel. icon. t. 512. Shrub divaricately branched. Leaves on short petioles, glabrous and green above, or loosely cobwebbed. Racemes terminal, or in short, lateral, few-flowered branches. Corolla blue or purple, twice as long as the calyx. In Italian and Melita specimens, the leaves are sometimes rufescent beneath.

Shrubby Germander. Fl. June, Sept. Clt. 1640. Shrub 2 to 3 feet.

5 T. brevifo'lium (Schreb. unilab. p. 27.) shrubby; leaves oblong, quite entire, with revolute margins, canescent on both surfaces; racemes short; peduncles 1-flowered; calyx tomentose, campanulate, equal, semiquinquefid. ♄. F. Native of Candia, on the sea shore, Melos and Astypalea; among rocks. Sibth. et Smith, fl. græc. 6. p. 24. t. 528. T. Créticum, Lam. dict. 2. p. 692. but not of Lin. Shrub divaricately much branched. Branches short, leafy. Leaves scarcely ½ an inch long, obtuse, sessile: floral leaves similar to the others. Calycine teeth acute. Corolla purplish or red, similar to those of *T. Créticum*. (fig. 88.)

FIG. 88.

Short-leaved Germander. Fl. June, July. Clt. 1824. Shrub 1 to 2 feet.

6 T. Cre'ticum (Lin. spec. p. 788.) shrubby; leaves oblong-linear, quite entire, with revolute edges, and clothed with white tomentum beneath, but at length almost glabrous above; raceme elongated, strict; flowers nearly sessile, solitary or by threes; calyx clothed with white tomentum, campanulate, with acute teeth. ♄. F. Native of the region of the Mediterranean, and of the Islands of Cyprus, Melos, and Astypalea, among rocks; also of Palestine and Egypt. Sibth. et Smith, fl. græc. 6. p. 25. t. 529. T. hyssopifòlium, Schreb. unil. p. 28. T. rosmarinifòlium, Lam. dict. 2. p. 693. T. Charamoniénse, Cav. descr. 1. p. 82.—Alp. exot. 103. t. 102.—Mor. hist. 3. p. 410. sect. 11. t. 16. f. 3. Leaves approximate at the base of the branches, very like those of rosemary. Whorls 2-6-flowered. Corollas reddish purple. Genitals shorter than the lip.

Cretan Germander. Fl. July, Aug. Clt. 1824. Shrub 1 to 3 feet.

7 T. racemo'sum (R. Br. prod. p. 504.) stem herbaceous, strict, branched; leaves small, oblong: lower ones a little toothed: superior ones quite entire, all glabrous above, and clothed with white tomentum beneath; racemes elongated, strict; peduncles 1-flowered; calyx campanulate, tomentose, equal. ♃.? G. Native of New Holland, on the south coast, R. Br.; in bogs at the river Lachlan, Cunningham. Branches twiggy, canescent. Leaves hardly ½ an inch long, but generally much smaller, furnished with 1-2 teeth on both sides. Corolla downy outside. Genitals shorter than the lip.

Racemose Germander. Pl. erect.

8 T. lanceola'tum (Benth. lab. p. 666.) herbaceous?; leaves lanceolate, narrowed at the base: lower ones a little toothed: upper ones quite entire, all clothed with canescent pubescence beneath; cymes axillary, pedunculate, corymbose; calyx pubescent, campanulate, with lanceolate acute nearly equal teeth. ♃.? G. Native of New Holland, near Bathurst. Branches ascending, pubescent. Leaves 1 to 1½ inch long. Cymes loose, longer than the leaves. Corolla pubescent, twice as long as the calyx; lobes all nearly equal. Stamens exserted.

Lanceolate-leaved Germander. Pl. ascending.

9 T. corymbo'sum (R. Br. prod. p. 504.) herbaceous? clothed with fine pubescence; leaves ovate, toothed or cut, green on

both surfaces: cymes axillary, pedunculate, corymbose; calyx nearly glabrous, campanulate, with lanceolate acute teeth. ♃.? G. Native of New Holland, among rocks about Port Jackson; and of Van Diemen's Land. Stem a little branched. Leaves distant: lower ones an inch long: upper floral ones minute, quite entire, clothed with fine pubescence above, and tomentose pubescence beneath. Cymes 5-7-flowered. Genitals exserted.

Corymbose-flowered Germander. Pl. 1 to 2 feet.

10 T. CAPE'NSE (Thunb. prod. p. 95.? Benth. lab. p. 667.) herbaceous, finely pubescent; leaves cuneated at the base, 3-5-cleft, with lanceolate-linear entire or 3-5-cleft segments, green on both surfaces, or canescent beneath; cymes axillary, pedunculate, corymbose; calyx glabrous, campanulate, equal, deeply 5-cleft, with lanceolate acute segments. ♃.? G. Native of the Cape of Good Hope. A'juga Capénsis, Pers. ench. 2. p. 109. Peduncles sub-secund, filiform, 3-5-flowered. Corolla hardly larger than the calyx. Stamens one half longer than the calyx.

Cape Germander. Pl. 1 to 3 feet.

11 T. ORIENTA'LE (Lin. spec. p. 786.) herbaceous, erect, nearly glabrous; leaves bipinnate, with linear, quite entire, or cut segments, green on both surfaces; peduncles loosely racemose; pedicels much longer than the floral leaves; racemes panicled; calyx glabrous, campanulate, with lanceolate equal acute teeth. ♃. H. Native of Asia Minor, and Caucasus, on the gravelly banks of rivulets; as of Armenia, Syria, Iberia. Sims, bot. mag. t. 1279.—Riv. mon. irr. 19.?—Commel. rar. t. 25. Herb branched, sometimes glabrous, and sometimes pubescent or canescent. Lower leaves 1½ to 2 inches long. Corollas glabrous, blue; lower segment large. Genitals longer than the lip.

Eastern Germander. Fl. July, Aug. Clt. 1752. Pl. 1 foot.

12 T. PARVIFLO'RUM (Schreb. unilab. p. 31. icone.) herbaceous, clothed with soft tomentum; leaves deeply twice or thrice ternate; the segments of the lower leaves broad, obtuse; of the superior ones linear; peduncles much longer than the floral leaves, divaricate, 1-flowered; racemes panicled; calyx clothed with soft tomentum, campanulate, equal, semiquinquefid. ♃. H. Native of Armenia and Syria. Stem erect, trichotomously much branched at top, canescent as well as the leaves and calyxes. Floral leaves minute. Corollas small, numerous, hardly longer than the calyxes, blue.

Small-flowered Germander. Pl. 1 to 3 feet.

13 T. OLIVIERIA'NUM (Ging. in herb. D. C. mss. ex Benth. lab. p. 668.) herbaceous, clothed with soft pubescence; leaves cuneiform, deeply toothed at apex, or 3-5-cleft; peduncles much longer than the floral leaves, divaricate, 1-flowered; calyx villous, campanulate, equal, deeply 5-cleft. ♃. F. Native of Syria, between Aleppo and Bagdad, Olivier. Stems leaves, and calyxes canescent. Lower leaves petiolate, 1½ inch long; the upper ones much smaller, and nearly sessile. Flowers disposed in a few-flowered panicle. Lip of corolla 3 times as long as the calyx. Achenia very villous.

Olivier's Germander. Pl. 1 foot.

14 T. CAMPANULA'TUM (Lin. spec. 786.) herbaceous, procumbent, glabrous; leaves sub-bipinnatifid, with linear, cuneated, quite entire, or cut, divaricate segments, glabrous on both surfaces; flowers solitary, almost sessile, shorter than the leaves; calyx campanulate, equal, glabrous. ♃. F. Native of the region of the Mediterranean; as of Spain, Balearic Islands, Sicily, Naples. T. diversiflòrum, Mœnch, ex Steud. nom. p. 828.—Riv. mon. irr. t. 24.? Stems prostrate at the base. Branches ascending a little. Corollas blue. Stamens shorter than the lip. Floral leaves less cut, exceeding the flowers.

Campanulate-calyxed Germander. Fl. July, Aug. Clt. 1728. Pl. prostrate.

15 T. CUBE'NSE (Lin. mant. p. 80.) herbaceous, glabrous; lower leaves ovate-cuneated, obtuse, deeply toothed: superior leaves deeply trifid or pinnate, with lanceolate or linear flat segments, green on both surfaces; peduncles axillary, 1-flowered, shorter than the floral leaves; calyx campanulate, equal, glabrous, deeply 5-cleft; stamens scarcely twice as long as the calyx. ♂. S. Native of Mexico, near Papantla, Tampico, Vera Cruz; Texas; Island of Cuba; Bahama Islands; South of Brazil; Buenos Ayres; Mendoza, and Cordova. Jacq. amer. p. 172. t. 183. f. 74. obs. 2. p. 5. t. 30. T. lævigàtum, Vahl, symb. 1. p. 40. T. chamædrifòlium, Mill. dict. no. 15.—Herb erect, branched, densely leafy. Lower leaves broad, cut to the middle. Racemes terminal, subsecund. Corollas blue, glabrous or pubescent; lip hardly twice the length of the calyx.

Cuba Germander. Fl. May. Clt. 1733. Pl. 1 foot.

16 T. BI'COLOR (Smith, in Rees' cycl.) herbaceous, glabrous; leaves ovate-oblong or lanceolate, obtuse, quite entire or cut, green on both surfaces; peduncles axillary, 1-flowered, shorter than the floral leaves; calyx campanulate, equal, glabrous, semiquinquefid; stamens about 3 times as long as the calyx. ♃. F. Native of Chili, on the mountains; and in Pampas de Santa Fe, Gillies. T. heterophýllum, Cav. icon. 6. p. 56. t. 577. T. orchídeum, Lindl. bot. reg. t. 1255. Leaves about an inch long, or cut into a few segments, sometimes nearly ovate, trifid; the young ones often linear, quite entire, and trifid. Corollas yellowish, tinged with red; tube inclosed.

Two-coloured Germander. Fl. July, Aug. Clt. 1826. Pl. 1 to 2 feet.

17 T. NUDICAU'LE (Hook. bot. misc. 2. p. 235.) herbaceous? glabrous, or clothed with fine pubescence; branches twiggy, nearly naked; leaves small, remote, trifid, with linear obtuse segments, green on both surfaces; flowers on short peduncles, solitary, spicately racemose; calyx campanulate, equal, semiquinquefid, and is, as well as the corollas, pubescently hairy. ♃.? G. Native of Peru, in the valley of Canta, Cruikshanks. Flowers approximate towards the tops of the branches. Corollas almost of *T. bicolor*, but more villous, and the lower segment smaller.

Naked-stemmed Germander. Pl. 1½ foot.

18 T. AFRICA'NUM (Thunb. prod. p. 95.? Benth. lab. p. 669.) suffruticose; branches erect, tomentosely pubescent; leaves deeply trifid, with linear, quite entire, rarely trifid segments, revolute on the margins, clothed with canescent tomentum beneath; peduncles axillary, solitary, 1-flowered, or the lower ones are subcymose, rather shorter than the floral leaves; calyx campanulate, equal, sub-canescent, deeply 5-cleft. ♄. G. Native of the Cape of Good Hope. T. trífidum, Retz, obs. 1. p. 21.? A'juga Africàna, Pers. ench. 2. p. 109. Stems numerous, rising from a woody base. Leaves fascicled in the axils. Flowers smaller than those of the next species. Racemes many-flowered.

African Germander. Shrub ½ to 1 foot.

19 T. PSEUDOCHAMÆPI'THYS (Lin. spec. p. 787.) suffruticose; branches erect, pilosely hairy; leaves deeply 3-5-cleft, with linear, quite entire, or trifid segments, revolute on the edges, rather hispid above, and finely pubescent beneath; peduncles axillary, solitary, 1-flowered, at length rather longer than the floral leaves; calyx campanulate, equal, pubescent, deeply 5-cleft. ♄. F. Native of Europe and Africa, in the region of the Mediterranean; as of Spain, Barbary, Syria: South of France, about Marseilles.—Sabb. hort. rom. 3. t. 95.—Mor. hist. 3. sect. 11. t. 21. f. 2. Branches numerous, simple, rising

from a woody base, hairy, as well as the peduncles and lower leaves. Racemes terminal, loose, subsecund. Lower segment of corolla 3 times as long as the calyx. Corollas purple or white. ?

False-Ground-Pine Germander. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

20 T. lacinia'tum (Torrey, in ann. lyc. 2. p. 231.) shrubby, glabrous; leaves pinnately 5-parted: upper ones tripartite: segments linear; flowers axillary, solitary, pedicellate; pedicels much shorter than the leaves; calyx subcampanulate, 5-parted, the lower segment bifid or tridentate. ♄. F. Native of North America, among the Rocky Mountains. Branched. Lower leaves sessile; segments blunt. Corollas large for the size of the plant, violaceous? villous outside; lower segment ovate, acute.

Jagged-leaved Germander. Shrub small.

Sect. IV. Pychnóbotrys (from *πυχνος, pychnos*, dense; and *βοτρυς, botrys*, a bunch of grapes; in reference to the whorls being crowded into simple or branched spikes or racemes.) Benth. lab. p. 671. Whorls from 4 to many-flowered, crowded into simple or branched spikes. Calyx inflated, or tubularly campanulate, declinate, with nearly equal teeth, or the upper teeth are broader. Upper segments of corolla very short, broad, truncate, or declinate: lateral ones small, oblong, declinate: the lower one broad and concave. Achenia wrinkled, glabrous.—Villous or glabrous herbs or shrubs, but never hoary.

21 T. abutiloi'des (Lher, stirp. 1. p. 84.) shrubby; branches pubescent; leaves ample, heart-shaped, green on both surfaces, villous; racemes simple, paniculately branched; whorls 2-6-flowered; calyx declinate, hairy, with ovate obtuse teeth; the upper tooth rather the broadest. ♄. G. Native of Madeira. Jacq. schœnbr. 3. t. 358. T. macrophýllum, Lam. dict. 2. p. 692. Leaves like those of *Sìda móllis*, on long petioles, 3-6 inches long, crenated. Corolla 1½ inch long, red. Genitals much exserted.

Mulberry-like Germander. Fl. April, May. Clt. 1777. Shrub 3 to 4 feet.

22 T. Wallichia'num (Benth. in Wall. pl. rar. asiat. 2. p. 19. lab. p. 671.) herbaceous, ascending; leaves elliptic-ovate, acuminated, narrowed a long way at the base, green on both surfaces; racemes simple; whorls many-flowered; calyx declinate, with hardly unequal teeth. ♃. G. Native of Silhet, in the East Indies. Stems simple, rooting at the base, clothed with rufous villi. Leaves 3-4 inches long, hispid from stiff scattered hairs, quite entire at the base. Whorls about 10-flowered. Calyx hispid.

Wallich's Germander. Pl. 1 foot.

23 T. Japónicum (Willd. spec. 3. p. 23.) herbaceous, erect, or ascending, nearly glabrous; leaves ovate-oblong or lanceolate, rounded at the base, green on both surfaces; raceme branched; whorls equal, 6-flowered; floral leaves lanceolate; calyx declinate, tubularly campanulate, glabrous, with lanceolate acute nearly equal teeth. ♃. F. Native of Japan, on the mountains. T. Virgínicum, Thunb. fl. jap. p. 244. Stems glabrous or pubescent on the angles. Leaves on short petioles, deeply and sharply serrated, pale beneath: floral ones bracteaformed, ciliated. Genitals about equal in length to the lower lip.

Japan Germander. Pl. 1 to 2 feet.

Sect. V. Stachy'botrys (from *σταχυς, stachys*, a spike; and *βοτρυς, botrys*, a bunch of grapes; so called in reference to the whorls being disposed in terminal, simple, terete spikes.) Benth. lab. p. 672. Whorls from 6 to many-flowered, disposed in simple, terminal, terete spikes. Calyx campanulate, declinate; the upper teeth, and especially the upper tooth, broadest, rarely almost equal. Upper segments of corolla oblong, declinate: lower one oblong, concave. Achenia reticulately wrinkled, glabrous.—Perennial, ascending, or erect, branched herbs.

24 T. infla'tum (Swartz, prod. p. 88. fl. ind. occ. 2. p. 1003.) herbaceous, erect, pubescent or villous; leaves ovate or ovate-lanceolate, roundly truncate at the base, or subcordate, rather canescent beneath; racemes almost simple; whorls equal, 6-flowered; bracteas lanceolate; calyx declinate, inflated, pubescent, or villous, with a contracted mouth: the upper tooth the broadest. ♃. S. Native of Mexico, Jamaica, Spanish Main, Brazil, Island of Tongatabou, Buenos Ayres, &c. T. villòsum, Forster, prod. no. 232. T. palústre, H. B. et Kunth, nov. gen. amer. 2. p. 306. T. vesicàrium, Mill. ex Steud. nom. p. 830. Habit of *T. Canadénse*; but differs in the leaves being cordate at the base; and particularly in the inflated calyxes, and shorter, usually obtuse teeth. Corolla red or purplish.

Inflated-calyxed Germander. Fl. Aug. Oct. Clt. 1778. Pl. 2 feet.

25 T. Canade'nse (Lin. spec. 789.) herbaceous, erect, canescent, or villous; leaves ovate-lanceolate, rounded at the base, rather canescent beneath; racemes simple; whorls equal, 6-flowered; bracteas subulate; calyx declinate, campanulate, hoary, or sub-villous: the upper teeth the broadest. ♃. H. Native from Canada to Carolina; and of Texas. T. Virgínicum, Lin. spec. p. 789. T. speciòsum, Hill. veg. syst. 14. t. 14. Stems simple, or a little branched. Leaves on short petioles, 2-3 inches long, serrated, hispid and green above, rarely glabrous. Corollas purplish.

Canadian Germander. Fl. Aug. Sept. Clt. 1768. Pl. 1 to 3 feet.

26 T. Hirca'nicum (Lin. spec. p. 789.) herbaceous, erect, pubescent; leaves ovate-cordate, sub-canescent beneath; raceme simple; whorls equal, 6-flowered; bracteas subulate, rather shorter than the calyxes; calyx declinate, bilabiate, having the upper tooth very broad. ♃. H. Native of Eastern Caucasus; also of Iberia, in woods and in hedges. Sims, bot. mag. t. 2013. Scorodònia spicàta, Mœnch, meth. p. 385.—Hall, comm. gœtt. 2. p. 343. t. 13.—Ard. spec. 13. t. 4.? Leaves petiolate, 1-3 inches long, coarsely crenated; floral leaves subulate. Spikes dense. Corolla purple, villous outside.

Hircanean Germander. Fl. Aug. Oct. Clt. 1763. Pl. 1 to 3 feet.

27 T. Arduí'ni (Lin. mant. p. 81.) herbaceous, erect, clothed with soft villi; leaves ovate, rounded at the base, greenish on both surfaces; racemes simple; whorls equal, 6-flowered; bracteas sessile, lanceolate, acuminated, exceeding the calyxes; calyx bilabiate, the upper tooth very broad. ♃. H. Native of the South-east of Europe; as of Dalmatia, Bulgaria, and the Bithynian Olympus, in rocky places. Sibth. et Smith, fl. græc. 6. p. 26. t. 531. T. lamiifòlium, D'Urv. pl. arch. in mem. soc. Lin. par. 1. p. 320. Scutellària Crética, Lin. spec. 836. Scorodónia Arduíni, Rchb. fl. germ. exc. p. 315.—Ard. spec. 1. p. 12. c. 3. Leaves nearly sessile, or the lower ones are on short petioles, 1-2 inches long, serrately crenated. Spikes dense, very villous. Corollas white, villous outside.

Arduini's Germander. Fl. June, Oct. Clt. 1823. Pl. 1½ foot.

28 T. bractea'tum (Desf. fl. atl. 2. p. 7. t. 120.? Benth. lab. p. 673.) herbaceous, ascending, villous; leaves ovate, cordate at the base, green on both surfaces; racemes simple; whorls equal, 6-flowered; bracteas petiolate, ovate, or lanceo-

late, equalling the calyxes; calyx bilabiate, the upper tooth very broad. ♃. F. Native of the North of Africa, on uncultivated hills near Tangiers, Salzmann; Tariffa, Durand; Mascar and Tlemsen, Desfontaines. Herb a little branched. Leaves ½ to 1 inch, bluntly crenated, petiolate. Racemes loose. Corolla pubescent outside.

Bracteate Germander. Pl. ½ foot.

29 T. compa'ctum (Lag. nov. gen. et spec. 17.) suffruticose, procumbent, villous; leaves cuneate-ovate, deeply crenated, hairy; floral leaves petiolate, lanceolate, ciliated; flowers spicate. ♄. F. Native of Spain, in Granada, Clemente. Leaves quite entire at the base, narrowed into the short petioles. Calyx inflated, with a narrow throat, semiquinquefid; upper segments ovate, and shorter than the others.

Compact-flowered Germander. Shrub procumbent.

Sect. VI. Scorodo'nia (from σκορόδον, *scorodon*, garlic; the *T. scorodònia* has an odour somewhat like garlic.) Benth. lab. p. 674. Whorls 2-flowered, secund, disposed in terminal, usually branched racemes. Calyx campanulate, declinate, the upper teeth, but especially the uppermost one, broader. Upper segments of corolla oblong, declinate. Achenia small, nearly globose, wrinkled or smoothish.—Perennial, ascending, or erect, branched herbs.

30 T. tomento'sum (Hęyne, ex Benth. in Wall. pl. rar. asiat. 1. p. 58. lab. p. 674.) herbaceous? erect; branches clothed with tomentose pubescence; leaves ovate, rounded at the base, villous above, and clothed with tomentose pubescence, and canescent beneath, rarely almost glabrous; racemes paniculately much branched; calyx declinate, pilose, bilabiate, the upper tooth the broadest. ♃. H. Native of the Indian peninsula. Herb hard and woody at the base.? Leaves large, 2-4 inches long, and 1½ to 2 inches broad, coarsely and acutely crenated. Panicles dense. Corolla yellowish; tube inclosed.

Var. β, glabriúsculum (Benth. lab. p. 674.) plant nearly glabrous. ♃. G. Native of Ceylon, on Mount Nuera Ellia, Macrae.

Tomentose Germander. Pl. 2 to 4 feet.

31 T. stoloni'ferum (Hamilt. ex Benth. in Wall. pl. asiat. rar. 1 p. 58. and perhaps of Roxb. fl. ind. 3. p. 3. Benth. lab. p. 674.) herbaceous, ascending or erect, glabrous or finely pubescent; leaves ovate, rounded or cuneated at the base, green on both surfaces, not wrinkled; raceme paniculately branched; calyx declinate, ovoid, inflated in the fructiferous state, the upper tooth the broadest; tube of corolla inclosed. ♃. G. Native of Silhet; and the Burman Empire, on Mount Taong-Dong. Root stoloniferous according to Roxb. Leaves on longish petioles, 1-2 inches long, thin, scarcely wrinkled, deeply crenated; the floral leaves in the racemes bractea-formed. Flowers pendulous, yellowish.

Stoloniferous Germander. Pl. 1 to 2 feet.

32 T. vi'scidum (Blum. bijdr. p. 827.) leaves ovate, coarsely and unequally serrated, wrinkled; racemes axillary and terminal, secund, and are, as well as the calyxes, clothed with viscid pubescence; bracteas lanceolate, length of calyxes; stem a little branched. ♃.? S. Native of Java, in humid mountain places near Tugu, and at the foot of Mount Burangrang. Allied to *T. Lusitánicum*.

Viscid Germander. Pl.?

33 T. la'xum (D. Don, prod. fl. nep. p. 109.) herbaceous, procumbent? or scandent? finely pubescent; leaves ovate-lanceolate, acuminated, serrated, green on both surfaces; racemes nearly simple, axillary, and terminal; calyxes opposite, declinate, rather pilose, the upper tooth very broad. ♃. H. Native of Nipaul, Hamilt. Differing from *T. stolonífera* in habit, narrower leaves, and short, loose, few-flowered racemes.

Loose-flowered Germander. Pl. scandent.?

34 T. Roylea'num (Wall. pl. rar. asiat. 1. p. 58. Benth. lab. p. 675.) herbaceous, ascending; branches hispid; leaves on short petioles, lanceolate-ovate, acute, serrated, subcordate at the base, wrinkled, villous, canescent beneath; racemes short, nearly simple; superior floral leaves shorter than the calyxes; calyx declinate, hispid, bilabiate, the upper tooth broader; tube of corolla exserted a little. ♃. F. Native of the North of India, on stony mountains; at Deyra Dhoon, and at Kheeree Pass, Royle; and between Mussooree and Lagrasson, Jacquemont. Allied to *T. quadrifàrium*, but the habit and characters are very distinct. Stems procumbent at the base. Racemes few-flowered. Corollas larger than in *T. quadrifàrium*, purple or white.

Royle's Germander. Pl. 1 to 1½ foot.

35 T. quadrifa'rium (Hamilt. ex D. Don, prod. fl. nep. p. 108.) herbaceous, erect; branches tomentosely villous or hispid; leaves on short petioles, ovate, serrated, cordate at the base, wrinkled, villous, rather canescent beneath; racemes branched; floral leaves broadly ovate, acuminated, exceeding the calyxes; calyx declinate, hispid, sub-bilabiate, the upper tooth the broadest; tube of corolla inclosed. ♃. H. Native of Silhet, Nipaul, and Himalaya, in stony places and by way sides. Stems usually rufescent. Leaves 1-2 inches long: upper ones sessile. Racemes dense. Corolla purple, twice as long as the calyx.

Four-rowed Germander. Pl. 1 to 3 feet.

36 T. argu'tum (R. Br. prod. p. 504.) herbaceous, humble, erect; branches villous; leaves lanceolate-ovate or ovate, crenately serrated, truncate at the base, green on both surfaces, and rather hispid; racemes almost simple; floral leaves lanceolate, exceeding the calyxes; calyx declinate, villous, sub-bilabiate: upper tooth the broadest; tube of corolla inclosed. ♃. F. Native of New Holland. Floral leaves ciliated. Flowers subsecund. Nearly allied to *T. quadrifàrium*, in the more humble stature, longer petioles, and narrower floral leaves.

Sharp-toothed-leaved Germander. Pl. ½ foot.

37 T. Scorodònia (Lin. spec. 789.) herbaceous, erect, hispid, pubescent, or nearly glabrous; leaves ovate, obtuse, crenated, rounded or cordate at the base, green on both surfaces; racemes a little branched: upper ones panicled; floral leaves minute; calyx declinate, rather villous, broadly campanulate, sub-bilabiate, the upper tooth large; tube of corolla exserted. ♃. H. Native throughout Europe, in woody hilly situations, among bushes and under hedges, where the soil is dry and stony; plentiful in Britain, in like situations. Hook. fl. lond. vol. 2. icone. Smith, engl. bot. t. 1543. Curt. lond. 5. t. 40. Fl. dan. t. 485. Scorodònia heterophýlla, Mœnch, meth. p. 384. T. sylvéstre, Lam. fl. fr. 2. p. 412. Scorodònia sylvéstris, Link, handb. p. 458. Scorodònia, Riv. mon. irr. t. 12. Blackw. t. 9.—Sabb. hort. rom. 3. t. 92. Stems simple, or a little branched. Leaves 1-2 inches long, wrinkled, on short petioles. Racemes slender, loose. Corollas pale yellow, downy outside. Stamens violaceous. The smell and taste of this plant are said to resemble hops. It is called *Ambroise* in Jersey; and in that island when cyder fails, they malt their barley at home, and instead of hops use to a very good purpose the *Ambroise* of the hedges. Rutty says, that when the herb is boiled in wort, the beer sooner becomes clear than when hops are used.

Wood-sage Germander. Fl. July. Britain. Pl. 1 to 2 feet.

38 T. pseudoscorodo'nia (Desf. fl. atl. 2. p. 5. t. 119.) suf-

fruticose, erect, hispid, or pubescent; leaves ovate, obtuse, crenated, rounded or cordate at the base, green on both surfaces, or canescent beneath; racemes nearly simple; floral leaves minute; calyx declinate, rather villous, sub-bilabiate, the upper tooth large; tube of corolla inclosed, or a little exserted. ♄. F. Native of the North of Africa, at Mount Lazar, near Mayane, in Algiers; Tangiers and Gibraltar. Scorodònia salviástrum, Link, handb. p. 458.? Scorodònia Fontanesiàna, Ser. bull. bot. p. 315. This differs from *T. Scorodònia*, in the shrubby stem, erect branches, more simple racemes, rather larger calyxes, and shorter corollas. Flowers yellow.

False-Wood-Sage. Fl. July, Aug. Clt. 1818. Shrub 1 to 2 feet.

39 T. Massilie'nse (Lin. spec. 789.) herbaceous or suffruticose, ascending; branches clothed with hoary pubescence; leaves ovate, crenated, rounded or cordate at the base, wrinkled: lower ones canescent beneath; racemes nearly simple or branched, loose, secund; floral leaves shorter than the calyxes; calyx declinate, rather villous, sub-bilabiate: upper tooth the largest; tube of corolla inclosed. ♃. H. Native of Europe, in the region of the Mediterranean; as about Marseilles, Corsica, Sardinia, Candia, &c. Jacq. hort. vind. 1. t. 94. Scorodònia Massiliénsis, Link, handb. p. 458. Scorodònia cordàta, Mœnch, meth. p. 385. T. odoràtum, Lam. fl. fr. 2. p. 413. T. Créticum, Clus. hist. 1. p. 348.—Ger. fl. gallopr. 277. t. 11. Leaves ½ an inch long, rarely 1 inch, much wrinkled. Racemes and flowers like those of the preceding, to which it is very nearly allied. Corollas purple.

Marseilles Germander. Fl. June, July. Clt. 1731. Pl. 1 foot.

40 T. Lusita'nicum (Lam. dict. 2. p. 692.) herbaceous or suffruticose; branches clothed with hoary pubescence; leaves lanceolate, crenated, wrinkled, rather canescent beneath; racemes a little branched, loose, secund; calyx declinate, upper tooth the broadest; tube of corolla inclosed. ♃. H. Native of the south-west of Europe; as of Spain, Portugal, Balearic Islands, in the fissures of rocks. T. Asiáticum, Lin. mant. p. 80. Jacq. hort. vind. 3. t. 41. T. salviástrum, Hoffm. et Link, fl. port. p. 84. t. 2. Mœnch, meth. p. 384. Habit of *T. Massiliénse*, from which it hardly differs, unless in the form of the leaves. Racemes usually more loose. Corollas purplish.

Portugal Germander. Fl. June, Oct. Clt. 1822. Pl. 1 foot.

† *A species belonging to the present section, but is not sufficiently known.*

41 T. salvia'strum (Schreb. unilab. p. 38.) stems erect, pubescent, clammy; leaves oval, crenulated, wrinkled, tomentose beneath, petiolate; racemes secund. ♃.? H. Native of Portugal. Leaves rounded at both ends, clothed with hoary, silky, short villi above, white beneath; floral leaves lanceolate, acute: upper ones minute, quite entire. Corolla villous outside.

Sage-like Germander. Pl. 1 foot.?

Sect. VII. Scórdium (from *σκορδιον*, *scordion*, garlic; the *T. scordium* has a smell approaching to that of garlic.) Benth. lab. p. 678. Whorls 2-6-flowered, distant, axillary. Floral leaves similar to the cauline leaves. Calyx tubular, declinate, gibbous at the base beneath; teeth 5, nearly equal, or the upper one is broadest. Upper segments of corolla oblong, declinate. Achenia very or scarcely wrinkled.—Annual or perennial herbs.

42 T. spinòsum (Lin. spec. 793.) herbaceous; branches spinescent at top; whorls axillary, remote, 1-6-flowered; calyx declinate: upper tooth very broad. ⊙. H. Native of Europe and Africa, in the region of the Mediterranean; as of Portugal, Spain, Sicily, Naples, Syria, and the Canary Islands. Sibth. et Smith, fl. græc. 6. p. 31. t. 539. T. mucronàtum, Lin. spec. 793. Scórdium spinòsum, Cav. icon. rar. 1. p. 19. t. 31. Scorodònia spinòsa, Link, handb. p. 458.—Barrel. icon. p. 319. t. 202.—Mor. hist. 3. p. 423. sect. 11. t. 22. f. 17. Herb procumbent, divaricately branched. Branches stiff, villous, nearly all spinescent. Lower leaves oblong, deeply serrated at apex: upper and rameal ones small, green on both surfaces, but pubescent. Calycine teeth spinescent. Corollas small, white, resupinate from the twisting of the tube.

Spinose Germander. Fl. May, June. Clt. 1640. Pl. procumbent.

43 T. resupina'tum (Desf. fl. atl. 2. p. 4. t. 117.) annual, villous; leaves oblong, narrowed at the base, green on both surfaces; floral leaves similar to the others, but narrower; whorls axillary, 2-flowered; calyx declinate, tubular beneath the gibbosities at the base? with awned teeth: upper tooth the broadest. ⊙. H. Native of the North of Africa, on argillaceous hills, near Mascar, Tangiers, Algiers. Herb divaricately branched. Whorls secund. Corollas yellowish, resupinate from the twisting of the tube.

Resupinate-flowered Germander. Fl. July, Aug. Clt. 1801. Pl. ½ foot.

44 T. Scórdium (Lin. spec. 790.) herbaceous, perennial, villous, rarely glabrous; leaves oblong, toothed, narrowed at the base or rounded, sessile, green on both surfaces; floral leaves similar to the rest; whorls axillary, 2-6-flowered; calyx declinate, campanulate, with short nearly equal teeth. ♃. H. Native of Europe, and the temperate parts of Asia, in bogs and watery places. Chamæ'drys Scórdium, Mœnch, meth. p. 384. T. palústre, Lam. fl. fr. 2. p. 411. T. arenàrium, Gmel. itin. 1. p. 149. t. 26. f. 2.—Riv. mon. t. 11. Scordium legítimum, Park. theatr. 111. f. 1.—Mor. hist. 3. p. 423. sect. 11. t. 22. f. 14. Stems creeping or rooting at the base; floriferous branches erect or ascending, more or less villous. Leaves about an inch long, hairy, soft: floral ones longer than the flowers. Corollas small, purplish. The fresh leaves are bitter, and rather pungent. Powdered, they destroy worms. A decoction of the plant is a good fomentation in gangrenous cases. It has a strong disagreeable smell, somewhat approaching to that of garlic; whence its specific name from *σκορδον*, garlic. It was once in high esteem as an antiseptic and an alexpharmic, to which it certainly had no claim. Cullen says it has a bitter, joined with some volatile parts; but that neither of these qualities is considerable enough to retain it in the present practice.

Garlic or Water Germander. Fl. July, Aug. England. Pl. ½ to 1 foot.

45 T. scordioi'des (Schreb. unilab. p. 37.) herbaceous, perennial, woolly, rarely almost glabrous; leaves ovate-oblong, crenated, cordately stem-clasping at the base, green on both surfaces; floral leaves similar to the rest; whorls axillary, 6-flowered; calyx declinate, campanulate, with short nearly equal teeth. ♃. H. Native of the South of Europe, in bogs, especially near the sea; as of Portugal, Spain, South of France, Italy, Sicily, Sardinia, Candia, &c.; in England, but not common; plentiful in the fens of the Isle of Ely; from Cambridge to Histon; at Westbeach, Cottenham; on the banks of the Isis, near Highbridge, and on Eynsham Common, Oxfordshire, &c. T. Scórdium, Brot. fl. lus. 1. p. 164. Woodv. med. bot. t. 57. Oeder, fl. dan. t. 593. Bieb. fl. cauc. 2. p. 36. Smith, engl. bot. t. 828. and of many other authors, but not of Lin. T. lanuginòsum, Bauh. pin. p. 247. Hoffm. et

Link, fl. port. 1. p. 84. t. 3. Habit of *T. Scórdium*, but usually more villous, and differs particularly in the shorter cordately stem-clasping leaves, which are not narrowed at the base. Corollas small, purplish.

Scordium-like Germander. Fl. July, Aug. England. Pl. ½ to 1 foot.

46 T. Bótrys (Lin. spec. 786.) annual, villous; leaves deeply pinnate, with oblong, quite entire or cut, divaricate segments, green on both surfaces; floral leaves similar to the cauline ones; whorls axillary, 6-flowered; calyx inflately tubular, gibbous beneath at the base? with equal, lanceolate teeth. ☉. H. Native of the South of Europe and North of Africa, in calcareous arid, dry places; as of France, Spain, Germany, Italy, Sicily, Algiers, &c. Mill. fig. 176. t. 264. f. 1. Sabb. hort. rom. 3. t. 91. Chamæ'drys Bótrys, Mœnch, meth. p. 383. Scorodònia Bótrys, Ser. bull. bot. p. 317.—Riv. mon. irr. t. 14.—Mor. hist. sect. 11. t. 22. f. 18. Herb erect, branched, more or less villous. Leaves petiolate: floral ones exceeding the flowers. Corollas small, purplish. The plant has a pleasant aromatic smell; it may, therefore, be successfully used in fevers, rheumatism, gout, &c.

Botrys or Cut-leaved annual Germander. Fl. July, Sept. Clt. 1633. Pl. ½ foot.

Sect. VIII. Chamæ'drys (from χαμαι, *chamai*, on the ground; and δρυς, *drus*, an oak; the plants are dwarf, with leaves resembling that of the oak.) Benth. lab. p. 680. Whorls 2-6-flowered, distinct, disposed in a loose terminal raceme. Calyx tubularly campanulate, declinate, oblique at the base; teeth 5, nearly equal, or the superior ones rather the broadest. Upper segments of corolla oblong, declinate. Achenia reticulately wrinkled.—Small shrubs, erect or procumbent at the base.

47 T. lu'cidum (Lin. spec. 790.) herbaceous, perennial, quite glabrous; leaves petiolate, ovate, deeply toothed, crenated at the base: floral ones smaller, scarcely toothed; whorls 2-6-flowered: the upper ones racemose; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ♃. H. Native in the region of the Mediterranean, in the fissures of rocks; as of Provence, Piedmont, Mount Atlas, and the mountains of Cyrenaica. Med. act. pal. 3. phys. 211. t. 12. f. 7. Chamæ'drys lùcida, Mœnch, meth. p. 383. Magn. hort. 52. icone. This differs from *T. Chamæ'drys*, in the stems being more firm, more erect, and taller; in the cauline leaves being larger and thinner, and in the floral leaves being usually smaller; but especially in the plant being quite glabrous. Calyxes purplish. Corollas reddish purple. Root creeping.

Shining Germander. Fl. June, Sept. Clt. 1730. Pl. 1 to 1½ foot.

48 T. Chamæ'drys (Lin. spec. 790.) perennial or suffruticose, procumbent at the base, pubescent or villous, rarely glabrous; leaves on short petioles, ovate or oblong, deeply crenated, cuneated at the base, green on both surfaces, or canescent beneath; floral leaves smaller, scarcely toothed; whorls 2-6-flowered: the superior ones racemose; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ♃. H. Native throughout Europe and Asia Pontica, on walls, rocks, and by way sides; as of Spain, France, Germany, Italy, Sicily, Turkey, Tauria, and Caucasus; in England, among the ruins of old castles and walls, but by no means plentiful. Smith, engl. bot. t. 680. Woodv. med. bot. suppl. 82. t. 243. Sabb. hort. rom. 2. t. 88. Chamæ'drys officinàlis, Mœnch, meth. p. 383. T. pseudochamæ'drys, Wender. in bot. zeit. 1826. p. 358. T. multiflòrum, Hort. but not of Lin. T. officinàle, Lam. fl. fr. 2. p. 414.—Riv. mon. t. 10. f. 2. Root creeping. Leaves often shining above, glabrous or villous: upper floral ones bracteaformed, quite entire, reddish. Racemes subsecund. Corollas reddish purple, villous outside. This plant has been esteemed chiefly as a mild aperient and corroborant, and was recommended in intermitting fevers, rheumatism, and gout. It has been employed in various forms and combinations, of which the Portland powder is one of the most celebrated instances. Its qualities seem nearly allied to those of horehound, and therefore it may be equally useful in asthmatic affections and coughs.

Germander, Common. Fl. May, Aug. England. Pl. ½ to ¾ foot.

49 T. ca'num (Fisch. et Meyer, ind. sem. hort. petrop. 1835. p. 40.) clothed with hoary tomentum, frutescent at the base, many-stemmed; stems erectish, simple; leaves oblong, toothed, cuneated at the base; floral leaves quite entire; whorls 6-flowered; pedicels length of calyx; calycine teeth equal, acute, mucronulate. ♄.? or ♃.? H. Native of the Transcaucasian province Somchetia. Allied to *T. Chamæ'drys* and *T. quadrátulum*; but differs from the first in being clothed with canescent villi; in the distant loose whorls, and quite entire floral leaves; and from the last in the elongated, almost simple stems, 6-flowered whorls, longer pedicels, villous corollas, &c. Corolla purple.

Hoary Germander. Pl. 1 to 2 feet.?

50 T. multiflòrum (Lin. spec. 788.? Benth. lab. p. 681.) suffruticose, nearly glabrous, or clothed with fine hoary pubescence; leaves on short petioles, ovate, acute, narrowed at the base, acutely toothed at apex, green on both surfaces, or canescent beneath; floral leaves smaller; whorls 2-6-flowered, distant, racemose; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ♄. F. Native of Spain.—Bocc. mus. t. 117.? Intermediate between *T. Chamæ'drys* and *T. Màrum*. Habit of the first, but more branched. Leaves 2-4 inches long. Flowers like those of *T. Chamæ'drys*, but one half smaller.

Many-flowered Germander. Fl. July, Sept. Clt. 1731. Shrub 1 foot.

51 T. Ma'rum (Lin. spec. p. 788.) shrubby, hoary; leaves small, ovate, quite entire, hoary beneath: floral ones smaller; whorls 2-4-flowered, racemose; calyx declinate, hairy, tubularly campanulate, with short nearly equal teeth. ♄. F. Native of the region of the Mediterranean; as of Spain, Corsica, Italy, &c. Woodv. med. bot. 153. t. 56.—Blackw. t. 47.—Riv. mon. irr. t. 23.—Sabb. hort. rom. 3. t. 90. Chamæ'drys Màrum, Mœnch, meth. p. 383. T. marítimum, Lam. fl. fr. 2. p. 414. —A small branched shrub, with the habit of *Thymus vulgàris*. Leaves small, petiolate, rarely obscurely crenated, canescent above, and tomentose beneath. Whorls subsecund, approximate into spikes. Corollas purplish, villous outside. The leaves and younger branches of *Màrum*, when recent, on being rubbed between the fingers, emit a volatile aromatic smell, which readily excites sneezing; but to the taste they are bitterish, accompanied with a sensation of heat and acrimony. Judging from the sensible qualities of this plant, it may be supposed to possess very active powers; and on this consideration it is strongly recommended by Wedelius as an important remedy in many diseases requiring medicines of a stimulant, aromatic, and deobstruent quality: his opinion seems in some measure to have been since verified by actual experience of its efficacy. At present, however, *Màrum* is chiefly used as an errhine, and is an ingredient in pulvis asari compositus. Cats are very fond of this plant, and often destroy it.

Marum Germander, or Cat-Thyme. Fl. July, Sept. Clt. 1640. Shrub 1 to 3 feet.

52 T. microphy'llum (Desf. cor. pl. Tourn. in ann. mus. 10. p. 300. t. 22.) suffruticose, humble, divaricately much branched; leaves small, ovate, crenated, glabrous above and

hoary beneath; whorls few, about 2-flowered; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ♄. F. Native of Candia, among rocks. T. quadrátulum, Smith, et Sibth. fl. græc. 6. p. 25. t. 530. but hardly of Schreb. T. divaricàtum, Sieb. pl. exs.? Corollas red. Habit of *T. flàvum*.

Var. β; branches short, canescent; leaves smaller; flowers smaller and fewer.

Small-leaved Germander. Shrub humble.

53 T. fla'vum (Lin. spec. 791.) shrubby; branches tomentosely pubescent; leaves broad-ovate, crenated, truncate or cuneated at the base, green on both surfaces, or canescent beneath; superior floral leaves quite entire, acute; whorls 2-6-flowered, racemose; calyx declinate, tubularly campanulate, with lanceolate nearly equal teeth. ♄. F. Native of Europe and Africa, in the region of the Mediterranean; as of Spain, Eastern Pyrenees, South of France, Corsica, Sardinia, Italy, Sicily, Dalmatia, Grecian Islands, Algiers, and Mount Atlas. Sibth. et Smith, fl. græc. 6. p. 27. t. 533. Chamæ'drys flàva, Mœnch, meth. p. 383.—Sabb. hort. rom. 3. t. 89.—Jungh. icon. cent. 1. f. 5.—Besl. eyst. 7. p. 11. f. 1.—Mor. hist. 3. p. 421. sect. 11. t. 22. f. 1.? Shrub much branched. Leaves thickish, variable in size, 3-10 lines long. Calyx coloured at top. Corolla yellowish.

Var. β, *purpùreum* (Benth. lab. p. 682.) flowers reddish purple; leaves usually canescent beneath. ♄. F. Native of Spain, Mount Parnassus, Syria, Cyprus, &c. T. règium, Hort. and probably of Schreb. T. lùcidum, Sibth. et Smith, fl. græc. 6. p. 27. t. 532. but not of Lin. T. divaricàtum, Sieb. pl. exs.?

Yellow-flowered Germander. Fl. July, Sept. Clt. 1640. Shrub 1 to 2 feet.

54 T. ramosi'ssimum (Desf. fl. atl. 2. p. 4. t. 118.) shrubby, much branched, hoary; branchlets filiform; leaves obovate, crenated; flowers solitary, axillary, and terminal; calyx slender, elongated, with nearly equal acute teeth. ♄. F. Native of Barbary, in the fissures of rocks near Cafsa. Leaves size of those of *T. Màrum*. Corollas small, violaceous. The whole plant exhales a very sweet scent.

Much-branched Germander. Shrub.

55 T. ni'tidum (Schreb. unilab. p. 35.) shrubby; stems bifariously bearded; leaves on short petioles, ovate, crenated, glabrous, shining, but bearded on the middle nerve at the base; floral leaves quite entire; whorls dimidiate, racemose. ♄. F. Native of Mauritania. Leaves entire at the base, with reflexed cut margins; floral leaves almost lanceolate, more pilose than in *T. flàvum*. Corollas purple. Perhaps a variety of *T. flàvum*.

Shining-leaved Germander. Shrub 1 to 2 feet.?

56 T. re'gium (Schreb. unilab. p. 35.) shrubby, diffuse; branches pubescent; leaves on short petioles, ovate, toothed in front: floral ones quite entire, sessile; whorls racemose. ♄. F. Native of Spain and Italy. Leaves deep green, with reflexed edges, shining, beset with short hairs, which are only seen under a lens, hoary beneath: floral ones equalling the calyxes. Whorls contiguous. Corollas purple. Probably a variety of *T. Chamæ'drys*.

Royal Germander. Fl. May, Oct. Clt. 1699. Shrub 1 to 1½ foot.

57 T. myrtifòlium (Poir. dict. suppl. 2. p. 766.) shrubby, erect, pubescent; leaves ovate, a little toothed, villous beneath, and cinereous; flowers spicate; calyx villous, with 5 acute, nearly equal teeth. ♄. F. Native of the Levant. Said to be nearly allied to *T. microphýllum*. Leaves petiolate, 3-5 lines long. Middle segment of lower lip of corolla dilated, roundish, crenulated. Perhaps a variety of *T. Màrum*.

Myrtle-leaved Germander. Shrub.

58 T. quadra'tulum (Schreb. unilab. p. 36.) perennial; stems and under sides of leaves clothed with white tomentum; leaves ovate-rhomboid, toothed, shining above; whorls racemose. ♃. H. Native of Spain. Stems erect, branched at the base. Leaves similar to those of *T. Màrum*, but a little broader. Racemes short. Calyx pubescent. Corolla purple. This appears to be nearest allied to *T. multiflòrum* and *T. Chamæ'drys*, ex Benth.

Small-square Germander. Pl. ½ foot.

59 T. subspinòsum (Pourr. ex Willd. enum. p. 596.) perennial; leaves quite entire, ovate, acute, petiolate, pubescent, with revolute margins, tomentose beneath; flowers racemose; branches spinescent. ♄. F. Native of the Balearic Islands. Very like *T. Màrum*, ex Willd.

Subspinose Germander. Fl. June, Aug. Clt. 1816. Shrub 1 to 1½ foot.

Sect. IX. Pòlium (from πολιος, *polios*, white; the *T. Polium* and some other species are white from tomentum.) Benth. lab. p. 684. Whorls few, condensed into terminal subglobose heads. Calyx tubularly campanulate, subdeclinate, oblique at the base, with 5 nearly equal teeth; the superior teeth hardly broader. Upper segments of corolla oblong, declinate: lateral ones small. Achenia much wrinkled.—Perennial herbs or under-shrubs. Stems generally procumbent at the base, much branched; floriferous branches ascending.

60 T. Pyrena'icum (Lin. spec. p. 791.) creeping, villous; leaves roundish, crenated, green on both surfaces; whorls few, crowded into a terminal head; calyx tubularly campanulate, declinate, with nearly equal teeth. ♃. H. Native of the South of Europe; as of Catalonia, Arragon, Pyrenees, and Auvergne. Pòlium Pyrenàicum, Mill. dict. no. 6. T. réptans, Pourr. act. toul. 3. p. 330. T. rotundifòlium, Schreb. unilab. p. 42.?—Bocc. mus. 2. t. 61.—Barrel. icon. t. 1086. Stems rooting at the base, creeping under the earth. Sterile branches prostrate: floriferous ones ascending. Leaves on short petioles. Heads solitary, terminal. Corollas pale yellow, the lower segment sometimes purplish.

Pyrenean Germander. Fl. June, Aug. Clt. 1731. Pl. procumbent.

61 T. buxifòlium (Schreb. unilab. p. 42.) suffruticose; leaves obovate-cuneated, with subrevolute crenated margins, green and nearly glabrous above, and canescent beneath; whorls crowded into a terminal head; calyx tubularly campanulate, declinate, with nearly equal teeth. ♄. F. Native of Spain, in the fissures of rocks. T. saxátile, Cav. icon. rar. 2. p. 19. t. 121. f. 1. Stems procumbent at the base, ascending, often much branched, pilosely pubescent. Leaves ½ an inch long, numerous, narrowed into short petioles at the base. Heads, calyxes, and flowers of *T. Pyrenàicum*. Corollas whitish, and often reddish.

Box-leaved Germander. Shrub procumbent.

62 T. cuneifòlium (Sibth. et Smith, fl. græc. 6. p. 30. t. 537.) procumbent, clothed with dense tomentose wool; leaves roundish, crenated, cuneated at the base, thick, densely tomentose on both surfaces; whorls few, condensed into a terminal head; calyx tubular, tomentose, with short nearly equal teeth. ♃. H. Native of Candia, on the Sphaciotic mountains. This differs from the two preceding species, at first sight, in the whole plant being canescent or yellowish from dense tomentum; but the habit is similar. Leaves scarcely ½ an inch long, thick. Corolla white, yellowish at base.

Wedge-leaved Germander. Pl. procumbent.

63 T. alpe'stre (Sibth. et Smith, fl. græc. 6. p. 31. t. 538.) suffruticose, humble, divaricately much branched, clothed with hoary or yellowish villi; leaves small, obovate-cuneated, round-

ish, crenated, with revolute edges ; whorls very few, subcapitate at the tops of the branches ; calyx declinate, ovate-tubular, pilose, with nearly equal short obtuse teeth. ♄. H. Native of Candia, on the Sphaciotic Mountains, and near Mirabello. T. saxátile, Sieb. pl. cret. exs. but not of Cav. Habit of *T. thymifòlium*, but allied to *T. Pòlium* in character. Leaves distant, 2-3 lines long, greenish on both surfaces. Heads terminal, size of peas, composed of 4-6 flowers. Corollas small, white.

Alp Germander. Shrub humble.

64 T. Pòlium (Lin. spec. p. 792.) suffruticose, canescent from tomentum, woolly, rarely pilosely hispid; leaves cuneated, oblong or linear, with revolute edges ; whorls few, condensed into globose or oblong terminal heads ; calyx tubularly campanulate, with nearly equal teeth. ♄. F. Native of Europe and Africa, in the region of the Mediterranean ; as well as of Tauria and Caucasus. Stems much branched ; branches procumbent or ascending, rarely erect. Leaves sessile, variable in form. Whorls 2-6-flowered. Corollas small, white, yellowish, or purple.

Var. α, flavéscens (Benth. lab. p. 685.) leaves broader ; heads very hairy ; tops of branches yellowish. ♄. F. In the western region common. T. aúreum, Schreb. unilab. p. 43. Cav. icon. 2. p. 16. t. 117. T. flávicans, Lam. dict. 2. p. 700. T. tomentòsum, Vill. fl. dauph. 2. p. 352. Pòlium aúreum, Mœnch, meth. p. 385. Pòlium lùteum, Mill. dict. no. 2.—Barrel. icon. t. 1082.—Blackw. 456. Flowers of a deep yellow colour. The yellow Poly or Mountain Germander.

Var. β, hirsùtum (Benth. lab. 685.) leaves oblong, scarcely canescent, and are, as well as the heads, pilose. ♄. F. Native of Egypt. T. Ægyptìacum, Pers. ench. 2. p. 112.

Var. γ, vulgàre, (Benth. lab. p. 685.) leaves oblong, and are, as well as the heads, clothed with tomentose wool ; corolla white. ♄. F. Common throughout the region of all the varieties. T. Pòlium, Lin. and other authors. Sibth. et Smith, fl. græc. 6. p. 29. t. 535. T. pseudohyssòpus, Schreb. unilab. p. 45. T. Teùthrion, Schreb. unilab. p. 46. T. Bèlion, Schreb. unilab. p. 47. T. Lusitánicum, Schreb. unilab. p. 47.? but not of Lam. T. álbum, Poir. dict. suppl. 2. p. 770. T. trifoliàtum, Vahl. symb. 1. p. 40. T. subtriphýllum, Lag. gen. et spec. nov. p. 17. Pòlium álbum, Mill. dict. no. 4. Pòlium latifòlium, Mill. dict. no. 7. Pòlium Smyrnèum, Mill. dict. no. 15. Pòlium angustifòlium, Mill. dict. no. 3. Pòlium ramòsum, Mill, dict. no. 2. Pòlium diffùsum, Mill. dict. no. 13.—Lob. icon. 486.—Barrell, icon. 1074.—Column. ecphr. 1. p. 59. t. 67. White Poly or Mountain Germander.

Var. δ, gnaphalòdes (Benth. lab. p. 686.) humble ; leaves and heads densely woolly. ♄. F. Native of Spain. T. gnaphalòdes. Vahl. symb. 1. p. 41. Lher. stirp. T. lanígerum, Lag. gen. et spec. nov. p. 17. ?

Var. ε, purpuráscens (Benth. lab. p. 686.) leaves oblong, and are, as well as the heads, clothed with tomentose wool ; corollas reddish purple. ♄. F. On the sea-shore about Marseilles, and on the shores of the Adriatic sea. T. Achæmènis, Schreb. unilab. p. 44. Pòlium integérrimum, Mill. dict. no. 14.—Mor. hist. 3. sect. 11. t. 2. f. 12. The purple Poly or Mountain Germander.

Var. ζ, angustifòlium (Benth. lab. p. 686.) leaves linear or linear-oblong, and are, as well as the heads, which are small, clothed with hoary, rarely yellowish, tomentum ; corollas red. ♄. F. Native throughout the whole region of the species. T. capitàtum, Lin. spec. 792. Cav. icon. 2. p. 17. t. 119. Sibth. et Smith, fl. græc. 6. p. 30. t. 536. T. flavéscens, Schreb. unilab. p. 44. T. Valentìnum, Schreb. unilab. p. 46. T. pycnophýllum, Schreb. unilab. p. 48. ? T. lavandulàtum, Pourr. T. corymbíferum, Desf. fl. atl. 2. p. 8. ? T. cylíndricum, Lam. ex Steud. nom. p. 829. Pòlium capitàtum, Mill. dict. no. 5. Pòlium serràtum, Mill. dict. no. 12. Pòlium spicàtum, Mill. dict. no. 18. Pòlium fruticòsum, Mill. dict. no. 11. Pòlium eréctum, Mill. dict. no. 8.—Barrel. icon. t. 1079 and 1078. Pòlium Monspessulànum, Bauh. hist. 3. p. 299.

Poly Mountain. Fl. July, Sept. Clt. var. α, 1731. ; γ, 1562. ; ε, 1816. ; ζ, 1731. Shrub ½ to 1 foot.

65 T. amplexicau'le (Benth. lab. p. 687.) suffruticose ; branches clothed with white wool ; leaves ovate-oblong or oblong, crenated, usually cordately stem clasping at the base, with revolute margins, at first tomentose above, but at length nearly glabrous, and clothed with dense white wool beneath ; whorls few, globosely capitate ; calyx declinate, tubularly campanulate, with nearly equal broad acute teeth ; tube of corolla exserted. ♄. F. Native of Spain. Habit and leaves of some of the varieties of *T. Pòlium*, but stiffer. Flowers similar to those of *T. montànum*, and *T. Pyrenàicum*, but much larger than in *T. Pòlium*. It differs from *T. thymifòlium* in the taller stature, form of leaves, and larger heads.

Stem-clasping-leaved Germander. Shrub.

66 T. thymifòlium (Schreb. unilab. p. 50. Benth. lab. p. 687.) suffruticose, humble, much branched ; branchlets hoary, ascending ; leaves oblong or obovate, hoary on both surfaces or only beneath ; whorls about 2-flowered, very few, subcapitate at the tops of the branches ; calyx declinate, tubularly campanulàte, with nearly equal broad acute teeth ; tube of corolla subexserted. ♄. F. Native of Spain. Habit of *T. alpéstre*, tufted. Leaves short, crowded, less wrinkled and less tomentose than in *T. Pòlium*, but more so than in *T. montànum*. Flowers 2-6 on each branch, hardly capitate. Calyx one half smaller than in *T. montànum*, and the corollas are reddish.

Thyme-leaved Poly or Germander. Fl. June, Oct. Clt. 1816. Shrub ¼ to ½ foot, tufted.

67 T. monta'num (Lin. spec. 791.) suffruticose, prostrate ; branches hoary or pubescent ; leaves oblong-linear, quite entire, hoary on both surfaces or only beneath, flat or the margins are revolute ; whorls few, condensed into a terminal head ; calyx subdeclinate, tubularly campanulate, glabrous or hoary, with nearly equal lanceolate subulately acuminated teeth. ♄. F. Native of the southern parts of Europe, on hills and mountains, in calcareous places ; as of Spain, South of France, South of Germany, Italy, Sicily, Grecian Mountains ; and of Volhynia and Tauria. Sibth. et Smith, fl. græc. 6. p. 28. t. 534. T. supìnum, Lin. spec. 791. Jacq. austr. 5. p. 8. t. 417. Pòlium montànum, Mill. dict. no. 1.—Lob. icon. 488. Stem much branched. Leaves smoothish above. Heads larger than in *T. Pòlium*, each usually composed of 2-4, 4-6-flowered whorls. Corollas cream-coloured or white.

Mountain Poly or Mountain Germander. Fl. June, Oct. Clt. 1710. Shrub prostrate.

68 T. pu'milum (Lin. spec. p. 792. ? Benth. lab. p. 687.) suffruticose, procumbent or erect ; branches hoary ; leaves narrow-linear, quite entire, hoary beneath, with revolute margins ; whorls few, condensed into terminal heads ; calyx subdeclinate, tubularly campanulate, with nearly equal lanceolate subulately acuminated teeth. ♄. F. Native of Spain. T. Libanòtis, Schreb. unilab. p. 38. ? Cav. icon. 2. p. 17. t. 118.—Barrel. icon. t. 1091 and 1093. ? This hardly differs from *T. montànum*, except in the more erect stems, narrower leaves, and purplish flowers.

Dwarf Mountain Poly. Fl. July, Aug. Clt. 1816. Shrub procumbent.

69 T. verticilla'tum (Cav. icon. 2. p. 77. t. 198.) stems erect ; leaves linear, verticillate, whitish, glaucous, sessile, with revolute margins ; heads terminal, leafy at the base ; calyx turbi-

nate, tomentose, 5 crenate. 4. F. Native of Spain, among the mountains. Roots woody. Leaves 4-6 in a whorl. Whorls approximate. Corollas yellowish.

Whorled-leaved Poly or Germander. Pl. ½ to 1 foot.

† *Species belonging to sect.* IX. *Pòlium, but are not sufficiently known.*

70 T. angusti'ssimum (Schreb. unilab. p. 39.) shrubby, erect; leaves linear, quite entire, nearly naked; heads of flowers terminal, pilose; calyx pilose, with a bearded mouth. ħ. F. Native of Spain.—Barrel. icon. t. 1080. Stems filiform, clothed with dense white tomentum. Leaves narrowed, with revolute edges. Heads solitary, usually composed of 3 whorls, small. Corolla white, hardly longer than the calyx. Perhaps a variety of *T. Pòlium*.

Very narrow-leaved Poly or Germander. Fl. June, July. Clt. 1818. Shrub ¼ foot.

71 T. cæle'ste (Schreb. unilab. p. 39.) suffruticose, erect; hoary from tomentum; leaves linear, quite entire; heads terminal, tomentose: calyx green, but loosely tomentose, with triangular teeth. ħ. F. Native of Spain, among the mountains in Valentia.—Barrel. icon. t. 1081. Heads solitary or by threes. Corollas white, smaller than those of the preceding. Perhaps a variety of *T. Pòlium*.

Heavenly Poly or Germander. Shrub ½ to 1 foot.?

72 T. cymòsum (Pers. ench. 2. p. 112.) flowers paniculately cymose; leaves linear, toothed; stem woolly, suffruticose. ħ. F. Native of Spain, near Aranjuez. Perhaps a variety of *T. Pòlium*.

Cymose-flowered Poly or Germander. Shrub.

73 T. marjora'na (Pers. l. c.) spikes ovate; peduncles subcymose; leaves linear, with revolute edges; stem almost filiform. ħ. F. Native of Spain. Perhaps a variety of *T. Pòlium*.

Marjoram Poly or Germander. Shrub.

† † *Doubtful species.*

74 T. sessilifòlium (Clarke's trav. 4. p. 555.) leaves hairy, sessile, obtuse: lower ones lanceolate, quite entire: upper ones and bracteas crenated, elliptic-lanceolate; flowers axillary, solitary; peduncles very short. ħ. F. Native of Turkey, between Constantinople and Rutschuk, Clarke. Stems erect, woolly. Leaves more than an inch long. Flowers an inch long, with a bearded throat.

Sessile-leaved Germander. Pl.?

75 T. undula'tum (Lour. coch. p. 362.) leaves oblong, undulated, a little crenated; corymbs terminal. ħ. G. Native of Cochinchina, in hedges. Stem shrubby, erect, branched. Leaves obtuse, glabrous, petiolate. Flowers pale, disposed in terminal racemose corymbs. Corolla 5-cleft, with a short tube and obtuse segments, the superior segments divaricate. Stamens very long, ascending. Achenia naked.

Undulated-leaved Germander. Shrub 5 feet.

76 T. the'a (Lour. coch. p. 363.) leaves ovate-lanceolate; stem procumbent; peduncles axillary, 3-flowered. ħ. G. Native of Cochinchina, among bushes. Stem shrubby, 8 feet, procumbent, glabrous, unarmed, terete, branched. Leaves ovate-oblong, acute, quite entire, petiolate, glabrous. Flowers white. Stamens longer than the corolla. Stigma bipartite, acute.

Tea Germander. Shrub procumbent.

77 T. rotundifòlium (Poir. dict. suppl. 2. p. 767.) leaves ovate-rounded, crenated, glabrous, on long petioles; spike terminal, few-flowered; peduncles very long; stem simple, tetragonal. 4. F. Native of Buenos Ayres, Commerson. T. Commersònii, Spreng, syst. 2. p. 710. Leaves distant, glabrous, petiolate. Peduncle slender, terminal, bearing a short spike of flowers at top. Calyx pubescent, acutely 5-toothed. Lip of corolla blue.

Round-leaved Germander. Pl. 1 foot.

78 T. fasciula'tum (Poir. dict. suppl. 2. p. 767.) stem shrubby; leaves subfasciculate, narrow-linear, glabrous, with a subtubercular tooth on one or other side; spike short, terminal. ħ. F. Native country unknown. Stem brown, glabrous, terete. Leaves sessile, 6-8 lines long. Corollas yellow.

Fascicled-leaved Germander. Shrub.

Cult. The greater number of the species grow best in a dry soil and shady situation; but *T. Scórdium* and *T. lanuginòsum* require a moist boggy soil. All the perennial herbaceous kinds are readily propagated by division and by seeds. Most of the shrubby species being rather tender require the protection of a frame or greenhouse in winter; and they are readily increased by cuttings of young wood. The seeds of annual kinds only require to be sown in the open border in spring, where they are intended to remain.

CIX. A'JUGA (said to be from *a* priv. and *ζυγος, zugos*, a yoke; in reference to the calyx being equal, not bilabiate; or either from *Abigo*, or from *a* priv. and Jugo, to yoke; both from a supposed power of procuring abortion, which, however, the plants do not possess.) Benth. lab. p. 690. A'juga and Teùcrium species, Lin. and other authors.—Phleboánthe, Tauch. —Bùgula and Chamæ'pithys, Tourn.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx ovate or globosely campanulate, nearly equal, 5-cleft or toothed. Corolla with an inclosed or exserted tube, straight or somewhat spirally twisted, usually furnished with a pilose ring inside; limb bilabiate; upper lip short, but generally very short, emarginate: lower lip elongated, spreading, trifid, having the lateral segments oblong, and the middle segment broader, emarginate, or bifid. Stamens 4, ascending, usually exserted from the upper lip, didynamous, lower ones the longest; anthers 2-celled: cells diverging or divaricate, at length confluent. Style about equally bifid at top; stigmas minute. Achenia reticulately wrinkled.—Annual or perennial herbs, usually procumbent or ascending, sometimes stoloniferous. Whorls 2 or many-flowered, dense, sometimes all axillary, when the floral leaves conform to the cauline ones; sometimes the superior whorls are approximate into spikes, then the floral leaves are small, and of a different form from the cauline ones.

Sect. I. Bu'gula (the Latin name of *Comfrey.*) Benth. lab. p. 692. Whorls 6, but generally many-flowered. Corollas usually blue, rose-coloured, white, purplish, but never yellow.

1 A. loba'ta (D. Don, prod. fl. nep. p. 108.) stolons creeping; leaves on long petioles, roundish, coarsely crenated or lobed, nearly glabrous. 4. F. Native of Nipaul and Gosainsthan. Herb nearly glabrous or sparingly pilose. Leaves 1-2 inches long, usually deeply cordate at the base, but sometimes truncate and cuneated. Lower whorls 2-flowered, upper ones approximate. Calyx 4-5 cleft.

Lobed-leaved Bugle. Pl. ½ foot.?

2 A. re'ptans (Lin. spec. 785.) stolons creeping; leaves ovate or obovate, quite entire or sinuated, and are, as well as the stems, nearly glabrous. 4. H. Native of Europe and Middle Asia, in grassy humid places; plentiful in Britain. Hook. fl. lond. vol. 2. icone. Smith, engl. bot. 7. t. 489. Bùgula réptans, Mill. dict. no. 1. Mœnch, meth. p. 382. Búgula, Riv. mon. irr. t. 75. f. 1.—Blackw. t. 64. f. 1. Floriferous branches

erect, glabrous, or pubescent. Radical leaves petiolate; cauline ones nearly sessile. Lower whorls remote; upper ones spicate, 6-20-flowered. Corollas varying from blue to rose-colour and white. This was formerly recommended as a vulnerary herb, but it is now altogether neglected.

Creeping or Common Bugle. Fl. May, July. Britain. Pl. ½ foot.

3 A. orienta'lis (Lin. spec. 785.) plant without stolons ascending, pilosely woolly; leaves ovate, coarsely and sinuately toothed, narrowed at the base: floral ones sessile, broad-ovate, deeply lobed or toothed, exceeding the flowers; whorls distant, or the upper ones are approximate; tube of corolla twisted, exserted, naked inside; limb of corolla resupinate. ♃. H. Native of Europe and Asia, in the region of the Mediterranean, on dry hills and pastures; as of Spain, Sicily, Italy, Grecian Islands, Syria, Tauria, and Caucasus, &c. Bùgula oblìqua, Mœnch, meth. p. 382. Bùgula orientàlis, Mill. dict. no. 5.—Dill. elth. t. 53. f. 61. Radical leaves petiolate, large. Calyx deeply 5-cleft, with narrow, very pilose segments. Corollas blue.

Eastern Bugle. Fl. May, June. Clt. 1732. Pl. 1 to 1½ foot.

4 A. pyramida'lis (Lin. spec. p. 785.) plant without stolons, pilosely hispid or glabrous, erect; cauline leaves approximate, scarcely petiolate, obovate: floral leaves broad-ovate, clasping the flowers, tetragonally pyramidate, the upper ones often coloured, all quite entire or obscurely sinuated; upper whorls or all spicate; tube of corolla straight, exserted, annulate inside. ♃. H. Native of Europe, in shady mountain-places; and of Eastern Caucasus; as of Lapland, Sweden, Pyrenees, Cevennes, Provence, Switzerland, Piedmont, Greece, &c. in several parts of the North of Scotland. Smith, engl. bot. t. 1270. Œd. fl. dan. 185. Bùgula pyramidàlis, Mill. dict. no. 2. Teùcrium pyramidàle, Crantz, stirp. austr. Radical leaves 1½ to 2 inches long, gradually becoming smaller as they ascend the stem. Whorls many-flowered. Calyx 5-cleft. Corollas blue or purple.

Pyramidal Bugle. Fl. May, June. Scotland. Pl. ½ foot.

5 A. cilia'ta (Bunge, enum. pl. chin. bor. p. 51.) plant without stolons; stems erect, elongated, glabrous; cauline leaves remote, ovate, coarsely toothed, membranaceous, almost glabrous, with ciliated margins: lower floral leaves similar to the cauline ones: upper ones ovate, acute, quite entire, coloured a little, ciliated; whorls spicate, or the lower ones are remote; tube of corolla much exserted. ♃. H. Native of the North of China, in humid shady places at the rivulet called Ssi-jui-ssy, Bunge. Stems a little branched. Corollas blue. Bracteas purplish. Very nearly allied to *A. Genevénsis*.

Ciliated Bugle. Pl. 1½ foot.

6 A. Geneve'nsis (Lin. spec. p. 785.) plant without stolons; stem erect, pilose; cauline leaves oblong-elliptic or obovate, narrowed at the base: lower ones petiolate: floral ones ovate or cuneated: superior ones scarcely equalling the flowers or shorter, all usually coarsely toothed, membranaceous, green on both surfaces, and beset with scattered hairs; upper whorls spicate: lower ones distant; tube of corolla much exserted. ♃. H. Native of Europe and Asiatic Russia, on grassy mountains; as of Sweden, France, Germany, Italy, Tauria, and Caucasus, North of China, &c.; North of England, among the mountains. A. alpìna, Lin. mant. p. 80. Smith, engl. bot. t. 477. A. foliòsa, Tratt. arab. 1. p. 25, with a figure. ? A. rugòsa, Host, fl. austr. 2. p. 120. A. multiflòra, Bunge, enum. pl. chin. bor. p. 51. A. pyramidàlis, Bieb. fl. cauc. 2. p. 32. Lasch. in Linnæa. 5. p. 443. and of many other authors, but not of Lin. A. alpéstris, Dumort, florul. belg. p. 42.? Teùcrum Genevénsis, Crantz, stirp. austr. Bùgula alpìna, All. ped. 1. p. 45. Bùgula decúmbens, Mill. dict. no. 2. Bùgula Genevénsis, Mill. dict. no. 4. Bùgula montàna, Riv. mon. irr. t. 140. f. 2. Plant very variable in stature, form of leaves, and hairiness, as sometimes hardly to be distinguished from *A. pyramidàlis*, and sometimes it is also allied to *A. austràlis* and *A. remòta*. Leaves more or less pilose, with a few teeth or lobes; upper floral ones coloured. Calyx 5-cleft, hairy. Corollas varying from blue to rose-colour and white; tube annulate inside.

FIG. 89.

Geneva Bugle. Fl. May, July. England. Pl. ½ to 1 foot.

7 A. remòta (Benth. in Wall. pl. rar. asiat. 1. p. 59. lab. p. 694.) plant without stolons, branched at the base, procumbent; floriferous branches ascending, villous; leaves oblong-elliptic or ovate, narrowed at the base: floral leaves ovate-cuneated, exceeding the flowers, all thickish and somewhat coriaceous, villous, coarsely few-toothed; whorls remote or the upper ones are approximate; tube of corolla exserted; middle segment of lower lip scarcely emarginate. ♃. H. Native of India, in the provinces of Oude, Hurdwar, and Kamaon, Wall; Himalaya at Nag-kanda, Royle; Deyra Dhoun, Royle and Jacquemont; Berali and Mirpoor, Jacquemont. This differs from *A. Genevénsis* in the characters given. Whorls many-flowered. Calyx inflately globose after inflorescence. Corollas varying from violaceous or blue to rose colour and white, more slender and smaller than in *A. Genevénsis*.

Remote Bugle. Pl. ascending or procumbent.

8 A. O'phrydis (Burch. cat. geogr. pl. afr. austr. no. 3700.) plant without stolons, erect, pilosely hispid; leaves obovate, narrowed at the base: floral leaves ovate, equalling the flowers or scarcely exceeding them, all thickish and somewhat coriaceous, glabrous or villous, coarsely few-toothed; lower whorls remote: upper ones spicate; tube of corolla equalling the calyx; middle lobe of lower lip bifid. ♃. G. Native of the Cape of Good Hope, Masson, Burchell. Allied to *A. Genevénsis* and *A. remòta*, but differs from both in the stems being erect and hispid, in the floral leaves being broad, and in the flowers being twice the size, and in the form of the corolla. Corollas blue; tube annulate inside.

Ophrys-like Bugle. Pl. ½ to ¾ foot.

9 A. austra'lis (R. Br. prod. p. 503.) plant without stolons; stems ascending or erect, pubescent, rather villous or glabrous; leaves narrow-oblong, narrowed at the base, quite entire or sinuated, thickish, rather villous: floral leaves similar to the cauline leaves, exceeding the flowers; lower whorls remote: upper ones subspicate; tube of corolla exserted; middle segment of lower lip emarginately bifid. ♃. F. Native of New Holland, in grassy places, at Port Jackson, and in the interior, &c. Very like *A. Genevénsis*, but differs in the leaves being narrower, longer, and more entire, especially the floral leaves. Stem, leaves, and calyxes pubescent, with short adpressed hairs. Teeth of calyx short. Corolla blue; tube annulate inside.

Southern Bugle. Fl. May, July. Clt. 1822. Pl. ½ foot.

10 A. Dieme'nica (Benth. lab. p. 695.) plant humble, without stolons, ascending; leaves narrow-oblong, narrowed at the base, petiolate, or the superior ones are sessile, quite entire or sinuately toothed, thickish: floral leaves similar to the cauline ones, much longer than the flowers; whorls all remote; tube of corolla equalling the calyx: middle segment of lower lip shortly emarginate. ♃. F. Native of Van Diemen's Land, Gunn and Lawrence. Plant more humble, more villous, and less erect than *A. austràlis*. Leaves, especially the floral ones, usually toothed. Corollas blue; ? tube annulate inside.

Van Diemen's Land Bugle. Pl. ¼ foot.

11 A. acau'lis (Brocchi, Osserv. sulli. abruz. p. 22.) plant without stolons; stems very short; leaves oblong or obovate, narrowed a long way at the base, hardly sinuately toothed: floral leaves similar to the cauline leaves, but smaller, all glabrous or pilose; whorls few, condensed; tube of corolla straight, much exserted. ♃. H. Native of the South of Italy, in the higher mountain pastures, in Abruzzo and Calabria; also of Sicily. A. decúmbens, Tenor. fl. nap. but not of Thunb. A. Tenòrii, Presl. fl. sic. p. 34. Stems shorter than the leaves, scarcely 2 inches. Leaves approximate, 1½ to 2 inches long, or longer; floral ones narrower, generally quite entire, about equal in length to the corollas. Whorls few-flowered. Calyx semiquinquefid. Corolla nearly an inch long; tube annulate inside.

Stemless Bugle. Pl. 2 to 3 inches.

12 A. sinua'ta (R. Br. prod. p. 503.) hairy; stems many, procumbent; radical leaves longer than the petioles, and are, as well as the floral ones, sinuated, attenuated at the base; whorls 6-flowered; calyx very hairy; corolla rather pilose. ♃. ? F. Native of New Holland, at the Coal river near Port Jackson. A very distinct species, with the habit of *A. parviflòra*. Flowers small, blue.

Sinuated-leaved Bugle. Pl. procumbent.

13 A. parviflòra (Benth. in Wall. pl. rar. asiat. 1. p. 59. lab. p. 696.) plant diffuse, without stolons; branches ascending, villous; leaves broad-ovate, narrowed into the petioles at the base, sinuately subdentate: floral leaves ovate, almost quite entire, exceeding the flowers, all thick, very villous, and subcanescent; flowers minute; tube of corolla shorter than the calyx. ♃. F. Native of the Himalaya, in Kamaon, Wall; at Simlah, Lady Dalhousie; Mussooree, Royle and Jacquemont; at Illahabad, and in the valley of the Jumna, Jacquemont. Stems numerous. Whorls many-flowered. Corollas pale violet, exannulate. Stamens inclosed.

Small-flowered Bugle. Pl. ¼ to ½ foot.

14 A. bracteòsa (Wall. ex Benth. l. c. lab. p. 696.) plant without stolons, diffuse; branches ascending, villous; leaves broad-ovate, narrowed into the petioles at the base: floral leaves similar to the rest, exceeding the flowers, all sinuately toothed or quite entire, thick, very villous, subcanescent; upper whorls spicate; flowers small; tube of corolla exserted. ♃. F. Native of Nipaul, Hamilt. A. integrifòlia, Hamilt. in D. Don, prod. fl. nep. p. 108. Habit and hairiness of *A. parviflòra*, but taller and more branched; cauline and floral leaves larger; whorls more approximate; flowers as large again, but one half smaller than those of *A. Genevénsis*. Corollas blue; tube annulate inside.

Bracteate Bugle. Fl. July, Aug. Clt. 1821. Pl. ½ to ¾ foot.

15 A. densiflòra (Wall, ex Benth. l. c. lab. p. 696.) plant without stolons, humble, ascending, or erect, villous; leaves oblong or ovate, subcrenated, narrowed at the base, thick, villous: upper floral leaves or all are shorter than the flowers; whorls spicate or the lower ones hardly remote; tube of corolla equalling the calyx: middle segment of lower lip scarcely emarginate. ♃. F. Native of Nipaul. Allied to *A. parviflòra* and *A. bracteòsa*. Corolla blue; lower lip size of that of *A. Genevénsis*.

Dense-flowered Bugle. Pl. ¼ to ½ foot.

16 A. decu'mbens (Thunb. fl. jap. 243. ? Benth. lab. p. 697.) plant procumbent, without stolons; leaves subovate, coarsely toothed or cut, narrowed at the base, glabrous or villous: lower floral leaves almost similar to the cauline leaves: superior ones or all are bractea-formed, shorter than the flowers; whorls spicate, or the lower ones are few, axillary, and distant; calycine teeth bluntish; tube of corolla inclosed or a little exserted. ♃. F. Native of Nipaul and Kamaon, Wall; Kheree Pass and Deyra Dhoun, Royle; China, Sir G. Staunton. Intermediate between *A. densiflòra* and *A. macrospérma*. Whorls globose.

Decumbent Bugle. Pl. procumbent.

17 A. macrospe'rma (Wall, ex Benth. l. c. lab. p. 697) plant without stolons, erect or ascending, branched; cauline leaves ample, ovate, coarsely toothed, narrowed a long way at the base, membranaceous, glabrous or sparingly pilose: lower leaves almost similar to the rest: upper floral leaves or all bractea-formed, and shorter than the flowers; whorls spicate, or the lower ones are subremote; calycine teeth obtuse; tube of corolla shortly exserted. ♃. F. Native of the East Indies, on the Pundua Mountains, and on Mount Taong Dong near Ava. Stem paniculately branched. Lower leaves on long petioles, 2-4 inches long. Calyx turbinate. Corolla small, with an elongated tube, which is inflated in the middle, and annulate inside.

Large-seeded Bugle. Pl. 1 to 2 feet.

Sect. II. Chamæ'pithys (from χαμαι, *chamai*, on the ground, and πιτυς, *pitus*, a pine; the odour of Chamæ'pithys is bitter and resinous like that of the pine.) Benth. lab. p. 697. Whorls 2, rarely 4-flowered. Corollas red or yellow; upper lip very short and truncate.

18 A. Laxma'nni (Benth. lab. p. 697.) stems ascending, pilosely woolly; leaves sessile, oblong or elliptic, obtuse, quite entire, pubescent or pilose: floral leaves similar to the cauline ones; whorls 2-flowered; calyx ample, semiquinquefid, with oblong, bluntish, nearly equal segments; tube of corolla inclosed. ♃. H. Native of the South-east of Europe and Middle Asia; as of Hungary, Transylvania, Bessarabia, Tauria, Caucasus, and Iberia. Teùcrium Laxmánni, Lin. syst. p. 439. Waldst. et Kit. pl. rar. hung. 1. t. 69. Phleboánthe Laxmánni, Tausch. in bot. zeit. 1828. 1. p. 323. Stems branched, clothed with long hairs. Leaves about 2 inches long, stem-clasping; lower ones narrowed at the base; upper ones roundish; floral leaves all exceeding the flowers. Corollas yellow, nearly an inch long. Genitals equal in length to the segments of corolla.

Laxmann's Ground-pine. Fl. June, Aug. Clt. 1800. Pl. 1 to 2 feet.

19 A. oblonga'ta (Bieb. fl. cauc. suppl. p. 388.) stem erectish, very pilose; leaves nearly sessile, narrowly oblong, obtuse, quite entire, pilose: floral leaves similar to the cauline leaves; whorls 2-flowered; upper tooth of calyx minute: lower ones equal in length to the tube; tube of corolla shortly exserted. ♃. H. Native of Caucasus, in sandy places; and of Syria, between Bagdad and Aleppo. A. salicifòlia, Stev. mem. soc. nat. cur. mosq. 3. p. 265, but not of Lin. This differs from *A. Laxmánni* in the smaller stature and leaves, more stiff hairs, and form of calyx. Stems usually panicled. Corollas yellow, about the size of those of *A. Laxmánni*, but the lateral segments are rather broader.

Oblong-leaved Ground-pine. Pl. 1 foot.

20 A. salicifòlia (Schreb. unilab. p. 26.) herbaceous, pubescent; leaves oblong-lanceolate, bluntish, quite entire or a little toothed, narrowed into the short petioles at the base; calyx tomentosely hairy, with oblong obtuse teeth, the upper tooth the shortest; flowers on short pedicels. ♃. H. Native of Syria, between Smyrna and Bursa; and of Tauria and Armenia. Sibth. et Smith, fl. græc. 6. p. 22. t. 526. Teùcrium salicifòlium, Lin. mant. p. 80. Schreb. dec. 1. p. 17. t. 9. This differs from *A. oblongàta* in the short stiff pubescence. Habit and flowers almost the same, but the calyx is larger.

Willow-leaved Ground-pine. Pl. procumbent. ?

21 A. chamæci'stus (Ging. in herb. D. C. ex Benth. lab. p. 698.) suffruticose; branches white, nearly glabrous; leaves sessile, ovate-elliptic, obtuse, quite entire, green on both surfaces, but finely pubescent or glabrous; flowers pedicellate; calyx attenuated at the base, with oblong obtuse equal teeth. ♄. F. Native of Persia. A very distinct species. Leaves an inch long. Calyx tomentose at the base, whitish, with green teeth. Tube of corolla a little exserted.

Dwarf-cistus Ground-pine. Shrub.

22 A. Iva (Schreb. unilab. p. 25.) annual, diffuse, pilosely hispid; leaves oblong-linear, coarsely toothed or almost quite entire, with subrevolute edges: floral leaves similar to the cauline leaves; whorls 2-6-flowered; tube of corolla exserted. ⊙. H. Native of the South of Europe and North of Africa, in the region of the Mediterranean. A. moschàta, Schreb. unilab. p. 26. Teùcrium Iva, Lin. spec. p. 787. Cav. icon. 2. t. 120. Teùcrium moschàtum, Lam. fl. fr. 2. p. 409. Moschària asperifòlia, Forsk, fl. ægypt. 154.—Mor. hist. sect. 11. t. 22. f. 3. —Lob. icon. t. 384. Branches numerous, tufted, leafy. The whole plant beset with stiff hairs. Leaves about an inch long, narrowed at the base. Corolla rose-coloured; tube annulate inside. This species possesses the same qualities as *A. Chamæpithys*. Var. β, flowers yellow. ♄. F. A. pseudoìva, D. C. fl. fr. suppl. p. 395. A. Iva, Sibth. et Smith, fl. græc. 6. p. 22. t. 525. This does not differ from the species, unless in the colour of the flower.

Iva Ground-pine. Fl. July, Aug. Clt. 1759. Pl. ¼ to ½ foot.

23 A. tridactylìtes (Ging. mss. ex Benth. lab. p. 699.) suffruticose, diffuse, pilosely hispid; leaves cuneated-oblong, deeply tridentate at the apex or trifid, with short ovate-oblong teeth: floral leaves similar to the cauline ones: upper ones shorter than the flowers; whorls 2-flowered; tube of corolla exserted. ♄. F. Native of Palestine, on the top of Mount St. Catherine, N. Bové; and at the foot of Mount Libanon, Meryon. Habit of *A. Iva*, but differs in the form of the leaves and smaller flowers. Corolla rose-coloured. Filaments pilose, like those of *A. Iva*.

Three-fingered-leaved Ground-pine. Shrub ¼ to ½ foot.

24 A. Chìa (Schreb. unilab. p. 25.) herbaceous, erect, pilosely hispid; leaves deeply trifid, with linear, quite entire or trifid lobes: floral leaves similar to the others, rather shorter than the corollas; whorls 2-flowered, distinct. ⊙. H. Native of Europe and Asia, in the region of the Mediterranean, on dry hills; as of Sicily, Italy, Island of Chio, and other Grecian islands; also of Tauria. Sibth. et Smith, fl. græc. 6. p. 21. t. 524. A. Chamæ´pithys, Guss. fl. sic. prod. 2. p. 66. Teùcrium Chìum, Poir. suppl. 2. p. 772. Hardly differing from *A. Chamæ´pithys*, unless in the corollas being twice as long, and in the stems and leaves being more hairy.

Var. β, *mìnor* (Benth. lab. p. 699.) ⊙. H. Native of Syria, near Aleppo, Russell. This variety is nearly allied to *A. tridactylìtes*.

Chio Ground-pine. Pl. ½ to 1 foot.

25 A. Chamæ´pithys (Schreb. unilab. 24.) herbaceous, diffuse; leaves deeply trifid, with linear, quite entire or trifid lobes: floral leaves similar to the others, exceeding the flowers; whorls 2-flowered. ⊙. H. Native of Middle and South Europe; also of Asia, in the Pontic region; Tauria and Caucasus. In England it abounds in Kent and Surrey, but otherwise a scarce plant. Smith, engl. bot. t. 77. Teùcrium Chamæ´pithys, Lin. spec. 787. Œd. fl. dan. t. 733. Bùgula Chamæ´pithys, Scop. carn. no. 718. Chamæ´pithys vulgàris, Link, handb. p. 453. Chamæ´pithys trífida, Dumort, florul. belg. p. 42.—Ludw. ect. t. 130.—Riv. mon. irr. t. 14. f. 1.—Mor. hist. sect. 11. f. 22. f. 1. Stems procumbent at the base, much branched, beset with long hairs like the leaves, which are ciliated with long hairs. Corolla yellow, dotted with red, pubescent outside. Filaments rather pilose. The whole plant has a highly aromatic odour, and was much esteemed in the same disorders as *Teùcrium Bòtrys*, and was an ingredient in the Portland powder.

Ground-Pine, Common. Fl. April, July. England. Pl. diffuse ¼ to ½ foot.

26 A. gla`bra (Presl. fl. sic. p. 36.? Benth. lab. p. 700.) herbaceous, glabrous; leaves dilated at the base, deeply trifid, with linear, quite entire lobes: floral leaves similar to the others; whorls 2-flowered; calycine teeth lanceolate, obtuse, glabrous. ⊙.? H. Native of Sicily and Syria. Teùcrium lævigàtum, Russ. nat. hist. alepp. 2. p. 255. This differs from the preceding by its being glabrous, and by the flowers being twice the size; and from *A. Chìa* by its being glabrous.

Glabrous Ground-Pine. Pl. ¼ to ½ foot.?

Sect. III Pseudoanisómeles (so called from the species having the habit of the genus *Anisómeles*, with the anthers of *Ajuga*. False Anisomeles.) Benth. lab. p. 700. Whorls 2-6-flowered. Upper lip of corolla hardly thrice as short as the lower lip. Australian plants. The two species have the calyx, corolla, and nearly the habit of *Anisómeles*, with the anthers of *Ajuga*. The achenia have not been seen.

27 A.? virga`ta (Benth. lab. p. 700.) stems elongated, twiggy, nearly simple; leaves oblong: cauline leaves coarsely serrated, somewhat canescently villous: floral leaves quite entire, exceeding the calyxes; whorls distant, 2-6-flowered, disposed in long racemes; tube of corolla inclosed. ♃.? G. Native of New Holland, in the interior, at the river Lachlan, Cunningham. Stems pubescent. Leaves almost of *Anisómeles;* lower ones petiolate; upper ones sessile, narrow at the base, 1-2 inches long. Flowers nearly sessile.

Twiggy Bugle. Pl. 1 to 1½ foot.

28 A.? tridenta`ta (Benth. lab. p. 701.) stems elongated, twiggy, simple; cauline leaves oblong, petiolate: floral leaves sessile, ovate, trifid at apex, exceeding the flowers; whorls distant, 2-6-flowered, disposed in long racemes; tube of corolla exserted. ♃.? G. Native along with the preceding, Cunningham. Whorls occupying the larger part of the stem, usually 2-flowered. Flowers nearly sessile. Calyx glabrous or pubescent, campanulate, deeply 5-toothed. This differs from the preceding in the smaller calyxes, larger corollas, and tridentate floral leaves.

Tridentate-leaved Bugle. Pl. 1 to 1½ foot.

† *A species not sufficiently known.*

29 A. re`pens (Roxb. fl. ind. 3. p. 3.) biennial, procumbent, villous; leaves oblong-lanceolate, narrowed into the petioles at the base, coarsely and unequally serrated; spikes terminal, cylindrical; bracteas oblong, ventricose, 5-flowered, therefore the whorls are 10-flowered. ♂. G. Native of the East Indies, in the province of Chittagong. A robust diffuse plant, having the lower branches generally radicant.

Creeping Bugle. Pl. robust.

Cult. For culture and propagation see *Teùcrium*, p. 870.

Most of the species belonging to section *Búgula* require a moist soil.

CX. CYMA`RIA (from *cyma*, a cyme; in allusion to the flowers being disposed in cymes.) Benth. in bot. reg. vol. 15. lab. p. 705.

Lin. syst. *Didynàmia, Gymnospérmia.* Calyx nearly globose, about 10-nerved, equal, 5-toothed; throat coarctate, naked inside. Corolla with a subexserted straight tube and a bilabiate limb; lips nearly equal; upper lip erect, entire, arched; lower lip spreading, trifid, having the middle segment entire. Stamens 4, ascending under the lower lip, didynamous; lower ones the longest; anthers 2-celled: cells at length divaricate. Upper lobe of style very short; stigmas minute. Achenia dry, wrinkled.—Shrubs. Flowers small, cymose; cymes racemose. This genus resembles *Craniótome* and *Plectránthus* in habit; yet the rugose achenia, less deeply separated than in most *Labiàtæ*,

seem to indicate its station as lying between *Ajugoídeæ* and *Verbenàceæ*.

1 C. dichótoma (Benth. in Wall. pl. rar. 1. p. 64. lab. p. 705.) leaves ovate, nearly glabrous above, scarcely wrinkled; cymes loose, panicled; peduncles slender, 3-4 times longer than the petioles. ♄. S. Native of the Burman Empire, on Mount Taong Dong and at Segaen. Branches tomentose. Leaves on short petioles, crenated, tomentose beneath while young.

Dichotomous Cymaria. Shrub 2 to 3 feet.

2 C. elonga`ta (Benth. in Wall. l. c. lab. p. 705.) leaves wrinkled, tomentose on both surfaces; cymes dense, on short peduncles; racemes terminal, elongated, loose. ♄. S. Native along with the preceding. This differs from the first in the branches being elongated and densely tomentose, in the leaves being on shorter petioles, and usually rounded at the base; cymes of flowers more numerous, disposed into an elongated terminal raceme. Calyx densely tomentose.

Elongated-branched Cymaria. Shrub 3 to 4 feet.

Cult. For culture and propagation, see *Plectránthus*, p. 682.

THE END.
